ORDERING INFORMATION

See detailed ordering and shipping information on page 3 of this data sheet.

Description

The FUSB303 device is a fully autonomous USB Type−C™ controller optimized for 15 W or less applications. The FUSB303 offers CC logic detection for Source Port role, Sink Port role, DRP, and accessory detection support, as well as Dead Battery support as defined in USB−C specifications. The FUSB303 features configurable address I^2C access to support multiple ports per system or it can operate autonomously configured by just pins. The FUSB303 features ultra−low power during operation, and an ultra−thin, 12−Lead QFN package.

Features

- Fully Autonomous USB−C™ Port Controller
- Supports Latest Type−C™ Specification Release 1.3
- Source, Sink, and DRP Port role Configuration with Optional Accessory Support
- Try.SRC and Try.SNK modes for Preferring Source Role or Sink Role Respectively
- V_{DD} Operating Range, 2.85 V − 5.5 V
- Typical Low Power Operation: I_{CC} < 10 μA
- GPIO and I^2C Configuration
- Max 28 V DC Tolerance on ID, VBUS_DET, CC1 and CC2
- Dead Battery Support (Sink Port role when No Power Applied)
- 4 kV HBM ESD Protection for Connector Pins
- Small Packaging, 12 Lead QFN (1.6 mm × 1.6 mm × 0.375 mm)

Applications

- Smartphones
- Tablets
- Laptops
- Accessoires
- Industrial
- Power Banks

2. Orientation decoded on this pin after a Source Debug Test System (DTS) attached to FUSB303.

High Voltage Tolerance on CCx and VBUS pins

The FUSB303 has additional protection for the type C connector pins where it can tolerate up to 28V on VBUS, CC1 and CC2 to protect against any misbehaving Type C device connect to the FUSB303. If VBUS tolerance is needed higher than 28V, a 900kΩ resistor can be used externally along with a Transient Voltage Suppressor (TVS) to achieve almost any higher voltage tolerance dictated by the TVS chosen.

Dead Battery

If power is not applied to FUSB303 and it is attached to a Source device, then the Source would pull up the CC line connected through the cable. The FUSB303 in response will turn on the pull−down that will bring the CC voltage to a range that the Source can detect an attached device and turn on VBUS.

GPIO Mode, Debug and Audio Accessories

When VDD is active and on the trailing edge of EN_N, the FUSB303 will sample PORT/DEBUG_N to determine if the FUSB303 operates as a Source (HIGH), Sink (LOW) or DRP (floating). Subsequently the PORT/DEBUG_N will be set LOW when a Debug Test System is detected.

If the FUSB303 is configured as a Sink (PORT/DEBUG_N= LOW upon enable), the FUSB303 will detect a Debug Test System if Rp is detected on both CC1 and CC2. Devices that support orientation detection will also have ADDR/ORIENT set based on the levels detected for CC1 and CC2. ID will be set HIGH−Z.

If the device is configured as a Source (PORT/DEBUG_N= HIGH upon enable), the FUSB303 will detect a Debug Test System if Rd is detected on both CC1 and CC2. Devices that support orientation detection will also have ADDR/ORIENT set based on the levels detected for CC1 and CC2. ID will be set LOW.

The FUSB303 also supports DRP toggling for detecting debug test systems. When PORT/DEBUG_N= float upon enable, the FUSB303 can detect both Source and Sink debug test systems depending on how it resolves its role as a Source or Sink. Then it acts either as a Source or Sink as described above.

The FUSB303 will report Debug Test System detection via the Type I^2C register as well. The detection is the same as described above except Source, Sink and DRP roles are configured via the Portrole register. This Portrole register setting has higher priority over the PORT/DEBUG_N pin state for Source/Sink/DRP port role.

The FUSB303 will set INT_N/OUT3 = LOW in GPIO mode when an Audio Accessory is detected. The FUSB303 will report Audio Accessory detection via the Type I^2C register as well when Audio Accessory detection is configured via the Portrole register.

