Description

The 8T49N240 is a fractional-feedback single channel jitter attenuator with frequency translation. It is equipped with three integer and one fractional output dividers, allowing the generation of up to four different output frequencies, ranging from 8kHz to 867MHz. These frequencies are completely independent of the input reference frequencies and the crystal reference frequency. The outputs may select among LVPECL, LVDS, HCSL, or LVCMOS output levels.

The 8T49N240 accepts up to two differential or single-ended input clocks and a fundamental-mode crystal input. The internal PLL can lock to either of the input reference clocks or just to the crystal to behave as a frequency synthesizer. The PLL can use the second input for redundant backup of the primary input reference, but in this case, both input clock references must be integer related in frequency.

The device supports hitless reference switching between input clocks. The device monitors both input clocks for Loss of Signal (LOS), and generates an alarm when an input clock failure is detected. Automatic and manual hitless reference switching options are supported. LOS behavior can be set to support gapped or un-gapped clocks.

The 8T49N240 supports holdover. The holdover has an initial accuracy of ±50ppB from the point where the loss of all applicable input reference(s) has been detected. It maintains a historical average operating point for the PLL that may be returned to in holdover at a limited phase slope.

The PLL has a register-selectable loop bandwidth from 0.2Hz to 6.4kHz.

The device supports Output Enable and Clock Select inputs and Lock, Holdover, and LOS status outputs.

The device is programmable through an I^2C interface. It also supports I^2C master capability to allow the register configuration to be read from an external EEPROM.

Factory pre-programmed devices are also available using the on-chip One Time Programmable (OTP) memory.

Typical Applications

- OTN, including ITU-T G.709 (2009) FEC
- CPRI interfaces
- Fiber optics
- 40G/100G Ethernet
- Gb Ethernet, Terabit IP switches / routers

Features

- Four differential outputs
- Excellent jitter performance:
  - < 200fs (typical) RMS (including spurs): 12kHz to 20MHz for integer-divider outputs in jitter attenuator mode or in fractional-feedback synthesizer mode
- Operating Modes: Synthesizer, Jitter Attenuator
- Operates from a 10MHz to 54MHz fundamental-mode crystal
- Initial holdover accuracy of ±50ppb
- Accepts up to two LVPECL, LVDS, LVHSTL, or LVCMOS input clocks
  - Accepts frequencies ranging from 8kHz to 875MHz
  - Auto and manual clock selection with hitless switching
  - Clock input monitoring including support for gapped clocks
- Phase-slope limiting and fully hitless switching options to control output clock phase transients
- Three outputs generate LVPECL / LVDS / HCSL clocks, one output generates LVPECL / LVDS / HCSL / LVCMOS clocks
  - Output frequencies ranging from 8kHz up to 867MHz (differential)
  - Output frequencies ranging from 8kHz to 250MHz (LVCMOS)
  - Three integer dividers with fixed divider ratios (see Table 3)
  - One fractional output divider
- Programmable loop bandwidth settings from 0.2Hz to 6.4kHz
  - Optional fast-lock function
- Four General Purpose I/O pins with optional support for status and control:
  - Two Output Enable control inputs provide control over the four clocks
  - Manual clock selection control input
  - Lock, Holdover, and Loss-of-Signal alarm outputs
- Open-drain Interrupt pin
- Register programmable through I^2C or via external I^2C EEPROM
- Full 2.5V or 3.3V supply modes, with some support for 1.8V
- -40°C to 85°C ambient operating temperature
- Package: 6 x 6 x 0.9 mm 40-VFQFN, lead-free (RoHS 6)

Pin Descriptions

Table 1. Pin Descriptions [a]

Number	Name	Type		Description
1	V_{CCA}	Power		Analog function supply for core analog functions. 2.5V or 3.3V supported.
2	V_{CCA}	Power		Analog function supply for analog functions associated with PLL. 2.5V or 3.3V supported.
3	GPIO[0]	I/O	Pullup	General-purpose input-output. LVTTL / LVCMOS Input levels.
4	V_{CCO0}	Power		High-speed output supply for output pair Q0, nQ0. 2.5V or 3.3V supported for differential output types. LVCMOS outputs also support 1.8V.
5	Q0	O	Universal	Output Clock 0. For more information, see Output Drivers.
6	nQ0	O	Universal	Output Clock 0. For more information, see Output Drivers.
7	GPIO[1]	I/O	Pullup	General-purpose input-output. LVTTL / LVCMOS Input levels.
8	nQ1	O	Universal	Output Clock 1. For more information, see Output Drivers.
9	Q1	O	Universal	Output Clock 1. For more information, see Output Drivers.
10	V_{CCO1}	Power		High-speed output supply for output pair Q1, nQ1. 2.5V or 3.3V supported for differential output types. LVCMOS outputs also support 1.8V.
11	SDATA	I/O	Pullup	I^2C interface bi-directional data.
12	SCLK	I/O	Pullup	I^2C interface bi-directional clock.

Table 1. Pin Descriptions [a] (Cont.)

Number	Name	Type		Description
13	V_{CC}	Power		Core digital function supply. 2.5V or 3.3V supported.
14 EPAD	V_{EE}	Power		Negative supply voltage. All V_{EE} pins and EPAD must be connected before any positive supply voltage is applied.
15	V_{CC}	Power		Core digital function supply. 2.5V or 3.3V supported.
16	CLK0	I	Pulldown	Non-inverting differential clock input 0.
17	nCLK0	I	Pullup / Pulldown	Inverting differential clock input 0. V_{CC} / 2 when left floating (set by internal pullup / pulldown resistors)
18	CLK1	I	Pulldown	Non-inverting differential clock input 1.
19	nCLK1	I	Pullup / Pulldown	Inverting differential clock input 1. V_{CC} / 2 when left floating (set by internal pullup / pulldown resistors)
20	S_A0	I	Pulldown	I^2C Address Bit A0.
21	V_{CCO2}	Power		High-speed output supply voltage for output pair Q2, nQ2. 2.5V or 3.3V supported for differential output types. LVCMOS outputs also support 1.8V.
22	Q2	O	Universal	Output Clock 2. For more information, see Output Drivers.
23	nQ2	O	Universal	Output Clock 2. For more information, see Output Drivers.
24	GPIO[2]	I/O	Pullup	General-purpose input-output. LVTTL / LVCMOS Input levels.
25	nQ3	O	Universal	Output Clock 3. For more information, see Output Drivers.
26	Q3	O	Universal	Output Clock 3. For more information, see Output Drivers.
27	V_{CCO3}	Power		High-speed output supply voltage for output pair Q3, nQ3. 2.5V or 3.3V supported for differential output types. LVCMOS outputs also support 1.8V.
28	GPIO[3]	I/O	Pullup	General-purpose input-output. LVTTL / LVCMOS Input levels.
29	nINT	O	Open-drain with pullup	Interrupt output.
30	V_{CCA}	Power		Analog function supply for analog functions associated with PLL. 2.5V or 3.3V supported.
31	nRST	I	Pullup	Master Reset input> LVTTL / LVCMOS interface levels: 0 = All registers and state machines are reset to their default values 1 = Device runs normally
32	V_{CCA}	Power		Analog function supply for core analog functions. 2.5V or 3.3V supported.
33	OSCI	I		Crystal Input. Accepts a 10MHz - 54MHz reference from a clock oscillator or a 12pF fundamental mode, parallel-resonant crystal.
34	OSCO	O		Crystal Output. This pin should be connected to a crystal. If an oscillator is connected to OSCI, then this pin must be left unconnected.
35	S_A1	I	Pulldown	I^2C Address bit A1.
36	V_{CCCS}	Power		Output supply for Control and Status pins: GPIO[3:0], SDATA, SCLK, S_A0, nINT, nRST,S_A1 1.8V, 2.5V, or 3.3V supported.
37	CAP1	Analog		PLL External Capacitance.

Table 1. Pin Descriptions [a] (Cont.)

Number	Name	Type		Description
38	CAP2	Analog		PLL External Capacitance.
39	CAP_REF	Analog		External Capacitance for input reference clock circuitry.
40	V_{CCA}	Power		Analog function supply for analog functions associated with PLL. 2.5V or 3.3V supported.

[a] *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, *Pin Characteristics,* for typical values.

Table 2. Pin Characteristics, V_{CC} = V_{CCOX} [a] = 3.3V±5% or 2.5V±5%

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
C_{IN}	Input Capacitance[b]				3.5		pF
C_{XTAL}	Crystal Pins (OSCI, OSCO) Internal Capacitance				8		pF
R_{PULLUP}	Input Pullup Resistor	SDATA, SCLK, nRST, GPIO[3:0]			51		kΩ
$R_{PULLDOWN}$	Input Pulldown Resistor	S_A0, S_A1			51		kΩ
C_{PD}	Power Dissipation Capacitance (per output pair)	Q3, LVCMOS	V_{CCOX} = 3.465V		13		pF
			V_{CCOX} = 2.625V		15		pF
			V_{CCOX} = 1.89V		15		pF
		LVDS, HCSL or LVPECL Q[0:2]			2.5		pF
		Q3, LVDS, HCSL or LVPECL			4.5		pF
R_{OUT}	Output Impedance	GPIO[3:0]	V_{CCCS} = 3.3V		26		Ω
			V_{CCCS} = 2.5V		32		
			V_{CCCS} = 1.8V		39		
		LVCMOS Q3, nQ3	V_{CCOX} = 3.3V		18		Ω
			V_{CCOX} = 2.5V		18		
			V_{CCOX} = 1.8V		24		

[a] V_{CCOX} denotes: V_{CCO0}, V_{CCO1}, V_{CCO2} or V_{CCO3}.

[b] This specification does not apply to the OSCI or OSCO pins.

Principles of Operation

The 8T49N240 can be locked to either of the input clocks and generate a wide range of synchronized output clocks. It could be used for example in either the transmit or receive path of Synchronous Ethernet equipment.

The 8T49N240 accepts up to two differential or single-ended input clocks ranging from 8kHz up to 875MHz. It generates up to four output clocks ranging from 8kHz up to 867MHz.

The PLL path within the 8T49N240 supports three states: Lock, Holdover and Free-run. Lock and holdover status may be monitored on register bits and pins. The PLL also supports automatic and manual hitless reference switching. In the locked state, the PLL locks to a valid clock input and its output clocks have a frequency accuracy equal to the frequency accuracy of the input clock. In the Holdover state, the PLL will output a clock which is based on the selected holdover behavior. The PLL within the 8T49N240 has an initial holdover frequency offset of ±50ppb. In the Free-run state, the PLL outputs a clock with the same frequency accuracy as the external crystal.

Upon power up, the PLL will enter Free-run state, in this state it generates output clocks with the same frequency accuracy as the external crystal. The 8T49N240 continuously monitors each input for activity (signal transitions). If no input references are provided, the device will remain locked to the crystal in Free-run state and will generate output frequencies as a synthesizer.

When an input clock has been validated the PLL will transition to the Lock state. In automatic reference switching, if the selected input clock fails and there are no other valid input clocks, the PLL will quickly detect that and go into Holdover. In the Holdover state, the PLL will output a clock which is based on the selected holdover behavior. If the selected input clock fails and another input clock is available then the 8T49N240 will hitlessly switch to that input clock. The reference switch can be either revertive or non-revertive. Manual switchover is also available with switchover only occurring on user command, either via register bit or via the Clock Select input function of the GPIO[3:0] pins.

The device supports conversion of any input frequencies to four different output frequencies: one independent output frequency on Q3 and three more integer-related frequencies on Q[0:2].

The 8T49N240 has a programmable loop bandwidth from 0.2Hz to 6.4kHz.

The device monitors all input clocks and generates an alarm when an input clock failure is detected.

The device is programmable through an I^2C and may also autonomously read its register settings from an internal One-Time Programmable (OTP) memory or an external serial I^2C EEPROM.

Crystal Input

The crystal input on the 8T49N240 is capable of being driven by a parallel-resonant, fundamental mode crystal with a frequency range of 10MHz - 54MHz

The oscillator input also supports being driven by a single-ended crystal oscillator or reference clock.

The initial holdover frequency offset is set by the device, but the long term drift depends on the quality of the crystal or oscillator attached to this port.

Bypass Path

The crystal input, CLK0 or CLK1 may be used directly as a clock source for the Q[3] output divider. This may only be done for input frequencies of 250MHz or less.

Input Clock Selection

The 8T49N240 accepts up to two input clocks with frequencies ranging from 8kHz up to 875MHz. Each input can accept LVPECL, LVDS, LVHSTL, HCSL or LVCMOS inputs using 1.8V, 2.5V or 3.3V logic levels.

In Manual mode, only one of the inputs may be chosen and if that input fails that PLL will enter holdover.

