

# MPQ1923-AEC1

100V, 8A, High-Frequency,  
Half-Bridge Gate Driver,  
AEC-Q100 Qualified

## DESCRIPTION

The MPQ1923-AEC1 is a high-frequency, N-channel MOSFET, half-bridge gate driver. The device's low-side MOSFET (LS-FET) and high-side MOSFET (HS-FET) driver channels are controlled independently, and are matched with <5ns in time delay.

In the case of an insufficient supply, the device's HS-FET and LS-FET under-voltage lockout (UVLO) protection forces the outputs low. The MPQ1923-AEC1 also features an integrated bootstrap (BST) diode to reduce the external component count.

The MPQ1923-AEC1 is available in QFN-10 (4mmx4mm) and QFN-8 (4mmx4mm) packages.

## FEATURES

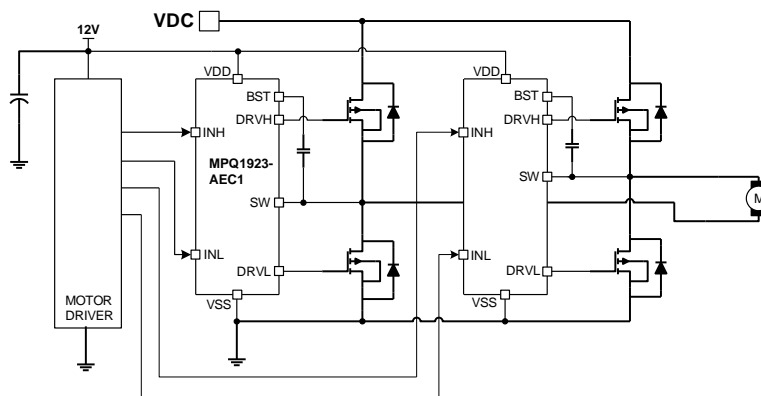

- Drives an N-Channel MOSFET Half-Bridge
- Low Dropout with 4.5V Under-Voltage Lockout (UVLO) Falling Threshold
- 120V Bootstrap Voltage ( $V_{BST}$ ) Range
- On-Chip Bootstrap Diode
- 20ns Typical Propagation Delay
- 8A Sink Current, 7A Source Current at 12V  $V_{DD}$
- <5ns Gate Driver Matching Time Delay
- Drives a 1nF Load with 7.2ns Rise Time ( $t_{RISE}$ ) and 5.5ns Fall Time ( $t_{FALL}$ ) at 12V  $V_{DD}$
- TTL-Compatible Input
- <300 $\mu$ A Quiescent Current ( $I_Q$ )
- UVLO Protection for the HS-FET and LS-FET Gate Drivers
- Available in QFN-10 (4mmx4mm) and QFN-8 (4mmx4mm) Packages
- Available in AEC-Q100 Grade 1

## APPLICATIONS

- Motor Drivers
- Telecom Half-Bridge Power Supplies
- Avionics DC/DC Converters
- Two-Switch Forward Converters
- Active-Clamp Forward Converters

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

## TYPICAL APPLICATION

## ORDERING INFORMATION

Part Number*	Package	Top Marking	MSL Rating
MPQ1923GRE-AEC1	QFN-10 (4mmx4mm)	See Below	1
MPQ1923GR-AEC1	QFN-8 (4mmx4mm)	See Below	1

\* For Tape & Reel, add suffix -Z (e.g. MPQ1923GRE-AEC1-Z).

## PIN FUNCTIONS

Pin #		Name	Description
QFN-10	QFN-8		
1	1	VDD	<b>Supply voltage.</b> The VDD pin supplies power to the internal circuitry. Connect a decoupling capacitor between VDD and ground to ensure a stable and clean supply.
2	2	BST	<b>Bootstrap.</b> The BST pin is the positive power supply for the internal floating high-side MOSFET (HS-FET) driver. Connect a bypass capacitor between the BST and SW pins.
3	3	DRVH	<b>Floating HS-FET driver output.</b>
4	4	SW	<b>Switching node.</b>
5, 6		NC	<b>Not connected.</b>
7	5	INH	<b>Control signal input for the floating HS-FET driver.</b>
8	6	INL	<b>Control signal input for the LS-FET driver.</b>
9	7	VSS	<b>Chip ground.</b>
10	8	DRVL	<b>LS-FET driver output.</b>
Pad	Pad	Exposed pad	<b>Exposed pad.</b> Connect the exposed pad to the VSS pin to improve thermal operation.

### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

Supply voltage ( $V_{DD}$ )	.....	-0.3V to +18V
SW voltage ( $V_{SW}$ )	.....	-5V to +120V
$V_{SW}$ (<2 $\mu$ s)	.....	-18V to +120V
BST voltage ( $V_{BST}$ )	.....	-0.3V to +120V
BST to SW	.....	-0.3V to +18V
DRVH voltage ( $V_{DRVH}$ )	.....	
	$V_{SW} - 0.3V$ to $V_{BST} + 0.3V$	
$V_{DRVH}$ (<2 $\mu$ s)	$V_{SW} - 2V$ to $V_{BST} + 0.3V$	
DRVL voltage ( $V_{DRVL}$ )	.....	-0.3V to $V_{DD} + 0.3V$
$V_{DRVL}$ (<2 $\mu$ s)	.....	-2V to $V_{DD} + 0.3V$
All other pins to VSS	.....	-0.3V to +10V
Continuous power dissipation <sup>(2)</sup>	.....	
QFN-10 (4mmx4mm)	.....	2.66W
QFN-8 (4mmx4mm)	.....	2.66W
Junction temperature	.....	150°C
Lead temperature	.....	260°C
Storage temperature	.....	-65°C to +150°C

### ***ESD Ratings***

Human body model (HBM) .....	±2000V
Charged device model (CDM) .....	±500V

### **Recommended Operating Conditions** <sup>(3)</sup>

Supply voltage ( $V_{DD}$ ) .....5V to 17V  
SW voltage ( $V_{SW}$ ) .....-1V to +100V  
SW slew rate..... <50V/ns  
Operating junction temp ( $T_J$ ) .... -40°C to +125°C

**Thermal Resistance** <sup>(4)</sup>       $\theta_{JA}$        $\theta_{JC}$

QFN-10 (4mmx4mm).....	47.....	7... °C/W
QFN-8 (4mmx4mm).....	47.....	7... °C/W

**Notes:**

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J$  (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) =  $(T_J$  (MAX) -  $T_A$ ) /  $\theta_{JA}$ . Exceeding the maximum allowable power dissipation can produce an excessive die temperature, which may cause the device to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS

$V_{DD} = V_{BST} - V_{SW} = 12V$ ,  $V_{SS} = V_{SW} = 0V$ , no load at DRVH and DRVL,  $T_A = -40^{\circ}C$  to  $125^{\circ}C$ , unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units

### Figure 2: Functional Block Diagram

## REFERENCE DESIGN CIRCUITS

### Half-Bridge Converter

In a half-bridge converter topology, the high-side MOSFET (HS-FET) and low-side MOSFET (LS-FET) are driven alternately with a dead time (DT) inserted between their respective on periods. INT and INL are driven with alternating signals via the pulse-width modulation (PWM) controller. The input voltage ( $V_{IN}$ ) can rise up to 100V when in a half-bridge topology (see Figure 5 in the Typical Application Circuits section on page 16).

### Two-Switch Forward Converter

In a two-switch forward converter topology, the HS-FET and LS-FET start up and shutdown simultaneously. During current-mode control, the INH and INL input signals sense the output voltage ( $V_{OUT}$ ) and output current ( $I_{OUT}$ ) via a

PWM controller. The Schottky diodes clamp the power transformer's reverse swing, and should be rated for  $V_{IN}$ , which can rise up to 100V (see Figure 6 in the Typical Application Circuits section on page 16).

### Active-Clamp Forward Converter

In an active-clamp forward converter topology, the HS-FET and LS-FET are driven alternately. The HS-FET and the reset capacitor ( $C_{RESET}$ ) reset the power transformer without loss.

Active-clamp forward converter topologies are optimal for duty cycles exceeding 50%. The MPQ1923-AEC1 may not be able to operate at 100V in an active-clamp forward topology (see Figure 7 in the Typical Application Circuits section on page 16).

