

IPS2200

Inductive Position Sensor IC

Description

The IPS2200 is a magnet-free, inductive position sensor ICs that can be used for high-speed absolute position sensing in automotive, industrial, medical, and consumer applications. The IPS2200 uses the physical principle of eddy currents to detect the position of a simple metallic target that is moving above a set of coils, consisting of one transmitter coil and two receiver coils.

The three coils are typically printed as copper traces on a printed circuit board (PCB). They are arranged such that the transmitter coil induces a secondary voltage in the two receiver coils, which depends on the position of the metallic target above the coils.

A signal representative of the target's position over the coils is obtained by demodulating and processing the secondary voltages from the receiver coils. The target can be any kind of metal, such as aluminum, steel, or a PCB with a printed copper layer.

The IPS2200 provides two independent interfaces:

- A high-speed analog or digital interface providing position information in the form of demodulated analog sine/cosine raw data or digital incremental outputs
- An I2C or SPI digital interface for diagnostics and programming

The IPS2200 operates at rotation speeds up to 250000 RPM (with coil designs using 1 period per turn). An ultra-low propagation delay down to 10 μ s or less provides high dynamic control for fast-moving objects.

The IPS2200 is available in a TSSOP package and is qualified for industrial use at -40°C to +125°C ambient temperature.

Typical Applications

- Rotor position detection for brushless DC motors; adaptable to any pole pair count
- Replacement of brushless resolvers
- Magnet-free rotor speed sensors

Features

- Position sensing based on an inductive principle
- Cost effective; no magnet required
- Immune to magnetic stray fields; no shielding required
- Suitable for harsh environments and extreme temperatures
- Differential and single-ended sine and cosine outputs
- Digital incremental outputs: 4 counts per period
- Nonvolatile user-configurable memory, programmable via I2C or SPI interface
- Single IC supports on-axis and off-axis rotation, linear motion, and arc motion sensing
- Adaptable to any full-scale angle range
- High accuracy: $\leq 0.2\%$ full scale
- Rotation sensing up to 360° angle range
- $\pm 18V$ over-voltage and reverse-polarity protection on output pins
- Fast diagnostic alarm through interrupt pin
- Wide operation temperature: -40°C up to +125°C
- Supply voltage programmable for 3.0V to 3.6V or 4.5V to 5.5V
- Small 16-TSSOP package (4.4 \times 5.0 mm body)

Available Support

IDT provides application modules that demonstrate IPS2200 position sensing, including rotary, arc, and linear applications.

1. Pin Assignments

The IPS2200 is available in a 16-TSSOP 4.4 × 5.0 mm RoHS package. It is qualified for an ambient temperature of -40°C to +125°C.

Figure 1. Pin Assignments for 4.4mm × 5.0mm 16-TSSOP Package – Top View

2. Pin Descriptions

Table 1. Pin Descriptions

Pin Number	Name	Type	Description
1	CSN_IRQN	Digital Input/Output	Chip select input for the SPI interface; push/pull interrupt output for I2C or SPI interface (programmable options, see Table 3).
2	RX1		
3	RX2	Analog Input	Connect the receiver coil 1 (sine) between the RX2 and RX1 pins.
4	RX3		
5	RX4	Analog Input	Connect the receiver coil 2 (cosine) between the RX4 and RX3 pins.
6	TX1		
7	TX2	Analog Input/Output	Connect the transmitter coil between the TX1 and TX2 pins. The resonant frequency is adjusted with a parallel capacitor C_T between TX1 and TX2 or with capacitors C_{T1} from TX2 to GND and C_{T2} from TX1 to GND.
8	VDDA	Supply	Internal analog voltage supply. Connect a capacitor C_{VA} to the GND pin.
9	GND	Supply	Common ground connection.
10	VDD	Supply	External supply voltage. Connect two parallel capacitors C_{VD} to the GND pin.
11	OUT1	Analog Output, Digital Output	Buffered analog or digital output; see Table 2.
12	OUT2	Analog Output, Digital Output	Buffered analog or digital output; see Table 2.
13	OUT3	Analog Output, Digital Output	Buffered analog or digital output; see Table 2.
14	OUT4	Analog Output, Digital Output	Buffered analog or digital output; see Table 2.
15	SCK_SCL	Digital Input	Clock input for digital programming and diagnostic interfaces: SCK clock input for SPI interface or SCL clock input for I2C interface.
16	SIO_SDA	Digital Input/Output	Bi-directional data I/O line for digital programming and diagnostic interfaces: SIO data line for SPI interface or SDA data line for I2C interface; open drain output.

Table 2. Buffered Output Configuration

Pin (See Figure 1)		Output Depending on Mode ^[a]			Diagnostic State
Pin Number	Pin Name	Analog Differential	Analog Single-Ended	Digital AB Incremental	All Modes, if enabled
14	OUT4	SIN	SIN	A	LOW
13	OUT3	SINN	REF_SIN	A_N	LOW
12	OUT2	COS	COS	B	HIGH
11	OUT1	COSN	REF_COS	B_N	HIGH

[a] Abbreviations used in Table 2:

- SIN: Demodulated and buffered output of RX1 (sine, non-inverted)
- SINN: Demodulated and buffered output of RX2 (sine, inverted)
- COS: Demodulated and buffered output of RX3 (cosine, non-inverted)
- COSN: Demodulated and buffered output of RX4 (cosine, inverted)
- REF_SIN: Bias voltage of sine signal, typical VDD/2
- REF_COS: Bias voltage of cosine signal, typical VDD/2
- A: Sign output of RX1 (A, non-inverted): HIGH if positive, LOW if negative
- A_N: Sign output of RX2 (A, inverted): HIGH if positive, LOW if negative
- B: Sign output of RX3 (B, non-inverted): HIGH if positive, LOW if negative
- B_N: Sign output of RX4 (B, inverted): HIGH if positive, LOW if negative

Diagnostic state: Alarm status indication if an enabled alarm occurs

Table 3. Digital Interface and Interrupt Output Configuration

Pin (See Figure 1)		Input/Output Depending on Interface Mode ^[a]			
TSSOP Pin Number	Pin Name	Half Duplex SPI	Half Duplex SPI with Interrupt	I2C with Address Select	I2C with Interrupt
16	SIO_SDA	SIO	SIO	SDA	SDA
15	SCK_SCL	SCK	SCK	SCL	SCL
1	CSN_IRQN	CSN	CSN/IRQN	SEL	IRQN

[a] Abbreviations used in Table 3:

- CSN: Chip-Select Input
- CSN/IRQN: Combined Chip-Select Input and Interrupt Output
- SIO: Serial Bi-directional Data I/O Port for SPI Modes
- SCK: Serial Clock Input for SPI Modes
- SEL: Hardware Address-Select Input for I2C Mode (two address options)
- SDA: Serial Bi-directional Data I/O Port for I2C Modes
- SCL: Serial Clock Input for I2C Modes
- IRQN: Interrupt Output

3. Absolute Maximum Ratings

The absolute maximum ratings are stress ratings only. Stresses greater than those listed below can cause permanent damage to the device. Functional operation of the IPS2200 at the absolute maximum ratings is not implied. Exposure to absolute maximum rating conditions could affect device reliability.

