

## MAX17554, MAX17555

### Integrated 60V, 50mA, Ultra-Small, High Efficiency, Synchronous Step-Down DC-DC Converters

#### Product Highlights

- Reduces External Components and Total Cost
  - No Schottky-Synchronous Operation
  - Internal Control Loop Compensation
  - Internal Fixed Soft-Start
  - Fixed Turn ON/OFF Input Voltage (MAX17554)
  - All-Ceramic Capacitors, Ultra-Compact Layout
- Reduces Number of DC-DC Regulators to Stock
  - Wide 4V to 60V Input Voltage (MAX17555)
  - Wide 10V to 60V Input Voltage (MAX17554)
  - Fixed 3.3V (MAX17554A, MAX17555A) and 5V (MAX17554B, MAX17555B) Output Voltage Options
  - Adjustable Output Range from 0.8V up to 90% of  $V_{IN}$  (MAX17554C, MAX17555C)
  - Deliver up to 50mA of Load Current
- Reduced Power Dissipation
  - Higher Light-Load Efficiency with Discontinuous-Conduction Mode (DCM) Operation
  - Power Loss Reduction with External Boot-Strap Input (FB/VO) for Internal Circuitry (Fixed Output Part Options)
  - Fixed 70kHz Switching Frequency
  - 3.8 $\mu$ A Shutdown Current (MAX17555)
- Flexible Design
  - Programmable EN/UV and HYST Threshold (MAX17555)
  - Open-Drain Output (RESET) for Output Status Monitoring (MAX17555)
- Robust Operation
  - Built-in Hiccup Mode Overload Protection
  - Overtemperature Protection
  - CISPR32 Class B Compliant
  - Wide -40°C to +125°C Ambient Operating Temperature, -40°C to +150°C Junction Temperature

#### Key Applications

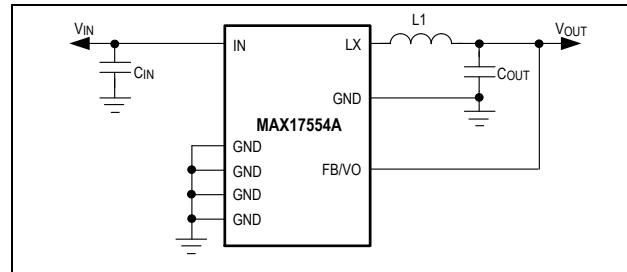

- Factory Automation

Within the Factory Automation space, one key need is the ability to generate less heat. Heat within the system has to be managed to prevent overheating and shutdown. The MAX17554 and MAX17555 generate

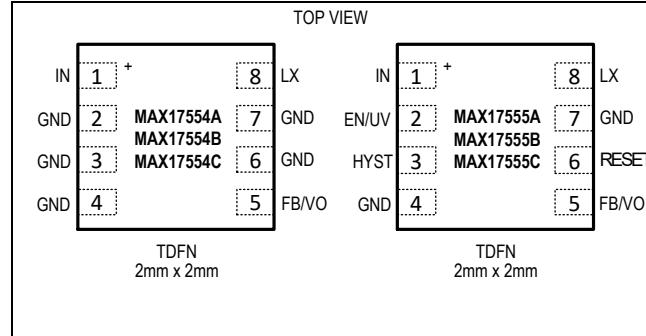

less heat since they are fully synchronous integrated FETs DC-DC converters with high efficiency.

- Aftermarket Market Automotive  
Asset tracking application is an example within the aftermarket automotive space where the MAX17554 and MAX17555 would provide a benefit. Typically, these units are designed to be as small as possible. The MAX17554 and MAX17555 have integrated FETs and internal loop compensation in delivering a small solution size.
- General Point of Load  
General point of load applies to a switching regulator that serves many applications and design environments. Robustness of the power conversion is critical to any environment. With an operating range of -40°C to +125 °C, current limit protection, overtemperature protection, and the ability to adhere to the CISPR32 class B emission standards, the MAX17554 and MAX17555 deliver a small, highly efficient power conversion in the most adverse environments.

