

3-phase solid state relays

Main features

- Zero cross switching 3-phase solid state relay
- Ratings up to 690 VAC, 75 AAC
- High blocking voltage
- DC or AC control voltage
- Integrated over voltage protection
- Over-temperature protection option with alarm output
- LED indication of control input and over-temperature alarm status
- UL certified motor ratings

Description

The **RZ3A** is a 3-phase, 3-pole switching solid state relay suitable for various industrial loads such as heating elements, motors and transformers.

The series covers a range of load currents, up to 75 AAC. The maximum current rating depends on the size of the heatsink to which the solid state relay is mounted. The output is protected against over voltages by means of an integrated varistor. Control ON indication is provided through a green LED.

The **RZ3A..P** optionally provides integrated over temperature protection that will protect the solid state relay output against damage from overheating. In case of overheating, an LED indication and alarm output is activated for remote signaling.

Specifications are at a surrounding temperature of 25°C unless otherwise specified.

Applications

Plastic extrusion machines, thermoforming machines, blow moulding machines, coffee machines, electrical ovens, vending machines, reflow ovens, dryers, climatic chambers, air handling units, plastic sealing machines, shrink tunnels, etc.

Main functions

- 3-pole switching AC solid state relay
- Rated operational current: 3x 25 AAC, 55 AAC or 75 AAC
- Voltage ratings: 400 VAC, 480 VAC, 600 VAC or 690 VAC
- 4-32 VDC or 24-275 VAC control voltage

Note:

- Performance Criteria 1 (PC1): no degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2 (PC2): during the test, degradation of performance or partial loss of function is allowed. However when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3 (PC3): temporary loss of function is allowed, provided the function can be restored by manual operation of the controls.
- Control input lines must be installed together to maintain products' susceptibility to Radio Frequency interference.

Use of AC solid state relays may, according to the application and the load current, cause conducted radio interferences. Use of mains filters may be necessary for cases where the user must meet E.M.C requirements. The capacitor values given inside the filtering specification tables should be taken only as indications, the filter attenuation will depend on the final application.

Short circuit protection

Protection Co-ordination, Type 1 vs Type 2:

Type 1 protection implies that after a short circuit, the device under test will no longer be in a functioning state. In type 2 co-ordination the device under test will still be functional after the short circuit. In both cases, however the short circuit has to be interrupted. The fuse between enclosure and supply shall not open. The door or cover of the enclosure shall not be blown open. There shall be no damage to conductors or terminals and the conductors shall not separate from terminals. There shall be no breakage or cracking of insulating bases to the extent that the integrity of the mounting of live parts is impaired. Discharge of parts or any risk of fire shall not occur.

The product variants listed in the table hereunder are suitable for use on a circuit capable of delivering not more than 65,000 Arms Symmetrical Amperes 600 Volts maximum when protected by fuses. Tests at 65,000 A were performed with Class J fuses, fast acting; please refer to the table below for maximum allowed ampere rating of the fuse. Use fuses only.

Tests with Class J fuses are representative of Class CC fuses.
