

General Description

The MAX22500E evaluation kit (EV kit) is a fully assembled and tested PCB that demonstrates the functionality of the MAX22500E half-duplex high speed RS-485/RS-422 transceiver with preemphasis functionality. The EV kit operates from a single 5V supply and includes on-board termination.

Features

- Operates From a Single 5V Supply
- Terminal Block and RJ45 Connectors for Easy RS-485/RS-422 Evaluation
- On-board Selectable Preemphasis Setting
- Fully Assembled and Tested

Quick Start

Required Equipment

- MAX22500E EV kit
- 5V, 500mA DC power supply
- 80MHz signal/function generator
- Oscilloscope

Startup Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation.

- 1) Ensure that all jumpers are in their default positions (see [Table 1](#)).
- 2) Set the DC power supply to 5V and connect the DC power supply to the VCC test point. Connect the ground terminal of the 5V supply to the GND test point.
- 3) Turn on the power supply.
- 4) Set the signal/function generator to output a 30MHz 0-to-5V square wave.
- 5) Connect the signal/function generator to the DI test point.
- 6) Using the oscilloscope, verify that the A, B, and RO outputs switch as expected with the signal on DI.

[Ordering Information](#) appears at end of data sheet.

Detailed Description of Hardware

The MAX22500E EV kit is a fully assembled and tested circuit board for evaluating the MAX22500E high-speed, half-duplex RS-485/RS-422 transceiver (U1). The EV kit is powered from a single 5V power supply and can be used for standalone evaluation or can be connected (using the on-board terminal block) to an RS-485/RS-422 network for easy in-system evaluation.

Powering the Board

The MAX22500E operates from a 5V voltage supply. The device also includes a separate logic supply input (VL) to interface with logic signal as low as 1.6V.

Close the J4 jumper to connect VL to VCC (VL = 5V), to operate the EV kit with a single supply.

Open the J4 jumper and connect a separate logic supply to the VL test point (TP6) to operate with a supply logic lower than 5V.

Driver and Receiver Enable

The EV kit features three jumpers (J3, J5, and J8) to enable/disable the driver and receiver outputs. Set J3 to low (2-3) to enable the receiver. Set J3 to high (1-2) to enable the driver.

To actively control both enables, remove the J2 and J3 jumpers and close J4, which connects DE and RE together.

Setting the Preemphasis

The MAX22500E features integrated driver preemphasis circuitry for reliable communication higher data rates over longer distances. Preemphasis is set with by connecting a resistor between PSET and ground.

The MAX22500E EV kit includes a 15k Ω to set the preemphasis for a 30Mbps data rate. Set the switch (SW1) to the on position to enable preemphasis. To disable preemphasis, set SW1 to the off position.

Termination for an End-of-Line Transceiver

The MAX22500E EV kit includes a 120 Ω termination resistor (R7) between the A and B RS-485 receiver inputs on the MAX22500E.

Table 1. Jumper Table (J1–J9)