## Absolute Maximum Ratings

IN to GND	-0.3V to +70V
LX to GND	-0.3V to $V_{IN}$ + 0.3V
EN/UV to GND (MAX17555)	-0.3V to $V_{IN}$ + 0.3V
HYST, $\overline{RESET}$ to GND (MAX17555)	-0.3V to +6V
FB/VO to GND (MAX17554A, MAX17554B, MAX17555A, MAX17555B)	-5.5V to +6V
FB/VO to GND (MAX17554C, MAX17555C)	-0.3V to +6V

Output Short-Circuit Duration	Continuous
Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ , 8-Pin TDFN, derate 6.2mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$ )	496mW
Operating Temperature Range ( <a href="#">Note 1</a> )	-40 $^\circ\text{C}$ to +125 $^\circ\text{C}$
Junction Temperature	-40 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Storage Temperature Range	-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
Lead Temperature (Soldering, 10s)	+300 $^\circ\text{C}$

**Note 1:** Junction temperatures greater than +125 $^\circ\text{C}$  degrade operating lifetimes.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Package Information

8 TDFN	
Package Code	T822CN+1
Outline Number	<a href="#">21-0487</a>
Land Pattern Number	<a href="#">90-0349</a>
Thermal Resistance, Four Layer Board	
Junction-to-Ambient ( $\theta_{JA}$ )	162 $^\circ\text{C}/\text{W}$
Junction-to-Case Thermal Resistance ( $\theta_{JC}$ )	20 $^\circ\text{C}/\text{W}$