Table 4. Absolute Maximum Ratings

Symbol	Parameter	Conditions	Minimum	Maximum	Units
V_{VDDmax}	External supply voltage	Continuous	-18	7.5	V
V_{OUT}	OUT1, OUT2, OUT3, and OUT4 output voltage	IC not supplied, permanent	-18	7.5	V
		IC supplied, permanent	-15	18	V
V_{RX1}	Receiver coil pin: RX1		-12	12	V
V_{RX2}	Receiver coil pin: RX2				
V_{RX3}	Receiver coil pin: RX3				
V_{RX4}	Receiver coil pin: RX4				
$V_{DIGITAL}$	Digital IO pins: SCK_SCL, SIO_SDA, CSN_IRQN		-0.3	18	V

Symbol	Parameter	Conditions	Minimum	Maximum	Units
V_{CSN_IRQN}	Digital IO pin CSN_IRQN	When used as input for I2C address selection and tied to VDD directly or with pull-up resistor.	Refer to V_{VDDmax}		V
$V_{VDDAmax}$	VDDA internal LDO output	VDDA is internally regulated, no connection to external voltage	Refer to V_{VDDA} in Table 5		V

4. Operating Conditions

Conditions: $VDD = 5V \pm 10\%$, $T_{AMB} = -40^\circ C$ to $+125^\circ C$, unless otherwise noted.

Table 5. Operating Conditions

Note: See important notes at the end of the table.

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
T_{AMB_TSSOP}	Ambient temperature: 16-TSSOP		-40		125	°C
T_J	Junction temperature		-40		145	°C
T_{STOR}	Storage temperature	Unmounted units must be limited to 10 hours at temperatures above $125^\circ C$	-55		150	°C
R_{THJA_TSSOP}	Thermal resistance junction to ambient: 16-TSSOP package	JEDEC MO-153		89		°C/W
t_{pup}	Start-up time	Power-on reset (POR) to valid output signal			3	ms
V_{EL}	Input rotational velocity	Electrical speed Sine or cosine periods per minute			250 000	rpm
$V_{VDDA_TH_H}$	Power on reset, high threshold	The device is activated when VDDA increases above this threshold			2.6	V
$V_{VDDA_TH_L}$	Power on reset, low threshold	The device is deactivated when VDDA decreases below this threshold	2.1			V
$VDDA_{POR_HYST}$	Power-on reset hysteresis	At VDDA pin	50			mV
I_{VDDA}	VDDA load current limitation			75		mA
I_{DD}	Current consumption	Without coils. no load		8.4	12	mA
		Programmable transmitter coil drive current (depending on inductance of transmitter coil)		For values, refer to Table 8		
C_{VA}	Capacitor from VDDA pin to GND			100		nF
C_{VD}	Capacitor from VDD pin to GND		70			nF
INL_{UV3V}	Accuracy, 3.3V mode, VDD= under-voltage alarm level to 3.0V	With ideal coil input signals, relative to an output signal of 1.8Vpp		± 0.3		% FS ^[a]
INL_{3V}	Accuracy, 3.3V mode, VDD= 3.0 to 3.6V			± 0.2		% FS
INL_{OV3V}	Accuracy, 3.3V mode, VDD= 3.6V to over-voltage alarm level			± 0.3		% FS
INL_{UV5V}	Accuracy, 5V mode, VDD= under-voltage alarm level to 4.5V	With ideal coil input signals, relative to an output signal of 3.0Vpp		± 0.3		% FS
INL_{5V}	Accuracy, 5.0V mode, VDD= 4.5 to 5.5V			± 0.2		% FS
INL_{OV5V}	Accuracy, 5.0V mode, VDD= 5.5V to over-voltage alarm level			± 0.3		% FS

[a] "% FS = percent of full scale = accuracy in % per period, where 100% is the angle range of one electrical period. For rotary multi-period designs, one electrical period = 360° (one full turn) divided by the number of periods per turn.

Examples:

- A 3-periodic coil design ($3 \times 120^\circ$) has a typical mechanical accuracy of $\pm 0.2\%$ per 120° = $\pm 0.24^\circ$
- A 4-periodic coil design ($4 \times 90^\circ$) has a typical mechanical accuracy of $\pm 0.2\%$ per 90° = $\pm 0.18^\circ$

5. Ambient Temperature Range

The minimum ambient temperature for the IPS2200 is -40°C.

The maximum ambient temperature depends on the following factors:

- The maximum junction temperature. See Table 5 for details.
- The selected transmitter coil current. The total power consumption of the chip depends on the internal power consumption and the user programmable current for the transmitter coil.
- The minimum usable coil current in a given application. Note that smaller coil inductances require more transmitter coil current, and larger coil inductances can operate with less coil current. The maximum allowed transmitter coil current is shown in Table 5.
- The IDT internal part qualification. The IPS2200 is qualified for -40°C to +125°C ambient temperature.

6. Electrical Characteristics

The following electrical specifications are valid for the operating conditions as specified in Table 5: ($T_{AMB} = -40^{\circ}C$ to $125^{\circ}C$).

