| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_17</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_17</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                   |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_EMC_17</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                          |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_EMC_17</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> |

## IOMUXC\_SW\_PAD\_CTL\_PAD\_GPIO\_EMC\_20 field descriptions (continued)

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_20</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_EMC_20</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_EMC_20</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_EMC_26<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_EMC_26<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |

| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_EMC_26<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |

| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_37</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_37</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                   |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_EMC_37</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                          |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_EMC_37</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> |

## IOMUXC\_SW\_PAD\_CTL\_PAD\_GPIO\_EMC\_40 field descriptions (continued)

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_EMC_40</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_EMC_40</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                                      |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_EMC_40</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |
| 5–3<br>DSE   | <p>Drive Strength Field</p> <p>Select one out of next values for pad: GPIO_EMC_40</p> <p>000 <b>DSE_0</b> — HI-Z</p> <p>001 <b>DSE_1</b> — Dual/Single voltage: 262/260 Ohm @ 1.8V, 247/157 Ohm @ 3.3V</p> <p>010 <b>DSE_2</b> — Dual/Single voltage: 134/130 Ohm @ 1.8V, 126/78 Ohm @ 3.3V</p> <p>011 <b>DSE_3</b> — Dual/Single voltage: 88/88 Ohm @ 1.8V, 84/53 Ohm @ 3.3V</p> <p>100 <b>DSE_4</b> — Dual/Single voltage: 62/65 Ohm @ 1.8V, 57/39 Ohm @ 3.3V</p> <p>101 <b>DSE_5</b> — Dual/Single voltage: 51/52 Ohm @ 1.8V, 47/32 Ohm @ 3.3V</p> <p>110 <b>DSE_6</b> — Dual/Single voltage: 43/43 Ohm @ 1.8V, 40/26 Ohm @ 3.3V</p> <p>111 <b>DSE_7</b> — Dual/Single voltage: 37/37 Ohm @ 1.8V, 34/23 Ohm @ 3.3V</p>                                                 |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_EMC_41<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_EMC_41<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |

| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_EMC_41<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |

| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B0_05</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p> |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_AD_B0_05</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                               |

| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p>                                                                                                  |

|              | <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B0_08</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_AD_B0_08</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_AD_B0_08</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_AD_B0_09<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_AD_B0_09<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_AD_B0_09<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |

Field</p> <p>Controls signals to select pull-up or pull-down internal resistance strength.</p> <p>Select one out of next values for pad: GPIO_AD_B0_15</p> <p>00 <b>PUS_0_100K_Ohm_Pull_Down</b> — 100K Ohm Pull Down</p> <p>01 <b>PUS_1_47K_Ohm_Pull_Up</b> — 47K Ohm Pull Up</p> <p>10 <b>PUS_2_100K_Ohm_Pull_Up</b> — 100K Ohm Pull Up</p> <p>11 <b>PUS_3_22K_Ohm_Pull_Up</b> — 22K Ohm Pull Up</p>                                                                                                                                                                                                                     |
| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B0_15</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B0_15</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p> |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_AD_B0_15</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p>                                                                                                  |

## IOMUXC\_SW\_PAD\_CTL\_PAD\_GPIO\_AD\_B1\_02 field descriptions (continued)

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B1_02</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_AD_B1_02</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                                      |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_AD_B1_02</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |
| 5–3<br>DSE   | <p>Drive Strength Field</p> <p>Select one out of next values for pad: GPIO_AD_B1_02</p> <p>000 <b>DSE_0</b> — HI-Z</p> <p>001 <b>DSE_1</b> — Dual/Single voltage: 262/260 Ohm @ 1.8V, 247/157 Ohm @ 3.3V</p> <p>010 <b>DSE_2</b> — Dual/Single voltage: 134/130 Ohm @ 1.8V, 126/78 Ohm @ 3.3V</p> <p>011 <b>DSE_3</b> — Dual/Single voltage: 88/88 Ohm @ 1.8V, 84/53 Ohm @ 3.3V</p> <p>100 <b>DSE_4</b> — Dual/Single voltage: 62/65 Ohm @ 1.8V, 57/39 Ohm @ 3.3V</p> <p>101 <b>DSE_5</b> — Dual/Single voltage: 51/52 Ohm @ 1.8V, 47/32 Ohm @ 3.3V</p> <p>110 <b>DSE_6</b> — Dual/Single voltage: 43/43 Ohm @ 1.8V, 40/26 Ohm @ 3.3V</p> <p>111 <b>DSE_7</b> — Dual/Single voltage: 37/37 Ohm @ 1.8V, 34/23 Ohm @ 3.3V</p>                                                 |

| 13<br>PUE    | Pull / Keep Select Field<br>Control signal to enable internal pull-up/down resistors or pad keeper functionality.<br>Select one out of next values for pad: GPIO_AD_B1_03<br>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.<br>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).                                                                                                                                                                                                                                                                                                                                                                                         |
| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_AD_B1_03<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_AD_B1_03<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_AD_B1_03<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |
| 5–3<br>DSE   | Drive Strength Field<br>Select one out of next values for pad: GPIO_AD_B1_03                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B1_09</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B1_09</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p> |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_AD_B1_09</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p>                                                                                                  |

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_AD_B1_12</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_AD_B1_12</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_AD_B1_12</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_AD_B1_13<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_AD_B1_13<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_AD_B1_13<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |
| 5–3<br>DSE   | Drive Strength Field<br>Select one out of next values for pad: GPIO_AD_B1_13                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_B0_08</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_B0_08</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                   |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_B0_08</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                          |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_B0_08</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> |

| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_B0_11</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_B0_11</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |

|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_B1_00</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_B1_00</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_B1_01<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_B1_01<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_B1_01<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |

| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_B1_07</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                   |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_B1_07</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                          |