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

## Pin Configurations

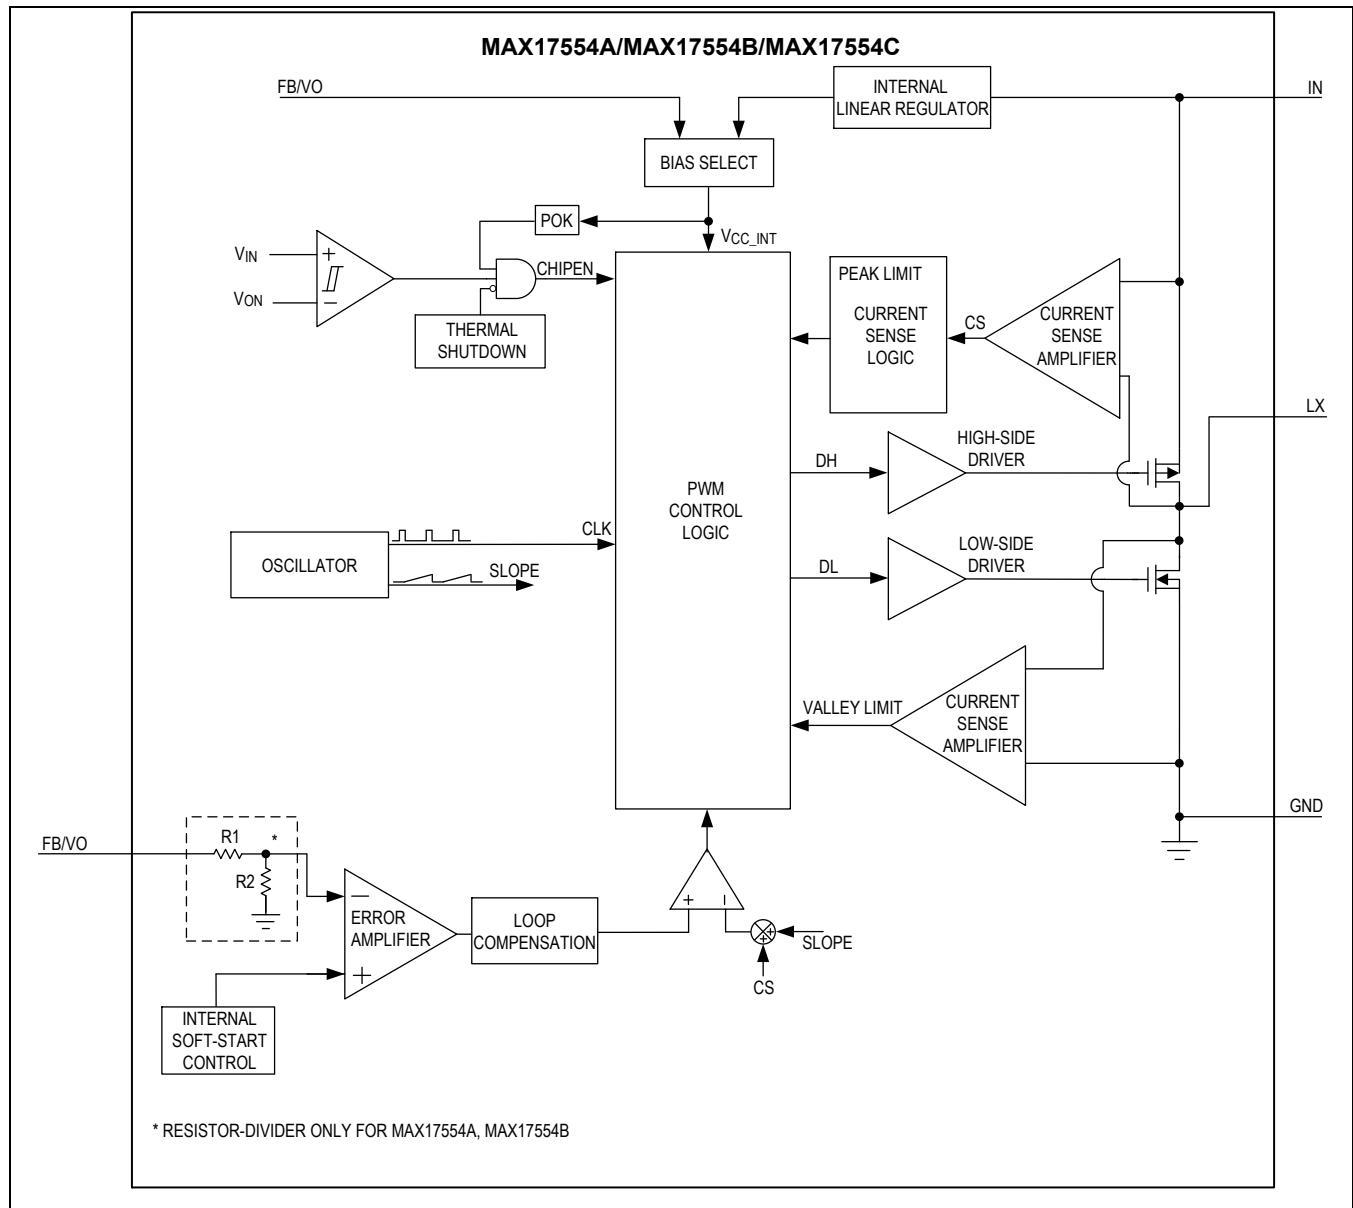

## Pin Descriptions

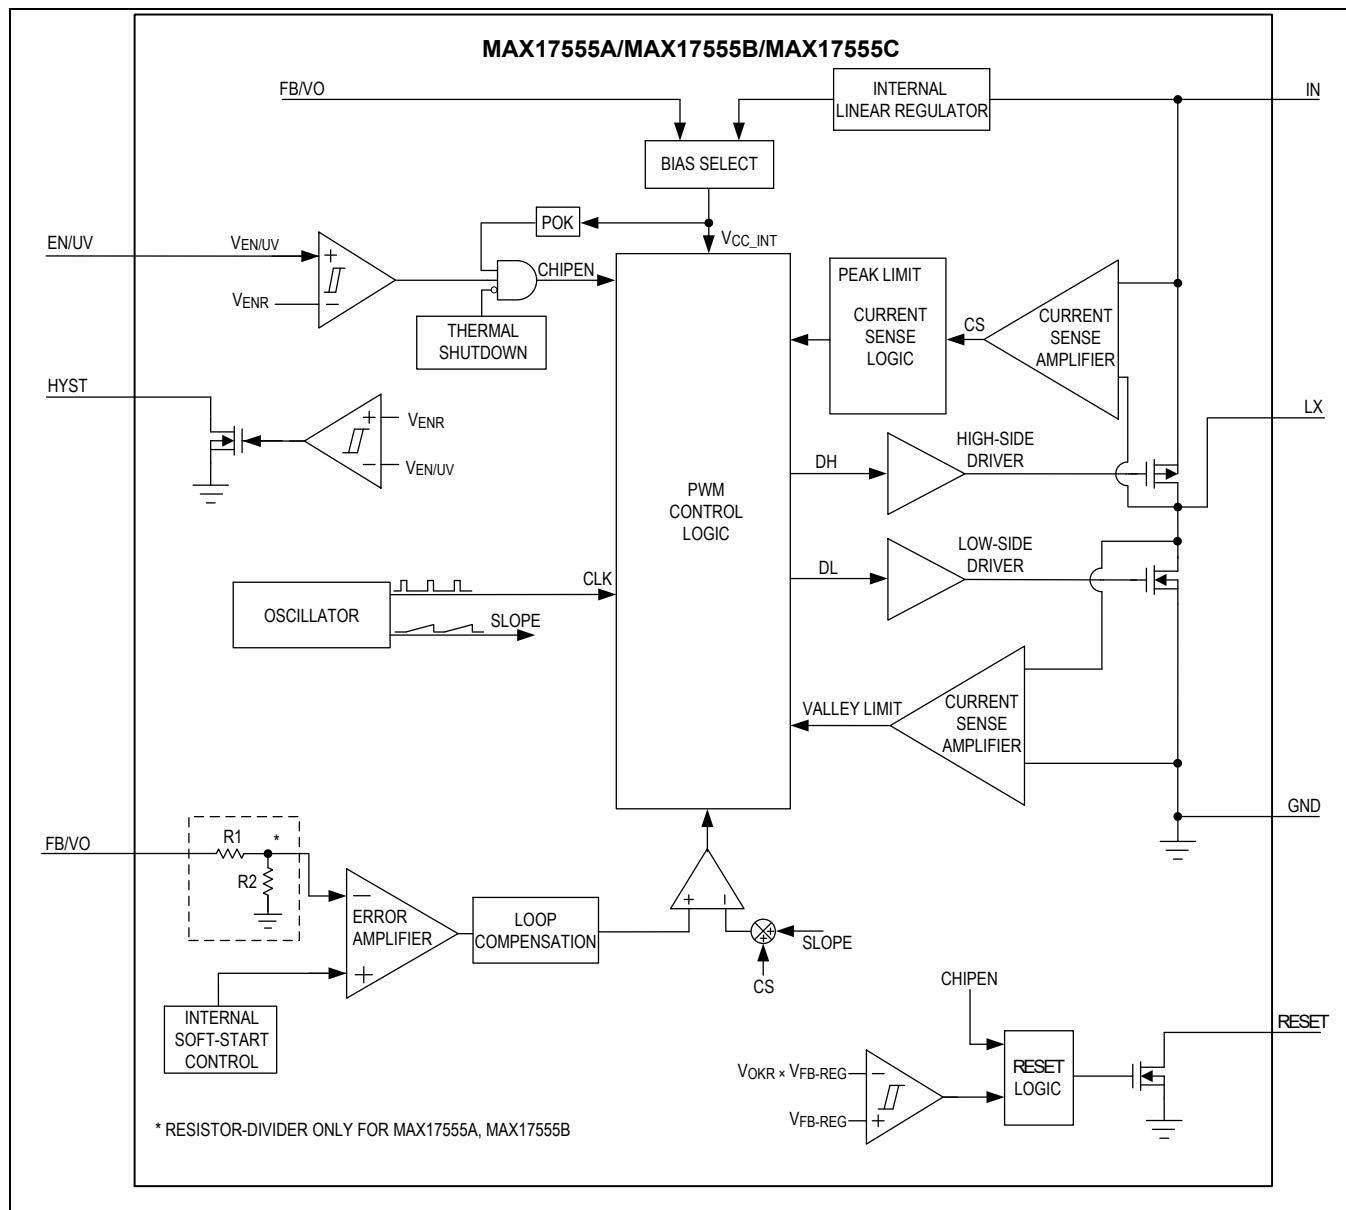

PIN	NAME	FUNCTION
1	IN	Power Supply Input Pin. Decouple to GND with a $1\mu\text{F}$ capacitor. Place the capacitor close to IN and GND pins.
2	GND, EN/UV	MAX17554: Connect to GND. MAX17555: Enable/Undervoltage Lockout Pin. Drive EN/UV high to enable the output voltage. Connect to the midpoint of a resistor-divider from IN to GND to set the input voltage at which the device turns ON. The allowed minimum turn off input voltage is 3.85V. Pull low to GND for disabling the device.
3	GND, HYST	MAX17554: Connect to GND. MAX17555: Converter Turn ON/OFF Hysteresis Programming Pin. Connect HYST to EN/UV with an external resistor to set the required hysteresis. HYST goes high impedance when EN/UV $> 1.215\text{V}$ (typ) and pulls low when EN/UV $< 1.09\text{V}$ (typ)
4	GND	Connect to GND.
5	FB/VO	Feedback Input. For fixed output parts (MAX17554A/MAX17554B, MAX17555A/MAX17555B), connect the output voltage node $V_{OUT}$ to FB/VO pin for both feedback and boot-strap function. Connect FB/VO to the center node of an external resistor-divider from the output to GND to set the output voltage for MAX17554C and MAX17555C. See the <a href="#">Adjusting the Output Voltage</a> section for more details.
6	GND, RESET	MAX17554: Connect to GND. MAX17555: Open-Drain RESET Output. The $\overline{\text{RESET}}$ output is driven low if FB/VO drops below 92% (typ) of its set value. RESET goes high impedance 30 $\mu\text{s}$ after FB/VO voltage rises above 95% (typ) of its set value. See <a href="#">Electrical Characteristics</a> section for more details.
7	GND	Ground. Connect GND to the power ground plane. Connect all the circuit ground connections together at a single point. See the <a href="#">PCB Layout Guidelines</a> section.
8	LX	Switching Node Pin. Connect LX to the switching-side of the inductor. LX is high impedance when the device is in shutdown mode.