Table 6. IPS2200 Electrical Characteristics, 3.3V Mode

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
VDD_3	Supply voltage		3.0 ^[a]	3.3	3.6 ^[b]	V
$VDDA_3$	Analog supply voltage	Internally regulated. Connect a $C_{VA} = 100nF$ capacitor from $VDDA$ to GND.	2.85	3.0	3.1	V
$V3_{OVR}$	Over-voltage detection, VDD rising	An over-voltage alarm is created if VDD rises above these limits.	3.8		4.3	V
$V3_{OVF}$	Over-voltage detection, VDD falling	An over-voltage alarm is cleared if VDD falls below these limits.	3.5 ^[c]		4.1	V
$V3_{OVH}$	Over-voltage detection hysteresis		150			mV
$V3_{UVR}$	Under-voltage detection, VDD falling	An under-voltage alarm is created if VDD falls below these limits.	2.2		2.95	V
$V3_{UVF}$	Under-voltage detection, VDD rising	An under-voltage alarm is cleared if VDD rises above these limits.	2.6		3.1 ^[d]	V
$V3_{UVH}$	Under-voltage detection hysteresis		100			mV
$V3VDDA_{UVF}$	$VDDA$ under-voltage detection	An under-voltage alarm is created if $VDDA$ falls below these limits.	2.6		2.85	V
$V3VDDA_{UVR}$	$VDDA$ under-voltage detection	An under-voltage alarm is created if $VDDA$ rises above these limits.	2.7		2.9	V

[a] If the VDD under-voltage alarm is enabled, the VDD_3 must be at least 3.1V.

[b] If the VDD over-voltage alarm is enabled, the VDD_3 must be maximum 3.5V.

[c] If the VDD over-voltage alarm is enabled, the VDD_3 must be maximum 3.5V.

[d] If the VDD under-voltage alarm is enabled, the VDD_3 must be at least 3.1V.

Table 7. IPS2200 Electrical Characteristics, 5.0V Mode

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
VDD_5	Supply voltage		4.5 ^[a]	5.0	5.5	V
$VDDA_5$	Analog supply voltage	Internally regulated. Connect a $C_{VA} = 100nF$ capacitor from $VDDA$ to GND.	3.9	4.0	4.1	V
$V5_{OVR}$	Over-voltage detection, VDD rising	An over-voltage alarm is created if VDD rises above these limits.	6.2		6.9	V
$V5_{OVF}$	Over-voltage detection, VDD falling	An over-voltage alarm is cleared if VDD falls below these limits.	5.9		6.6	V
$V5_{OVH}$	Over-voltage detection hysteresis		150			mV

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V5 _{UVR}	Under-voltage detection, VDD falling	An under-voltage alarm is created if VDD falls below these limits.	3.8		4.4	V
V5 _{UVF}	Under-voltage detection, VDD rising	An under-voltage alarm is cleared if VDD rises above these limits.	4.0		4.6[b]	V
V5 _{U VH}	Under-voltage detection hysteresis		100			mV
V5VDDA _{UVF}	VDDA under-voltage detection	A VDDA under-voltage alarm is triggered when VDDA falls below these limits.	3.45		3.9	V
V5VDDA _{UVR}	VDDA under-voltage detection	A VDDA under-voltage alarm is cleared if VDDA rises above these limits.	3.5		3.9	V

[a] If the VDD under-voltage alarm is enabled, the VDD5 must be at least 4.6V.

[b] If the VDD under-voltage alarm is enabled, the VDD5 must be at least 4.6V.

Table 8. LC Oscillator Specifications

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
L	Excitation coil inductance	For transmitter coil as shown in the block diagram in Figure 12.			30	µH
R _{P,eq}	Equivalent parallel resistance of the LC resonant circuit	See Equation 1 and Equation 2 .	100			Ω
f _{LC}	Excitation frequency	LC oscillator; determined by external components L and C.	1.7		5.8	MHz
F _{OSC_ACC}	Accuracy of transmitter oscillator frequency measurement	Gated by the internal oscillator.	-10		10	%
f _{LC_DIAG_L}	LC oscillator lower frequency diagnostics range	Programmable frequency where an out-of-range frequency diagnostics alarm can be enabled.	0.007			MHz
f _{LC_DIAG_H}	LC oscillator upper frequency diagnostics range				10	
V _{TX_P}	LC oscillator amplitude	Peak-to-peak voltage; pins TX1 vs. TX2; all modes. The coil current is user programmable.			11	V _{pp}
I _{LC}	Programmable transmitter coil drive current	Equivalent DC current. Programmable, depending on transmitter coil inductance.	0	3	20	mA
I _{LCmax}	Maximum transmitter coil drive current tolerance	At room temperature	18	20	22	mA

Configuration with a single capacitor C_T in the LC oscillator.

The oscillator frequency is determined by the values of coil L and capacitor C_T :

$$f_{TX} = \frac{1}{2\pi\sqrt{LC_T}}$$

Where:

f_{TX} = Oscillator frequency in MHz

L = Coil impedance in μ Henry

C_T = Capacitance in μ Farad

Configuration with split capacitors C_{T1} and C_{T2} for improved EMC performance. Both capacitors must have the same capacitance.

The oscillator frequency is determined by the values of coil L and capacitors C_{T1} and C_{T2} :

$$f_{TX} = \frac{1}{2\pi\sqrt{\frac{L \cdot C_{T1} \cdot C_{T2}}{C_{T1} + C_{T2}}}}$$

$$\rightarrow \text{for } C_{T1} = C_{T2} : f_{TX} = \frac{1}{2\pi\sqrt{L \frac{C_{T1}}{2}}}$$

Where:

f_{TX} = Oscillator frequency in MHz

L = Coil impedance in μ Henry

C_{T1}, C_{T2} = Capacitance in μ Farad

Figure 3. LC Oscillator Connection with Split TX Capacitors

The equivalent parallel resistance R_{Peq} of the LC oscillator can be calculated using Equation 2:

$$R_{Peq} = \frac{1}{R_S} \times \frac{L}{C} \quad \text{Equation 1}$$

$$R_S = \frac{1}{R_{Peq}} \times \frac{L}{C} \quad \text{Equation 2}$$

Where

R_{Peq} Equivalent parallel resistance of the LC oscillator.

R_s Serial resistance of the transmitter coil at the transmitter frequency.

L Coil reactance at the resonant frequency.

C Capacitance of the parallel capacitor C_T .

Note that the capacitor losses are not included in the equation.