It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_B1_08<br><br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                            |

| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_SD_B0_00<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_SD_B0_00<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |

| 15–14<br>PUS | Pull Up / Down Config. Field<br>Controls signals to select pull-up or pull-down internal resistance strength.<br>Select one out of next values for pad: GPIO_SD_B0_01<br>00 <b>PUS_0_100K_Ohm_Pull_Down</b> — 100K Ohm Pull Down<br>01 <b>PUS_1_47K_Ohm_Pull_Up</b> — 47K Ohm Pull Up<br>10 <b>PUS_2_100K_Ohm_Pull_Up</b> — 100K Ohm Pull Up<br>11 <b>PUS_3_22K_Ohm_Pull_Up</b> — 22K Ohm Pull Up                                                                                                                                                                                                                         |
| 13<br>PUE    | Pull / Keep Select Field<br>Control signal to enable internal pull-up/down resistors or pad keeper functionality.<br>Select one out of next values for pad: GPIO_SD_B0_01<br>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.<br>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).                                                                                                                                                                                                                                                                          |
| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_SD_B0_01<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_SD_B0_01<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                    |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_SD_B0_01<br>00 <b>Low</b> — 50MHz     |

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_SD_B0_04</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_SD_B0_04</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_SD_B0_04</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |
| 5–3<br>DSE   | <p>Drive Strength Field</p> <p>Select one out of next values for pad: GPIO_SD_B0_04</p> <p>000 <b>DSE_0</b> — HI-Z</p> <p>001 <b>DSE_1</b> — Dual/Single voltage: 262/260 Ohm @ 1.8V, 247/157 Ohm @ 3.3V</p> <p>010 <b>DSE_2</b> — Dual/Single voltage: 134/130 Ohm @ 1.8V, 126/78 Ohm @ 3.3V</p> <p>011 <b>DSE_3</b> — Dual/Single voltage: 88/88 Ohm @ 1.8V, 84/53 Ohm @ 3.3V</p> <p>100 <b>DSE_4</b> — Dual/Single voltage: 62/65 Ohm @ 1.8V, 57/39 Ohm @ 3.3V</p> <p>101 <b>DSE_5</b> — Dual/Single voltage: 51/52 Ohm @ 1.8V, 47/32 Ohm @ 3.3V</p> <p>110 <b>DSE_6</b> — Dual/Single voltage: 43/43 Ohm @ 1.8V, 40/26 Ohm @ 3.3V</p> <p>111 <b>DSE_7</b> — Dual/Single voltage: 37/37 Ohm @ 1.8V, 34/23 Ohm @ 3.3V</p>                                                 |

| 13<br>PUE    | Pull / Keep Select Field<br>Control signal to enable internal pull-up/down resistors or pad keeper functionality.<br>Select one out of next values for pad: GPIO_SD_B0_05<br>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.<br>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).                                                                                                                                                                                                                                                                                                                                                                                         |
| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_SD_B0_05<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_SD_B0_05<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_SD_B0_05<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |
| 5–3<br>DSE   | Drive Strength Field<br>Select one out of next values for pad: GPIO_SD_B0_05                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Field</p> <p>Controls signals to select pull-up or pull-down internal resistance strength.</p> <p>Select one out of next values for pad: GPIO_SD_B1_05</p> <p>00 <b>PUS_0_100K_Ohm_Pull_Down</b> — 100K Ohm Pull Down</p> <p>01 <b>PUS_1_47K_Ohm_Pull_Up</b> — 47K Ohm Pull Up</p> <p>10 <b>PUS_2_100K_Ohm_Pull_Up</b> — 100K Ohm Pull Up</p> <p>11 <b>PUS_3_22K_Ohm_Pull_Up</b> — 22K Ohm Pull Up</p>                                                                                                                                                                                                                     |
| 13<br>PUE    | <p>Pull / Keep Select Field</p> <p>Control signal to enable internal pull-up/down resistors or pad keeper functionality.</p> <p>Select one out of next values for pad: GPIO_SD_B1_05</p> <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_SD_B1_05</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p> |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0. Select one out of next values for pad: GPIO_SD_B1_05</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p>                                                                                                  |

| Field        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.</p> <p>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 12<br>PKE    | <p>Pull / Keep Enable Field</p> <p>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).</p> <p>When the pull/keeper is disabled, PUE and PUS have no functionality.</p> <p>Select one out of next values for pad: GPIO_SD_B1_08</p> <p>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled</p> <p>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled</p>                                                                                                                        |
| 11<br>ODE    | <p>Open Drain Enable Field</p> <p>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.</p> <p>Select one out of next values for pad: GPIO_SD_B1_08</p> <p>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)</p> <p>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)</p>                                                                                                                                                               |
| 10–8<br>-    | <p>This field is reserved.</p> <p>Reserved</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 7–6<br>SPEED | <p>Speed Field</p> <p>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>Select one out of next values for pad: GPIO_SD_B1_08</p> <p>00 <b>Low</b> — 50MHz</p> <p>01 <b>Medium</b> — 100MHz - 150MHz</p> <p>10 <b>Medium</b> — 100MHz - 150MHz</p> <p>11 <b>Maximum</b> — 150MHz - 200MHz</p> |