Manual mode may be operated by directly selecting the desired input reference in the REFSEL register field. It may also operate via pin-selection of the desired input clock by selecting that mode in the REFSEL register field. In that case, GPIO[2] must be used as a Clock Select input (CSEL). CSEL = 0 will select the CLK0 input and CSEL = 1 will select the CLK1 input.

In addition, the crystal frequency may be passed directly to the output divider Q[3] for use as a reference.

Inputs do not support transmission of spread-spectrum clocking sources. Since this family is intended for high-performance applications, it will assume input reference sources to have stabilities of ±100ppm or better, except where gapped clock inputs are used.

If the PLL is working in automatic mode, then one of the input reference sources is assigned as the higher priority. At power-up or if the currently selected input reference fails, the PLL will switch to the highest priority input reference that is valid at that time (see Input Clock Monitor section for details).

Automatic mode has two sub-options: revertive or non-revertive. In revertive mode, the PLL will switch to a reference with a higher priority setting whenever one becomes valid. In non-revertive mode the PLL remains with the currently selected source as long as it remains valid.

The clock input selection is based on the input clock priority set by the Clock Input Priority control bit.

Input Clock Monitor

Each clock input is monitored for Loss of Signal (LOS). If no activity has been detected on the clock input within a user-selectable time period then the clock input is considered to be failed and an internal Loss-of-Signal status flag is set, which may cause an input switchover depending on other settings. The user-selectable time period has sufficient range to allow a gapped clock missing many consecutive edges to be considered a valid input.

User-selection of the clock monitor time-period is based on a counter driven by a monitor clock. The monitor clock is fixed at the frequency of the PLL's VCO divided by 8. With a VCO range of 2.44GHz - 2.6GHz, the monitor clock has a frequency range of 305MHz to 325MHz.

The monitor logic for each input reference will count the number of monitor clock edges indicated in the appropriate Monitor Control register. If an edge is received on the input reference being monitored, then the count resets and begins again. If the target edge count is reached before an input reference edge is received, then an internal soft alarm is raised and the count re-starts. During the soft alarm period, the PLL tracking will not be adjusted. If an input reference edge is received before the count expires for the second time, then the soft alarm status is cleared and the PLL will resume adjustments. If the count expires again without any input reference edge being received, then a Loss-of-Signal alarm is declared.

It is expected that for normal (non-gapped) clock operation, users will set the monitor clock count for each input reference to be slightly longer than the nominal period of that input reference. A margin of 2-3 monitor clock periods should give a reasonably quick reaction time and yet prevent false alarms.

For gapped clock operation, the user will set the monitor clock count to a few monitor clock periods longer than the longest expected clock gap period. The monitor count registers support 17-bit count values, which will support at least a gap length of two clock periods for any supported input reference frequency, with longer gaps being supported for faster input reference frequencies.

Using this configuration for a gapped clock, the PLL will continue to adjust while the normally expected gap is present, but will freeze once the expected gap length has been exceeded and alarm after twice the normal gap length has passed.

Once a LOS on any of the input clocks is detected, the appropriate internal LOS alarm will be asserted and it will remain asserted until that input clock returns and is validated. Validation occurs once 8 rising edges have been received on that input reference. If another error condition on the same input clock is detected during the validation time then the alarm remains asserted and the validation period starts over.

Each LOS flag may also be reflected on one of the GPIO[2:1] outputs. Changes in status of any reference can also generate an interrupt if not masked.

Holdover

8T49N240 supports a small initial holdover frequency offset in non-gapped clock mode. When the input clock monitor is set to support gapped clock operation, this initial holdover frequency offset is indeterminate since the desired behavior with gapped clocks is for the PLL to continue to adjust itself even if clock edges are missing. In gapped clock mode, the PLL will not enter holdover until the input is missing for two LOS monitor periods.

The holdover performance characteristics of a clock are referred as its accuracy and stability, and are characterized in terms of the fractional frequency offset. The 8T49N240 can only control the initial frequency accuracy. Longer-term accuracy and stability are determined by the accuracy and stability of the external oscillator.

When the PLL loses all valid input references, it will enter the holdover state. In fast average mode, the PLL will initially maintain its most recent frequency offset setting and then transition at a rate dictated by its selected phase-slope limit setting to a frequency offset setting that is based on historical settings. This behavior is intended to compensate for any frequency drift that may have occurred on the input reference before it was detected to be lost.

The historical holdover value will have three options:

- Return to center of tuning range within the VCO band.
- Instantaneous mode - the holdover frequency will use the DPLL current frequency 100msec before it entered holdover. The accuracy is shown in the *AC Characteristics Table,* Table 36.
- Fast average mode - an internal IIR (Infinite Impulse Response) filter is employed to get the frequency offset. The IIR filter gives a 3dB attenuation point corresponding to nominal a period of 20 minutes. The accuracy is shown in the *AC Characteristics Table,* Table 36.

When entering holdover, the PLL will set a separate internal HOLD alarm internally. This alarm may be read from internal status register, appear on the appropriate GPIO pin and/or assert the nINT output.

While the PLL is in holdover, its frequency offset is now relative to the crystal input and so the output clocks will be tracing their accuracy to the local oscillator or crystal. At some point in time, depending on the stability and accuracy of that source, the clock(s) will have drifted outside of the limits of the holdover state and be considered to be in a free-run state. Since this borderline is defined outside the PLL and dictated by the accuracy and stability of the external local crystal or oscillator, the 8T49N240 cannot know or influence when that transition occurs.

Input to Output Clock Frequency

The 8T49N240 is designed to accept any frequency within its input range and generate four different output frequencies that are integer-related to the PLL frequency and hence to each other, but not to the input frequencies. The internal architecture of the device ensures that most translations will result in the exact output frequency specified. Please contact IDT for configuration software or other assistance in determining if a desired configuration will be supported exactly.

Synthesizer Mode Operation

The device may act as a frequency synthesizer with the PLL generating its operating frequency from just the crystal input. By setting the SYN_MODE register bit and setting the STATE[1:0] field to Free-run, no input clock references are required to generate the desired output frequencies.

When operating as a synthesizer, the precision of the output frequency will be < 20ppb for any supported configuration.

Loop Filter and Bandwidth

The 8T49N240 uses two external capacitors of fixed value to support its loop bandwidth. When operating in Synthesizer mode a fixed loop bandwidth of approximately 200kHz is provided.

When not operating as a synthesizer, the 8T49N240 will support a range of loop bandwidths: 0.2Hz, 0.4Hz, 0.8Hz, 1.6Hz, 3.2Hz, 6.4Hz, 12Hz, 25Hz, 50Hz, 100Hz, 200Hz, 400Hz, 800Hz, 1.6kHz or 6.4kHz.

The device supports two different loop bandwidth settings: acquisition and locked. These loop bandwidths are selected from the list of options described above. If enabled, the acquisition bandwidth is used while lock is being acquired to allow the PLL to `fast-lock'. Once locked the PLL will use the locked bandwidth setting. If the acquisition bandwidth setting is not used, the PLL will use the locked bandwidth setting at all times.

Integer Output Dividers (Q0, Q1 or Q2)

Each integer output divider block (Q0, Q1 or Q2) allows one of several fixed divide ratios to be chosen. Odd divide ratios of 3 or 5, along with all even divide ratios from 4 to 160 are supported for each output. There is an independent divider block for each output, but each is taking its input frequency directly from the single PLL. The PLL has a frequency range of 2.44GHz to 2.6GHz. The divide ratios, settings and possible output frequencies are shown in Table 3.

Table 3. Output Divide Ratios

Divide Ratio	Minimum F_{OUT} (MHz)	Maximum F_{OUT} (MHz)
3	813.33	866.67
4	610	650
5	488	520
6	406.67	433.33
8	305	325
10	244	260
...		
160	15.25	16.25

Fractional Output Divider Programming (Q3 Only)

For the FracN output divider Q[3], the output divide ratio is given by:

- Output Divide Ratio = (N.F)x2
- N = Integer Part: 4, 5, ...(2^{18}-1)
- F = Fractional Part: [0, 1, 2, ...(2^{28}-1)]/(2^{28})

For integer operation of this output dividers, N = 3 is also supported for the full output frequency range.

Output Divider Frequency Sources

Output dividers associated with the Q[0:2] outputs take their input frequency directly from the PLL.

The output divider associated with the Q[3] output can take its input frequency from the PLL, the CLK0 or CLK1 input reference frequency or the crystal frequency.

Output Phase Control on Switchover

There are two options on how the output phase can be controlled when the 8T49N240 enters or leaves the holdover state, or the PLL switches between input references. Phase-slope limiting or fully hitless switching (sometimes called phase build-out) may be selected. The SWMODE bit selects which behavior is to be followed.

If fully hitless switching is selected, then the output phase will remain unchanged under any of these conditions. Note that fully hitless switching is not supported when external loop-back is being used.

If phase-slope limiting is selected, then the output phase will adjust from its previous value until it is tracking the new condition at a rate dictated by the SLEW[1:0] bits.

Output Drivers

The Q0 to Q3 clock outputs are provided with register-controlled output drivers. By selecting the output drive type in the appropriate register, any of these outputs can support LVPECL, HCSL or LVDS logic levels.

In addition, the Q3 output can support LVCMOS operation. Please refer to the section below for behavior if this option is selected for Q3.

The operating voltage ranges of each output is determined by its independent output power pin (V_{CCO}) and thus each can have different output voltage levels. Output voltage levels of 2.5V or 3.3V are supported for differential operation and LVCMOS operation. In addition, LVCMOS output operation supports 1.8V V_{CCO}.

Each output may be enabled or disabled by register bits and/or GPIO pins.

LVCMOS Operation (Q3 Only)

When the Q3 output is configured to provide LVCMOS levels, then both the Q and nQ outputs will toggle at the selected output frequency. All the previously described configuration and control apply equally to both outputs. Frequency, voltage levels and enable / disable status apply to both the Q and nQ pins. When configured as LVCMOS, the Q and nQ outputs can be selected to be phase-aligned with each other or inverted relative to one another. Selection of phase-alignment may have negative effects on the phase noise performance of any part of the device due to increased simultaneous switching noise within the device.

Power-Saving Modes

To allow the device to consume the least power possible for a given application, the following functions are included under register control:

- Any unused output, including all output divider logic, can be individually powered-off.
- Any unused input, including the clock monitoring logic can be individually powered-off.
- The digital PLL can be powered-off when running in synthesizer mode.
- Clock gating on logic that is not being used.

Status / Control Signals and Interrupts

The status and control signals for the device, may be operated at 1.8V, 2.5V or 3.3V as determined by the voltage applied to the V_{CCCS} pin. All signals will share the same voltage levels.

Signals involved include: nINT, nRST, GPIO[3:0], S_A0, S_A1, SCLK and SDATA. The voltage used here is independent of the voltage chosen for the digital and analog core voltages and the output voltages selected for the clock outputs.

General-Purpose I/Os and Interrupts

The 8T49N240 provides four General Purpose Input / Output (GPIO) pins for miscellaneous status and control functions. Each GPIO may be configured as either an input or an output. Each GPIO may be directly controlled from register bits or be used as a predefined function as shown in Table 4. Note that the default state prior to configuration being loaded from internal OTP will be to set each GPIO to input direction to function as an Output Enable.

Table 4. GPIO Configuration

GPIO Pin	Configured as Input		Configured as Output	
	Fixed Function (default)	General Purpose	Fixed Function	General Purpose
3	-	GPI[3]	LOL	GPO[3]
2	CSEL	GPI[2]	LOS[0]	GPO[2]
1	OSEL[1]	GPI[1]	LOS[1]	GPO[1]
0	OSEL[0]	GPI[0]	HOLD	GPO[0]

If used in the Fixed Function mode of operation, the GPIO bits will reflect the real-time status of their respective status bits as shown in Table 4.

The LOL alarm will support two modes of operation:

- De-asserts once PLL is locked, or
- De-asserts after PLL is locked and all internal synchronization operations that may destabilize output clocks are completed.

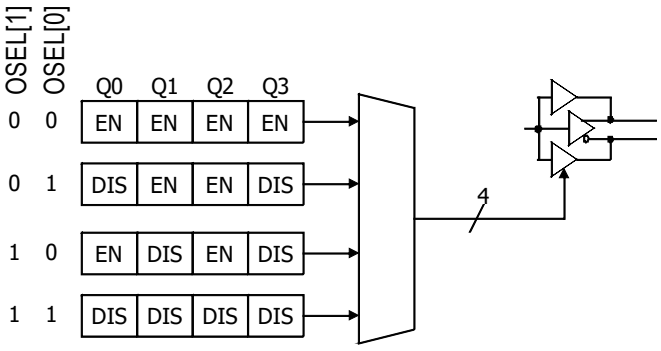
Interrupt Functionality

Interrupt functionality includes an interrupt status flag for each of PLL Loss-of-Lock status (LOL), PLL in holdover status (HOLD) and Loss-of-Signal status for each input (LOS[1:0]). Those Status Flags are set whenever there is an alarm on their respective functions. The Status Flag will remain set until the alarm has been cleared and a '1' has been written to the Status Flag's register location or if a reset occurs. Each Status Flag will also have an Interrupt Enable bit that will determine if that Status Flag is allowed to cause the Device Interrupt Status to be affected (enabled) or not (disabled). All Interrupt Enable bits will be in the disabled state after reset. The Device Interrupt Status Flag and nINT output pin are asserted if any of the enabled interrupt Status Flags are set.