FORCE.SNK and FORCE.SRC Functionality

In some cases, a device may need to force its role to a Sink or a Source especially if two DRP devices are connected together and they have connected in the wrong device role. In that case, the FUSB303 has incorporated a function that allows it to be forced into either Sink or Source. However, if it cannot complete this role change, the FUSB303 will resume its previous role and flag success or failure with I_FRC_SUCC and I_FRC_FAIL interrupts respectively.

Remedial Actions

In some cases, a device may start to detect a Source or Sink but get caught in a loop trying to resolve the detected device.

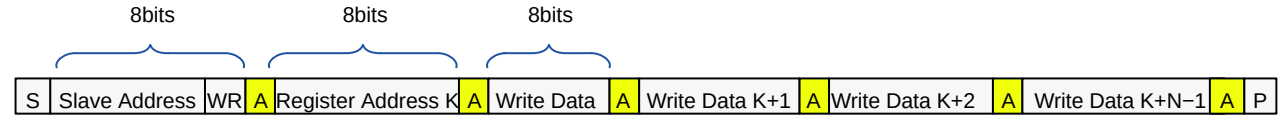
In that case the FUSB303 provides functionality to resolve to a stable attached state. This functionality can be turned on and off via the REMEDY_EN and DCABLE_EN bits. Multiple cases are tried and some of the register settings will be changed to try to achieve stable attach. The I_REMEDY interrupt will allow the processor to know that this functionality has been triggered.

AUTOSNK Mode

When the FUSB303 is powered directly from VBAT the AUTO_SNK_EN mode can be used to prevent the application from attaching as a Source when the battery is weak or disconnect and attach as a Sink. With AUTO_SNK_EN enabled the port will attempt to configure as a Sink when attached to another DRP. If connected to another Sink, the port will detach. The threshold at which AUTOSNK can be triggered can be programmed via the AUTH_SNK_TH bits. The I_AUTOSNK interrupt is triggered whenever this functionality is invoked.

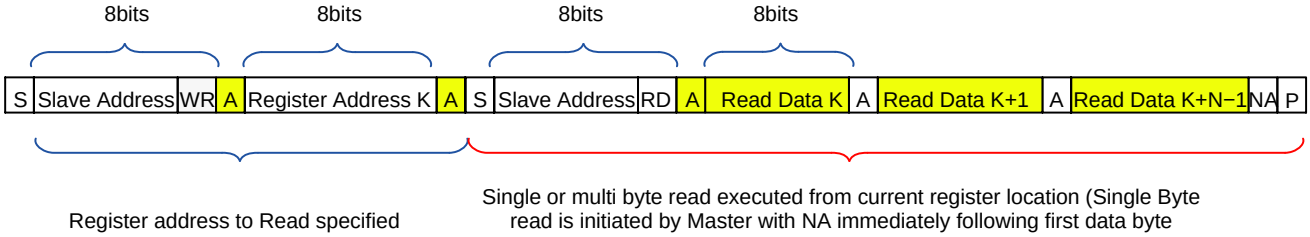
Power Up, Initialization and Reset, Interrupt Operation, I²C Interface

The FUSB303 includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 6 requirements. This block is designed for fast mode. Examples of an I²C write and read sequence are shown Figure 5 and Figure 6 respectively.



NOTE: Single byte write is initiated by Master with P immediately following the first data byte and slave A

Figure 5. I²C Write Example



NOTE: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed

From Master to Slave
From Slave to Master

S Start Condition
A Acknowledge (SDA Low)
NA NOT Acknowledge (SDA high)
WR Write=O
RD Read =1
P Stop Condition