## Functional Block Diagrams

### MAX17554

**MAX17555**

## Detailed Description

MAX17554 and MAX17555 are ultra-small, high-efficiency, high voltage, synchronous step-down DC-DC converters with integrated MOSFETs that operate over a wide input voltage range and deliver up to 50mA of load current. The MAX17554 operates over a wide input voltage range from 10V to 60V and the MAX17555 operates over a wide input voltage range from 4V to 60V. The MAX17554 offers a converter solution with only three active pins, whereas the MAX17555 offers a flexible converter design in terms of EN/UV and HYST thresholds and RESET features. MAX17554A/MAX17555A and MAX17554B/MAX17555B are fixed 3.3V and 5V output voltage devices, respectively. MAX17554C/MAX17555C are adjustable output (0.8V to 0.9 x V<sub>IN</sub>) devices. The feedback voltage regulation accuracy of the converters over the -40°C to +125°C temperature range is  $\pm 1.5\%$  for MAX17554A/MAX17555A and MAX17554B/MAX17555B, and  $\pm 1.25\%$  for MAX17554C/MAX17555C.

The devices feature a peak-current mode control architecture. During normal operation, at each rising edge of the clock, the high-side p-MOSFET turns on and remains on until either the appropriate or maximum duty cycle is reached or the peak current limit is detected. During the high-side p-MOSFET on-time, the inductor current ramps up. During the rest of the switching cycle or until the inductor current reaches zero, the high-side p-MOSFET remains off, the low-side n-MOSFET remains on, and the inductor current ramps down. The device features the Discontinuous Conduction Mode (DCM), in which the negative inductor current is inhibited to enable higher light load efficiency. In DCM, the device operates at a fixed switching frequency until the minimum on-time is reached. If the load demand is less than the energy corresponding to the minimum on-time pulse, the converter skips pulses to maintain output voltage regulation.

A fixed soft-start time of 0.8ms (typ) allows users to reduce input inrush current. The MAX17555 features an enable/undervoltage lockout (EN/UV) and a hysteresis (HYST) pins to allow the users to turn the device on or off at the desired input-voltage level. The MAX17555 also features an open-drain RESET pin to provide a power-good signal to the system upon achieving successful regulation of the output voltage.

### Enable/Undervoltage Input (EN/UV) with HYST (MAX17555)

The device features an enable/undervoltage lockout (EN/UV) pin and a hysteresis (HYST) pin that allow the user to turn the device on or off at the desired input-voltage level. EN/UV can also be used to enable/disable the converter. Driving EN/UV low (below V<sub>ENF</sub>) disables both power MOSFETs as well as other internal circuitry, and reduces IN quiescent current to below 3.8 $\mu$ A (typ). Driving EN/UV high (above V<sub>ENR</sub>) enables the converter. An external voltage-divider between IN and EN/UV to GND and an external resistor from HYST to EN/UV adjusts the input voltage at which the device turns on or turns off. See the [Setting the Input Undervoltage Level with Hysteresis](#) section for more details.

When the part is enabled, the device's internal error-amplifier reference voltage starts to ramp up after an internal delay. In the MAX17555 while operating within input range, the maximum internal delay of 170 $\mu$ s (typ) is observed when EN/UV voltage rises above 1.215V (typ). In the MAX17554, the maximum internal delay of 170 $\mu$ s (typ) is observed when the input voltage rises above V<sub>ON</sub>. The duration of the soft-start ramp is 800 $\mu$ s (typ), allowing a smooth increase of the output voltage.

### Reset Output (RESET) (MAX17555)

The device includes an open-drain RESET output to monitor the output voltage. RESET goes to high impedance 30 $\mu$ s (typ) after the regulator output voltage increases above 95% (typ) of the nominal set voltage. RESET goes low when the regulator output voltage drops below 92% (typ) of the nominal set voltage. RESET also goes low when EN/UV is pulled low, and during the hiccup time out period.

### Startup into Prebiased Output

The device supports prebiased startup. When the device starts into a prebiased output, both the high-side and the low-side MOSFETs are turned off so that the converter does not sink current from the output. High-side and low-side MOSFETs do not start switching until the pulse width modulation (PWM) comparator commands the first PWM pulse, at which point switching commences. The output voltage is then smoothly ramped up to the target value in alignment with the internal reference.