Output Enable Operation

When GPIO[1:0] are used as Output Enable control signals, the function of the pins is to select one of four register-based maps that indicate which outputs should be enabled or disabled.

Figure 2. Output Enable Map Operation



In order to enable a clock output x (x = 0, 1, 2, or 3), three conditions must be met:

- The output must be powered (Qx_DIS = 0).
- The output must be enabled via registers (OUTEN[x] = 1).
- If the GPIO[1:0] are configured as OSEL[1:0] respectively, the output enable select pins (OSEL[1:0]) must select an output enable map that enables output x (see Figure 2).

Device Hardware Configuration

The 8T49N240 supports an internal One-Time Programmable (OTP) memory that can be pre-programmed at the factory with one complete device configuration. Some or all of this pre-programmed configuration will be loaded into the device's registers on power-up or reset.

These default register settings can be over-written using the serial programming interface once reset is complete. Any configuration written via the serial programming interface needs to be re-written after any power cycle or reset. Please contact IDT if a specific factory-programmed configuration is desired.

Device Start-up and Reset Behavior

The 8T49N240 has an internal power-up reset (POR) circuit and a Master Reset input pin nRST. If either is asserted, the device will be in the Reset State.

While in the reset state (nRST input asserted or POR active), the device will operate as follows:

- All registers will return to and be held in their default states as indicated in the applicable register description.
- All internal state machines will be in their reset conditions.
- The serial interface will not respond to read or write cycles.
- The GPIO signals will be configured as Output Enable inputs.
- All clock outputs will be disabled.
- All interrupt status and Interrupt Enable bits will be cleared, negating the nINT signal.

Upon the later of the internal POR circuit expiring or the nRST input negating, the device will exit reset and begin self-configuration.

The device will load an initial block of its internal registers using the configuration stored in the internal One-Time Programmable (OTP) memory. Once this step is complete, the 8T49N240 will check the register settings to see if it should load the remainder of its configuration from an external I^2C EEPROM at a defined address or continue loading from OTP, or both. See the section on I^2C Boot Initialization for details on how this is performed.

Once the full configuration has been loaded, the device will respond to accesses on the serial port and will attempt to lock the PLL to the crystal and begin operation. Once the PLL is locked, all the outputs derived from it will be synchronized.

Serial Control Port Description

Serial Control Port Configuration Description

The device has a serial control port capable of responding as a slave in an I^2C compatible configuration, to allow access to any of the internal registers for device programming or examination of internal status. All registers are configured to have default values. See the specifics for each register for details.

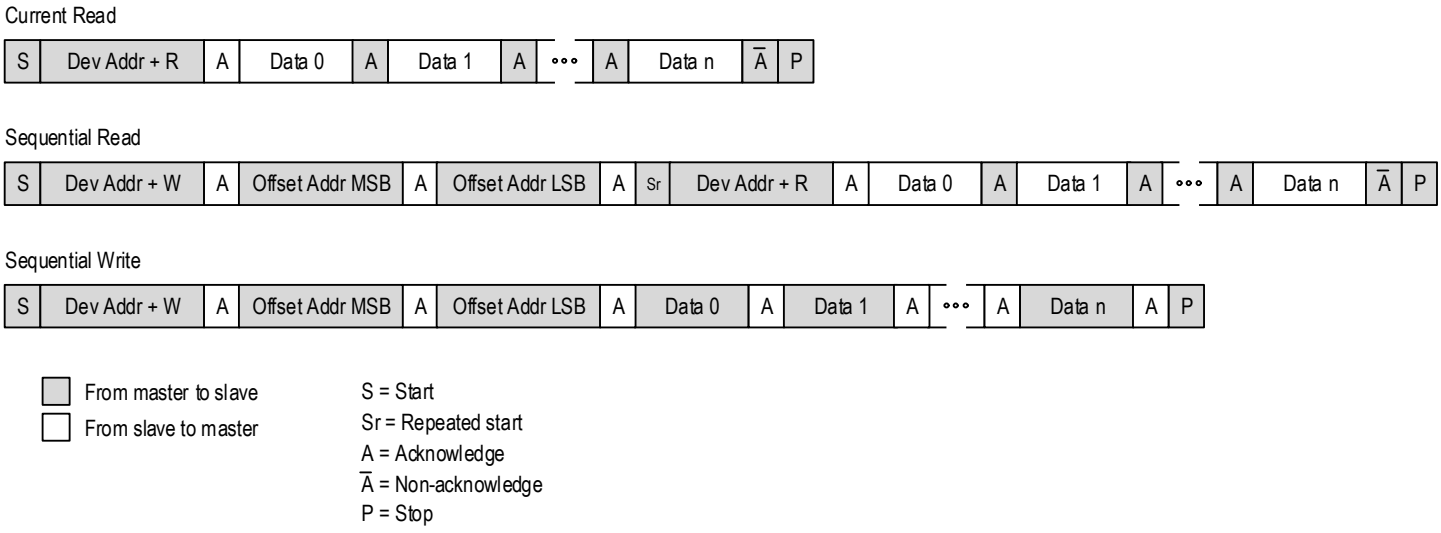
The device has the additional capability of becoming a master on the I^2C bus only for the purpose of reading its initial register configurations from a serial EEPROM on the I^2C bus. Writing of the configuration to the serial EEPROM must be performed by another device on the same I^2C bus or pre-programmed into the device prior to assembly.

I^2C Mode Operation

The I^2C interface is designed to fully support v2.1 of the I^2C Specification for Normal and Fast mode operation. The device acts as a slave device on the I^2C bus at 100kHz or 400kHz using the address defined in the Serial Interface Control register (0006h), as modified by the S_A0and S_A1 input pin settings. The interface accepts byte-oriented block write and block read operations. Two address bytes specify the register address of the byte position of the first register to write or read. Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first). Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I^2C compliance, it is recommended to use external pull-up resistors for SDATA and SCLK. The internal pull-up resistors have a size of 51kΩ typical.

Figure 3. I^2C Slave Read and Write Cycle Sequencing



I²C Master Mode

When operating in I²C mode, the 8T49N240 has the capability to become a bus master on the I²C bus for the purposes of reading its configuration from an external I²C EEPROM. Only a block read cycle will be supported.

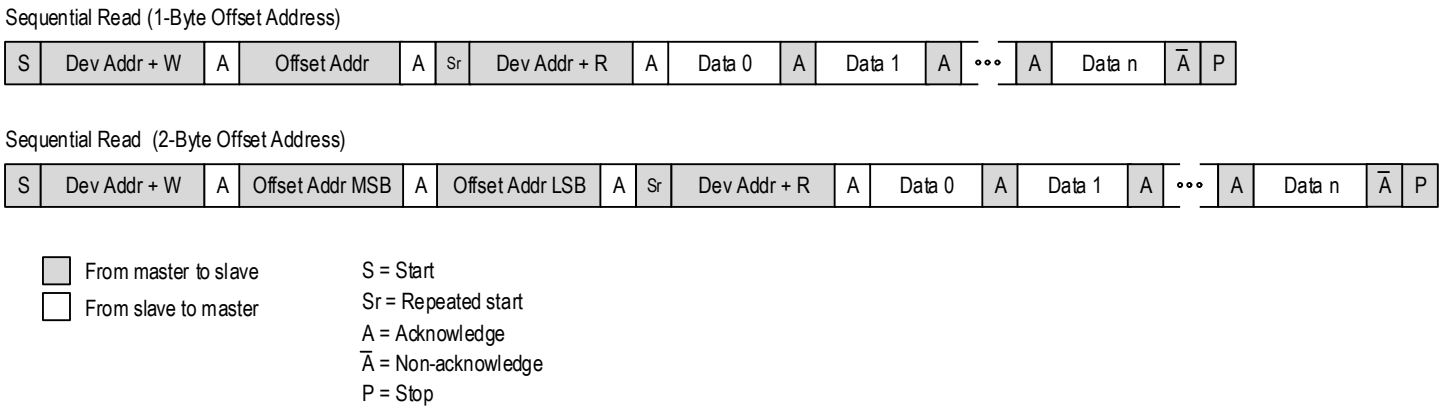
As an I²C bus master, the 8T49N240 will support the following functions:

- 7-bit addressing mode
- Base address register for EEPROM
- Validation of the read block via CCITT-8 CRC check against value stored in last byte (84h) of EEPROM
- Support for 100kHz and 400kHz operation with speed negotiation. If bit d0 is set at Byte address 05h in the EEPROM, this will shift from 100kHz operation to 400kHz operation.
- Support for 1- or 2-byte addressing mode
- Master arbitration with programmable number of retries
- Fixed-period cycle response timer to prevent permanently hanging the I²C bus.
- Read will abort with an alarm (BOOTFAIL) if any of the following conditions occur: Slave NACK, Arbitration Fail, Collision during Address Phase, CRC failure, Slave Response time-out

The 8T49N240 will not support the following functions:

- I²C General Call
- Slave clock stretching
- I²C Start Byte protocol
- EEPROM Chaining
- CBUS compatibility
- Responding to its own slave address when acting as a master
- Writing to external I²C devices including the external EEPROM used for booting

Figure 4. I²C Master Read Cycle Sequencing



I²C Boot-up Initialization Mode

If enabled (via the BOOT_EEP bit in the Startup register), once the nRST input has been de-asserted (high) and its internal power-up reset sequence has completed, the device will contend for ownership of the I²C bus to read its initial register settings from a memory location on the I²C bus. The address of that memory location is kept in non-volatile memory in the Startup register. During the boot-up process, the device will not respond to serial control port accesses. Once the initialization process is complete, the contents of any of the device's registers can be altered. It is the responsibility of the user to make any desired adjustments in initial values directly in the serial bus memory.

If a NACK is received to any of the read cycles performed by the device during the initialization process, or if the CRC does not match the one stored in address 84h of the EEPROM the process will be aborted and any uninitialized registers will remain with their default values. The BOOTFAIL bit in the Global Interrupt Status register (0210h) will also be set in this event.

Contents of the EEPROM should be as shown in Table 5.

Table 5. External Serial EEPROM Contents

EEPROM Offset (Hex)	Contents							
	D7	D6	D5	D4	D3	D2	D1	D0

Output Divider Control Register (Integer Portion) Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
N_Qm[7:0]	R/W	03h	1st Stage Output Divider Ratio for Output Clock Qm, nQm (m = 0, 1, 2): 00h - 02h = Do not use 03h - 06h = actual divide ratio (e.g. 03h = /3, A0h = /160) 07h - A0h = even numbers represent actual divide ratio, odd numbers should not be used (07h = Do Not Use, 08h = /8, 09h = Do Not Use, 0Ah = /10, etc.) A1h - FFh = Do not use
N_Q3[17:0]	R/W	20002h	Integer Portion of Output Divider Ratio for Output Clock Q3, nQ3: Values of 0, 1 or 2 cannot be written to this register. Actual divider ratio is 2x the value written here.
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Input Monitor Control Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
LOS_m[16:0]	R/W	1FFFFh	Number of Input Monitoring clock periods before Input Reference m is considered to be missed (soft alarm). Minimum setting is 3.
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 20. Interrupt Enable Control Register Bit Field Locations and Descriptions

Interrupt Enable Control Register Block Field Locations								
Address (Hex)	D7	D6	D5	D4	D3	D2	D1	D0
0079	Rsvd	LOL_EN	Rsvd	HOLD_EN	Rsvd		LOS1_EN	LOS0_EN

Interrupt Enable Control Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
LOL_EN	R/W	0b	Interrupt Enable Control for Loss-of-Lock Interrupt Status Bit: 0 = LOL_INT register bit will not affect status of nINT output signal 1 = LOL_INT register bit will affect status of nINT output signal
HOLD_EN	R/W	0b	Interrupt Enable Control for Holdover Interrupt Status Bit: 0 = HOLD_INT register bit will not affect status of nINT output signal 1 = HOLD_INT register bit will affect status of nINT output signal
LOSm_EN	R/W	0b	Interrupt Enable Control for Loss-of-Signal Interrupt Status Bit for Input Reference m: 0 = LOSm_INT register bit will not affect status of nINT output signal 1 = LOSm_INT register bit will affect status of nINT output signal
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 21. Interrupt Status Register Bit Field Locations and Descriptions

This register contains “sticky” bits for tracking the status of the various alarms. Whenever an alarm occurs, the appropriate Interrupt Status bit will be set. The Interrupt Status bit will remain asserted even after the original alarm goes away. The Interrupt Status bits remain asserted until explicitly cleared by a write of a 1 to the bit over the serial port. This type of functionality is referred to as Read / Write-1-to-Clear (R/W1C).