Figure 6. I²C Write Example

When power is first applied, the FUSB303 will power up in the configuration set by the PORT/DEBUG_N input with Audio Accessory Support enabled and all interrupts masked. If the ADDR/ORIENT input is HIGH or LOW (I²C mode) the local processor can then re−configure the FUSB303 to the desired mode and clear the global interrupt mask bit, INT_MASK using the I²C interface. The INT_N/OUT3 pin is an active LOW, open drain output. This pin indicates to the host processor that an interrupt has occurred in the FUSB303 which needs attention. The INT_N/OUT3 pin is in a high impedance state by default after power−up or device reset, and the global interrupt mask (INT_MASK in Control register) is set. After INT_MASK bit is cleared by the local processor, the INT_N/OUT3 pin stays high impedance in preparation of future interrupts. When an interruptible event occurs, INT_N/OUT3 is driven LOW and is in a high impedance state again when the processor clears the interrupt by writing a one in the position of the interrupt bit that was set. Subsequent to the initial power up or reset; if the processor writes a “1” to global interrupt mask bit when the system is already powered up, the INT_N/OUT3 pin stays in a high impedance state and ignores all interrupts until the global interrupt mask bit is cleared. If an event happens that would ordinarily cause an interrupt when the global interrupt mask bit is set, the INT_N/OUT3 pin goes LOW when the global interrupt mask is cleared.

Interrupt bits hold their value and to clear a specific interrupt, a “1” needs to be written to that interrupt bit.

I²C Address

The ADDR/ORIENT bit HIGH or LOW is indicated in bit 5 of the slave address shown in Table 4.

Table 4. FUSB303 I²C SLAVE ADDRESS

Name	Size (Bits)	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Slave Address	8	0	1	ADDR/ORIENT state	0	0	0	1	R/W

Table 5. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter			Min.	Max.	Unit
V_{VDD}	Supply Voltage from V_{DD}			−0.5	6.0	V
V_{CON}	ID, VBUS_DET, CC1 and CC2 voltage			−0.5	28.0	V
V_{IO}	PORT/DEBUG_N, ADDR/ORIENT, INT_N/OUT3, SDA/OUT1, SCL/OUT2 pins voltage			−0.5	6.0	V
V_{IO}	EN_N			−0.5	2.0	V
$T_{STORAGE}$	Storage Temperature Range			−65	+150	C
T_J	Maximum Junction Temperature				+150	C
T_L	Lead Temperature (Soldering, 10 seconds)				+260	C
ESD	IEC 61000−4−2 System ESD with external TVS	Connector Pins (VBUS, CC1 & CC2)	Air Gap	15		kV
			Contact	8		
	Human Body Model, JEDEC JESD22−A114	Connector Pins (VBUS_DET, CC1 and CC2)		4		kV
		Others		2		
	Charged Device Model, JEDEC LESD22−C101	All Pins		1		

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 6. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{BUS}	VBUS_DET Voltage	4.0	5.0	22	V
V_{DD}	Supply Voltage	2.85	3.3	5.5	V
T_A	Operating Temperature	−40		+85	C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Table 7. DC AND TRANSIENT CHARACTERISTICS

(Unless otherwise specified: Recommended T_A and T_J temperature ranges. All typical values are at T_A = 25°C and V_{DD} = 3.3 V unless otherwise specified.)

Symbol	Parameter	T_A = −40 to +85°C, T_J=−40 to +125°C			Unit
		Min.	Typ.	Max	
TYPE C SPECIFIC PARAMETERS

I_{i2C}	Input Current of SDA/OUT1and SCL/OUT2 Pins,	2.85 to 5.5	Input Voltage 0 V to 3.6 V			2	μA
I_{CCTI2C}	VDD Current when SDA/OUT1or SCL/OUT2 is HIGH	2.85 to 5.5	Worst Input Voltage			2	μA
V_{OLSDA}	Low−Level Output Voltage at 2 mA Sink Current (Open−Drain)	2.85 to 5.5	I_{OL} = 2 mA			0.3	V
I_{OLSDA}	Low−Level Output Current (Open−Drain)	3.0 to 5.5	V_{OLSDA} = 0.4 V	20			mA
C_I	Capacitance for Each I/O Pin	2.85 to 5.5			5		pF