Figure 4. Parallel Resonator Circuit

Table 9. Coil Receiver Front-End Specifications

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V_{RX}	Receiver coil amplitude	Input signal full range. $V_{out} = 3.0V_{pp}$ (single ended)	5 ^[a]		5200 ^[a]	mV_{pp}
A_{IN_MM}	Amplitude mismatch correction range	Programmable individual gain mismatch correction of Receiver coil signals (SIN and COS)	0		11	%
A_{MM_RES}	Amplitude mismatch correction granularity			7		Bit
$A_{IN_OFFSET_MIN}$	Input offset minimum correction range	Offset of sine and cosine signal, percentage of transmitter coil amplitude.	-0.09		+0.09	%
$A_{IN_OFFSET_MAX}$	Input offset maximum correction range	Minimum and maximum values depend on the Rx gain setting.	-0.27		+0.27	%
OFF_{CORR_RES}	Input offset correction granularity	Programmable step size.		7		Bit
R_{RX}	Coil receiver DC input resistance	Single-ended to GND.		200		$k\Omega$
		Differential.		800		$k\Omega$

[a] Minimum and maximum Receiver voltage input levels depend on front-end gain setting, integration cycles, and LC oscillator frequency

Table 10. Diagnostic Checks

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
t_{FAIL}	Failure reaction time (time to flag an error condition at the IRQN pin)	Chip internal diagnostic checks.			500	μs
R_{OPEN_TH}	Resistance of Rx coil, open coil detection	Rx coil short/open error flag activated.	2200			$k\Omega$
		Rx coil short/open error flag cleared.			354	$k\Omega$
R_{SHORT_GND}	External resistance from any coil input to GND, short to ground detection	Rx coil short/open error flag activated.			19	$k\Omega$
		Rx coil short/open error flag cleared.	630			$k\Omega$
R_{SHORT_VDD}	External resistance from any coil input to VDD, short to VDD detection	Rx coil short short/open error flag activated; $VDD = 2.7$ to $6.4V$.			160	$k\Omega$
		Rx coil short/open error flag cleared. $VDD = 2.7$ to $6.4V$	840			$k\Omega$
R_{SHORT_TH}	External resistance between coils for detection of a short between coils	R1R2 short error flag threshold; $VDD = 3.0$ to $3.6V$.	35	140	410	$k\Omega$
		R1R2 short error flag threshold; $VDD = 4.5$ to $5.5V$.	20	70	180	$k\Omega$
DC_{OFF_AL}	DC common mode output offset alarm limits	Absolute value relative to $VDD/2$. Output offset alarm flag activated.	100		200	mV

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
Diag _{LO}	Diagnostic Low indication	SIN, SINN, A, AN Outputs, I _{LOAD} = 1mA sink current	0	1	3	%VDD
Diag _{HI}	Diagnostic High indication	COS, COSN, B, BN Outputs I _{LOAD} = 1mA source current	97	98.6	100	%VDD

Table 11. Back-End Specification, Analog Outputs SIN, SINN, COS, COSN

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V _{3OUT}	Analog output range, 3.3V option	-1mA ≤ I _{OUT} ≤ 1mA	GND + 0.7		VDD – 0.4	V
V _{3OUT}	Analog output range, 5V option		GND + 1.0		VDD – 1.0	V
V _{3OUT_PP}	Analog output voltage amplitude, 3.3V option	Single ended peak-to-peak voltage range	0.9	1.275	1.65	V _{PP}
V _{5OUT_PP}	Analog output voltage amplitude, 5V option		1.4	1.95	2.5	V _{PP}
V _{DDOUT_CM}	Output DC offset voltage, common mode voltage	All modes	47.5		52.5	%VDD
D _{C_{OFFDRIFT}}	DC offset voltage drift	Over temperature range	-50		50	µV/°C
D _{C_{OFF}}	DC offset voltage after trimming	At trim temperature, over gain range and transmitter frequency range, VDD= 3.0 to 5.5V	6		6	mV
I _{OUT3}	Output current; 3.3V option	Output load current	-1		+1	mA
I _{OUT5}	Output current; 5V option		-2		+2	mA
I _{OL}	Output overload current,		20		30	mA
C _{RAW_I}	Capacitive load, EMC filters	Refer to section 18 for C _{O1} to C _{O4}			47	nF
Noise	Device output noise	Maximum gain, no output filtering, shorted coil inputs		2		mV _{rms}

Table 12. Back-End Specification, Quadrature Pulse Output Option, Pins A, A_N, B, and B_N

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
V _{QUAD_OH}	High level output voltage	Sign of demodulated input voltage: high = positive; low = negative	70		100	%VDD
V _{QUAD_OL}	Low level output voltage		0		30

Table 15. Electrostatic Discharges (ESD)

Symbol	Parameter	Conditions	Classification	Units
$V_{ESD,OUT}$	ESD tolerance for pins OUT1, OUT2, OUT3, OUT4, CSN_IRQN, VDD	According to AEC-Q100-002 / JS-001, HBM100pF / 1.5kΩ	3A: 4000 to < 8000	V
V_{ESD}	ESD tolerance for pins RX1, RX2, RX3, RX4, VDDA, SCK_SCL, SIO_SDA		2: 2000 to < 4000	
$V_{ESD,OSC}$	ESD tolerance for pins TX1, TX2		1A: 250 to < 500	

[a] When handling semiconductor devices such as IPS2200, always observe ESD guidelines to avoid electrostatic discharges on these parts.

7. Circuit Description

7.1 Overview

The IPS2200 sensor circuit consists of one transmitter coil and two receiver coils, which are typically designed as traces on a printed circuit board. The two receiver coils have a sinusoidal shape and are shifted by 90° with respect to each other; refer to Figure 6 and Figure 7 for typical coil shapes. A metal target is placed above the coil arrangement.

Circuit signal flow:

1. The IPS2200 drives AC current into the transmitter coil and generates an alternating magnetic field.
2. The magnetic field induces voltages in the receiver coils. Without a metallic target, due to the balanced, anti-serial connection of their segments, the voltages are compensated to achieve zero output at each pair of terminals.
3. If a metal target is placed above the coils:
 - a. The magnetic field induces eddy currents on the surface of the metal target.
 - b. The eddy currents generate a counter magnetic field, thus reducing the total flux density underneath.
 - c. The voltage induced in the receiver coil areas underneath the target is reduced, creating an imbalance in the anti-serial coil segment voltages
 - d. An output voltage occurs on the terminals, changing amplitude and polarity with the target position.
4. The IPS2200 IC amplifies, rectifies, and filters the receiver voltages and outputs them for external signal processing.

Due to the 90° phase shift of the two receiver coils, the output signals also have a 90° phase shift in relation to the target position, generating ratiometric sine and cosine signals. The signals can be converted into an absolute position, for example by applying an arctangent operation of V_{sin} and V_{cos} .

$$\text{Position} = \arctan\left(\frac{V_{\text{sin}}}{V_{\text{cos}}}\right) \quad \text{Equation 3}$$

Note: See Table 2 for definitions of the OUT1, OUT2, OUT3, and OUT4 pins.