| 13<br>PUE    | Pull / Keep Select Field<br>Control signal to enable internal pull-up/down resistors or pad keeper functionality.<br>Select one out of next values for pad: GPIO_SD_B1_09<br>0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled.<br>1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).                                                                                                                                                                                                                                                                                                                                                                                         |
| 12<br>PKE    | Pull / Keep Enable Field<br>The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).<br>When the pull/keeper is disabled, PUE and PUS have no functionality.<br>Select one out of next values for pad: GPIO_SD_B1_09<br>0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled<br>1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled                                                                                                                |
| 11<br>ODE    | Open Drain Enable Field<br>If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.<br>Select one out of next values for pad: GPIO_SD_B1_09<br>0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS)<br>1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)                                                                                                                                                   |
| 10–8<br>-    | This field is reserved.<br>Reserved                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 7–6<br>SPEED | Speed Field<br>SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.<br>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.<br>Select one out of next values for pad: GPIO_SD_B1_09<br>00 <b>Low</b> — 50MHz<br>01 <b>Medium</b> — 100MHz - 150MHz<br>10 <b>Medium</b> — 100MHz - 150MHz<br>11 <b>Maximum</b> — 150MHz - 200MHz |
| 5–3<br>DSE   | Drive Strength Field<br>Select one out of next values for pad: GPIO_SD_B1_09                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### 12.2 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

**Figure 12-1. Chip IOMUX Scheme**

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO\_DR)
- GPIO direction register (GPIO\_GDIR)
- Pad sample register (GPIO\_PSR)
- Interrupt control registers (GPIO\_ICR1, GPIO\_ICR2)

- Edge select register (GPIO\_EDGE\_SEL)
- Interrupt mask register (GPIO\_IMR)
- Interrupt status register (GPIO\_ISR)

These registers are described in detail in the Register section.

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO\_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for  $n = 0 - 7$ ). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

### 12.2.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 12-2](#)

**Figure 12-2. GPIO Block Diagram**

## 12.2.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (GPIO\_DR)
  - Controls the direction of the signal using the GPIO direction register (GPIO\_GDIR)
  - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO\_PSR).
- GPIO interrupt capabilities:
  - Supports up to 32 interrupts
  - Identifies interrupt edges
  - Generates three active-high interrupts to the SoC interrupt controller

## 12.3 Clocks

The table found here describes the clock sources for GPIO.

Please see the CCM for clock setting, configuration and gating information.

**Table 12-2. GPIO Clocks**

| Clock name | Description             |
|------------|-------------------------|
| ipg_clk_s  | Peripheral access clock |

## 12.4 GPIO Functional Description

This section provides a complete functional description of the block.

### 12.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO\_GDIR).

When configured as an output (GPIO\_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO\_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO\_GDIR bit = 0), the state of the input can be read from the corresponding GPIO\_PSR bit.

## 12.4.2 GPIO pad structure

Figure 12-3. GPIO pad functional diagram

### 12.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

#### 12.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 12-4. Schmitt trigger transfer characteristic

Figure 12-5. Receiver output in CMOS and hysteresis

#### 12.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

#### 12.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type

- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

Figure 12-6. Output Driver Functional Diagram

#### 12.4.2.2.1 Drive strength

Drive strength selection can be used to make the impedance matched and get better signal integrity.

#### 12.4.2.2.2 Output keeper

A simple latch to hold the input value.

**Figure 12-7. Keeper functional diagram**

#### 12.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

#### 12.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

Figure 12-8. Output buffer in open drain mode

12.4.2.3 Operating Frequency

Table 12-3. IO Operating Frequency

| DSE Setting | SRE / SPEED Setting | R_fixture (Ohm)<br>OVDD = 1.8V nominal | R_fixture (Ohm)<br>OVDD = 3.3V nominal | Operating Frequency<br>(MHz) |

## 12.4.3 GPIO Programming

### 12.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO\_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

#### NOTE

While the GPIO direction is set to input (GPIO\_GDIR = 0), a read access to GPIO\_DR does not return GPIO\_DR data. Instead, it returns the GPIO\_PSR data, which is the corresponding input signal value.

### 12.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO\_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO\_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

## 12.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO\_ICR1 and GPIO\_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO\_ICR1 and GPIO\_ICR2 settings, see the Register section.

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

## 12.5 GPIO register descriptions

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

### 12.5.1 GPIO memory map

GPIO1 base address: 401B\_8000h

GPIO2 base address: 401B\_C000h

GPIO3 base address: 401C\_0000h

GPIO4 base address: 401C\_4000h

GPIO5 base address: 400C\_0000h

| Offset | Register                                      | Width<br>(In bits) | Access | Reset value |
|--------|-----------------------------------------------|--------------------|--------|-------------|
| 0h     | GPIO data register (DR)                       | 32                 | RW     | 0000_0000h  |
| 4h     | GPIO direction register (GDIR)                | 32                 | RW     | 0000_0000h  |
| 8h     | GPIO pad status register (PSR)                | 32                 | RO     | 0000_0000h  |
| Ch     | GPIO interrupt configuration register1 (ICR1) | 32                 | RW     | 0000_0000h  |
| 10h    | GPIO interrupt configuration register2 (ICR2) | 32                 | RW     | 0000_0000h  |
| 14h    | GPIO interrupt mask register (IMR)            | 32                 | RW     | 0000_0000h  |
| 18h    | GPIO interrupt status register (ISR)          | 32                 | W1C    | 0000_0000h  |
| 1Ch    | GPIO edge select register (EDGE_SEL)          | 32                 | RW     | 0000_0000h  |
| 84h    | GPIO data register SET (DR_SET)               | 32                 | WO     | 0000_0000h  |
| 88h    | GPIO data register CLEAR (DR_CLEAR)           | 32                 | WO     | 0000_0000h  |
| 8Ch    | GPIO data register TOGGLE (DR_TOGGLE)         | 32                 | WO     | 0000_0000h  |

## 12.5.2 GPIO data register (DR)

### 12.5.2.1 Offset

| Register | Offset |
|----------|--------|
| DR       | 0h     |

### 12.5.2.2 Function

The 32-bit GPIO\_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO\_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.

- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

| Field | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31-0  | DR                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DR    | <p>Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).</p> <p><b>NOTE:</b> The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.</p> |

## 12.5.3 GPIO direction register (GDIR)

### 12.5.3.1 Offset

| Register | Offset |
|----------|--------|
| GDIR     | 4h     |

12.5.3.2 Function

GPIO\_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

12.5.3.4 Fields

| Field | Function                                                                                                                                                                                                                                                                                                     |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31-0  | GDIR                                                                                                                                                                                                                                                                                                         |
| GDIR  | GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.<br><b>NOTE:</b> GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.<br>0b - GPIO is configured as input.<br>1b - GPIO is configured as output. |

12.5.4 GPIO pad status register (PSR)

12.5.4.1 Offset

| Register | Offset |
|----------|--------|
| PSR      | 8h     |

### 12.5.4.2 Function

GPIO\_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the `ipg_clk_s` clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

| Field | Function                                                                                                                                                                                                                                                        |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31-0  | PSR                                                                                                                                                                                                                                                             |
| PSR   | <p>GPIO pad status bits (status bits). Reading GPIO_PSR returns the state of the corresponding input signal.</p> <p>Settings:</p> <p><b>NOTE:</b> The IOMUXC must be configured to GPIO mode for GPIO_PSR to reflect the state of the corresponding signal.</p> |

## 12.5.5 GPIO interrupt configuration register1 (ICR1)

## 12.5.5.1 Offset

| Register | Offset |
|----------|--------|
| ICR1     | Ch     |

## 12.5.5.2 Function

GPIO\_ICR1 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

## 12.5.6 GPIO interrupt configuration register2 (ICR2)

### 12.5.6.1 Offset

| Register | Offset |
|----------|--------|
| ICR2     | 10h    |

### 12.5.6.2 Function

GPIO\_ICR2 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

### 12.5.6.3 Diagram

## 12.5.8 GPIO interrupt status register (ISR)

### 12.5.8.1 Offset

| Register | Offset |
|----------|--------|
| ISR      | 18h    |

### 12.5.8.2 Function

The GPIO\_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

### 12.5.8.3 Diagram

### 12.5.8.4 Fields

| Field | Function                                                                                                                                                                                                                                                                      |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31-0  | ISR                                                                                                                                                                                                                                                                           |
| ISR   | Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR. |

## GPIO register descriptions

| Field | Function                                                                                                                                                                             |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position. |

## 12.5.9 GPIO edge select register (EDGE\_SEL)

### 12.5.9.1 Offset

| Register | Offset |
|----------|--------|
| EDGE_SEL | 1Ch    |

### 12.5.9.2 Function

GPIO\_EDGE\_SEL may be used to override the ICR registers' configuration. If the GPIO\_EDGE\_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

### 12.5.9.3 Diagram

### 12.5.9.4 Fields

| Field | Function      |
|-------|---------------|
| 31-0  | GPIO_EDGE_SEL |

| Field         | Function                                                                                                                                   |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| GPIO_EDGE_SEL | Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal. |

## 12.5.10 GPIO data register SET (DR\_SET)

# Chapter 13

## Clock and Power Management

### 13.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

### 13.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

information on the CCM architecture, functional description and programming model.

- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

### 13.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management subsystem are implemented in the following blocks:

- Power Management Unit (PMU). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.
- On Chip DC-DC regulator. See the DCDC chapter for more detailed information.

### 13.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the [System Reset Controller \(SRC\)](#).

### 13.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

#### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

## **13.3 Clock Management**

### 13.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

Figure 13-2. Clock Management System

### 13.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 13.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

#### NOTE

1. The 24 MHz XTALOSC can be the external clock source of SYSTICK. Hardware divides this down to 100KHz before it reaches SYSTICK.
2. If XTALOSC24M\_LOWPWR\_CTRLn[OSC\_SEL] is set to ROSC, the chip's 24MHz clock will be from the 24MHz RCOSC. In this case, the RCOSC should be enabled properly beforehand.

### 13.3.2.2 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{vco}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the Arm core complex. It is a programmable integer frequency multiplier capable of output

frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency.

- PLL2 (also referred to as System\_PLL or 528\_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs (PLL2\_PFD0...PLL2\_PFD3). The main PLL2 output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, SDRAM interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1\_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3\_PFD0...PLL3\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL3 output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency
- PLL6 (also referred to as ENET\_PLL) - This PLL implements a fixed  $20 + (5/6)$  multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
  - 50 or 25 MHz for the external ethernet interface.
  - 125 MHz for reduced gigabit ethernet interface.
  - 100 MHz for general purposes.
- PLL7 (also referred to as USB2\_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as OTG PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

### 13.3.2.2.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the `BYPASS_CLK_SRC` field of the PLL control register. See [CCM Analog Memory Map/ Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the `BYPASS` bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (`ENABLE=0`), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the `ENABLE` bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related `PFDx_CLKGATE` bit in `CCM_ANALOG_PFD_480n` or `CCM_ANALOG_PFD_528n`, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be clock un-gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.nxp.com](http://www.nxp.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### 13.3.2.3 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- Arm core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

#### NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

### 13.3.2.4 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.

- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

### **13.3.3 Peripheral components of clock management system**

#### **13.3.3.1 Interface and functional clock**

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### 13.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