Table 11. FAST MODE I^2C TIMING SPECIFICATIONS (see Figure 7)

Symbol	Parameter	Fast Mode		
		Min.	Max.	Unit
f_{SCL}	SCL/OUT2 Clock Frequency		400	kHz
$t_{HD;STA}$	Hold Time (Repeated) START Condition	0.6		μs
t_{LOW}	Low Period of SCL/OUT2 Clock	1.3		μs
t_{HIGH}	High Period of SCL/OUT2 Clock	0.6		μs
$t_{SU;STA}$	Set−up Time for Repeated START Condition	0.6		μs
$t_{HD;DAT}$	Data Hold Time		0.9	μs
$t_{SU;DAT}$	Data Set−up Time (Note 5)	100		ns
t_r	Rise Time of SDA/OUT1 and SCL/OUT2 Signals (Note 6)	$20\times(V_{DD}/5.5\ V)$	250	ns
t_f	Fall Time of SDA/OUT1 and SCL/OUT2 Signals (Note 6)	$20\times(V_{DD}/5.5\ V)$	250	ns
$t_{SU;STO}$	Set−up Time for STOP Condition	0.6		μs
t_{BUF}	Bus−Free Time between STOP and START Conditions	1.3		μs
t_{SP}	Pulse Width of Spikes that Must Be Suppressed by the Input Filter		50	ns

5. A fast−mode I^2C−bus device can be used in a standard−mode I^2C−bus system, but the requirement $t_{SU;DAT} \geq 250$ ns must be met. This is automatically the case if the device does not stretch the LOW period of the SCL/OUT2 signal. If such a device does stretch the LOW period of the SCL/OUT2 signal, it must output the next data bit to the I^2C_ line tr_max + $t_{SU;DAT}$ = 1000 + 250 = 1250 ns (according to the standard−mode I^2C bus specification) before the SCL/OUT2 line is released
6. Cb equals the total capacitance of one bus line in pF. If mixed with high−speed devices, faster fall times are allowed according to the I^2C specification

REGISTER DEFINITIONS

Table 12. REGISTER MAP

Address	Register Name	Type	Rst Val	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
00h	Reserved	N/A	N/A	Do Not Use							
01h	Device ID	R	10h	VER_ID[3:0]				REV_ID[3:0]			
02h	Device Type	R	01h	DEVICE_TYPE[7:0]							
03h	Portrole	R/W	4nh (see below)		ORIENTDEB	TRY[1:0]		AUDIOACC	DRP	SNK	SRC
04h	Control	R/W	4Bh	T_DRP		DRPTOGGLE[1:0]		DCABLE_EN	HOST_CUR[1:0]		INT_MASK
05h	Control1	R/W	B3h	REMEDY_EN	AUTO_SNK_TH[1:0]		AUTO_SNK_EN	ENABLE	TCCDEB[2:0]		
06h-08h	Reserved	N/A	N/A	Do Not Use							
09h	Manual	W/C & R/W	00h			FORCE_SRC	FORCE_SNK	UNATT_SNK	UNATT_SRC	DISABLED	ERROR_REC
0Ah	Reset	W/C	00h								SW_RES
0Bh-0Dh	Reserved	N/A	N/A	Do Not Use							
0Eh	Mask	R/W	00h		M_ORIENT	M_FAULT	M_VBUS_CHG	M_AUTOSNK	M_BC_LVL	M_DETACH	M_ATTACH
0Fh	Mask1	R/W	00h		M_REM_VBOFF	M_REM_VBON		M_REM_FAIL	M_FRC_FAIL	M_FRC_SUCC	M_REMEDY
10h	Reserved	N/A	N/A	Do Not Use							
11h	Status	R	40h	AUTOSNK	VSAFE0V	ORIENT[1:0]		VBUSOK	BC_LVL[1:0]		ATTACH
12h	Status1	R	00h							FAULT	REMEDY
13h	Type	R	00h		DEBUGSRC	DEBUGSNK	SINK	SOURCE	ACTIVECABLE	AUDIOVBUS	AUDIO
14h	Interrupt	R/W1C	00h		I_ORIENT	I_FAULT	I_VBUS_CHG	I_AUTOSNK	I_BC_LVL	I_DETACH	I_ATTACH
15h	Interrupt1	R/W1C	00h		I_REM_VBOFF	I_REM_VBON		I_REM_FAIL	I_FRC_FAIL	I_FRC_SUCC	I_REMEDY
16h-1Fh	Reserved	N/A	N/A	Do Not Use							

