

# Isolated High Current IGBT Gate Driver

## NCD57080A, NCD57080B, NCD57080C

NCD57080A, NCD57080B and NCD57080C are high-current single channel IGBT gate drivers with 3.75 kVrms internal galvanic isolation, designed for high system efficiency and reliability in high power applications. The devices accept complementary inputs and depending on the pin configuration, offer options such as Active Miller Clamp (NCD57080A), negative power supply (NCD57080B) and separate high and low (OUTH and OUTL) driver outputs (NCD57080C) for system design convenience. NCD57080 (A/B/C) accommodate wide range of input bias voltage and signal levels from 3.3 V to 20 V. NCD57080 (A/B/C) are available in narrow-body SOIC-8 package.

### Features

- High Peak Output Current (+6.5 A/-6.5 A)
- Low Clamp Voltage Drop Eliminates the Need of Negative Power Supply to Prevent Spurious Gate Turn-on (NCD57080A)
- Short Propagation Delays with Accurate Matching
- IGBT Gate Clamping during Short Circuit
- IGBT Gate Active Pull Down
- Tight UVLO Thresholds for Bias Flexibility
- Wide Bias Voltage Range including Negative  $V_{EE2}$  (NCD57080B)
- 3.3 V, 5 V, and 15 V Logic Input
- 3.75 kVrms Galvanic Isolation
- High Transient Immunity
- High Electromagnetic Immunity
- This Device is Pb-Free, Halogen Free/BFR Free and is RoHS Compliant

### Typical Applications

- Motor Control
- Uninterruptible Power Supplies (UPS)
- Industrial Power Supplies
- HVAC

**Table 1. FUNCTION DESCRIPTION**

Pin Name	No.	I/O	Description
V <sub>DD1</sub>	1	Power	Input side power supply. A good quality bypassing capacitor is required from this pin to GND1 and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than V <sub>UVLO1-OUT-ON</sub> is present. Please see Figure 8 for more details.
IN+	2	I	Non inverted gate driver input. It is internally clamped to V <sub>DD1</sub> and has a pull-down resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative going pulse-width is required at IN+ before OUT or OUTH/OUTL responds.
IN-	3	I	Inverted gate driver input. It is internally clamped to V <sub>DD1</sub> and has a pull-up resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum negative or positive going pulse-width is required at IN- before OUT or OUTH/OUTL responds.
GND1	4	Power	Input side ground reference.
V <sub>DD2</sub>	5	Power	Output side positive power supply. The operating range for this pin is from UVLO2 to its maximum allowed value. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.
GND2 (NCD57080A, NCD57080C)	8	Power	Output side gate drive reference connecting to IGBT emitter or FET source.
GND2 (NCD57080B)	7		
OUT (NCD57080A, NCD57080B)	6	O	Driver output that provides the appropriate drive voltage and source/sink current to the IGBT/FET gate. OUT is actively pulled low during start-up.
OUTH (NCD57080C)	6	O	Driver high output that provides the appropriate drive voltage and source current to the IGBT/FET gate.
OUTL (NCD57080C)	7	O	Driver low output that provides the appropriate drive voltage and sink current to the IGBT/FET gate. OUTL is actively pulled low during start-up.
CLAMP (NCD57080A)	7	O	Provides clamping for the IGBT/FET gate during the off period to protect it from parasitic turn-on. Its internal N FET is turned on when the voltage of this pin falls below V <sub>CLAMP-THR</sub> . It is to be tied directly to IGBT/FET gate with minimum trace length for best results.
V <sub>EE2</sub> (NCD57080B)	8	Power	Output side negative power supply. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.

Figure 24. Input Current – Negative Input

**Under Voltage Lockout (Refer to Figure 8A/8B/8C/8D)**

UVLO ensures correct switching of IGBT connected to the driver output.

- The IGBT is turned-off and the output is disabled, if the supply  $V_{DD1}$  drops below  $V_{UVLO1-OUT-OFF}$  or  $V_{DD2}$  drops below  $V_{UVLO2-OUT-OFF}$ .
- The driver output does not follow the input signal on IN+ or IN- until the  $V_{DDX}$  rises above the  $V_{UVLOX-OUT-ON}$  and the input signal rising edge is applied to the IN+ or IN-
- $V_{EE2}$  is not monitored (NCD57080B)

With high loading gate capacitances over 10 nF it is important to follow the decoupling capacitor routing guidelines as shown on Figure 32. The decoupling capacitor value should be at least 10  $\mu$ F. Also gate resistor of minimal

value of 2  $\Omega$  has to be used in order to avoid interference of the high di/dt with internal circuitry (e.g. UVLO2).

After the power-on of the driver there has to be a rising edge applied to the IN+ or falling edge to the IN- in order for the output to start following the inputs. This serves as a protection against producing partial pulses at the output if the  $V_{DD1}$  or  $V_{DD2}$  is applied in the middle of the input PWM pulse.

If the  $V_{DD2}$  rises over  $V_{UVLO-OUT-ON}$  level the PWM will appear on the output after  $t_{UVR2} + t_{UVR2-spread}$ . The  $t_{UVR2-spread}$  time is variable and is defined as a time from end of  $t_{UVR2}$  to first rising edge on IN+ input. If the  $V_{DD2}$  is starting from 0 V the time until PWM is at the output of the driver is longer than  $t_{UVR2} + t_{UVR2-spread}$ . This is caused by start up time of internal circuits of the driver.

