CFB750-300S Series

Application Note V15 December 2020

1. Introduction

The CFB750-300S Series is an industry standard half-brick DC-DC converter, providing up to 750W of output power @ single output voltages of 12, 15, 24, 28, 36, 48VDC. It has a high input voltage range of 200 to 425VDC (300VDC nominal) and reinforced with a 3000VAC isolation.

High efficiency up to 91%, allowing case operating temperature range of -40°C to 85°C . An optional heat sink is available to extend the full power range of the unit. Very low no load power consumption (10mA), an ideal solution for energy critical system applications.

The standard control functions include remote on/off (positive or negative) and 60-110% adjustable output voltage.

Fully protected against input UVLO (under voltage lock out), output over-current, output over-voltage and over-temperature and continuous short circuit conditions.

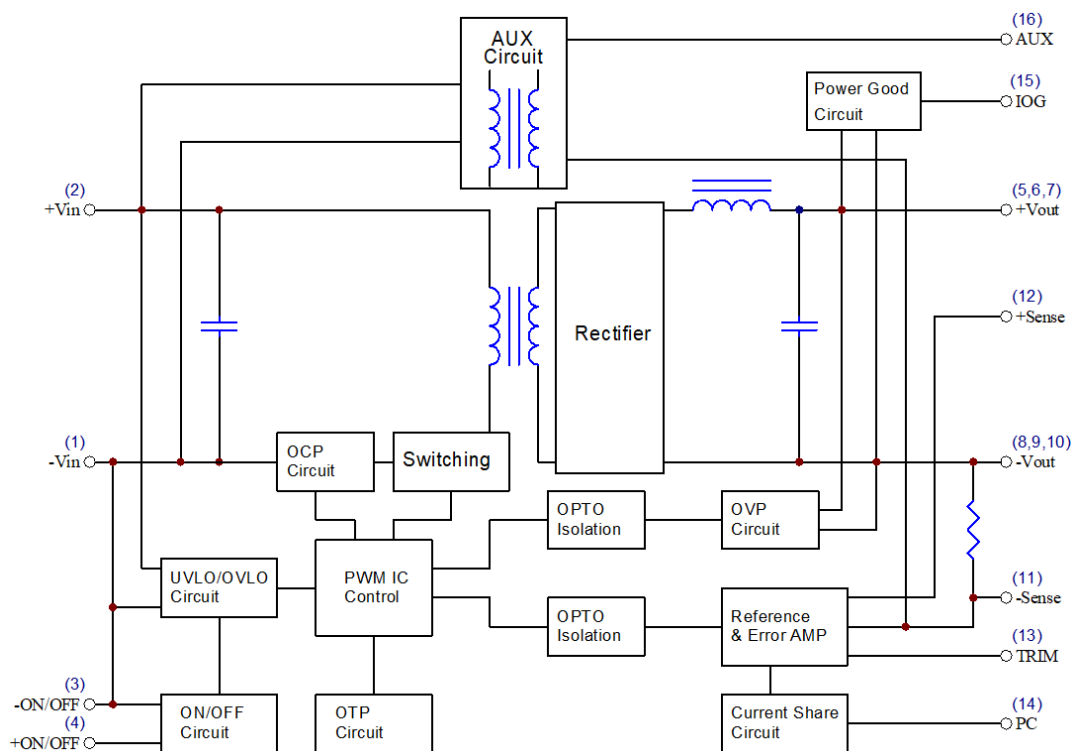

All models are highly suitable for distributed power architectures, telecommunications, servers, base station, battery operated equipment, and industrial applications.

2. DC-DC Converter Features

- 750W Isolated Output
- Efficiency to 91%
- Fixed Switching Frequency
- Low No Load Power Consumption
- Remote On/Off
- Input Under-Voltage Protection
- Over Temperature Protection
- Over Voltage/Current Protection
- Full Brick Size meet Industrial Standard
- Single Wire Parallel
- Safety Meets IEC/EN/UL 62368-1
- Fully Isolated 3000VAC

3. Function Block and Sequence Time Chart

MTBF	I _o =100% of I _{o_maxi} MIL - HDBK - 217F_Notice 1, GB, 25°C	All		370		K hours
Weight		All		230		grams
Case Material	Plastic, DAP					
Baseplate Material	Aluminum					
Potting Material	UL 94V-0					
Pin Material	Base: Copper Plating: Nickel with Matte Tin					
Shock/Vibration	EN50155 / EN61373					
Humidity	95% RH max. Non Condensing					
Altitude	2000m Operating Altitude			12000m Transport Altitude		
Thermal Shock	MIL-STD-810F					
EMI	Meets EN55032 with external input filter, see 7.2				Class A	
ESD	Meets IEC/EN61000-4-2			Air ± 8 kV, Contanct ± 4 kV		Perf. Criteria A
Radiated immunity	Meets IEC/EN61000-4-3			3 V/m		Perf. Criteria A
Fast Transient	Meets IEC/EN61000-4-4 ± 1 kV, external input capacitor required, see 7				Perf. Criteria A	
Surge	Meets IEC/EN61000-4-5 EN55024: Line to Earth ±4kV, Line to Line ±2kV, external circuit required, see 7.1				Perf. Criteria A	
Conducted immunity	Meets IEC/EN61000-4-6			3Vrms		Perf. Criteria A
Power Frequency Magnetic Field Immunity	Meets IEC/EN61000-4-8			50/60Hz, 3A/m (r.m.s.)		Perf. Criteria A

CFB750-300S Series

Application Note V15 December 2020

5. Main Features and Functions

5.1 Operating Temperature Range

The CFB750-300S series converters can be operated within a wide case temperature range of -40°C to 85°C . Consideration must be given to the derating curves when ascertaining maximum power that can be drawn from the converter. The maximum power drawn from open full brick models is influenced by usual factors, such as:

- Input voltage range
- Output load current
- Forced air or natural convection
- Heat sink optional

5.2 Output Voltage Adjustment

Section 6.10 describes in detail how to trim the output voltage with respect to its set point. The output voltage on all models is adjustable within the range of $+10\%$ to -40% .