7. Do not use registers that are blank
8. Values read from undefined register bits are not defined and invalid. Do not write to undefined registers

Table 13. DEVICE ID (Address: 01h, Reset Value: 0001_0000b, Type: Read Only)

Bit #	Name	Size (Bits)	Description
7:4	VER_ID	4	Device version ID by Trim, etc. A_[REV_ID]: 0001 (FUSB303 A)
3:0	REV_ID	4	Revision History of each version [VER_ID]_revA: 0000

Table 14. DEVICE TYPE (Address: 02h, Type: Read Only)

Bit #	Name	Size (Bits)	Description
7:0	DEVICE_TYPE[7:0]	8	01h: FUSB303 02h: FUSB303T (metal option without dead battery Rd pull−downs)

Table 15. PORTROLE (See Note 9)
(Address: 03h, Reset Value: 0100_1nnnb (Reset value for bits nnn will be set by the state of the PORT/DEBUG_N pin either during power up when EN_N is LOW or when Vdd is valid and EN_N goes HIGH to LOW) or when SW_RES is set HIGH. In dead battery mode, nnn = 010 or configured as SNK) Type: Read/Write)

Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	ORIENTDEB	1	1: When a Debug Accessory is found, continue to orientation detection if CC is on CC1 or CC2 (result is in Status.Orient[1:0])
5:4	TRY[1:0]	2	00: Disable (normal DRP detection for DRPs) 01: Enable Try.SNK state machine detection for DRP only 10: Enable Try.SRC state machine detection for DRP only 11: Disable (cannot have Try.SNK and Try.SRC active together)
3	AUDIOACC	1	1: Enable Audio Accessory Support (Debug Accessory support is always enabled)
2	DRP	1	1: Configure device as a Dual Role Port (see reset value text above)
1	SNK	1	1: Configure device as a Sink (see reset value text above)
0	SRC	1	1: Configure device as a Source (see reset value text above)

9. If DRP bit, SNK bit and SRC bit are all set to 1, then the priority of which Portrole the FUSB303 assumes is first priority is DRP, second priority is SNK and last priority is SRC. See Manual register note below for priority between Manual register bits and Portrole register.

Table 16. CONTROL
Address: 04h, Reset Value: 0100_1011b, Type: Read/Write

Bit #	Name	Size (Bits)	Description
7:6	T_DRP[:0]	2	Sets the total period of the DRP toggle cycle (i.e. Unattached.SNK period + Unattached.SRC period): 00: 60 ms 01: 70 ms 10: 80 ms 11: 90 ms
5:4	DRPTOGGLE[1:0]	2	Selects different timing for Dual Role Port Toggle between Unattached.SNK State and Unattached.SRC State. 00: 60% in Unattached.SNK and 40% in Unattached.SRC 01: 50% in Unattached.SNK and 50% in Unattached.SRC 10: 40% in Unattached.SNK and 60% in Unattached.SRC 11: 30% in Unattached.SNK and 70% in Unattached.SRC
3	DCABLE_EN	1	1: Enable Dangling Cable internal methods to achieve a stable attach
2:1	HOST_CUR[1:0]	2	Controls the pull−up current when device enabled as a Source 00: Reserved. Do not use. 01: 80 μA – Default USB Power 10: 180 μA – Medium Current Mode: 1.5 A 11: 330 μA – High Current Mode: 3 A
0	INT_MASK	1	1: Global interrupt mask to mask all interrupts