#### 13.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM\_CMEOR).

#### 13.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### **13.3.3.3 Clock Domain(s)**

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

### **13.3.3.4 Domain level clock management**

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### **13.3.3.5 Domain dependencies**

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## 13.4 Power management

### 13.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

Figure 13-3. Power Management System

#### 13.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

**Figure 13-4. SOC Power Tree**

The integrated PMU includes the following components:

- On-chip DCDC regulator
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

### 13.4.1.1.1 DCDC Regulator

The DCDC regulator includes the following features:

- Adjustable (25 mV per step) high efficiency regulator
- Supports 3.3 V ( $\pm 10\%$ ) input voltage
- Output ranged in 0.9 V~1.3 V
- Supports nominal run, low power standby and off modes
- Supports 0.9 V~1.3 V output in run mode

- Supports 0.9 V~1.0 V output in standby mode
- Over current and over voltage detection

These modes allow the regulator to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

The DVFS (Dynamic Voltage and Frequency Scaling) in a typical cost/complexity optimized application is considered by means of an internal DCDC. The DCDC workpoint can be dynamically adjusted according to the system's working frequency requirement.

#### 13.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 (VDD\_HIGH\_IN, NVCC\_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.
- LDO\_2P5 - The LDO\_2P5 (VDD\_HIGH\_IN, VDD\_HIGH\_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power (weak) regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, and other analog and mix signal components integrated into the SoC.

#### 13.4.1.1.3 USB LDO

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

#### 13.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS modules. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

#### 13.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and Memory sub-domain (PDRAMx).
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 160 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

#### 13.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

### 13.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

**Figure 13-5. Power domain interface**

#### 13.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- Arm - The Arm domain contains the Arm Core platform (except for TCM memory arrays and controller). This domain can be supplied from internal or external controllable regulator.
- FlexRAM memory array - The FlexRAM memory array is partitioned into 3 sub-domains:
  - 32 KB always-on domain (also known as **PDRET** domain: Bank0 of FlexRAM)
  - 224 KB **PDRAM0** domain (Bank1 to Bank7 of FlexRAM)
  - 256 KB **PDRAM1** domain (Bank8 to Bank15 of FlexRAM) which could be power-gated separately.
- SNVS/RTC low power domain - The SRTC (Secure Real Time Counter) domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply. This SNVS domain also contains Low Power State Retention (LPSR) GPIO, IOMUX, and LPSR general purpose register.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC. It is supplied by the same power supply as the Arm Core Platform.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Arm Core Platform - DVFS and power gating.
- FlexRAM memories - DVFS and power gating.
- Main SoC logic - DVFS, no power gating.

#### 13.4.1.4.2 Domain memory and domain logic state retention in case of power gating

The following is the list of relevant memories and logic domains with the description of their state-retention support.

#### NOTE

For more detailed information, see the table "Low Power Mode Definition" in this chapter.

- Arm Core Platform logic - the software state retention for all logic is implemented in this domain and L1 cache memories. Software state retention means that the content of relevant registers should be stored in some memory retaining its state (OCRAM for example) while the logic domain is power-gated.
- PDRET memories - hardware state-retention in all power modes except SNVS mode.
- FlexRAM PDRAM0 memories - hardware state-retention . When Arm core is power gated, PDRAM0 memories can be either left on with its content retained or power gated together with the core.
- FlexRAM PDRAM1 memories - can be powered gated (together) independently of Arm core power gating.
- SoC - hardware state-retention .
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

### 13.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

#### 13.4.1.4.3.1 Arm Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. The ISO field determines the delay between the power-down request and enabling the platform isolation. The ISO2SW field determines the delay between the platform isolation and the actual power-off switch to the supplies.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. The SW field determines the delay between the power-up request and the actual power-up of the supplies. The SW2ISO field determines the delay between asserting power toggle and negating platform isolation.
  - Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
  - Arm Core Platform should execute a "WFI" instruction.

**Figure 13-6. Arm Core Platform isolation and power on switch flow**

#### 13.4.1.4.3.2 FlexRAM PDRAMx

1. Configure the GPC/PGC Registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the PDRAMx logic from the rest of the SoC logic (PGC\_MEGA\_x Registers controls PDRAM1 domain, while PDRAM0 domain follows PGC\_CPU\_x Register configuration):

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC\_CNTR to power down PDRAMx

**Figure 13-7. PDRAMx isolation and power on switch flow**

#### 13.4.1.4.3.3 SoC

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply,

configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

#### 13.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Arm Core Platform and PDRAMx - Isolation needs to be enabled before power-down. This is taken care of automatically after CCM and PGC are configured and the Arm Core Platform executes the "WFI" instruction.
- SNVS\_LP - Different from the 2 domains above, the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP (such as the real-time clock). The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

**Figure 13-8. Isolation cells and Voltage level shifters placing**

#### 13.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- SoC domain: including Core Platform, FlexRAM memories and SoC logic - Scalable voltage in both dynamic and static scenarios
- ANALOG components including PLLs - Fixed voltage

- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 13.4.1.6 Voltage domain management

#### 13.4.1.6.1 Dynamic

##### 13.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the Arm and SoC voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

#### 13.4.1.6.2 Static

##### 13.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next Arm "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Arm Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

### 13.4.1.7 System domains layout

The following table describes the different power modes.

For more information regarding the low-power application design points on i.MX RT series, see the application note [AN12085: How to use i.MX RT Low Power Feature](#).

#### NOTE

The IDLE, SUSPEND and SNVS are usually referred as low power mode.