Interrupt Status Register Block Field Locations								
Address (Hex)	D7	D6	D5	D4	D3	D2	D1	D0
0200	Rsvd	LOL_INT	Rsvd	HOLD_INT	Rsvd		LOS1_INT	LOS0_INT
0201	Rsvd							

Interrupt Status Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
LOL_INT	R/W1C	0b	Interrupt Status Bit for Loss-of-Lock: 0 = No Loss-of-Lock alarm flag on PLL has occurred since the last time this register bit was cleared 1 = At least one Loss-of-Lock alarm flag on PLL has occurred since the last time this register bit was cleared
HOLD_INT	R/W1C	0b	Interrupt Status Bit for Holdover: 0 = No Holdover alarm flag has occurred since the last time this register bit was cleared 1 = At least one Holdover alarm flag has occurred since the last time this register bit was cleared
LOSm_INT	R/W1C	0b	Interrupt Status Bit for Loss-of-Signal on Input Reference m: 0 = No Loss-of-Signal alarm flag on Input Reference m has occurred since the last time this register bit was cleared 1 = At least one Loss-of-Signal alarm flag on Input Reference m has occurred since the last time this register bit was cleared
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 22. Digital PLL Status Register Bit Field Locations and Descriptions

The following register is included for debug purposes only. It shows the actual digital PLL0 state directly. This means that the bits may change rapidly as the DPLL operates. The fields in this register do not represent a “snapshot” in time, so they may be inconsistent with one another if the DPLL is rapidly changing at the time of reading. Fast changes in the status of the PLL cannot be captured by polling these bits, in which case, IDT recommends using the Sticky Bits interrupts and GPIOs.

Digital PLL Status Register Block Field Locations								
Address (Hex)	D7	D6	D5	D4	D3	D2	D1	D0
0202	Rsvd			Rsvd	NO_REF	CURR_REF[2:0]

Global Interrupt Status Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
INT	R/O	-	Device Interrupt Status: 0 = No Interrupt Status bits that are enabled are asserted (nINT pin released) 1 = At least one Interrupt Status bit that is enabled is asserted (nINT pin asserted low)
EEP_ERR	R/O	-	CRC Mismatch on EEPROM Read. Once set this bit is only cleared by reset.
BOOTFAIL	R/O	-	Reading of Serial EEPROM failed. Once set this bit is only cleared by reset.
EEPDONE	R/O	-	Serial EEPROM Read cycle has completed. Once set this bit is only cleared by reset.
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Absolute Maximum Ratings

Note: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the DC Electrical Characteristics or AC Electrical Characteristics is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Table 25. Absolute Maximum Ratings Table

Item	Rating
Supply Voltage, V_{CC}	3.63V
Inputs, V_I OSCI[a] Other Input	 0V to 2V -0.5V to V_{CC} + 0.5V
Outputs, V_O (Q[3:0], nQ[3:0])	-0.5V to V_{CCOX}[b] + 0.5V
Outputs, V_O (GPIO[3:0], SCLK, SDATA, nINT)	-0.5V to V_{CCCS} + 0.5V
Outputs, I_O (Q[3:0], nQ[3:0]) Continuous Current Surge Current	 40mA 65mA
Outputs, I_O (GPIO[3:0], SCLK, SDATA, nINT)) Continuous Current Surge Current	 8mA 13mA
Junction Temperature, T_J	125°C
Storage Temperature, T_{STG}	-65°C to 150°C

[a] This limit only applies when over-driving the OSCI input from an external clock source. When used with a crystal, this limit does not apply.

[b] V_{CCOX} denotes: V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

Supply Voltage Characteristics

Table 26. Power Supply DC Characteristics, V_{CC} = 3.3V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{CC}	Core Supply Voltage		3.135	3.3	3.465	V
V_{CCA}	Analog Supply Voltage		3.135	3.3	V_{CC}	V
V_{CCCS}	Control and Status Supply Voltage[a]		1.71		V_{CC}	V
I_{CC}	Core Supply Current[b]			40	53	mA
I_{CCCS}	Control and Status Supply Current[b]			3	5	mA
I_{CCA}	Analog Supply Current[b]			140	186	mA
I_{EE}	Power Supply Current[c]	Q[0:3] Configured for LVPECL Logic Levels. Outputs Unloaded		345	438	mA

[a] GPIO [3:0], SDATA, SCLK, S_A1, S_A0, nINT, nRST pins are floating.

[b] I_{CC}, I_{CCCS}, and I_{CCA} are included in I_{EE} when Q[0:3] configured for LVPECL logic levels.

[c] Internal dynamic switching current at maximum f_{OUT} is included.

Table 27. Power Supply DC Characteristics, V_{CC} = 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{CC}	Core Supply Voltage		2.375	2.5	2.625	V
V_{CCA}	Analog Supply Voltage		2.375	2.5	V_{CC}	V
V_{CCCS}	Control and Status Supply Voltage[a]		1.71		V_{CC}	V
I_{CC}	Core Supply Current[b]			39	50	mA
I_{CCCS}	Control and Status Supply Current[b]			3	5	mA
I_{CCA}	Analog Supply Current[b]			135	179	mA
I_{EE}	Power Supply Current[c]	Q[0:3] Configured for LVPECL Logic Levels. Outputs Unloaded		328	415	mA

[a] GPIO [3:0], SDATA, SCLK, S_A1, S_A0, nINT, nRST pins are floating.

[b] I_{CC}, $I_{CCCS,}$ and I_{CCA} are included in I_{EE} when Q[0:3] configured for LVPECL logic levels.

[c] Internal dynamic switching current at maximum f_{OUT} is included.

Table 28. Maximum Output Supply Current, V_{CC} = V_{CCCS} = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter	Test Conditions	V_{CCOx}[a] = 3.3V ±5%				V_{CCOx}[a] = 2.5V ±5%				V_{CCOx}[a] = 1.8V ±5%	Units
			LVPECL	LVDS	HCSL	LVCMOS	LVPECL	LVDS	HCSL	LVCMOS	LVCMOS	
I_{CCO0}[b]	Q0, nQ0 Output Supply Current	Outputs Unloaded	50	60	50	N/A	44	52	44	N/A	N/A	mA
I_{CCO1}[b]	Q1, nQ1 Output Supply Current	Outputs Unloaded	52	63	52	N/A	45	54	45	N/A	N/A	mA
I_{CCO2}[b]	Q2, nQ2 Output Supply Current	Outputs Unloaded	52	61	52	N/A	45	54	45	N/A	N/A	mA
I_{CCO3}[b]	Q3, nQ3 Output Supply Current	Outputs Unloaded	58	67	58	63	52	61	52	56	52	mA

[a] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

[b] Internal dynamic switching current at maximum f_{OUT} is included.

DC Electrical Characteristics

Table 29. LVCMOS/LVTTL DC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C[a]

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
V_{IH}	Input High Voltage	GPIO[3:0], SDATA, SCLK, nRST, S_A0, S_A1	V_{CCCS} = 3.3V	2.1		V_{CCCS} +0.3	V
			V_{CCCS} = 2.5V	1.7		V_{CCCS} +0.3	V
			V_{CCCS} = 1.8V	1.4		V_{CCCS} +0.3	V

		nRST, SDATA, SCLK	V_{CCCS} = V_{IN} = 3.465V, 2.625V, 1.89V			5	µA
		GPIO[3:0]	V_{CCCS} = V_{IN} = 3.465V, 2.625V, 1.89V			1	mA
I_{IL}	Input Low Current	S_A0, S_A1	V_{CCCS} = 3.465V, 2.625V, 1.89V, V_{IN} = 0V	-5			µA
		nRST, SDATA, SCLK	V_{CCCS} = 3.465V, 2.625V, 1.89V, V_{IN} = 0V	-150			µA
		GPIO[3:0]	V_{CCCS} = 3.465V, 2.625V, 1.89V, V_{IN} = 0V	-1			mA
V_{OH}	Output High Voltage	GPIO[3:0]	V_{CCCS} = 3.3V ±5%, I_{OH} = -2mA	2.4			V
		SDATA, SCLK, nINT[b]	V_{CCCS} = 1.8V ±5%, I_{OH} = -5µA				
		GPIO[3:0]	V_{CCCS} = 2.5V ±5%, I_{OH} = -1mA	1.7			V
		SDATA, SCLK, nINT[b]	V_{CCCS} = 2.5V ±5%, I_{OH} = -5µA				
		GPIO[3:0]	V_{CCCS} = 1.8V ±5%, I_{OH} = -5µA	V_{CCCS} -0.45V			V
		SDATA, SCLK, nINT[b]					
V_{OL}	Output Low Voltage	SDATA, SCLK, nINT, GPIO[3:0][b]	V_{CCCS} = 3.3V ±5%, I_{OL} = 2mA			0.4	V
			V_{CCCS} = 2.5V±5%, I_{OL} = 1mA			0.4	V
			V_{CCCS} = 1.8V±5%, I_{OL} = 2mA			0.45	V

[a] V_{IL} should not be less than -0.3V.

[b] Use of external pull-up resistors is recommended for the SDATA, SCLK, nINT pins.

Table 30: Differential Input DC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter[a]		Test Conditions	Minimum	Typical	Maximum	Units
I_{IH}	Input High Current	CLKx, nCLKx	V_{CC} = V_{IN} = 3.465V or 2.625V			150	µA
I_{IL}	Input Low Current	CLKx	V_{CC} = 3.465V or 2.625V, V_{IN} = 0V	-5			µA
		nCLKx	V_{CC} = 3.465V or 2.625V, V_{IN} = 0V	-150			µA
V_{PP}	Peak-to-Peak Voltage[b]			0.15		1.3	V
V_{CMR}	Common Mode Input Voltage[b, c]			V_{EE}		V_{CC} -1.2	V

[a] CLKx denotes CLK0, CLK1. nCLKx denotes nCLK0, nCLK1

[b] V_{IL} should not be less than -0.3V. V_{IH} should not be higher than V_{CC}.

[c] Common mode voltage is defined as the cross-point.

Table 31. LVPECL DC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter	Test Conditions	V_{CCOx}[a] = 3.3V±5%			V_{CCOx}[a] = 2.5V±5%			Units
			Minimum	Typical	Maximum	Minimum	Typical	Maximum	
V_{OH}	Output High Voltage[b]		V_{CCOx} - 1.3		V_{CCOx} - 0.8	V_{CCOx} - 1.4		V_{CCOx} - 0.9	V
V_{OL}	Output Low Voltage[b]		V_{CCOx} - 1.95		V_{CCOx} - 1.75	V_{CCOx} - 1.95		V_{CCOx} - 1.75	V

[a] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

[b] Outputs terminated with 50Ω to V_{CCOx} – 2V.

Table 32. LVDS DC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{CCOx}[a] = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C[b]

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{OD}	Differential Output Voltage[c],[d]		250		450	mV
ΔV_{OD}	V_{OD} Magnitude Change				50	mV
V_{OS}	Offset Voltage		1.1		1.375	V
ΔV_{OS}	V_{OS} Magnitude Change				50	mV

[a] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, and V_{CCO3}.

[b] Terminated with 100Ω across Qx and nQx.

[c] V_{OD} (Differential Output Voltage) refers to a single-ended value (swing of negative or positive signal only), not a differential value. Differential values can be obtained by doubling the single-ended measurement shown in this table.

[d] V_{OD} specification also applies to output frequencies ≤ 125MHz.

Table 33. LVCMOS DC Characteristics (Q3 Only), V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{EE} = 0V, T_A = -40°C to 85°C

Symbol	Parameter	Test Conditions	V_{CCO3} = 3.3V±5%			V_{CCO3} = 2.5V±5%			V_{CCO3} = 1.8V ±5%			Units
			Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	
V_{OH}	Output High Voltage	I_{OH} = -8mA	2.8			2.0			1.2			V
V_{OL}	Output Low Voltage	I_{OL} = 8mA			0.3			0.4			0.5	V

Table 34. Input Frequency Characteristics, V_{CC} = 3.3V±5% or 2.5V±5%, T_A = -40°C to 85°C

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
f_{IN}	Input Frequency[a]	OSCI, OSCO	Using a crystal (See Table 35 for Crystal Characteristics)	10		54	MHz
			Over-driving Crystal Input Doubler Logic Enabled[b]	10		54	MHz
			Over-driving Crystal Input Doubler Logic Disabled[b]	10		108	MHz
		CLKx, nCLKx[c]		0.008		875	MHz
f_{PD}	Phase Detector Frequency[d]			0.008		8	MHz
f_{SCLK}	Serial Port Clock SCLK (slave mode)	I^2C Operation		100		400	kHz

[a] For the input reference frequency, the divider values must be set for the VCO to operate within its supported range.