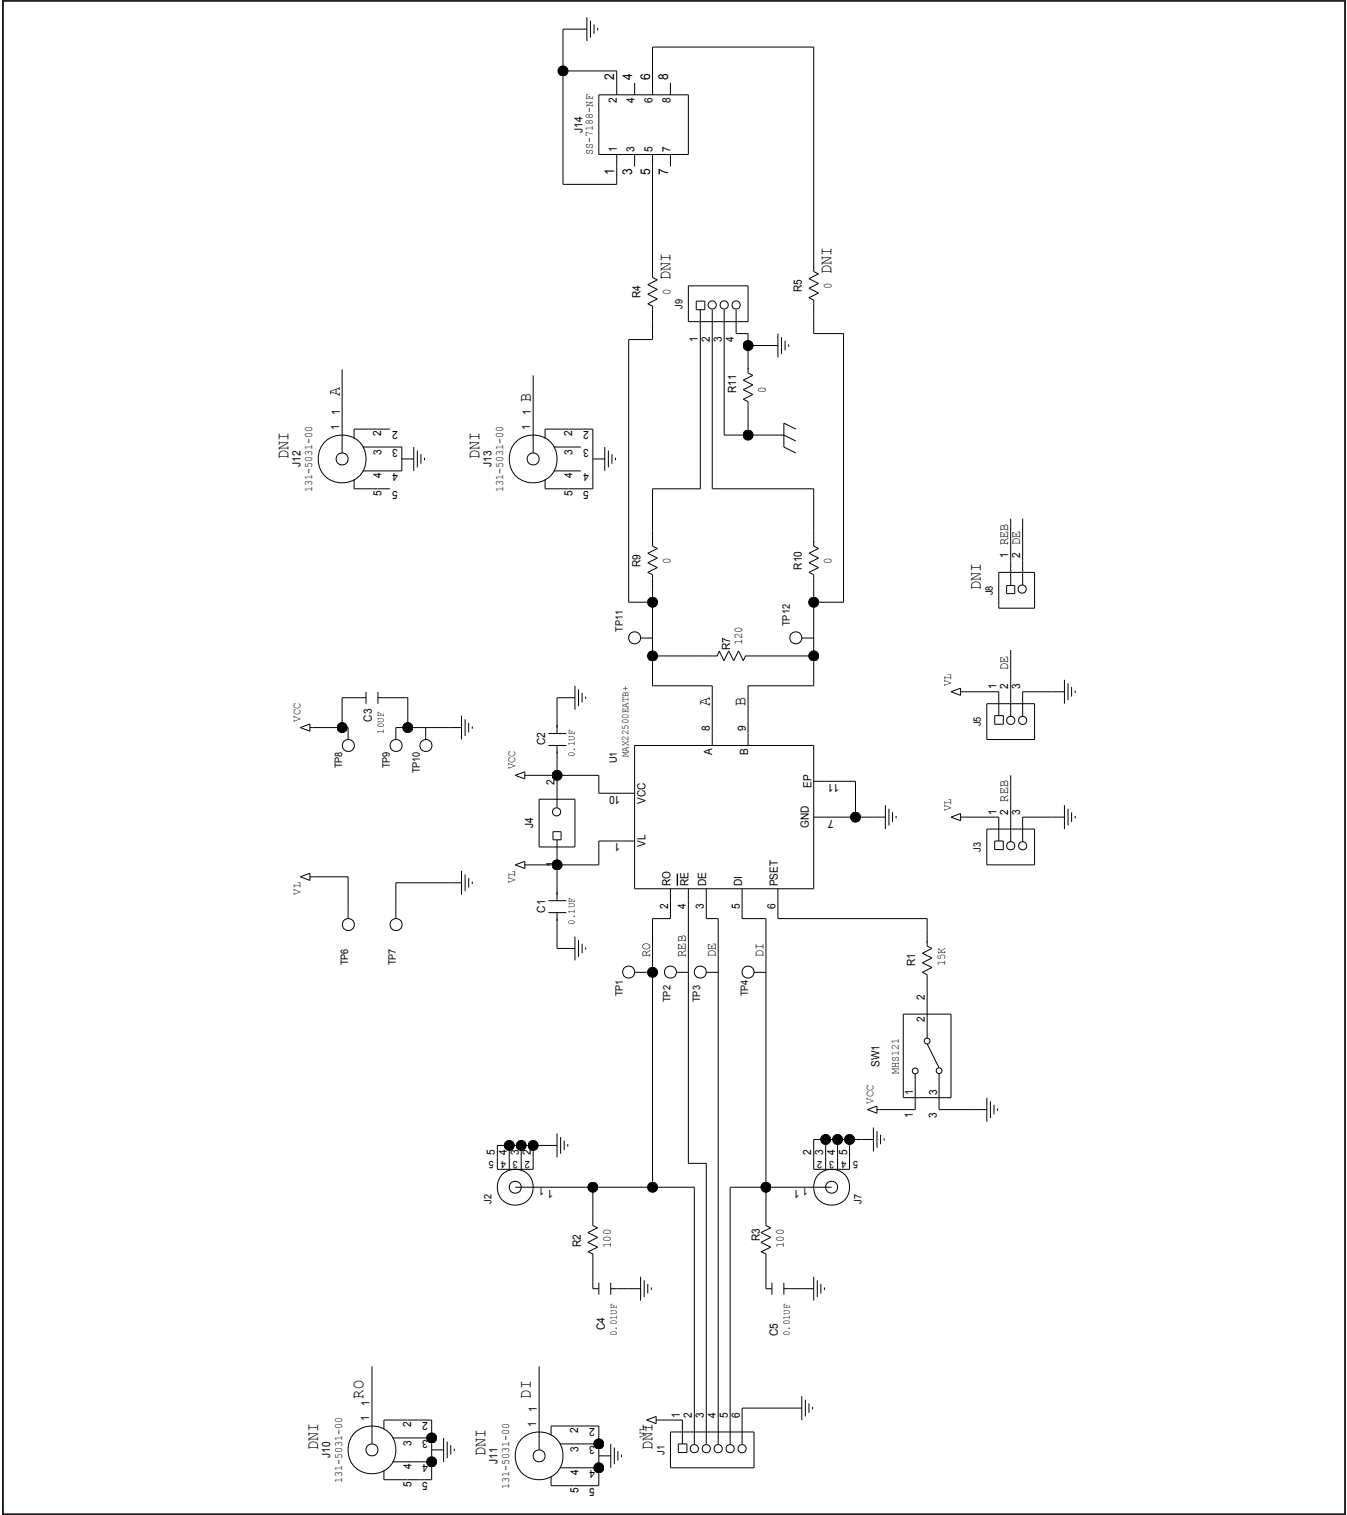

JUMPER	SHUNT POSITION	DESCRIPTION
J3	1-2	Receiver is disabled.
	2-3*	Receiver is enabled.
J4	Open	VL is not connected to VCC. Apply an external voltage to power VL.
	Closed*	VL is connected to VCC.
J5	1-2*	Driver is enabled.
	2-3	Driver is disabled.
J8	Open*	DE and $\overline{\text{RE}}$ are not connected together.
	Closed	DE and $\overline{\text{RE}}$ are connected together.

*Default position.