- **IDLE Modes:** CPU in WFI state, some portion of the chip can be clock gated or power gated. The chip can wakeup from this mode from IRQ with a very short latency. IDLE mode is entered automatically from RUN mode when CPU executes WFI instruction, so the state of IDLE mode will have dependency on the state of the RUN mode. To avoid showing a lot of IDLE modes, the following two IDLE states are defined:
  - **System IDLE:** the IDLE mode entered from Low Speed Run mode. When entering from other RUN modes, the difference is mainly the CPU/Bus frequency.
  - **Low Power IDLE:** the IDLE mode entered from Low Power RUN mode.
- **SUSPEND Mode:** CPU power gated, all clocks gated only except 32KHz, analog modules also enter low power state. It provides the lowest power while keeps the system alive, but it would have longer exit time.
- **SNVS Mode:** All the modules are turned off, only except RTC is active.

**Table 13-1. Low Power Mode Definition**

|                    | Overdrive Run | Full Speed Run | Low Power Run | System Idle | Low Power Idle | Suspend      | SNVS |
|--------------------|---------------|----------------|---------------|-------------|----------------|--------------|------|
| VDD_SOC_IN voltage | 1.25V min     | 1.15V min      | 0.925V min    | 1.15V min   | 0.925V min     | 0.925V min   | OFF  |
| CCM LPM Mode       | Run           | Run            | Run           | WAIT        | WAIT           | STOP         | N/A  |
| Arm Core           | up to 600 MHz | up to 528 MHz  | up to 24 MHz  | WFI         | WFI            | Powered down | OFF  |

*Table continues on the next page...*

**Table 13-1. Low Power Mode Definition (continued)**

|                     | Overdrive Run           | Full Speed Run          | Low Power Run           | System Idle             | Low Power Idle          | Suspend      | SNVS                |
|---------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|--------------|---------------------|
| AHB Clock           | up to 600 MHz           | up to 528 MHz           | up to 24 MHz            | up to 528 MHz           | up to 24 MHz            | OFF          | OFF                 |
| IPG clock           | up to 150 MHz           | up to 132 MHz           | up to 24 MHz            | up to 132 MHz           | up to 24 MHz            | OFF          | OFF                 |
| PER clock           | up to 75 MHz            | up to 72 MHz            | up to 24 MHz            | up to 72 MHz            | up to 24 MHz            | OFF          | OFF                 |
| L1 Cache            | ON                      | ON                      | ON                      | ON                      | ON                      | Powered down | OFF                 |
| PDRET               | ON                      | ON                      | ON                      | ON                      | ON                      | ON           | OFF                 |
| PDRAM0              | ON                      | ON                      | ON                      | ON                      | ON                      | ON           | OFF                 |
| PDRAM1              | ON                      | ON                      | ON                      | ON/OFF                  | ON/OFF                  | ON/OFF       | OFF                 |
| System PLL          | ON                      | ON                      | Powered down            | ON                      | Powered down            | Powered down | OFF                 |
| Other PLL           | ON                      | ON                      | Powered down            | Powered down            | Powered down            | Powered down | OFF                 |
| XTAL                | ON                      | ON                      | OFF                     | ON                      | OFF                     | OFF          | OFF                 |
| RC OSC              | OFF                     | OFF                     | ON                      | OFF                     | ON                      | OFF          | OFF                 |
| LDO2P5              | ON                      | ON                      | OFF                     | ON                      | OFF                     | OFF          | OFF                 |
| LDO1P1              | ON                      | ON                      | OFF                     | ON                      | OFF                     | OFF          | OFF                 |
| WEAK2P5             | OFF                     | OFF                     | ON                      | OFF                     | ON                      | OFF          | OFF                 |
| WEAK1P1             | OFF                     | OFF                     | ON                      | OFF                     | ON                      | OFF          | OFF                 |
| Bandgap             | ON                      | ON                      | OFF                     | ON                      | OFF                     | OFF          | OFF                 |
| Low Power Bandgap   | ON                      | ON                      | ON                      | ON                      | ON                      | ON           | OFF                 |
| Module clocks       | ON as configured in CCM | ON as configured in CCM | ON as configured in CCM | ON as configured in CCM | ON as configured in CCM | OFF          | OFF                 |
| GPIO wakeup         | N/A                     | N/A                     | N/A                     | Yes                     | Yes                     | Yes          | Yes<br>(1 pin only) |
| RTC wakeup          | N/A                     | N/A                     | N/A                     | Yes                     | Yes                     | Yes          | Yes                 |
| USB remote wakeup   | N/A                     | N/A                     | N/A                     | Yes                     | Yes                     | Yes          | No                  |
| Other wakeup source | N/A                     | N/A                     | N/A                     | Yes                     | Yes                     | No           | No                  |

There is a single hardware signal (stop\_mode) coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is controlled by the PMU\_MISC0[STOP\_MODE\_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 13-2. STOP mode configuration**

| Block       | STOP_MODE_CONFIG=0                                                      | STOP_MODE_CONFIG=1                                                         |
|-------------|-------------------------------------------------------------------------|----------------------------------------------------------------------------|
| reg1p1      | off                                                                     | on                                                                         |
| reg2p5      | off                                                                     | on                                                                         |
| reg3p0      | off/on depending on vbus. Uses crude local reference if vbus is present | off/on depending on vbus . Uses analog central bandgap if VBUS is present. |
| bandgap     | off                                                                     | functional                                                                 |
| temp_sensor | off                                                                     | off                                                                        |
| well_bias   | hardware controlled                                                     | hardware controlled                                                        |
| All PLLs    | off                                                                     | off                                                                        |
| OSC24M      | off                                                                     | Controlled by CCM configuration                                            |