Figure 5. Response of the IPS2200

Figure 6 shows an example of a linear motion sensor with one transmitter coil (transmitter loop) and two receiver coils (Sin loop and Cos loop). Due to the alternating clockwise and counterclockwise winding direction of each

segment in a loop (for example $Rx\cos = \text{clockwise Cos Loop1} + \text{counterclockwise Cos Loop 2}$), the induced voltages in each segment have alternating opposite polarity.

$$V_{\text{Cos Loop1}} = -V_{\text{Cos Loop2}}$$

Equation 4

If no target is present, the secondary voltages cancel each other:

$$V_{\text{Cos}} = V_{\text{Cos Loop1}} - V_{\text{Cos Loop2}} = 0V$$

Equation 5

With a target placed above the coils, the secondary voltage induced in the covered area is lower than the secondary voltage without a target above it.

$$V_{\text{Cos Loop1}} \neq -V_{\text{Cos Loop2}}$$

Equation 6

This creates an imbalance of the secondary voltage segments, and thus, a secondary voltage $\neq 0V$ is generated, depending on the location of the target.

$$V_{\text{Cos}} = V_{\text{Cos Loop1}} - V_{\text{Cos Loop2}} \neq 0V$$

Equation 7

Figure 6. Coil Design for a Linear Motion Sensor

The same principles shown for the linear motion sensor in Figure 6 can be applied to an arc or rotary sensor as shown in Figure 7.

Figure 7. Coil Design for a 360° Rotary Sensor

8. Sampling Rate, Resolution, Output Data Rate, and Propagation Delay

Since the IPS2200 uses analog signal processing (no ADC), there is no sampling rate and the resolution is virtually infinite.

Due to the internal chopping and demodulation processes, there is a programmable output data rate and corresponding propagation delay.

The overall signal processing is very fast, allowing operation at very high speeds up to 250000 rpm (electrical) and more with very fast update rates and propagation delays in the range of 4.3 μ s to 7.7 μ s for the shortest integration factor (5 \times) and 13.6 μ s to 31.3 μ s for the longest integration factor (31 \times).

The coil receiver circuit automatically locks to the transmitter coil oscillator frequency. It automatically corrects for LC oscillator frequency drifts due to temperature changes or air gap changes for the target. Consequently, the demodulator at the receiver is also dependent on the LC oscillator frequency.

In addition to the LC oscillator frequency, a second contributing factor is the integration factor of the demodulator (essentially a digital filtering process). The data rate and propagation delay are defined as a step response on the input when the output reaches > 90% of the maximum signal level.

It can be calculated via Equation 8:

$$\text{Output Data Rate } [\mu\text{s}] = \frac{(IF+1)}{f_{LC}} \quad \text{Equation 8}$$

$$\text{Data Propagation Delay } [\mu\text{s}] = \frac{2 \cdot (IF+1)}{f_{LC}} + 1 \cdot \tau \quad \text{Equation 9}$$

Where

IF Integration factor: a programmable factor of 5 to 31

f_{LC} LC oscillator frequency

τ Internal time constant (tau) = 2.2 μ s

Table 16. Output Data Rate, Propagation Delay

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
t_{PD}	Raw data update rate, propagation delay of R1 and R2 input signals at output.	$f_{LC} = 5.6\text{MHz}$, integration factor = 5 \times to 31 \times (programmable)	4.3		13.6	μs
		$f_{LC} = 2.2\text{MHz}$, integration factor = 5 \times to 31 \times (programmable)	7.65		31.3	μs

Data Update Rate: Integration Factor vs. LC Oscillator Frequency

Figure 8. Data Update Rate vs. LC Oscillator Frequency vs. Integration Factor

9. Output Modes

9.1 Analog Differential Sine-Cosine Analog Output Mode

In this mode, both sine and cosine signals are available as full differential outputs. This configuration is recommended for best signal integrity and EMC performance.

Figure 9. Sine-Cosine Analog Mode Output Signals

9.2 Analog Single Ended Sine-Cosine Analog Output Mode

In single ended mode, the SIN and COS signals are available with respect to GND. SIN_N and COS_N signals provide a buffered reference signal (VDD/2).

Figure 10. Sine-Cosine Analog Mode Output Signals

9.3 Digital Incremental Differential AB Mode

In AB incremental mode, four digital output signals have one symmetric period in every 360° electrical period.

Signal B is shifted by 90° (electrical) relative to signal A, allowing four states per 360° (electrical period), see Table 17.

Table 17. Output Status in AB Incremental Mode

State #	Position (Electrical)	Signal A	Signal A_N	Signal B	Signal B_N
1	0° >pos >=90°	1	0	1	0
2	90° >pos >=180°	1	0	0	1
3	180° >pos >=270°	0	1	0	1
4	270° >pos >=360°	0	1	1	0

Signals A_N and B_N are the inverted signals of A and B, allowing differential signal transmission for best signal integrity and EMC performance.

By having A and B phase shifted, the direction of rotation can be determined:

- Clockwise rotation: signal B is high at rising edge of A as shown in Figure 11 at 360° where moving from left to right (0° to 360°)
- Counter clockwise rotation: signal B is low at rising edge of A as shown in Figure 11 at 180° where moving from right to left (360° to 0°)

Figure 11. Digital Incremental Differential AB Mode Output Signals

Note that the AB output provides only one pulse per phase on each output. The number of pulses per revolution can be increased by coil designs having multiple periods per turn.

10. Operating at High Speed

The IPS2200 uses analog signal processing, so it can handle inputs signals at very high speed. The input signal can have a frequency of up to 4.16kHz, which is equivalent to 250000 RPM (electrical phases per minute). Even higher frequencies and therefore higher speeds are possible, but with reduced performance and signal amplitude.

The mechanical rotor speed can be calculated with Equation 10:

$$\text{rpm(mech)} = \frac{\text{rpm (el)}}{\text{coil periods}} \quad \text{Equation 10}$$

Where

rpm (mech) Rotation speed of the rotor (and target) in revolutions per minute.

rpm (el) Maximum electrical input frequency of the sensor in rpm (electrical)
 = 250000 electrical periods per minute (rpm)
 = 4166 electrical periods per second = 4.166kHz

coil periods Number of electrical periods per turn
 = number of coil periods per 360° circle
 = number of metal target segments

Figure 23 shows a design for a 6 pole motor (having 3 pole pairs) using a 3-periodic coil design.