### Overcurrent Protection

The devices implement a hysteretic peak current limit protection scheme to protect the internal MOSFETs and inductor under output short circuit conditions. When the inductor peak current exceeds  $I_{PEAK-LIMIT}$  (0.24A typ), the high side switch is turned off and the low side switch is turned on to reduce the inductor current. After the current is reduced to  $I_{VALLEY-LIMIT}$  (0.15A typ during startup and 0.022A typ during steady state), the high-side MOSFET is turned on at the rising edge of the next clock pulse. Since the inductor current is bounded between the two values, the inductor current runaway never happens in this scheme. The devices enter hiccup mode if the inductor current hits  $I_{PEAK-LIMIT}$  for 16 consecutive times. In hiccup mode, the converter is protected by suspending switching for a hiccup timeout period of 64ms (typ). Once the hiccup timeout period expires, soft-start is attempted again. The hiccup mode of operation ensures low power dissipation under output short-circuit conditions.

### Thermal Shutdown Protection

Thermal shutdown protection limits total power dissipation in the devices. When the junction temperature of the devices exceeds  $+160^{\circ}\text{C}$  (typ), a thermal sensor shuts down the devices, allowing the devices to cool. The thermal sensor turns the devices on again after the junction temperature cools by  $20^{\circ}\text{C}$  (typ). Soft-start resets during thermal shutdown. Carefully evaluate the total power dissipation (see [Power Dissipation](#) section) to avoid unwanted triggering of the thermal shutdown protection in normal operation.

## Applications Information

### Inductor Selection

The MAX17554/5 are designed for discontinuous conduction mode (DCM) of operation to achieve high light load efficiency. Operating the converter in DCM for the entire operating range allows the selection of a smaller inductor, and hence reduces the solution size. Use the following equation to keep the converter in DCM for the entire operating range:

$$L_{MAX} \leq \frac{V_{OUT} + I_{OUT(MAX)} \times (R_{DS-ONL(MAX)} + R_{DCR(MAX)})}{2 \times I_{OUT(MAX)} \times f_{SW}} \times \left( 1 - \frac{V_{OUT} + I_{OUT(MAX)} \times (R_{DS-ONL(MAX)} + R_{DCR(MAX)})}{V_{IN(MIN)} - I_{OUT(MAX)} \times (R_{DS-ONH(MAX)} - R_{DS-ONL(MAX)})} \right) \times (1-TOL)$$

where:

$V_{OUT}$  = Steady-state output voltage in V,

$I_{OUT(MAX)}$  = Maximum load current in A,

$R_{DCR(MAX)}$  = Worst-case DC resistance of the inductor in  $\Omega$ ,

$f_{SW}$  = Switching frequency in Hz,

$V_{IN(MIN)}$  = Minimum operating input voltage in V,

$R_{DS-ONL(MAX)}$  and  $R_{DS-ONH(MAX)}$  = Worst-case on-state resistance of low-side and high-side MOSFETs respectively in  $\Omega$ ,

TOL = Tolerance of inductor in pu.

The inductor peak current should not exceed the minimum peak current limit of the device ( $I_{PEAK-LIMIT}$ , 210mA min) in order to not trigger overcurrent/hiccup protection. Use the following equation to ensure the maximum inductor peak current is less than 210mA:

$$L_{MIN} \geq \frac{45.4 \times I_{OUT} \times V_{OUT}}{(1-TOL) \times f_{SW}} \times \left( 1 - \frac{V_{OUT}}{V_{IN(MAX)}} \right)$$

The selected inductor ( $L_{SEL}$ ) should meet following criteria:

$$L_{MIN} \leq L_{SEL} \leq L_{MAX}$$

In the design cases where the calculated  $L_{MIN}$  is higher than  $L_{MAX}$ , either reduce the output current or increase the  $V_{IN(MIN)}$  for a feasible design solution.

Since the MAX17554/5 operates in DCM, the device switches at a fixed frequency until the minimum on-time ( $t_{ON\_MIN}$ ) is reached. If the load demand is less than the energy corresponding to the minimum on-time pulse, the converter skips switching pulses to maintain the output voltage regulation. For the  $L_{SEL}$ , use the following formula to calculate the minimum load current required to operate at a fixed switching frequency:

$$I_{OUT\_MIN} = \frac{0.5 \times (V_{IN} - V_{OUT}) \times V_{IN} \times t_{ON\_MIN}^2 \times f_{SW}}{V_{OUT} \times L_{SEL}}$$

where:

$V_{IN}$  = Operating input voltage in V,

$t_{ON\_MIN}$  = Minimum on-time in s.