[b] For optimal noise performance, the use of a quartz crystal is recommended (for more information, see Overdriving the XTAL Interface).

[c] CLKx denotes CLK0, CLK1; nCLKx denotes nCLK0, nCLK1.

[d] Pre-dividers must be used to divide the CLKx frequency down to an f_{PD} valid frequency range.

Table 35. Crystal Characteristics

Parameter	Test Conditions	Minimum	Typical	Maximum	Units
Mode of Oscillation			Fundamental		
Frequency		10		54	MHz
Equivalent Series Resistance (ESR)			15	30	Ω
Load Capacitance (C_L)	Crystal frequency ≤ 40MHz		12		pF
	Crystal frequency > 40MHz			12	pF
Frequency Stability (total)		-100		100	ppm

AC Electrical Characteristics

Table 36. AC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{CCOx} = 3.3V ±5%, 2.5V ±5% or 1.8V ±5% (1.8V Only Supported for LVCMOS Outputs), T_A = -40°C to 85°C [a], [b]

[a] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

[b] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[c] Appropriate SE_MODE bit must be configured to select phase-aligned or phase-inverted operation.

[d] All Q and nQ outputs in phase-inverted operation.

[e] This parameter is guaranteed by characterization. Not tested in production.

[f] This parameter is defined in accordance with JEDEC Standard 65.

[g] Measured at the output differential cross point.

[h] Defined as skew within a bank of outputs at the same supply voltage and with equal load conditions.

[i] Characterized in PLL Mode. Duty cycle of bypassed signals (input reference clocks or crystal input) is not adjusted by the device.

[j] This parameter was measured using CLK0 as the reference input and CLK1 as the external feedback input. Characterized with 8T49N240-906NLGI.

[k] Tested in fast-lock operation after >20 minutes of locked operation to ensure holdover averaging logic is stable.

[l] This parameter is guaranteed by design.

[m] Using internal feedback mode configuration.

[n] Device programmed with SWMODE = 0 (absorbs phase differences).

[o] Characterized with 8T49N240-900.

[p] Characterized with 8T49N240-901.

[q] Characterized with 8T49N240-902.

[r] Tested with all outputs operating at 156.25MHz.

[s] Assuming a clear I^2C bus.

Table 37. HCSL AC Characteristics, V_{CC} = 3.3V ±5% or 2.5V ±5%, V_{CCOx} = 3.3V ±5% or 2.5V ±5%, T_A = -40°C to 85°C[a], [b]

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{RB}	Ring-back Voltage Margin[c], [d]		-100		100	mV
t_{STABLE}	Time before V_{RB} is allowed[c, d]		500			ps
V_{MAX}	Absolute Max. Output Voltage[e], [f]				1150	mV
V_{MIN}	Absolute Min. Output Voltage[e, g]		-300			mV
V_{CROSS}	Absolute Crossing Voltage[h], [i]		200		500	mV
ΔV_{CROSS}	Total Variation of VCROSS Over all Edges[h, j]				140	mV

[a] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[b] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

[c] Measurement taken from differential waveform.

[d] T_{STABLE} is the time the differential clock must maintain a minimum ±150mV differential voltage after rising/falling edges before it is allowed to drop back into the V_{RB} ±100mV differential range.

[e] Measurement taken from single ended waveform.

[f] Defined as the maximum instantaneous voltage including overshoot.

[g] Defined as the minimum instantaneous voltage including undershoot.

[h] Measured at crossing point where the instantaneous voltage value of the rising edge of Qx equals the falling edge of nQx.

[i] Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.

[j] Defined as the total variation of all crossing voltages of rising Qx and falling nQx, This is the maximum allowed variance in V_{CROSS} for any particular system.

Table 38. RMS Phase Jitter, V_{CC} = 3.3V ±5%, V_{CCOx} = 3.3V ±5%, 2.5V ±5% or 1.8V ±5% (1.8V Only Supported for LVCMOS Outputs), T_A = -40°C to 85°C[a] [b]

t_{REFCLK_RMS} (PCIe Gen 3)	Phase Jitter RMS[d, f]	f = 100MHz, 25MHz Crystal Input Evaluation Band: 0Hz - Nyquist (clock frequency/2)		0.13	0.3	0.8	ps

[a] V_{CCOx} denotes V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}.

[b] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

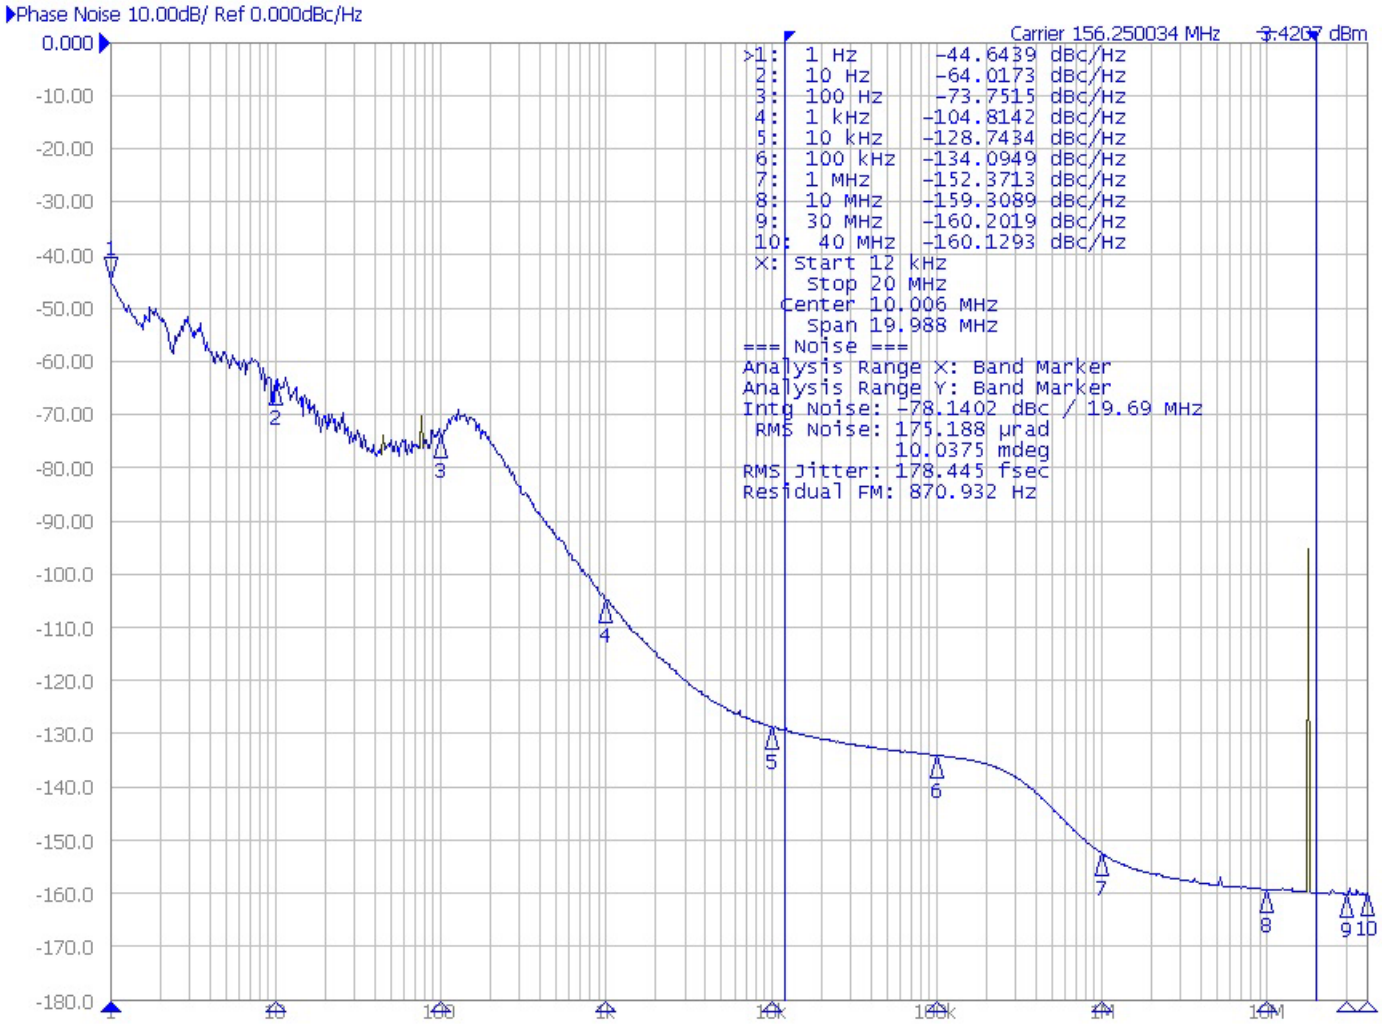
[c] Peak-to-Peak jitter after applying system transfer function for the Common Clock Architecture. Maximum limit for PCI Express Gen 1

[d] This parameter is guaranteed by characterization. Not tested in production.

[e] RMS jitter after applying the two evaluation bands to the two transfer functions defined in the Common Clock Architecture and reporting the worst case results for each evaluation band. Maximum limit for PCI Express Generation 2 is 3.1ps RMS for $t_{REFCLK\_HF\_RMS}$ (High Band) and 3.0ps RMS for $t_{REFCLK\_LF\_RMS}$ (Low Band).

[f] RMS jitter after applying system transfer function for the common clock architecture. This specification is based on the PCI Express Base Specification Revision 0.7, October 2009 and is subject to change pending the final release version of the specification.

Typical Phase Noise at 156.25MHz



Applications Information

Recommendations for Unused Input and Output Pins

Inputs

CLKx/nCLKx Input

For applications not requiring the use of one or more reference clock inputs, both CLKx and nCLKx can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from CLKx to ground. It is recommended that CLKx, nCLKx not be driven with active signals when not selected.

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Outputs

LVPECL Outputs

Any unused LVPECL output pair can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

LVDS Outputs

Any unused LVDS output pair can be either left floating or terminated with 100Ω across. If they are left floating there should be no trace attached.

LVCMOS Outputs

Any LVCMOS output can be left floating if unused. There should be no trace attached.

HCSL Outputs

All unused differential outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

Overdriving the XTAL Interface

The OSCI input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The OSCO pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/ns. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise.

Figure 5 shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and changing R2 to 50Ω. The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver.

Figure 5. General Diagram for LVCMOS Driver to XTAL Input Interface

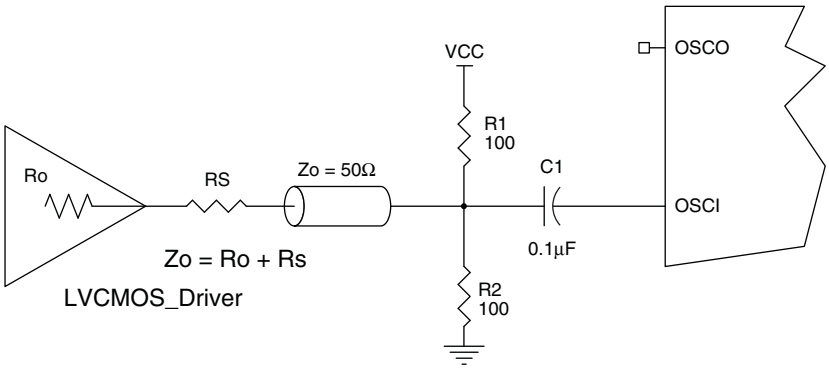


Figure 6 shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the XTAL_IN input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

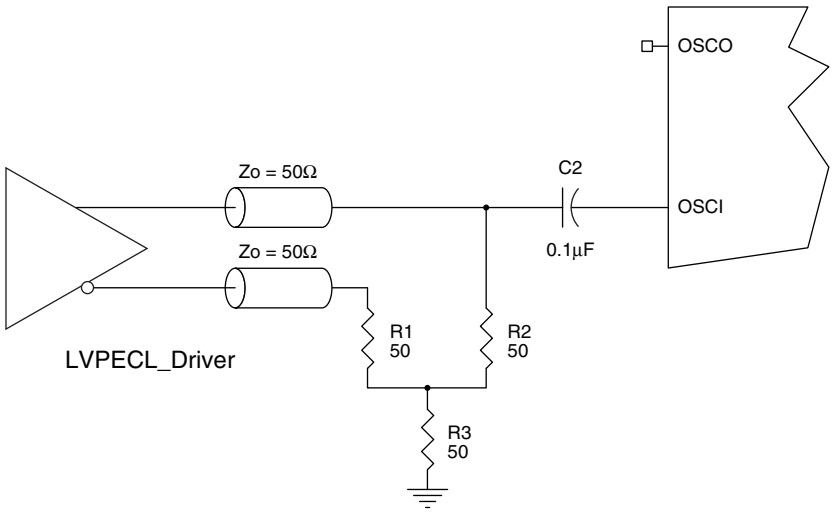
Figure 6. General Diagram for LVPECL Driver to XTAL Input Interface