The maximum mechanical rotation speed of this motor is calculated according to Equation 11.

$$\frac{250000 \text{ rpm}}{3} = 83333 \text{ rpm} \quad \text{Equation 11}$$

Table 18. Output Modes and Maximum Speed

	SIN/COS Output Mode	AB Output Mode		Maximum Rotor Speed
Target Design (metal/no metal)	Sine, Cosine Cycles per Revolution	Quadrature Pulses per Revolution	Quadrature Counts per Revolution	Mechanical Speed
1 × (180° / 180°)	1 × 360°	1	4	250000 rpm
2 × (90° / 90°)	2 × 180°	2	8	125000 rpm
3 × (60° / 60°)	3 × 120°	3	12	83333 rpm
4 × (45° / 45°)	4 × 90°	4	16	62500 rpm
6 × (30° / 30°)	6 × 60°	6	24	41666 rpm
8 × (22.5° / 22.5°)	8 × 45°	8	32	31250 rpm
10 × (18° / 18°)	10 × 36°	10	40	25000 rpm
...	1 cycle per target	1 pulse per target	4 × counts per target	250000 RPM / targets per wheel

11. Digital Diagnostics and Programming Interfaces

In order to program the IPS2200 and to enable fast diagnostics without interrupting the analog high speed signal path, an additional digital serial interface is available.

The IPS2200 offers four modes of digital communication for the diagnostics and programming interface:

- Half duplex SPI interface (default setting).
- Half duplex SPI interface with interrupt (programming option).
- I2C interface with interrupt (programming option).
- I2C interface with address select (programming option).

11.1 Block Diagram

Figure 12 shows the block diagram of the IPS2200.

Figure 12. Block Diagram

The main building blocks include the following:

- Power Management: power-on-reset (POR) circuit; low drop-out (LDO) regulators for analog and digital supplies.
- Oscillator: generation of the transmitter coil signal.
- Analog Front-End:
 - Input filter, offset, and gain setting: analog AM signal preconditioning.
 - Synchronous integrator: demodulation of the AM signal.
- Offset Control: correction of offsets at the receiver coil inputs RX1/RX2 and RX3/RX4.
- Gain Control: correction of amplitude mismatching from RX1/RX2 and RX3/RX4 input signals.
- Configuration, NVM: nonvolatile storage of factory and user-programmable settings.
- Programming Interface: configuration, communication, and diagnostics via selectable I2C or SPI bidirectional interface.
- Diagnostics, Timer: Diagnostics for critical blocks to ensure functional safety and watchdog timer.
- Protection: over-voltage, reverse polarity and short circuit protection.

There are four interface options for the OUT1, OUT2, OUT3, and OUT4 pins (see Table 2):

- Differential analog output
- Single-ended analog output with reference
- Incremental digital AB pulse output (one pulse per phase)

12. Connection Options

Note: In Figure 13, Figure 14, and Figure 15, the active function of dual function pins is shown in **bold** font.

The IPS2200 must be programmed to match to the correct VDD voltage supply level (3.3V or 5.0V).

Figure 13. Analog Interface with Diagnostics Mode, Fixed Configuration

When using the digital interface pins as shown in Figure 14 and Figure 15, IPS2200 and ECU must share the same VDD voltage supply level to match the digital HIGH and LOW signal levels.

Figure 14. Analog and Digital Interface, On-The-Fly Gain and Offset Correction, Extended Diagnostics

Figure 15. Analog and Digital Interface, On-The-Fly Gain and Offset Correction, Extended Diagnostics with MCU Interrupt

13. Digital Diagnostics and Programming Interfaces

In order to program the chip and to enable fast diagnostics without interrupting the analog high speed signal path, an additional digital serial interface is available.

The IPS2200 offers four modes of digital communication for the diagnostics and programming interface:

1. Half duplex SPI interface (default setting)
2. Half duplex SPI interface with interrupt (programming option)
3. I2C interface with interrupt (programming option)
4. I2C interface with address select (programming option)

13.1 Supply Voltage Operation: 3.3V or 5V

The IPS2550 can be programmed to operate with either a $3.3V \pm 10\%$ or a $5.0V \pm 10\%$ supply voltage.

If the IPS2200 is programmed for the 5V operation, but connected to a 3.3V supply, it will be in a 5V under-voltage state. However, it can still be programmed for 3.3V operation. After the next power-on-reset, the IPS2200 boots as a 3.3V device.

If the IPS2200 is programmed for 3.3V operation, but connected to a 5V supply, it will be in a 3.3V over-voltage state. However, it can still be programmed for 5.0V operation. After the next power-on-reset, the IPS2200 boots as a 5.0V device.

13.2 Half-Duplex SPI Interface

This is a standard bi-directional, half-duplex SPI interface. The SPI slave module is activated by the SPI 3-wire master, which initiates the transaction by pulling the chip-select pin low (CSN_IRQN, pin 1). A serial clock (SCK_SCL, pin 15), is driven by the master. The Serial Data In/Out line (SIO_SDA, pin 16) is a bidirectional data line between master and slave. In a typical scenario, the master transmits a command with a specified length of 8-bit over the SIO line. If it is a write command, the master keeps transmitting data over the same line. If the first bits were a READ command, the slave transmits a fixed length of data over the SIO line to the master.

Table 19. SPI Interface Parameters

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
CL_SPI	SPI clock rate			100	Kbit/s	
t _{R_SIO}	Rise time of SIO	Signal level change from 10 to 90%; $\leq 15pF$ capacitive load		35	ns	
t _{F_SIOL}	Fall time of SDA or SCL	Signal level change from 90 to 10%; $\leq 15pF$ capacitive load		35	ns	

Note: In Figure 16, Figure 17, Figure 18, Figure 19, and Figure 20, for IPS2200 pins that have dual functions, the function that is active is shown in **bold** font.

Figure 16. Half Duplex 3-3 Wire SPI Interface

A master can communicate with multiple slaves. Each slave device has an independent CSN line but shares the SCK and SIO lines with all slaves. A slave is only addressed when the corresponding CSN pin is pulled low.

Figure 17. Half Duplex 3-3 Wire SPI Multi-slave Interface

For a detailed description of the SPI interface, refer to the *IPS2200 Programming Guide*.