Table 17. CONTROL1

(Address: 05h, Reset Value: 1011_0011b, Type: Read/Write)

Bit #	Name	Size (Bits)	Description
7	REMEDY_EN	1	1: Enable the Remedy detection to employ internal methods to achieve stable attach
6:5	AUTO_SNK_TH [1:0]	2	Sets the weak battery VDD threshold voltage when AUTO_SNK_EN is enabled. 00: 3.0 V 01: 3.1 V 10: 3.2 V 11: 3.3 V
4	AUTO_SNK_EN	1	1: Enable automatic Sink port role based on weak battery VDD threshold in bits AUTO_SNK_TH in Control register below
3	ENABLE	1	1: Enable the FUSB303 if the external EN_N pin is LOW in I^2C mode (that is, not in GPIO mode)
2:0	TCCDEB[2:0]	3	Controls debounce time for attaching a device 000: 120 ms 001: 130 ms 010: 140 ms 011: 150 ms 100: 160 ms 101: 170 ms 110: 180 ms 111: Reserved

Table 18. Manual (Note 10)

(Address: 09h, Reset Value: 0000_0000b, Type: Read/Write (see bits below: W/C = Write one self clearing, R/W = Read/Write and N/A = Not Applicable)

Bit #	Name	R/W/C	Size (Bits)	Description
7:6	Reserved	N/A	2	Do Not Use
5	FORCE_SRC	W/C	1	1: Forces the FUSB303 to behave as a Source
4	FORCE_SNK	W/C	1	1: Forces the FUSB303 to behave as a Sink
3	UNATT_SNK	W/C	1	1: Put device in Unattached.SNK State as defined in the Type C spec
2	UNATT_SRC	W/C	1	1: Put device in Unattached.SRC state as defined in the Type C spec
1	DISABLED (Note 11)	R/W	1	1: Put device in Disabled state as defined in the Type C spec
0	ERROR_REC	W/C	1	1: Put device in ErrorRecovery state as defined in the Type C spec

10. If more than one bit is set to 1b simultaneously then an order of priority will be used. First priority is DISABLED, second is ERROR_REC, third is FORCE_SRC, fourth is FORCE_SNK, fifth is UNATT_SRC, last is UNATT_SNK. The highest priority bit will take precedence and all other bits will be cleared automatically.
11. The DISABLED bit must be manually cleared. Also DISABLED bit has a higher priority over Portrole register since the DISABLED bit has to be cleared in order to execute the new Portrole register settings. However, all other Manual register bits don't have a lot of meaning if the Portrole register is changed and so Portrole register setting should have higher priority than all bits except for DISABLED bit.

Table 19. RESET

(Address: 0Ah, Reset Value: 0000_0000b, Type: Write/Clear)

Bit #	Name	Size (Bits)	Description
7:1	Reserved	7	Do Not Use
0	SW_RES	1	1: Reset the FUSB303 and I^2C Registers

Table 20. MASK

(Address: 0Eh, Reset Value: 0000_0000b, Type: Read/Write)

Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	M_ORIENT	1	1: Mask the I_ORIENT interrupt bit from asserting INT_N pin
5	M_FAULT	1	1: Mask the I_FAULT interrupt bit from asserting INT_N pin
4	M_VBUS_CHG	1	1: Mask the I_VBUS interrupt bit from asserting INT_N pin
3	M_AUTOSNK	1	1: Mask the I_AUTOSNK interrupt bit from asserting INT_N pin
2	M_BC_LVL	1	1: Mask the I_BC_LVL interrupt bit from asserting INT_N pin
1	M_DETACH	1	1: Mask the I_DETACH interrupt bit from asserting INT_N pin
0	M_ATTACH	1	1: Mask the I_ATTACH interrupt bit from asserting INT_N pin

12. Masking the interrupt just does not cause INT_N to be asserted. The interrupt bit will still be asserted in the Interrrupt register and so that an all zeroes Interrupt register value is not needed for INT_N to be deasserted.