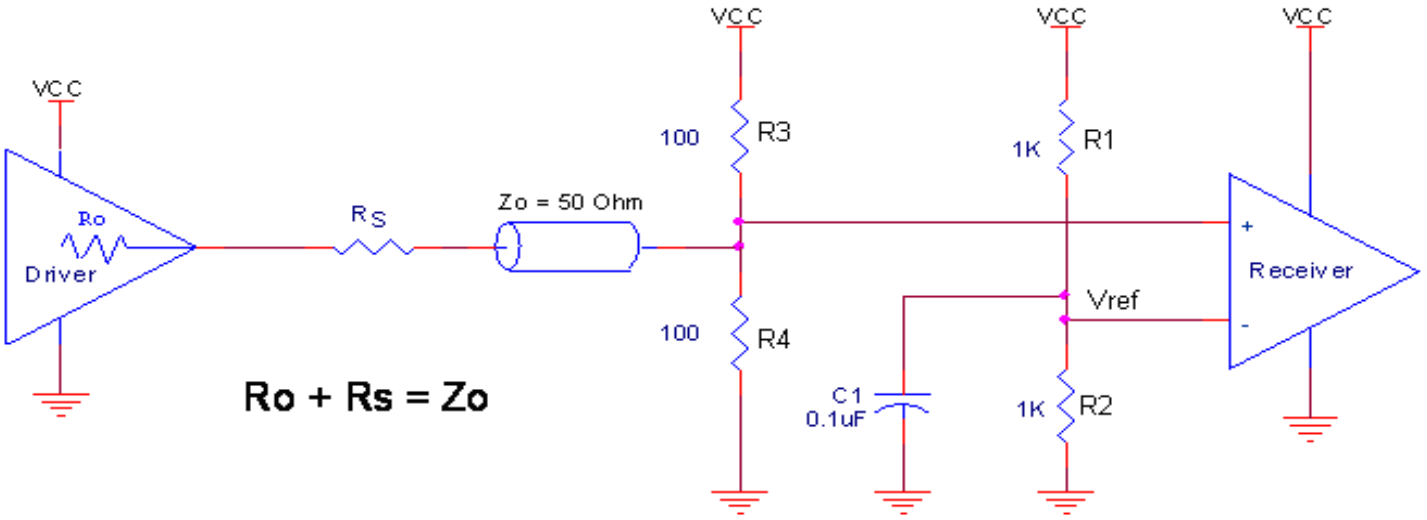


Wiring the Differential Input to Accept Single-Ended Levels

Figure 7 shows how a differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{CC}/2$ is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is 2.5V and V_{CC} = 3.3V, R1 and R2 value should be adjusted to set V_{REF} at 1.25V. The values below are for when both the single ended swing and V_{CC} are at the same voltage. This configuration requires that the sum of the output impedance of the driver (Ro) and the series resistance (Rs) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways.

First, R3 and R4 in parallel should equal the transmission line impedance. For most 50Ω applications, R3 and R4 can be 100Ω. The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V_{IL} cannot be less than -0.3V and V_{IH} cannot be more than V_{CC} + 0.3V. Suggest edge rate faster than 1V/ns. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

Figure 7. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels



3.3V Differential Clock Input Interface

CLKx/nCLKx accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figure 8 to Figure 12 show interface examples for the CLKx/nCLKx input driven by the most common driver types. The input interfaces suggested here are examples only.

Please consult with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 8, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

Figure 8. CLKx/nCLKx Input Driven by an IDT Open Emitter LVHSTL Driver

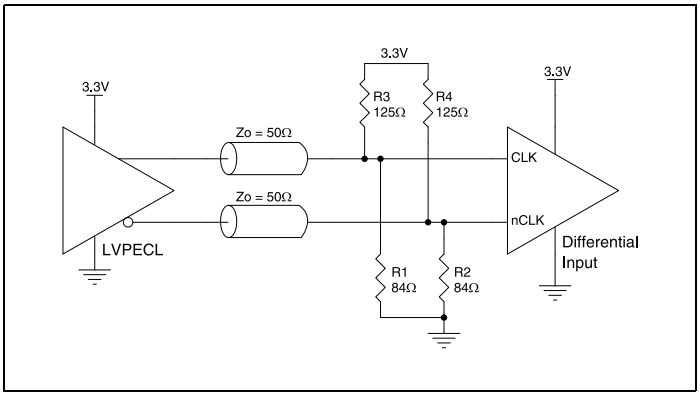

Figure 11. CLKx/nCLKx Input Driven by a 3.3V LVDS Driver

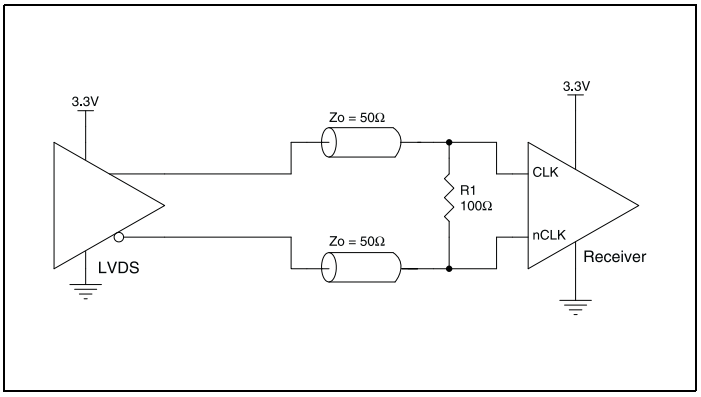

Figure 12. CLKx/nCLKx Input Driven by a 3.3V HCSL Driver

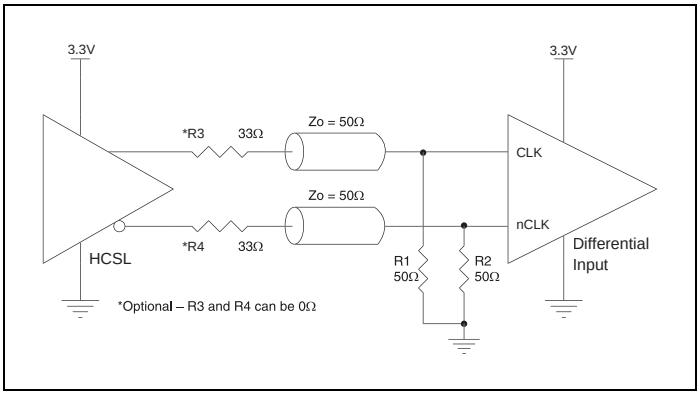

2.5V Differential Clock Input Interface

CLKx/nCLKx accepts LVDS, LVPECL, LVHSTL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. Figure 13 to Figure 17 show interface examples for the CLKx/nCLKx input driven by the most common driver types.

The input interfaces suggested here are examples only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example, in Figure 13, the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

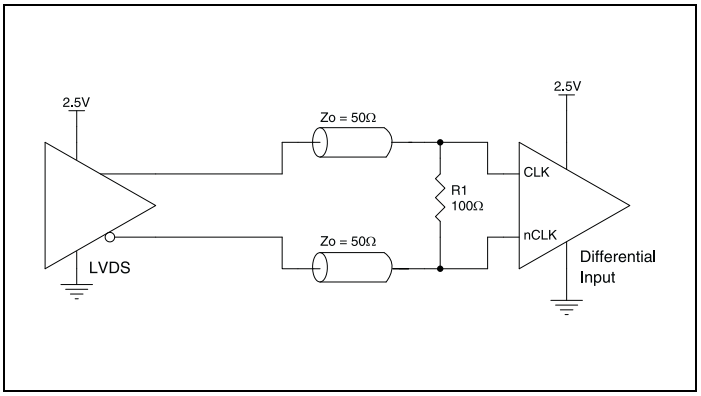

Figure 17. CLKx/nCLKx Input Driven by a 2.5V HCSL Driver

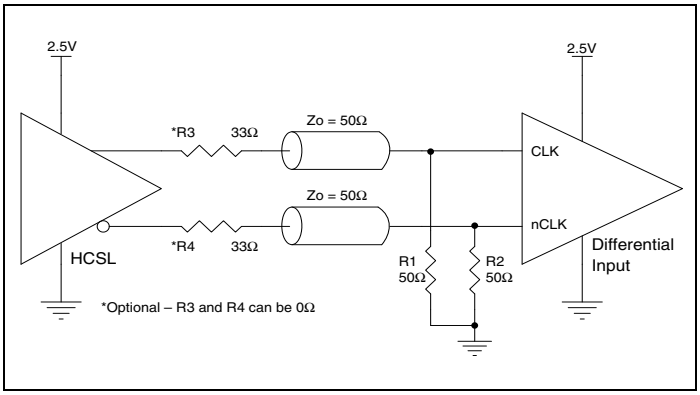

LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance (Z_T) is between 90Ω and 132Ω. The actual value should be selected to match the differential impedance (Z_0) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source.

The standard termination schematic as shown in Figure 18 can be used with either type of output structure. Figure 19, which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF. If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

Figure 18. Standard LVDS Termination

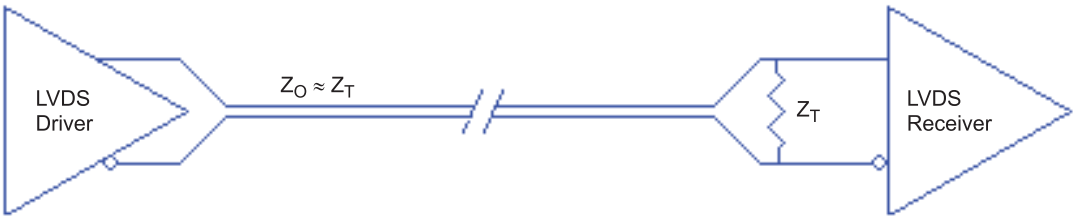

Figure 19. Optional LVDS Termination

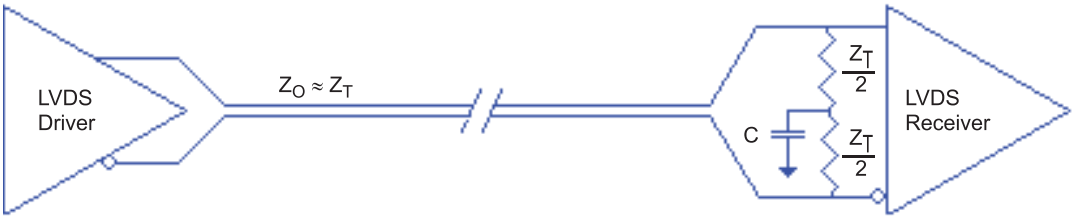

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. Figure 20 and Figure 21 show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 20. 3.3V LVPECL Output Termination

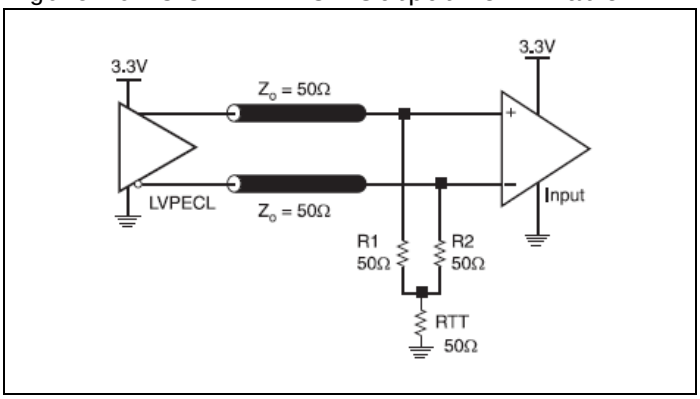

Figure 21. 3.3V LVPECL Output Termination

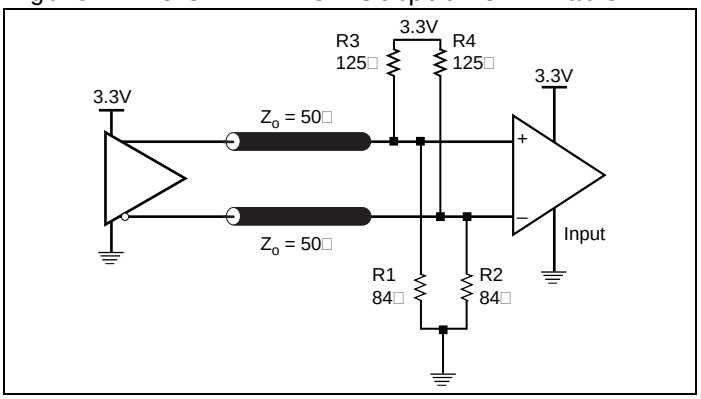

Termination for 2.5V LVPECL Outputs

Figure 22 to Figure 24 show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to V_{CCO} – 2V. For V_{CCO} = 2.5V, the V_{CCO} – 2V is very close to ground level. The R3 in Figure 24 can be eliminated and the termination is shown in Figure 23.

