

High Speed 3-Channel Digital Isolator

NCID9301, NCID9311

Description

The NCID9301 and NCID9311 are galvanically isolated high-speed 3-channel digital isolator with output enable. This device supports isolated communications thereby allowing digital signals to communicate between systems without conducting ground loops or hazardous voltages.

It utilizes onsemi's patented galvanic off-chip capacitor isolation technology and optimized IC design to achieve high insulation and high noise immunity, characterized by high common mode rejection and power supply rejection specifications. The thick ceramic substrate yields capacitors with ~25 times the thickness of thin film on-chip capacitors and coreless transformers. The result is a combination of the electrical performance benefits that digital isolators offer with the safety reliability of a >0.5 mm insulator barrier similar to what has historically been offered by optocouplers.

The device is housed in a 16-pin wide body small outline package.

Features

- Off-Chip Capacitive Isolation to Achieve Reliable High Voltage Insulation
 - ◆ DTI (Distance Through Insulation): ≥ 0.5 mm
 - ◆ Maximum Working Insulation Voltage: 2000 V_{peak}
- Bi-directional Communication
- 100 kV/μs Minimum Common Mode Rejection
- 8 mm Creepage and Clearance Distance to Achieve Reliable High Voltage Insulation
- Specifications Guaranteed Over 2.5 V to 5.5 V Supply Voltage and -40°C to 125°C Extended Temperature Range
- Over Temperature Detection
- Output Enable Function (Primary and Secondary side)
- NCIV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable (Pending)
- Safety and Regulatory Approvals
 - ◆ UL1577, 5000 V_{RMS} for 1 Minute
 - ◆ DIN EN/IEC 60747-17 (Pending)

Typical Applications

- Isolated PWM Control
- Industrial Fieldbus Communications
- Microprocessor System Interface (SPI, I²C, etc.)
- Programmable Logic Control
- Isolated Data Acquisition System
- Voltage Level Translator

1. VINX = Input signal of a given channel (A, B or C). EN_X = Enable pin for primary or secondary side (1 or 2). V_{OX} = Output signal of a given channel (A, B or C). V_{DDI} = Input-side V_{DD}. V_{DDO} = Output-side V_{DD}. X = Irrelevant. H = High level. L = Low level. NC = No Connection.
2. The outputs are in undetermined state when V_{DDO} < V_{UVLO}.

SAFETY AND INSULATION RATINGS

As per DIN EN/IEC 60747-17, this digital isolator is suitable for “safe electrical insulation” only within the safety limit data. Compliance with the safety ratings must be ensured by means of protective circuits.

I_{OL}	Low Level Output Current	–	2	mA
DR	Signaling Rate	0	15	Mbps

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

- During power up or down, ensure that both the input and output supply voltages reach the proper recommended operating voltages to avoid any momentary instability at the output state.
- For reliable operation at recommended operating conditions, V_{DD} supply pins require at least a pair of external bypass capacitors, placed within 2 mm from V_{DD} pins 1 and 16 and GND pins 2 and 15. Recommended values are 0.1 μF and 1 μF .

ISOLATION CHARACTERISTICS

Apply over all recommended conditions. All typical values are measured at $T_A = 25^\circ\text{C}$.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{ISO}	Input-Output Isolation Voltage	$T_A = 25^\circ\text{C}$, Relative Humidity < 50%, $t = 1.0$ minute, $I_{I-O} \leq 10 \mu\text{A}$, 50 Hz (Notes 5, 6, 7)	5000	–	–	V_{RMS}
R_{ISO}	Isolation Resistance	$V_{I-O} = 500$ V (Note 5)	–	10^{11}	–	
C_{ISO}	Isolation Capacitance	$V_{I-O} = 0$ V, Frequency = 1.0 MHz (Note 5)	–	1	–	pF

- Device is considered a two-terminal device: pins 1 to 8 are shorted together and pins 9 to 16 are shorted together.
- 5,000 V_{RMS} for 1-minute duration is equivalent to 6,000 V_{RMS} for 1-second duration.
- The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating, refer to equipment-level safety specification or DIN EN/IEC 60747-17 Safety and Insulation Ratings Table on page 4.

APPLICATION INFORMATION

Theory of Operation

NCID9301 and NCID9311 are 3-channel digital isolators. The chip to chip galvanic isolation are provided by a pair of off-chip capacitors. Digital circuits are used for processing signals through the 0.5 mm thick isolation barrier.

Pins are trimmed internally as input or output at IO Switch. Each direction of communication between two isolated circuits are achieved by implementing a pair of Serializer/Deserializer and Manchester Encoder/Decoder functional blocks as shown in Figure 17. The Serializer circuit converts the parallel data from the IO Switch into a serial (one bit) stream and the Manchester Encoder converts this data stream into coded data making it more robust, efficient and accurate for transmission. After encoding, all inputs signals are coded as V_{ITX} and transmitted across the isolation barrier via Transceiver.

The off-chip ceramic capacitors that serve both as the isolation barrier and as the medium of transmission for signal switching using On-Off keying (OOK) technique, illustrated in the transceiver block diagram in Figure 18

and Figure 19. At the transmitter side, the V_{ITX} input logic state is modulated with a high frequency carrier signal. The resulting signal is amplified and transmitted to the isolation barrier. The receiver side detects the barrier signal and demodulates it using an envelope detection technique and output V_{ORX} .

The output signal of the transceiver V_{ORX} will go to the Manchester Decoder. This decoder is used along with the receiver to recover the original data from the coded form and the Deserializer converts the serial stream back to the original, parallel data and redistributed back to the corresponding output pins. Both the Serializer/Deserializer and Manchester Encoder/Decoder are functional blocks on the transmitting and receiving chips.

The output enable pin EN controls the impedance of the V_{OX} . When EN is at LOW, output V_{OX} is set to high impedance state. The V_{OX} will only follow the V_{INX} when EN is set to HIGH. V_{OX} is at default state LOW when the power supply at the transmitter side is turned off or the input V_{INX} is disconnected.

Layout Recommendation

Layout of the digital circuits relies on good suppression of unwanted noise and electromagnetic interference. It is recommended to use 4-layer FR4 PCB, with ground plane below the components, power plane below the ground plane, signal lines and power fill on top, and signal lines and ground fill at the bottom as shown in Figure 20. The alternating polarities of the layers creates interplane capacitances that aids the bypass capacitors required for reliable operation at digital switching rates.

In the layout with digital isolators, it is required that the isolated circuits have separate ground and power planes. The section below the device should be clear with no power, ground or signal traces. Maintain a gap equal to or greater than the specified minimum creepage clearance of the device package.

It is highly advised to connect at least a pair of low ESR supply bypass capacitors, placed within 2 mm from the

power supply pins 1 and 16 and ground pins 2 and 15 as shown in Figure 21. Recommended values are 1 μ F and 0.1 μ F, respectively. Place them between the V_{DD} pins of the device and the via to the power planes, with the higher frequency, lower value capacitor closer to the device pins. Directly connect the device ground pins 2, 8, 9 and 15 by via to their corresponding ground planes.

Over Temperature Detection

NCID9301 and NCID9311 have built-in Over Temperature Detection (OTD) feature that protects the IC from thermal damage. The output pins will automatically switch to default state when the ambient temperature exceeds the maximum junction temperature at threshold of approximately 160°C. The device will return to normal operation when the temperature decreases approximately 20°C below the OTD threshold.