### Input Capacitor Selection

The input filter capacitor reduces peak currents drawn from the power source, switching noise, and voltage ripple on the input. Use low-ESR ceramic capacitors with high ripple-current capability at the input. X7R capacitors are recommended in industrial applications for their temperature stability. Decouple IN to GND with a minimum of 1 $\mu$ F/1206 package or equivalent capacitor. Calculate the input capacitance using the following equation based on the input ripple requirement:

$$C_{IN} = \frac{I_{OUT(MAX)} \times \frac{V_{OUT}}{V_{IN}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right)}{\eta \times f_{SW} \times \Delta V_{IN}}$$

where:

$V_{IN}$  = Input voltage in V,

$V_{OUT}$  = Steady-state output voltage in V,

$I_{OUT(MAX)}$  = Maximum load current in A,

$f_{SW}$  = Switching frequency in Hz,

$\Delta V_{IN}$  = Allowable input voltage ripple in V,

$\eta$  = Efficiency.

In applications where the source is distant from the device input, an appropriate electrolytic capacitor should be added to provide necessary damping for potential oscillations caused by the inductance of the input power path and input ceramic capacitor.

### Output Capacitor Selection

X7R ceramic output capacitors are preferred due to their stability at temperatures in industrial applications. It should be noted that dielectric materials used in ceramic capacitors exhibit capacitance loss due to DC bias levels and should be appropriately derated to ensure the required output capacitance is obtained in the application. The output capacitor has two functions: it stores sufficient energy to support the output voltage under load transient conditions and stabilizes the device's internal control loop. The required output capacitance can be calculated as follows:

$$C_{OUT} = \frac{18.7 \times 10^{-3}}{V_{OUT}} \sqrt{\frac{L_{SEL}}{\frac{V_{OUT}}{I_{OUT}} \times \left(1 - \frac{V_{OUT}}{60}\right)}}$$

The approximate steady state output voltage ripple in DCM can be calculated by the following equation:

$$\Delta V_{OUTDCM} = \frac{0.5 \times (I_{PK-DCM} - I_{OUT})^2 \times L_{SEL}}{C_{OUT}} \times \left( \frac{1}{V_{IN} - V_{OUT}} + \frac{1}{V_{OUT}} \right)$$

$$I_{PK-DCM} = \sqrt{\frac{2 \times I_{OUT} \times V_{OUT}}{L_{SEL} \times f_{SW}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right)}$$

where:

$I_{OUT}$  = Load current in A,

$L_{SEL}$  = Selected inductance in H,

$V_{IN}$  = Input voltage in V,

$V_{OUT}$  = Steady-state output voltage in V,

$f_{SW}$  = Switching frequency in Hz.

### Setting the Input Undervoltage Level with Hysteresis (MAX17555)

The device offers an adjustable input undervoltage and adjustable hysteresis levels. Set the voltage at which the device turns on with a resistive voltage-divider connected from IN to GND and a resistor from HYST to EN/UV (see [Figure 1](#)).

## Integrated 60V, 50mA, Ultra-Small, High Efficiency, Synchronous Step-Down DC-DC Converters

MAX17554, MAX17555

Connect the center node of the resistive voltage-divider to EN/UV pin. Choose R1 to be 3.32MΩ (max) and then calculate R2 and R3 as follows:

$$R2 = \frac{V_{ENF} \times R1}{(V_{IN(OFF)} - V_{ENF})}$$

$$R3 = \frac{V_{ENR} \times R1 \times R2}{(V_{IN(ON)} \times R2 - V_{ENR} \times (R1 + R2))}$$

where  $V_{IN(ON)}$  and  $V_{IN(OFF)}$  are the voltages at which the device is required to turn on and turn off, respectively. While selecting the above resistors, the HYST pin sink current capability given in [Electrical Characteristics](#) table should be considered.

When the HYST function is not used, connect the HYST pin to GND (see [Figure 1](#)) and calculate R2 as follows:

$$R2 = \frac{V_{ENR} \times R1}{(V_{IN(ON)} - V_{ENR})}$$

If the EN/UV pin is driven from an external signal source, it is recommended to place a series resistance of minimum 1kΩ between the signal source output and the EN/UV pin to reduce voltage ringing on the line.