## 13.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for Arm core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

### 13.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 13-3. Power saving design/architecture and power saving techniques**

| Techniques                                              | Active SoC Power | Standby SoC Power | System Power |
|---------------------------------------------------------|------------------|-------------------|--------------|
| Temperature Monitoring, and active frequency throttling | √                |                   |              |
| Arm Core Platform SRPG (Software)                       |                  | √                 |              |
| Arm Core Platform Power Gating                          |                  | √                 |              |
| Clock gating (automatic dynamic and forced)             | √                |                   |              |
| Integrated PMU (IR drop, efficiency, accuracy)          | √                |                   | √            |

### 13.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the Arm domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 13.4.2.3 Peripheral Power management

#### 13.4.2.3.1 IO power reduction

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)

#### 13.4.2.4 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

Figure 13-9. SOC Power Architecture

## 13.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS\_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a `pmic_en_b` and `set_pwr_off_irq` signal. PMIC logic also supports the SNVS\_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the `pmic_en_b` is generated by the state of the state machine.

**Figure 13-10. Dumb PMIC Mode State Machine**

The Dumb PMIC Mode uses `pmic_en_b` to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- **Debounce:** The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the `set_pwr_off_irq` interrupt. While in the ON state and the button is pressed longer than the debounce time the `set_pwr_off_irq` is generated.
- **Off to On Time:** The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. After the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- **Max Timeout:** The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Smart PMIC mode is meant to connect to another PMIC. The `pmic_en_b` signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the `set_pwr_off_irq`.

## 13.6 WAKEUP Pin

This chip supports the use of a WAKEUP pin (GPIO5\_IO00 ALT5) to request main SoC power on to exit SNVS mode. To use it, follow the tips below.

- SNVS must be in Dumb PMIC mode (*default*, and must for on-chip DCDC)
- Configure IOMUXC\_SNVS to select WAKEUP pin ALT5 to mux it to GPIO5\_IO00
- Configure GPIO5 ICR to either low level or high level sensitive
- Set GPIO5 IMR bit0 to enable GPIO5\_IO00 interrupt
- Enter SNVS mode by SW or ON/OFF button, then on-chip DCDC will be off, and PMIC\_ON\_REQ pin will also go to low to notify outside
- Assert WAKEUP pin for at least two 32 KHz cycles (active high or low depends on GPIO5 ICR configuration), so that GPIO5 interrupt gets sampled by SNVS module
- SNVS will assert PMIC\_ON\_REQ pin high and on-chip DCDC begins to ramp on
- SoC power on procedure (except SNVS) begins (ROM boot, ...)

#### NOTE

The OCRAM clock cannot be turned off when CM7 Cache is running, on this device. See [CCM\\_CCGR3\[CG14\]](#) bitfield.

System STOP/WAIT status can be observed on pin. See CCM\_STOP/CCM\_WAIT in the "Muxing Options" table of the [External Signals and Pin Multiplexing](#) chapter, for pin muxing details.

### 14.2 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

## 14.2.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- Arm core root clock is generated from a dedicated source clock.
- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for Arm core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

## 14.2.2 CCM Block Diagram

**Figure 14-1. Block Diagram**

CCM contains the following sub-blocks:

**Table 14-2. CCM Sub-blocks**

| CCM_CLK_SRC_DIV Sub-block | Description                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCM_CLK_IGNITION          | Manages the ignition process. This module starts its functionality after CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset. |
| CCM_CLK_SWITCHER          | Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates switcher clock outputs ( pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.                                                       |

*Table continues on the next page...*

**Table 14-2. CCM Sub-blocks (continued)**

| CCM_CLK_SRC_DIV Sub-block | Description                                                                                                                                                                       |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CCM_CLK_ROOT_GEN          | Receives the main clocks (PLLs / PFDs) and generates the output root clocks.                                                                                                      |
| CCM_CLK_LOGIC             | Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks. |
| CCM_LPM                   | Manages the low power modes of the IC.                                                                                                                                            |
| CCM_HND_SK                | Manages the handshake when changing certain root clock dividers that require handshake.                                                                                           |

## 14.3 External Signals

The following table describes the external signals of CCM:

**Table 14-3. CCM External Signals**

| Signal            | Description                                                                                                                                                   | Pad           | Mode | Direction |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------|-----------|
| CCM_REF_EN_B      | Enable external reference clock (CKIH)                                                                                                                        | GPIO_SD_B1_07 | ALT6 | O         |
| CCM_CLKO1         | Observability clock 1 output                                                                                                                                  | GPIO_SD_B0_04 | ALT6 | O         |
| CCM_CLKO2         | Observability clock 2 output                                                                                                                                  | GPIO_SD_B0_05 | ALT6 | O         |
| CCM_PMIC_STBY_REQ | Signal coming from PMIC to indicate that the voltage started to change in PMIC_STBY_REQ. CCM will ignore this indication if CLPCR [BYPASS_PMIC_READY] is set. | PMIC_STBY_REQ | ALT0 | I         |
| CCM_PMIC_READY    | Signal goes to STANBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.                                | GPIO_AD_B0_12 | ALT1 | O         |
|                   |                                                                                                                                                               | GPIO_EMC_32   | ALT3 | O         |
|                   |                                                                                                                                                               | GPIO_AD_B1_08 | ALT3 | O         |
|                   |                                                                                                                                                               | GPIO_AD_B1_01 | ALT4 | O         |
|                   |                                                                                                                                                               | GPIO_SD_B1_03 | ALT6 | O         |

## 14.4 CCM Clock Tree

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

For detailed sub-block information, see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

### NOTE

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.