## ACTIVE MILLER CLAMP PROTECTION (CLAMP)

NCD57080B supports bipolar power supply to prevent unintentional turning on.

For operation with bipolar supplies, the IGBT is turned off with a negative voltage through OUT with respect to its emitter. This prevents the IGBT from unintentionally turning on because of current induced from its collector to its gate due to Miller effect. Typical values for bipolar operation are  $V_{DD2} = 15\text{ V}$  and  $V_{EE2} = -5\text{ V}$  with respect to GND2.

NCD57080A supports unipolar power supply with active Miller clamp.

For operation with unipolar supply, typically,  $V_{DD2} = 15\text{ V}$  with respect to GND2, and  $V_{EE2} = \text{GND2}$ . In this case, the IGBT can turn on due to additional charge from IGBT Miller capacitance caused by a high voltage slew rate transition on the IGBT collector. To prevent IGBT to turn on, the CLAMP pin is connected directly to IGBT gate and Miller current is sunk through a low impedance CLAMP transistor. When the IGBT is turned-off and the gate voltage transitions below  $V_{CLAMB}$  the CLAMP output is activated

Figure 25. Current Path with Miller Clamp Protection

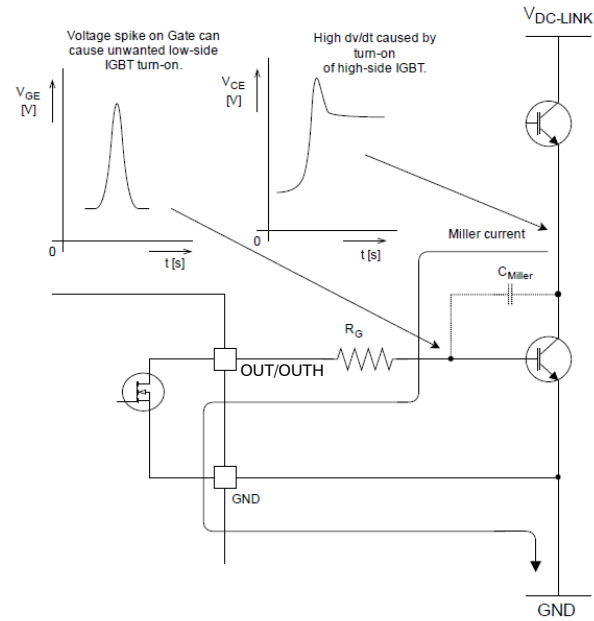

Figure 26. Current Path without Miller Clamp Protection

### Non-inverting and Inverting Input Pin (IN+, IN-)

NCD57080x has two possible input modes to control IGBT. Both inputs have defined minimum input pulse width to filter occasional glitches.

- Non-inverting input IN+ controls the driver output while inverting input IN- is set to LOW
- Inverting input IN- controls the driver output while non-inverting input IN+ is set to HIGH

**WARNING:** When the application uses an independent or separate power supply for the control unit and the input side of the driver, all inputs should be protected by a serial resistor (In case of a power failure of the driver, the driver may be damaged due to overloading of the input protection circuits)

### Power Supply ( $V_{DD1}$ , $V_{DD2}$ , $V_{EE2}$ )

NCD57080A and NCD57080C are designed to support unipolar power supply.

NCD57080B is designed to support bipolar power supply.

For reliable high output current delivery suitable external power capacitors are required. Parallel combination of  $100\text{ nF} + 4.7\text{ }\mu\text{F}$  ceramic capacitors is optimal for a wide range of applications using IGBT. For reliable driving of IGBT modules (containing several parallel IGBTs) a higher capacity is required (typically  $100\text{ nF} + 10\text{ }\mu\text{F}$ ). Capacitors should be as close as possible to the driver's power pins.

- In bipolar power supply the driver is typically supplied with a positive voltage of  $15\text{ V}$  at  $V_{DD2}$  and negative voltage  $-5\text{ V}$  at  $V_{EE2}$  (Figure 27). Negative power supply prevents a dynamic turn on through the internal IGBT input capacitance
- In Unipolar power supply the driver is typically supplied with a positive voltage of  $15\text{ V}$  at  $V_{DD2}$ . Dynamic turn on through the internal IGBT input capacitance could be prevented by Active Miller Clamp function (NCD57080A). CLAMP output should be directly connected to IGBT gate (Figure 25)

ON Semiconductor®

SCALE 1:1

SOIC-8 NB  
CASE 751-07  
ISSUE AK

DATE 16 FEB 2011

## NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.

DIM	MILLIMETERS		INCHES	
	MIN	MAX	MIN	MAX
A	4.80	5.00	0.189	0.197
B	3.80	4.00	0.150	0.157
C	1.35	1.75	0.053	0.069
D	0.33	0.51	0.013	0.020
G	1.27 BSC		0.050 BSC	
H	0.10	0.25	0.004	0.010
J	0.19	0.25	0.007	0.010