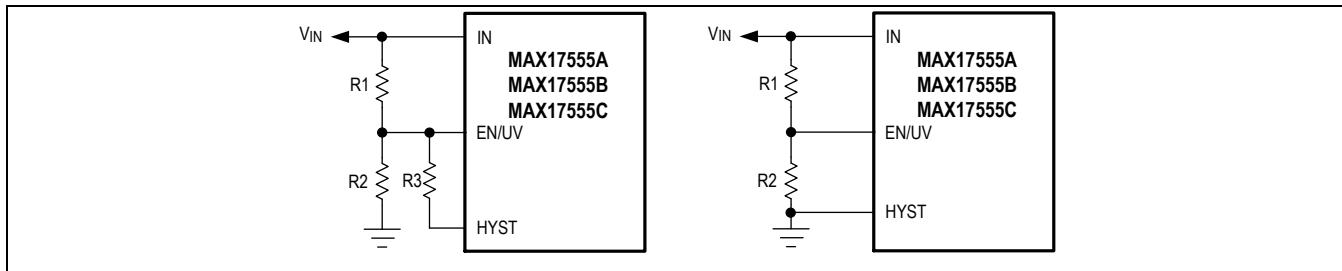

Figure 1. Setting the Input Undervoltage Level with and without Hysteresis

### Adjusting the Output Voltage

For the MAX17554A, MAX17554B, MAX17555A, and MAX17555B, connect FB/VO directly to the output node of the step-down converter. The output voltage of MAX17554C and MAX17555C can be programmed from 0.8V to 0.9 x VIN. Set the output voltage by using a resistive feedback divider from output to GND (see [Figure 2](#)). Connect the center node of the divider to the FB/VO pin. Choose  $R_B$  less than or equal to 100kΩ and calculate  $R_U$  with the following equation:

$$R_U = R_B \times \left[ \frac{V_{OUT}}{0.8} - 1 \right]$$

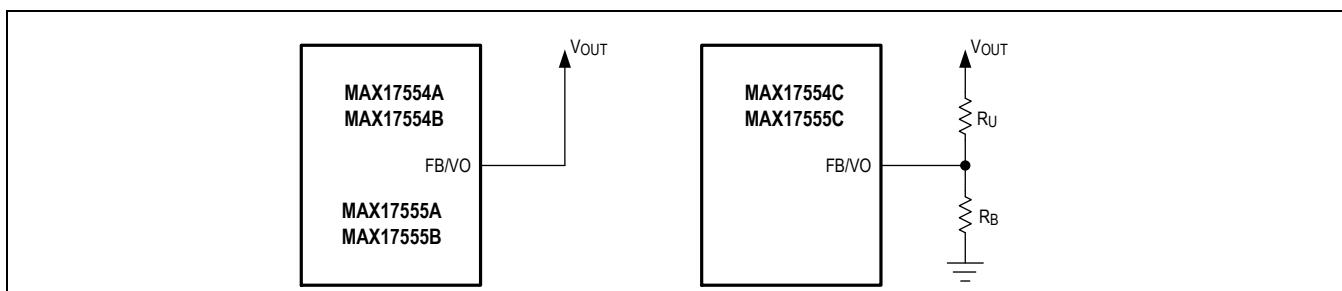

Figure 2. Setting the Output Voltage

## Power Dissipation

At a particular operating condition, the power losses that lead to the temperature rise of the device are estimated as follows:

$$P_{LOSS} = P_{OUT} \times \left( \frac{1}{\eta} - 1 \right) - (I_{OUT}^2 \times R_{DCR})$$
$$P_{OUT} = V_{OUT} \times I_{OUT}$$

where:

$P_{OUT}$  = Output power in W,

$\eta$  = Efficiency of the converter,

$R_{DCR}$  = DC resistance of the output inductor in  $\Omega$ .

See the [Typical Operating Characteristics](#) for more information on efficiency at typical operating conditions. The Theta-JA ( $\theta_{JA}$ ) of the package is as follows:

$$\theta_{JA} = 162^\circ\text{C/W}$$

The maximum junction temperature ( $T_{J(MAX)}$ ) of the device can be estimated at any given maximum ambient temperature ( $T_{A(MAX)}$ ) from the following equation:

$$T_{J(MAX)} = T_{A(MAX)} + (\theta_{JA} \times P_{LOSS})$$

Junction temperature greater than  $+125^\circ\text{C}$  degrades operating lifetimes.

## PCB Layout Guidelines

All connections carrying pulsed currents must be very short and as wide as possible. The inductance of these connections must be kept to an absolute minimum due to the high  $di/dt$  of the currents. Since inductance of a current-carrying loop is proportional to the area enclosed by the loop, if the loop area is made very small, inductance is reduced. Additionally, small-current loop areas reduce radiated EMI.

A ceramic input filter capacitor should be placed close to the IN pins of the IC. This eliminates as much trace inductance effects as possible and gives the IC a cleaner voltage supply.

When routing the circuitry around the IC, the analog small-signal ground and the power ground for switching currents must be kept separate. They should be connected together at a point where switching activity is at a minimum. This helps keep the analog ground quiet. The ground plane should be kept continuous/unbroken as far as possible. No trace carrying high switching current should be placed directly over any ground plane discontinuity. PCB layout also affects the thermal performance of the design. For a sample layout that ensures first pass success, refer to the MAX17554 evaluation kit layout available at [www.maximintegrated.com](http://www.maximintegrated.com).