Figure 22. 2.5V LVPECL Driver Termination Example

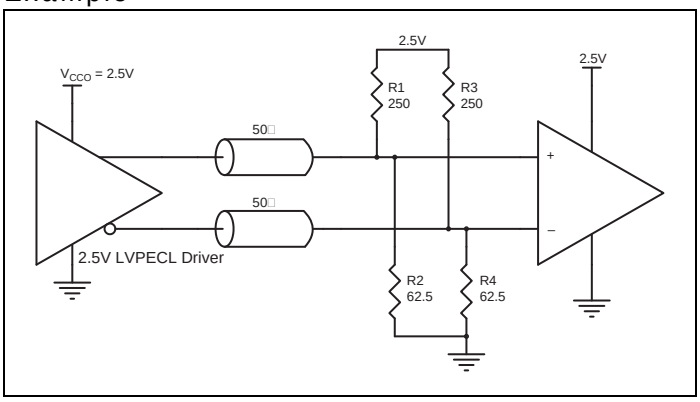

Figure 23. 2.5V LVPECL Driver Termination Example

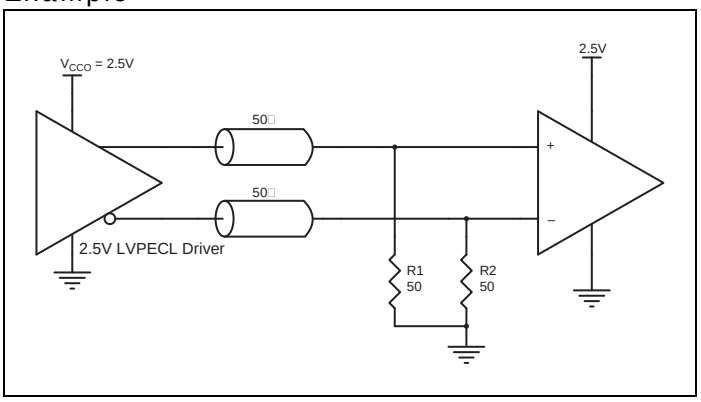

Figure 24. 2.5V LVPECL Driver Termination Example

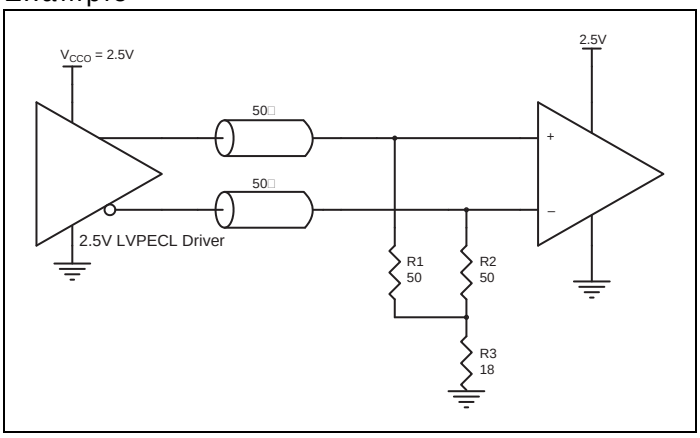

HCSL Recommended Termination

Figure 25 is the recommended source termination for applications where the driver and receiver will be on a separate PCBs. This termination is the standard for PCI Express™ and HCSL output types. All traces should be 50Ω impedance single-ended or 100Ω differential.

Figure 25. Recommended Source Termination (Where the driver and receiver will be on separate PCBs)

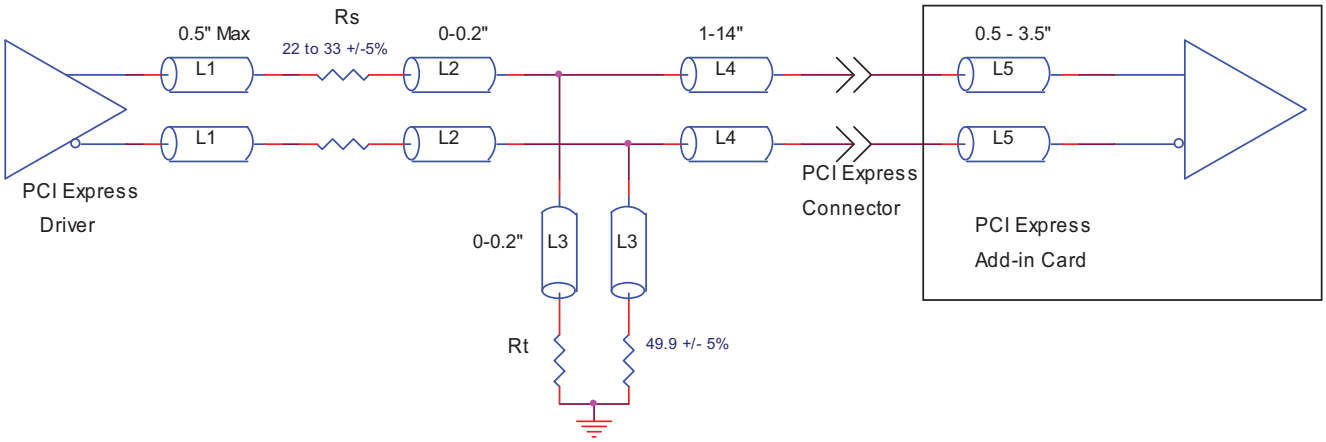

Figure 26 is the recommended termination for applications where a point-to-point connection can be used. A point-to-point connection contains both the driver and the receiver on the same PCB. With a matched termination at the receiver, transmission-line reflections will be minimized. In addition, a series resistor (Rs) at the driver offers flexibility and can help dampen unwanted reflections. The optional resistor can range from 0Ω to 33Ω. All traces should be 50Ω impedance single-ended or 100Ω differential.

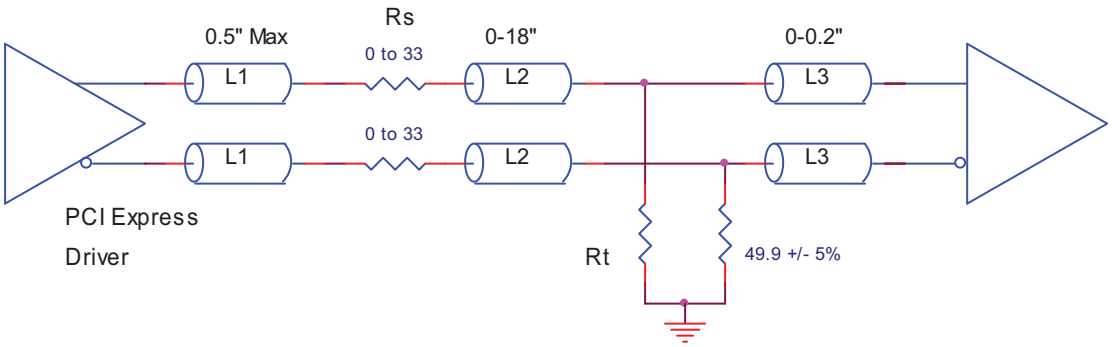
Figure 26. Recommended Termination (Where a point-to-point connection can be used)



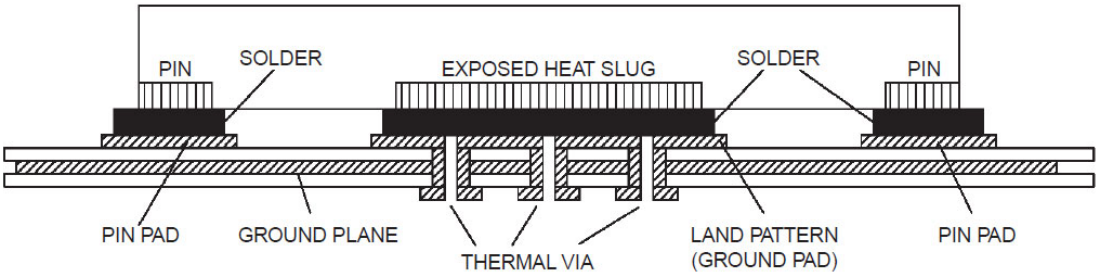
VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in Figure 27. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed.

Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/ Electrically Enhance Lead frame Base Package, Amkor Technology.

Figure 27. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (Drawing not to scale)



Schematic and Layout Information

Please contact IDT for schematic and layout information relevant to this product. Contact information can be found on the last page of this datasheet.

Crystal Recommendation

This device will be validated using FOX 277LF series through-hole crystals including Part # 277LF-40-18 (40MHz). If a surface mount crystal is desired, the FOX FX325BS series of crystals at an appropriate frequency, such as Part # 603-30-38 (40MHz), is recommended for use with this product.

PCI Express Application Note

PCI Express jitter analysis methodology models the system response to reference clock jitter. The block diagram below shows the most frequently used *Common Clock Architecture* in which a copy of the reference clock is provided to both ends of the PCI Express Link.

In the jitter analysis, the transmit (Tx) and receive (Rx) SerDes PLLs are modeled as well as the phase interpolator in the receiver. These transfer functions are called H1, H2, and H3 respectively. The overall system transfer function at the receiver is:

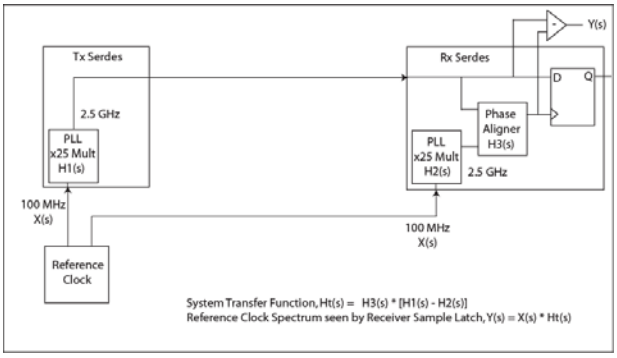
$$Ht(s) = H3(s) \times [H1(s) - H2(s)]$$

The jitter spectrum seen by the receiver is the result of applying this system transfer function to the clock spectrum X(s) and is:

$$Y(s) = X(s) \times H3(s) \times [H1(s) - H2(s)]$$

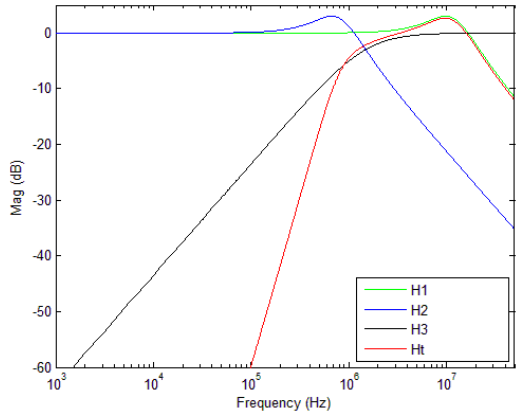
In order to generate time domain jitter numbers, an inverse Fourier Transform is performed on X(s)*H3(s) * [H1(s) - H2(s)].

Figure 28. PCI Express Common Clock Architecture



For PCI Express Gen 1, one transfer function is defined and the evaluation is performed over the entire spectrum: DC to Nyquist (e.g., for a 100MHz reference clock: 0Hz–50MHz) and the jitter result is reported in peak-peak.

Figure 29. PCIe Gen 1 Magnitude of Transfer Function



For PCI Express Gen 2, two transfer functions are defined with 2 evaluation ranges and the final jitter number is reported in RMS. The two evaluation ranges for PCI Express Gen 2 are 10kHz – 1.5MHz (Low Band) and 1.5MHz – Nyquist (High Band). The plots show the individual transfer functions as well as the overall transfer function Ht.