Table 21. MASK1

(Address: 0Fh, Reset Value: 0000_0000b, Type: Read/Write)

Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	M_REM_VBOFF	1	1: Mask the I_REM_VBOFF interrupt bit from asserting INT_N pin
5	M_REM_VBON	1	1: Mask the I_REM_VBON interrupt bit from asserting INT_N pin
4	Reserved	1	Do Not Use
3	M_REM_FAIL	1	1: Mask the I_REM_FAIL interrupt bit from asserting INT_N pin
2	M_FRC_FAIL	1	1: Mask the I_FRC_FAIL interrupt bit from asserting INT_N pin
1	M_FRC_SUCC	1	1: Mask the I_FRC_SUCC interrupt bit from asserting INT_N pin
0	M_REMEDY	1	1: Mask the I_REMEDY interrupt bit from asserting INT_N pin

13. Masking the interrupt just does not cause INT_N to be asserted. The interrupt bit will still be asserted in the Interrrupt register and so that an all zeroes Interrupt register value is not needed for INT_N to be deasserted

Table 22. STATUS

(Address: 11h, Reset Value: 0000_0000b, Type: Read Only)

Bit #	Name	Size (Bits)	Description
7	AUTOSNK	1	1:AUTOSNK mode is activated since the VDD voltage is lower than AUTO_SNK_TH voltage
6	VSAFE0V	1	1: Status to indicate VBUS_DET is below vSafe0V max of 0.8 Vpin
5:4	ORIENT[1:0]	2	Status to indicate which CCx pins has the cable CC connection 00: No or unresolved connection detected 01: Cable CC is connected through the CC1 (A5) pin 10: Cable CC is connected through the CC2 (B5) pin 11: A fault has occurred during the detection
3	VBUSOK	1	1: Status to indicate VBUS_DET is in the valid VBUS 5V range
2:1	BC_LVL[1:0]	2	Thresholds that allow detection of current advertisement on CC line 00: (Ra or unattached) Sink or unattached Source 01: Rd threshold for Sink default current advertisement 10: Rd threshold for Sink 1.5 A current advertisement 11: Rd threshold for Sink 3 A current advertisement
0	ATTACH	1	1: Attached to a device or accessory of a type shown in the Type register

Table 23. STATUS1
(Address: 12h, Reset Value: 0000_0000b, Type: Read Only)

Bit #	Name	Size (Bits)	Description
7:2	Reserved	6	Do Not Use
1	FAULT	1	1: Status to indicate that as a Sink, CC has exceed the normal vRd voltage range
0	REMEDY	1	1: Status to indicate that FUSB303 is employing internal methods to achieve a stable attach

Table 24. TYPE
(Address: 13h, Reset Value: 0000_0000b, Type: Read Only)

Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	DEBUGSRC	1	1: FUSB303 is attached as a Source Debug Accessory ([Unoriented/Oriented]DebugAccessory.SRC)
5	DEBUGSNK	1	1: FUSB303 is attached as a Sink Debug Accessory (DebugAccessory.SNK)
4	SINK	1	1: FUSB303 is attached as a Sink (Attached.SNK)
3	SOURCE	1	1: FUSB303 is attached as a Source (Attached.SRC)
2	ACTIVECABLE	1	1: FUSB303 is attached to an Active Cable (Ra detected)
1	AUDIOVBUS	1	1: Indicates an Audio Accessory with VBUS has been detected (AudioAccessory with VBUS)
0	AUDIO	1	1: Indicates an Audio Accessory without VBUS has been detected (AudioAccessory without VBUS)

Table 25. INTERRUPT
(Address: 14h, Reset Value: 0000_0000b, Type: Read/Write 1 to Clear)

Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	I_ORIENT	1	1: Interrupt flagged whenever ORIENT changes from 0,0 to 0,1 or 1,0 but not 1,1. Interrupt not flagged when ORIENT is cleared.
5	I_FAULT	1	1: Interrupt flagged when CC1 or CC2 voltage exceeds normal Rd range when FUSB303 has Rd termination on CC1 and/or CC2
4	I_VBUS_CHG	1	1: Interrupt flagged when VBUS has crossed vVBUSthr or vVBthLH thresholds
3	I_AUTOSNK	1	1: Interrupt flagged when AUTOSNK mode has been activated or deactivated
2	I_BC_LVL	1	1: Interrupt flagged when a change in BC_LVL[1:0] advertised current level has occurred
1	I_DETACH	1	1: Interrupt flagged when a device or accessory has been detached
0	I_ATTACH	1	1: Interrupt flagged when a device or accessory of type indicated in the Type register has been attached

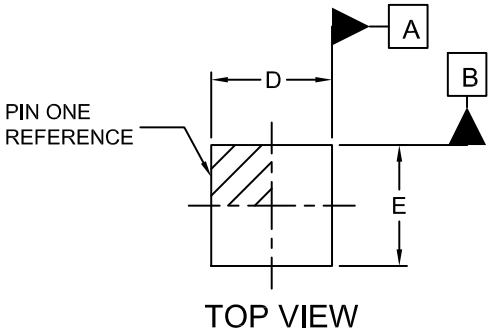
Table 26. INTERRUPT1

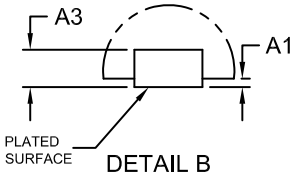
(Address: 15h, Reset Value: 0000_0000b, Type: Read/Write 1 to Clear)

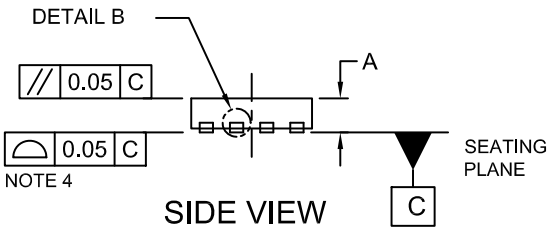
Bit #	Name	Size (Bits)	Description
7	Reserved	1	Do Not Use
6	I_REM_VBOFF	1	1: Interrupt to request VBUS be turned off and discharged while executing internal methods to achieve stable attach
5	I_REM_VBON	1	1: Interrupt to request VBUS be turned on while executing internal methods to achieve stable attach
4	Reserved	1	Do Not Use
3	I_REM_FAIL	1	1: Interrupt to indicate that internal methods to achieve stable attach have failed.
2	I_FRC_FAIL	1	1: Interrupt to indicate that FORCE_SRC or FORCE_SNK has failed to execute either because it was being forced into a state it was already in or for other reasons
1	I_FRC_SUCC	1	1: Interrupt to indicate that FORCE_SRC or FORCE_SNK has successfully being executed.
0	I_REMEDY	1	1: Interrupt to indicate that detection issues caused FUSB303 to employ internal methods to achieve stable attach

FUSB303

X2QFN12 1.6x1.6, 0.4P
CASE 722AG
ISSUE A







NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 2009.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b APPLIES TO THE PLATED TERMINALS AND IS MEASURED BETWEEN 0.10 AND 0.20mm FROM THE TERMINAL TIP.
4. PROFILE APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

DIM	MILLIMETERS		
	MIN.	NOM.	MAX.
A	0.34	0.37	0.40
A1	---	---	0.05
A3		0.127 REF	
b	0.15	0.175	0.20
D	1.55	1.60	1.65
E	1.55	1.60	1.65
e		0.40 BSC	
L	0.25	0.30	0.35
L2	0.45	0.50	0.55