## APPLICATION INFORMATION

The INH and INL input signals can be controlled independently. If both INH and INL control the HS-FET and LS-FET of the same bridge, set a sufficient DT between the low INH and low INL signals (and vice versa) to avoid shoot-through. DT is the time interval between low INH and low INL. Figure 3 shows the shoot-through timing diagram.

### PCB Mounting

To comply with IPC-2221 or IPC-9592 standards, conformal coating is required after mounting the device on the PCB.

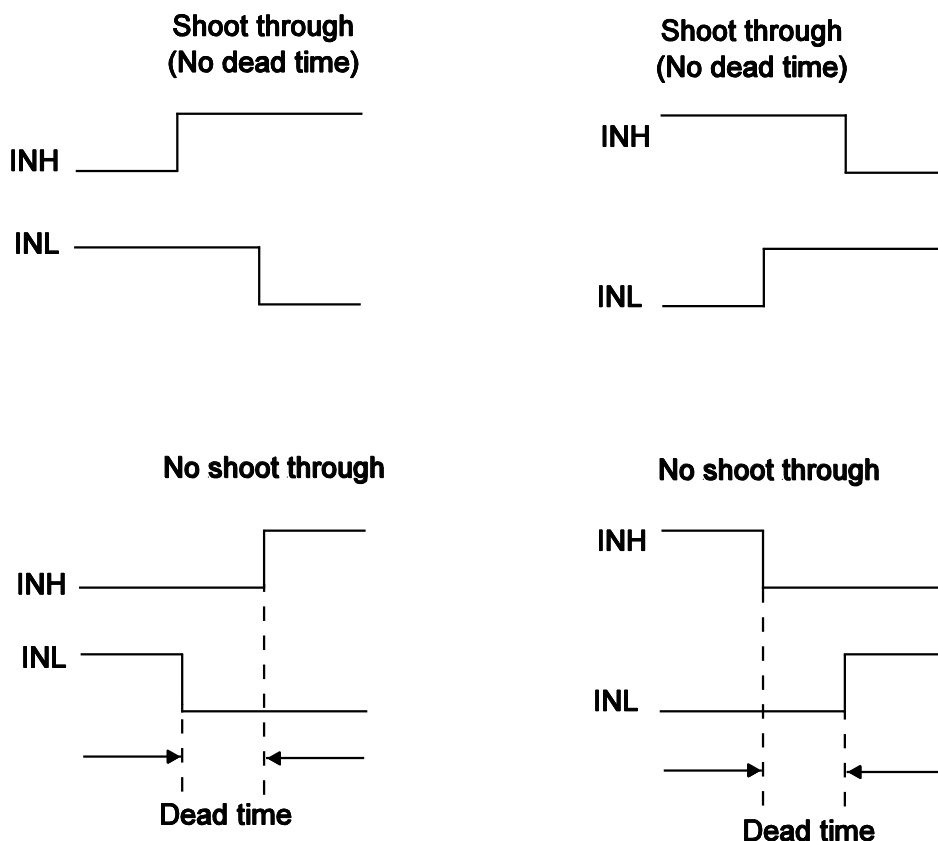

Figure 3: Shoot-Through Timing Diagram

## PCB Layout Guidelines

Efficient PCB layout is critical for stable operation. The MPQ1923-AEC1 is designed to accommodate negative undershoot; however, excessive undershoot can lead to unpredictable operation or damage to the IC. For the best results, refer to Figure 4 and follow the guidelines below:

1. Connect the HS-FET source and the LS-FET drain using a short and direct trace to avoid negative undershoot on the phase node due to parasitic inductance.
2. Use surface-mount N-channel MOSFETs that allow for a very short connection between the HS-FETs and LS-FETs.
3. Place the bootstrap capacitor (C3) and the supply bypass capacitor (C2) as close to the IC as possible.
4. Connect the ground side of C3 and C2 to both the GND pin and the exposed pad using multiple vias. The ground side of the capacitors are connected to a solid ground plane.

5. Route the high-current ground path between the input supply, the input bulk capacitor (C6), and the MOSFETs. Route this path away from the IC.