13.3 I2C Interface

The IPS2200 includes a standard I2C interface. The I2C address is programmable. In addition, the CSN_IRQN pin can be programmed as either an I2C address selection (SEL) pin or as an interrupt output (IRQN) pin when using the I2C interface (see Table 3). The IPS2200 is configured as a I2C slave, several slaves can be connected in parallel on the I2C bus.

Table 20. I2C Interface Parameters

Symbol	Parameter	Conditions	Minimum	Typical	Maximum	Units
CL _{I2C}	I2C clock rate				100	Kbit/s
t _{SCL_LOW}	Low level state of SCL clock		4.7			μs
t _{SCL_HIGH}	High level state of SCL clock		4.0			μs
t _{R_SDA_SCL}	Rise time of SDA or SCL	Signal level change from 10 to 90%			1000	ns
t _{F_SDA_SCL}	Fall time of SDA or SCL	Signal level change from 90 to 10%			300	ns

Two wires, serial data (SIO_SDA, pin 16) and serial clock (SCK_SCL, pin 15), carry information between the devices connected to the bus. Both SDA and SCL are-connected to the positive supply voltage VDD via an external pull-up resistor. When the bus is free, both lines are HIGH. The output stages of devices connected to the bus must have an open-drain or open-collector to perform the wired-AND function.

An external master (host controller) initiates a transfer, generates clock signals, and terminates a transfer. The implementation supports the I2C slave function, which is addressed by the master and supports the I2C bus specification version 2.1.

13.3.1. I2C with Address Selection (Programming Option)

When the IPS2200 is programmed to use the I2C interface with address selection, the CSN_IRQN pin is used to select the I2C slave address by hardware.

Figure 18. I2C Interface with Address Select

13.3.2. I2C Interface with Interrupt (Programming Option)

When the IPS2200 is programmed to use the I2C interface with the interrupt function, it operates as a standard I2C interface. The I2C address is programmable. In addition, the CSN_IRQN pin is used as an interrupt output for fast signaling of a diagnostic event.

Figure 19. I2C Interface Configuration with Interrupt on a Single Slave

Note: In this mode, several I2C slaves are connected in parallel. Each I2C slave must have an individual I2C address.

Figure 20. I2C Interface Configuration with Multi-slave Interrupt

For a detailed description of the I2C interface, refer to the *IPS2200 Programming Guide*.

14. Protection and Diagnostics

14.1 I/O Protection

In order to meet the automotive requirements for over-voltage and reverse-polarity protection on both the output and power supply pins, the IPS2200 includes several protection and diagnosis features:

1. Protection against short circuit of the output pins SIN, SINN, COS, and COSN to GND or to VDD
2. Over-voltage and reverse-polarity protection:
 - a. On supply pin VDD to GND
 - b. On analog output pins SIN, SINN, COS, and COSN to GND
 - c. On digital output pins SIO_SDA, CSN_IRQN, and SCK_SCL to GND

15. Programming Options

The IPS2200 family offers a variety of programming options. The IC is programmed through the digital bi-directional SPI or I2C interface. The main programming functions are described in Table 21.

15.1 Lock Feature (Cyber Security)

The IPS2200 contains a write lock bit option, which can be set by the user. Once the write lock bit is set, no further writing to the chip is possible.

Note: For programming details, see the *IPS2200 Programming Guide*, which is available from IDT on request.

Table 21. Programming Options Overview

Function	Programming Options
Supply voltage range	3.3V $\pm 10\%$ or 5.0V $\pm 10\%$, alarm levels
High speed interface	Sine/cosine differential, single-ended, A/B
Digital diagnostic and programming interface	Half-duplex SPI, half-duplex SPI with interrupt, I2C with address select, I2C with interrupt
SPI interface	SPI modes with/without interrupt, clock polarity, clock phase Data order: MSB first / LSB first
I2C interface	Slave address, I2C mode with address select or with interrupt
Diagnostic signaling on high speed interface	Enable/disable: Output pins are pulled low or high in diagnostic state
Security lock function	Register access R/W / read-only
RF front end integration cycles	Number of integration cycles; adjust noise vs. speed
Receiver overall gain	Overall gain coarse adjustment
Sine, cosine channel gain	Amplitude mismatch correction, fine adjustment
Sine, cosine offset	Pre-adjustment of input offsets
Tx oscillator	Bias current, optimization of coil performance
Time base counter	Measurement of Tx oscillator frequency, upper/lower frequency alarm
Interrupt	Enable/disable interrupt events

16. Diagnostics

The diagnostics described in Table 22 are performed on the chip level and are flagged in corresponding registers if a fault detection occurs. Each of these diagnostic functions can be enabled or disabled to generate an interrupt event at the CSN_IRQN output. In addition, an interrupt event can also be signaled through the high speed interface pins (SIN, SINK, COS, COSN; see Table 2) by putting them into the diagnostic state.

Alarm types marked as “Static” will remain set while the error persists and are cleared only by power-on-reset (POR); alarm types marked as “Temporary” will be cleared when the source of the error is removed.

Diagnostic flags marked as “Continuous” are continuously tested; diagnostic flags marked as “Start-up” are checked at start-up only.