Figure 30. PCIe Gen 2A Magnitude of Transfer Function

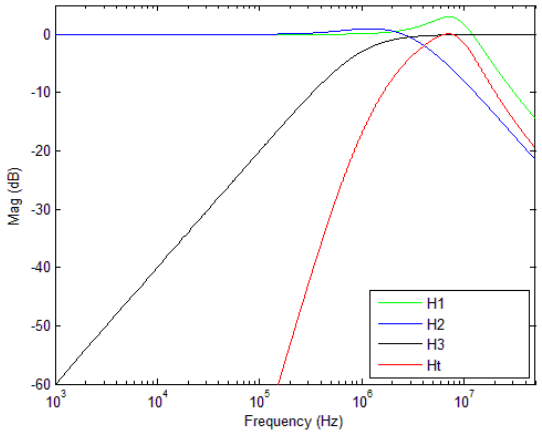


Figure 31. PCIe Gen 2B Magnitude of Transfer Function

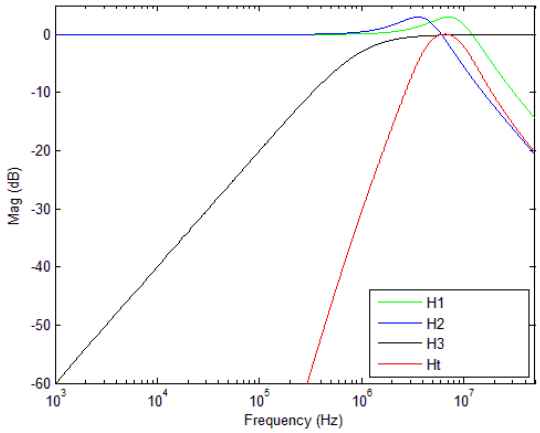
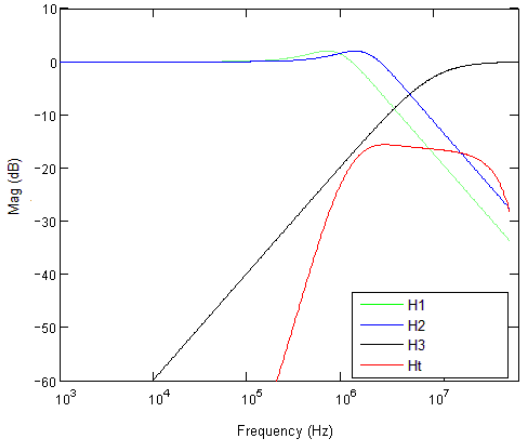


For PCI Express Gen 3, one transfer function is defined and the evaluation is performed over the entire spectrum. The transfer function parameters are different from Gen 1 and the jitter result is reported in RMS.

Figure 32. PCIe Gen 3 Magnitude of Transfer Function



For a more thorough overview of PCI Express jitter analysis methodology, please refer to IDT Application Note, *PCI Express Reference Clock Requirements.*

Power Dissipation and Thermal Considerations

The 8T49N240 is a multi-functional, high-speed device that targets a wide variety of clock frequencies and applications. Since this device is highly programmable with a broad range of features and functionality, the power consumption will vary as these features and functions are enabled.

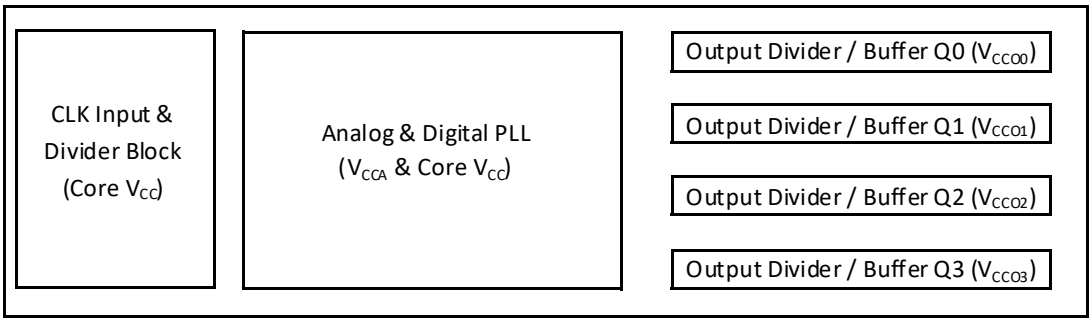
The 8T49N240 is designed and characterized to operate within the ambient industrial temperature range of -40°C to 85°C. The ambient temperature represents the temperature around the device, not the junction temperature. When using the device in extreme cases, such as maximum operating frequency and high ambient temperature, external air flow may be required in order to ensure a safe and reliable junction temperature. Extreme care must be taken to avoid exceeding a 125°C junction temperature.

The power calculation examples in this section are generated using maximum ambient temperature and supply voltage. For many applications, the power consumption will be much lower. For any concerns on calculating the power dissipation for your own specific configuration, please contact IDT technical support.

Power Domains

The 8T49N240 has a number of separate power domains that can be independently enabled and disabled via register accesses (all power supply pins must still be connected to a valid supply voltage). Figure 33 indicates the individual domains and the associated power pins.

Figure 33. 8T49N240 Power Domains



Power Consumption Calculation

The process of determining total power consumption involves the following steps:

1. Determine the power consumption using maximum current values for core and analog voltage supplies from Table 26 and Table 27.
2. Determine the nominal power consumption of each enabled output path, which consists of:
   a. A base amount of power that is independent of operating frequency, as shown in Table 42 to Table 50 (depending on the chosen output protocol).
   b. A variable amount of power that is related to the output frequency. This can be determined by multiplying the output frequency by the FQ_Factor shown in Table 42 to Table 50.
3. All of the above totals are summed.

Thermal Considerations

Once the total power consumption is determined, it is necessary to calculate the maximum operating junction temperature for the device under the environmental conditions it will operate in. Thermal conduction paths, air flow rate, and ambient air temperature are factors that can affect this calculation. The thermal conduction path refers to whether heat is to be conducted away via a heatsink, via airflow, or via conduction into the PCB through the device pads (including the ePAD). Thermal conduction data is provided for typical scenarios in Table 41. For assistance with calculating results under other scenarios, please contact IDT technical support.

Q3	40.54

Table 50. 1.8V LVCMOS Output Calculation

Output	Base_Current (mA)
Q3	38.83

Applying the values to the following equation will yield output current by frequency:

Qx Current (mA) = FQ_Factor * Frequency (MHz) + Base_Current

where:

Qx Current is the specific output current according to output type and frequency

FQ_Factor is used for calculating current increase due to output frequency

Base_Current is the base current for each output path independent of output frequency

The second step is to multiply the power dissipated by the thermal impedance to determine the maximum power gradient, using the following equation:

$$T_J = T_A + (\theta_{JA} * Pd_{total})$$

where:

T_J is the junction temperature (°C)

T_A is the ambient temperature (°C)

θ_{JA} is the thermal resistance value from Table 41, dependent on ambient airflow (°C/W)

Pd_{total} is the total power dissipation of the 8T49N240 under usage conditions, including power dissipated due to loading (W).

Note that the power dissipation per output pair due to loading is assumed to be 27.95mW for LVPECL outputs and 44.5mW for HCSL outputs. When selecting LVCMOS outputs, power dissipation through the load will vary based on a variety of factors including termination type and trace length. For these examples, power dissipation through loading will be calculated using C_{PD} (found in Table 26) and output frequency:

$$Pd_{OUT} = C_{PD} * F_{OUT} * V_{CCO}^2$$

where:

Pd_{OUT} is the power dissipation of the output (W)

C_{PD} is the power dissipation capacitance (F)

F_{OUT} is the output frequency of the selected output (Hz)

V_{CCO} is the voltage supplied to the appropriate output (V)

Example Calculations

Table 51. Example 1: Common Customer Configuration (3.3V Core Voltage)

Output	Output Type	Frequency (MHz)	V_{CCO}
Q0	LVPECL	125	3.3
Q1	Disabled	Disabled	3.3
Q2	LVPECL	50	3.3
Q3	LVPECL	100	3.3

- Core Supply Current + Control and Status Supply Current = I_{CC} + I_{CCCS} = 58mA (max)
- Analog Supply Current, I_{CCA} = 186mA (max)
- Output Supply Current:
  Q0 Current = 125 * 0.00642 + 41.9 = 42.7mA
  Q1 Current = 0mA (Output disabled)
  Q2 Current = 50 * 0.00642 + 41.9 = 42.2mA
  Q3 Current = 100 * 0.00628 + 47.6 = 48.2mA

- Total Output Supply Current = 133.1mA (max)
- Total Device Current = 58mA + 186mA + 133.1mA = 377.1mA
- Total Device Power = 3.465V * 377.1mA = 1306.7mW
- Power dissipated through output loading:
  LVPECL = 27.95mW * 3 = 83.85mW
  LVDS = already accounted for in device power
  HCSL = n/a
  LVCMOS = n/a
- Total Power = 1306.7mW + 83.85mW = 1390.6mW or 1.4W

With an ambient temperature of 85°C and no airflow, the junction temperature is:

T_J = 85°C + 26.3°C/W * 1.4W = 122°C

This is below the limit of 125°C.

Table 52. Example 2: Common Customer Configuration (2.5V Core Voltage)

Output	Output Type	Frequency (MHz)	V_{CCO}
Q0	LVPECL	156.25	2.5
Q1	LVDS	125	2.5
Q2	HCSL	125	2.5
Q3	LVCMOS	25	2.5

- Core Supply Current + Control and Status Supply Current = I_{CC} + I_{CCCS} = 55mA (max)
- Analog Supply Current, I_{CCA} = 179mA (max)
- Output Supply Current:
  Q0 Current = 156.25 * 0.00290 + 38.6 = 39.0mA
  Q1 Current = 125 * 0.00293 + 47.5 = 47.9mA
  Q2 Current = 125 * 0.00257 + 38.7 = 39mA
  Q3 Current = 40.5mA

- Total Output Supply Current = 166.4mA (max)
- Total Device Current = 55mA + 179mA + 166.4mA = 400.4mA
- Total Device Power = 2.625V * 400.4mA = 1051mW
- Power dissipated through output loading:
  LVPECL = 27.95mW * 1 = 27.95mW
  LVDS = already accounted for in device power
  HCSL = 45.5mW * 1 = 44.5mW
  LVCMOS = 15pF * 25MHz * $(2.625V)^2$ * 1 output pair = 2.58mW
- Total Power = 1051mW + 27.95mW + 44.5mW + 2.58mW = 1126mW or 1.13W

With an ambient temperature of 85°C and no airflow, the junction temperature is:

T_J = 85°C + 26.3°C/W * 1.13W = 114.7°C

This is below the limit of 125°C.

Table 53. Example 3: Common Customer Configuration (2.5V Core Voltage)

Output	Output Type	Frequency (MHz)	V_{CCO}
Q0	LVPECL	156.25	3.3
Q1	LVDS	156.25	2.5
Q2	HCSL	50	3.3
Q3	LVCMOS	33.333	1.8

- Core Supply Current + Control and Status Supply Current = I_{CC} + I_{CCCS} = 55mA (max)
- Analog Supply Current, I_{CCA} = 179mA (max)
- Output Supply Current:

  Q0 Current = 156.25 * 0.00642 + 41.9 = 42.9mA

  Q1 Current = 156.25 * 0.00293 + 47.5 = 48.0mA

  Q2 Current = 50 * 0.00567 + 42.0 = 42.3mA

  Q3 Current = 38.8mA

- Total Output Supply Current = 85.2mA (V_{CCO} = 3.3V), 48mA (V_{CCO} = 2.5V), 38.8mA (V_{CCO} = 1.8V)

  Total Device Current:
  3.3V: 85.2mA
  2.5V: 55mA + 179mA + 48mA = 282mA
  1.8V: 38.8mA
- Total Device Power = 3.465V * 85.2mA + 2.625V * 282mA + 1.89V * 38.8mA = 1108.8mW
- Power dissipated through output loading:

  LVPECL = 27.95mW * 1 = 27.95mW

  LVDS = already accounted for in device power

  HCSL = 45.5mW * 1 = 45.5mW

  LVCMOS = 15pF * 33.333MHz * $(1.89V)^2$ * 1 output pair = 1.79mW
- Total Power = 1108.8mW + 27.95mW + 44.5mW + 1.79mW = 1183mW or 1.2W

With an ambient temperature of 85°C and no airflow, the junction temperature is:

T_J = 85°C + 26.3°C/W * 1.2W = 116.6°C

This is below the limit of 125°C.

Revision History

Revision Date	Description of Change
January 15, 2018	Corrected I^2C read sequence diagrams in Figure 3 and Figure 4 to match I^2C specification and device actual performance. Note: Only the drawings were incorrect – the part's behavior did not change and continues to meet the I^2C specification.
July 30, 2018	▪ Per PCN# N1807-01, effective date August 19, 2018 ▪ Updated the package outline drawings; however, no technical changes
December 8, 2017	▪ Updated the titles of Table 38 and Table 39 ▪ Completed other minor document changes
November 7, 2017	▪ Updated I2C Mode Operation to indicate support for v2.1 of the *I^2C Specification* ▪ Added a note before Table 22 (Digital PLL Status Register Bit Field Locations) ▪ Added the following fields to the Digital PLL Status Register: NO_REF, CURR_REF, PLLLCK, and SM_STS ▪ Added a marking diagram
August 3, 2017	Completed minor changes.
August 2, 2017	Added the C_{XTAL} symbol to Table 2.
May 31, 2017	Initial release.