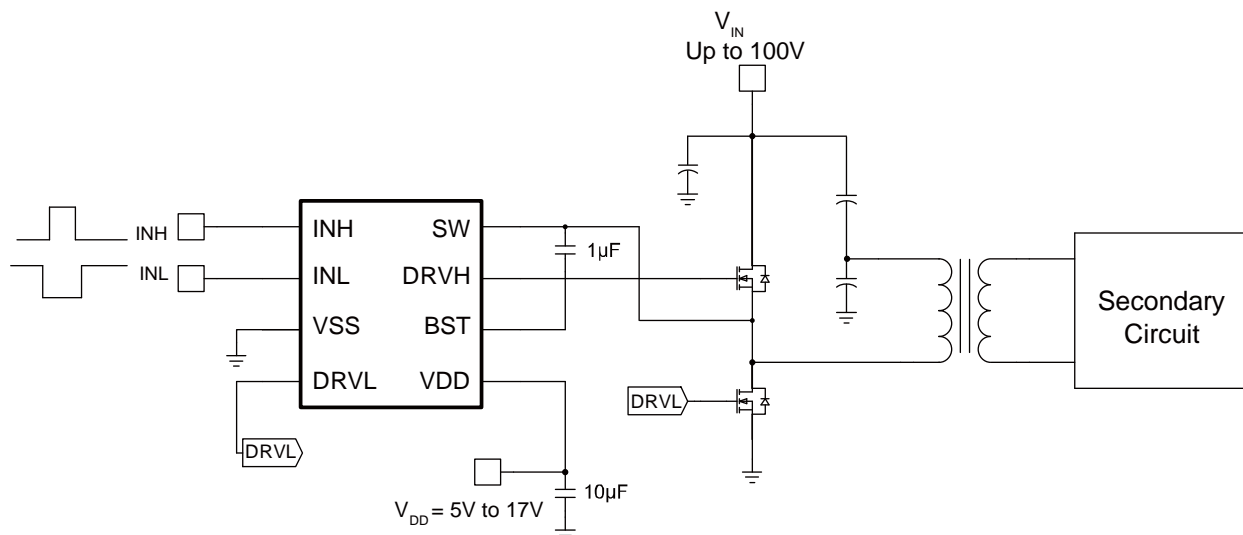

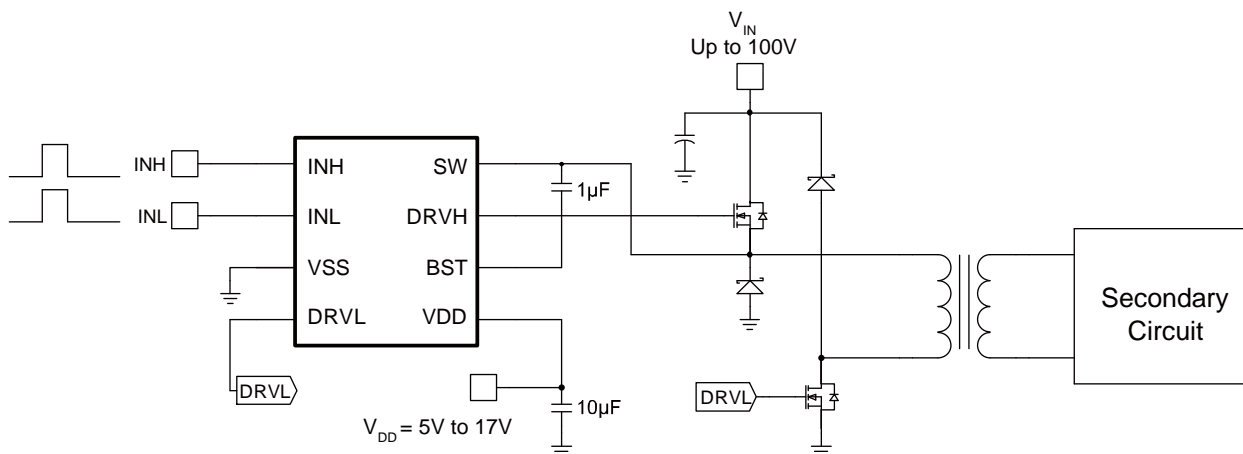

Figure 4: Recommended PCB Layout