## CLOCK SWITCHER

## CLOCK ROOT GEN

## SYSTEM CLOCKS

Figure 14-3. Clock Tree - Part 2

## 14.5 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

Table 14-4. System Clocks, Gating, and Override

| Module            | Module Clock | Clock Root   | Module Clock Gating Enable        | Module Override Enable |
|-------------------|--------------|--------------|-----------------------------------|------------------------|
| ACMP <sub>n</sub> | acmp1 clocks | ipg_clk_root | CCGR3[CG10]<br>(acmp1_clk_enable) |                        |
|                   | acmp2 clocks | ipg_clk_root | CCGR3[CG11]<br>(acmp2_clk_enable) |                        |

Table continues on the next page...

## 14.6 Functional Description

This section provides a complete functional description of the block.

### 14.6.1 Clock Generation

#### 14.6.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

##### 14.6.1.1.1 CKIL synchronizing to IPG\_CLK

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

#### 14.6.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

#### 14.6.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency )

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

#### 14.6.1.3.1 ARM PLL (PLL1)

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

PLL output frequency = Fref \* DIV\_SEL/2

#### NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

#### 14.6.1.3.2 System PLL (PLL2)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM\_ANALOG\_PLL\_SYS\_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}{\text{CCM\_ANALOG\_PLL\_SYS\_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STEP]}}{2 \times \text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}$$

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

This PLL also supports a Fractional-N synthesizer.

#### 14.6.1.3.3 USB1 PLL (PLL3)

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation.

#### 14.6.1.3.4 Audio PLL (PLL4)

The audio PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

#### 14.6.1.3.5 Video PLL (PLL5)

The video PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

#### 14.6.1.3.6 Ethernet PLL (PLL6)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The reference clocks generated by this PLL are:

- ref\_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll2 fixed at 25 MHz

#### 14.6.1.3.7 USB2 PLL (PLL7)

USB2 PLL is only used by the USB UTM interface through a direct connection.

#### 14.6.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{vco} * 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.nxp.com](http://www.nxp.com) for procedure details.

#### 14.6.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

CCM\_CLK\_ROOT\_GEN

#### 14.6.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

Figure 14-4 describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

### Figure 14-4. Switcher clock generation

#### 14.6.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM\_ANALOG module, switcher and clk\_root\_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

### 14.6.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

### 14.6.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

Figure 14-5. BUS clock generation

**NOTE**

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

**14.6.1.5.5 Divider change handshake**

Modifying the following dividers will start the handshake .

- `periph_clk_sel`
- `arm_podf`
- `ahb_podf`

The dividers listed above are designed with a handshake. For dividers without a handshake design, the following sequence must be performed when updating PODF value:

1. Gate the output clock off before updating PODF value.
2. Gate the output clock on after the PODF value is updated and stable.

To update the PODF value without gating the output clock off will cause unpredictable results such as no clock output.

**14.6.1.6 Disabling / Enabling PLLs**

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

**14.6.1.7 Clock Switching Multiplexers**

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM uses several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. For the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are several glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

**Table 14-6. Glitchless Multiplexers**

| Glitchless Mux  | Mux Select Bit        | Handshake Bit               |
|-----------------|-----------------------|-----------------------------|
| periph_clk_mux  | CBCDR[periph_clk_sel] | CDHIPR[periph_clk_sel_busy] |
| semc_clk_mux    | CBCDR[semc_clk_sel]   |                             |
| pll3_sw_clk_mux | CCSR[pll3_sw_clk_sel] |                             |

### NOTE

Any change of the periph\_clk\_sel sync mux select will involve handshake. Refer to the CDHIPR register for the handshake busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 14-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the AHB\_CLK\_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH\_CLK2\_SEL] and CBCDR[PERIPH\_CLK2\_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH\_CLK\_SEL].

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The output clocks to the mux are required to be gated before switching the source clock in the CCM clock mux. If the output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

#### 14.6.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

**Figure 14-6. Clock split in LPCG**

## 14.6.2 DVFS support

When performing DVFS, the frequency shift procedure for the Arm core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM\_ANALOG module.

### NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

### NOTE

CCM\_ANALOG will not control the voltage value in Bypass mode

### 14.6.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

#### 14.6.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

#### 14.6.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all Arm cores are in WFI, and L2 cache and SCU are idle.

##### 14.6.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. After CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

Any enabled interrupt assertion will start the exit from WAIT mode.

### 14.6.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 14.6.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for Arm platform. External supply voltage can be reduced to decrease leakage.

#### 14.6.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM\_PMIC\_STBY\_REQ asserted, if vstby bit is set
- osc\_en signal is negated
- osc\_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM\_PMIC\_STBY\_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

#### 14.6.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.

3. After the number of cycles of CKILs defined in `stby_count` bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until `oscnt` has finished its counting to make sure that oscillator is ready.
5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore Arm power by `GPC_PUP_REQ`. If power was removed from the Arm platform, GPC will notify CCM by asserting signal `GPC_PUP_ACK` that power to Arm is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. After assertion of notification from src that the resets for the power gated modules has been finished, (`src_power_gating_reset_done` is set) negate the low power request signals to all modules and enable all module clocks including Arm clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

After the system is in run mode, the `ccm_ipg_stop` and `system_in_stop_mode` signals negate.

## 14.7 CCM Memory Map/Register Definition

### NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at boot time](#) for more information.

**CCM memory map**

| Absolute address (hex) | Register name                                        | Width (in bits) | Access | Reset value | Section/page                |