Table 22. Diagnostic Features

Diagnostic Flag	Type	Active	Description
VDD over-voltage	Temporary	Continuous	If the external supply voltage exceeds the maximum limit of typical +10%, this flag is asserted. To avoid a flag toggling, a comparator hysteresis is implemented. See Table 6 for alarm levels in 3.3V Mode and Table 7 for alarm levels in 5V Mode.
VDD under-voltage	Temporary	Continuous	If the external supply voltage falls short of the minimum limit of typical -10%, this flag is asserted. To avoid a flag toggling, a comparator hysteresis is implemented. See Table 6 for alarm levels in 3.3V Mode and Table 7 for alarm levels in 5V Mode.
Data access fail	Temporary	Continuous	Chip internal failure.
Protocol integrity fail	Temporary	Continuous	Failure in the I2C/SPI data transfer.
Shadow register DED	Static	Continuous	Shadow register bank double-bit error detection.
Shadow register SED	Temporary	Continuous	Shadow register bank single-bit error detection. Each single-bit error detection triggers a single-bit error correction (SEC) of the register output.
Nonvolatile memory DED	Static	Start-up	NVM double-bit error detection. Each individual addressed word is checked and flagged for bit error.
Nonvolatile memory SED	Temporary	Start-up	NVM single-bit error detection. Each individual addressed word is checked and flagged for bit errors. Each single-bit error detection triggers a single-bit error correction (SEC) of the NVM output.
LC oscillator failure	Temporary	Continuous	This flag is set when the LC oscillator frequency is out of range. The frequency range is programmable; see section 16.2 for details.
LC oscillator stuck	Temporary	Continuous	This flag is set when the LC oscillator stops running.
VDDA under-voltage or CSN_IRQN over-voltage or SIO_SDA over-voltage	Temporary	Continuous	This flag is set when the internally regulated analog supply voltage VDDA falls below specified limits or when an over-voltage on pins CSN_IRQN or SIO_SDA is detected. See Table 6 or Table 7 for VDDA alarm levels and Table 4 for IRQN_CSN and SIO_SDA over-voltage alarm levels.
Low amplitude	Temporary	Continuous	In the Incremental Digital Mode, a minimum signal level must be defined (gain factor) for a valid output function. If this flag is asserted, the gain factor must be increased.
Internal bus failure	Temporary	Continuous	Chip internal failure.
IRQN watchdog failure	Static	Continuous	A cyclic interrupt request can be initiated by starting a watchdog counter. When the timer is expired, the interrupt flag is asserted and the timer restarts. The timer can be stopped by resetting the watchdog value to zero.
Mechanical damage	Static	Continuous	The chip is checked for mechanical damage (cracks in the silicon)
Output buffer failure	Temporary	Continuous	This flag is set when the mean value of analog outputs SIN+SINK or COS+COSN differs from VDD/2 by more than the specified limits described in Table 11.
Output buffer overload	Temporary	Continuous	This flag is set when the output amplifier load current is above the specified limits.
R1 to R2 coil short	Static	Start-up	A short between the receiver coils R1 and R2 is checked after POR. The check result is stored and flagged until the next POR.

Diagnostic Flag	Type	Active	Description
R2 coil failure	Temporary	Continuous	This flag is set if there is a short between receiver coil R2 and GND, a short between receiver coil R2 and VDD, or an open receiver coil R2.
R1 coil failure	Temporary	Continuous	This flag is set if there is a short between receiver coil R1 and GND, a short between receiver coil R1 and VDD, or an open receiver coil R1.

16.1 Internal Register and Memory Errors

For all registers, volatile and nonvolatile memories, a cyclic redundancy check (CRC) is implemented, allowing 2-bit error detection and 1-bit error correction. An alarm flag is set when a CRC error occurs.

16.2 LC Oscillator Frequency Out of Range

The typical frequency range for the transmitter LC oscillator is from ~2MHz to 5MHz, which is the open frequency band between the medium-wave radio band (0.52MHz to 1.73MHz) and the short-wave radio band (5.8MHz to 6.3MHz). Due to the use of external components (printed inductor and discrete capacitor), the Tx oscillation frequency will change over temperature, mainly depending on the temperature coefficient of the discrete capacitor (see C_T in the application circuit on page 1).

Recommendation: Use a capacitor with a low temperature coefficient (see the recommendation given below Table 8).

In order to ensure that the oscillation frequency is within the boundaries of a given application, the oscillation frequency of the Tx oscillator is internally measured and displayed as a proportional value in a register. The user can select upper and lower limits for these register values that will create an alarm flag when the oscillation frequency is outside of these programmable boundaries.

17. Application Examples

Typical coil and target arrangements are shown in Figure 21 to Figure 24: As examples, rotary designs for $1 \times 360^\circ$, $2 \times 180^\circ$, $3 \times 120^\circ$ and $4 \times 90^\circ$ are shown. Many other combinations (essentially any $n \times 360^\circ/n$) are possible, where n is an integer number.

For example, in sensor designs for brushless DC rotor position feedback, n could be the number of pole pairs on the rotor. In such cases, the output signal of the IPS2200 would be one electric period per each pole pair.

Figure 21. Coil Design and Signal Output for a 360° Rotary Sensor

Figure 22. Coil Design and Signal Output for a $2 \times 180^\circ$ Rotary SensorFigure 23. Coil Design and Signal Output for a $3 \times 120^\circ$ Rotary SensorFigure 24. Coil Design and Signal Output for a $4 \times 90^\circ$ Rotary Sensor

18. Electromagnetic Compatibility (EMC)

Guidelines for EMC compliant circuit designs are available in a separate document "IPS2200 EMC recommendations" on request.

19. Package Outline Drawings

The package outline drawings are appended at the end of this document and are accessible from the link below. The package information is the most current data available.

www.idt.com/document/psc/16-tssop-package-outline-drawing-44mm-body-065mm-pitch-pgg16t1

20. Marking Diagram

20.1 Marking of Production Parts

- Line 1: First characters of part code (IPS); "ES" is added for engineering samples
- Line 2: Next four characters of the part code (2200) followed by
 - B = Design revision
 - I = Operation temperature range, Industrial
- Line 3: "LOT" = Lot number
- Line 4: "YYWW" = Manufacturing date:
 - YY = last two digits of manufacturing year
 - WW = manufacturing week
 - R = RoHS compliant statement

21. Ordering Information

Orderable Part Number	Description and Package	MSL Rating	Carrier Type	Temperature
IPS2200BI1W	16-TSSOP, 4.4 × 5.0 mm	1	7" Reel, 500 parts / reel	-40° to +125°C
IPS2200BI1R	16-TSSOP, 4.4 × 5.0 mm	1	13" Reel, 4000 parts / reel	-40° to +125°C
Note: For communication and programming, the IPS2200 Application Modules listed below require an IPS-COMBOARD, which is available separately.				
IPS2200STKIT	IPS2200 Starter Kit including USB communication board, application module and connection cables			

22. Revision History

Revision	Date	Description
1.2	Jul.15.20	Pin naming aligned with other position sensor products
1.1	Jul.1.20	Formulas added for calculating the LC oscillator frequency.
1.0	Apr.15.20	Official release for product launch <ul style="list-style-type: none"> • 3.3V and 5V supply voltage operation changed. • Circuit and block descriptions updated. • Values updated for absolute maximum ratings, operating conditions, and electrical characteristics. • Updated formatting. • Section 9 (Output Modes) is added.
0.1	Feb.16.19	Preliminary release.

NOTE:

1. ALL DIMENSIONS ARE IN MILLIMETERS

LAND PATTERN DIMENSIONS

Package Revision History		
Date Created	Rev No.	Description
Jan 26, 2018	Rev 00	Revised from PSC-4056-02 PGG16

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