5.3 Over Current Protection

All models have internal over current and continuous short circuit protection. The unit operates normally once the fault condition is removed. At the point of current limit inception, the converter will go into Constant Current mode protection.

5.4 Output Over Voltage Protection

The output over voltage protection consists of circuitry that internally limits the output voltage. If more accurate output over voltage protection is required then an external circuit can be used via the remote on/off pin.

Note: Please note that device inside the power supply might fail when voltage more than rated output voltage

is applied to output pin. This could happen when the customer tests the over voltage protection of unit.

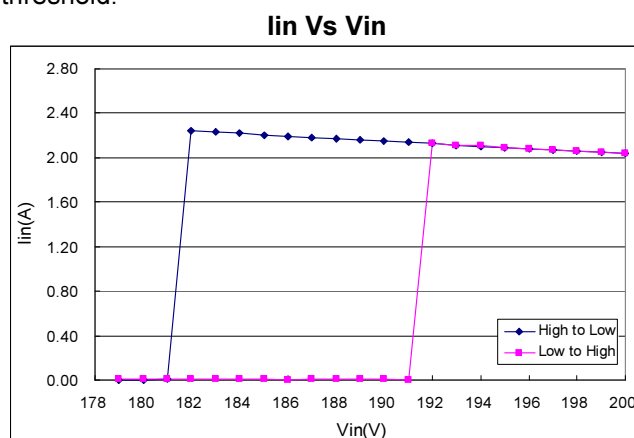

5.5 Remote On/Off

The CFB750-300S series allows the user to switch the module on and off electronically with the remote on/off feature. All models are available in "positive logic" and "negative logic" (optional) versions. The converter turns on if the remote on/off pin is high ($>3.5\text{Vdc}$ to 75Vdc or open circuit). Setting the pin low (0 to $<1.2\text{Vdc}$) will turn the converter off. The signal level of the remote on/off input is defined with respect to ground. If not using the remote on/off pin, leave the pin open (converter will be on). Models with part number suffix "N" are the "negative logic" remote on/off version. The unit turns off if the remote on/off pin is high ($>3.5\text{Vdc}$ to 75Vdc or open circuit). The converter turns on if the on/off pin input is low (0 to $<1.2\text{Vdc}$). Note that the converter is off by default. **See 6.14**

Logic State (Pin 2)	Negative Logic	Positive Logic
Logic Low – Switch Closed	Module on	Module off
Logic High – Switch Open	Module off	Module on

5.6 UVLO (Under Voltage Lock Out)

Input under voltage lockout is standard on the CFB750-300S unit. The unit will shut down when the input voltage drops below a threshold, and the unit will operate when the input voltage goes above the upper threshold.

5.7 Over Temperature Protection

These modules have an over temperature protection circuit to safeguard against thermal damage. Shutdown occurs with the maximum case reference temperature is exceeded. The module will restart when the case temperature falls below over temperature recovery threshold. Please measure case temperature of the center part of aluminum baseplate.

CFB750-300S Series

Application Note V15 December 2020

Lead Free Wave Soldering Profile

6. Applications

6.1 Recommend Layout, PCB Footprint and Soldering Information

The system designer or end user must ensure that metal and other components in the vicinity of the converter meet the spacing requirements for which the system is approved. Low resistance and inductance PCB layout traces are the norm and should be used where possible. Due consideration must also be given to proper low impedance tracks between power module, input and output grounds.

Clean the soldered side of the module with a brush, Prevent liquid from getting into the module. Do not clean by soaking the module into liquid. Do not allow solvent to come in contact with product labels or resin case as this may changed the color of the resin case or cause deletion of the letters printed on the product label. After cleaning, dry the modules well.

The suggested soldering iron is 450°C for up to 5seconds (less than 50W). Furthermore, the recommended soldering profile and PCB layout are shown below.

6.2 Connection for Standard Use

The connection for standard use is shown below. An external input capacitor (C1) 330uF for all models is recommended to reduce input ripple voltage. External output capacitors (C2, C3) are recommended to reduce output ripple and noise, 1000uF aluminum and 1uF ceramic capacitor.

The CFB750-300S series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 10A fast acting fuse for all models. It is recommended that the circuit have a transient voltage suppressor diode (TVS) across the input terminal to protect the unit against surge or spike voltage and input reverse voltage (as shown).

CFB750-300S Series

Application Note V15 December 2020

Symbol	Component	Reference
F1	Input fuse	Section 7.1
C1	External capacitor on input side	Note
C2, C3	External capacitor on the output side	Section 6.12/6.13
Noise Filter	External input noise filter	Section 7.2
Remote On/Off	External Remote On/Off control	Section 6.16
Trim	External output voltage adjustment	Section 6.10
Heat sink	External heat sink	Section 6.4/6.5/6.6/6.7
+Sense/-Sense	--	Section 6.11

Note:

If the impedance of input line is high, C1 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than -20 °C.

6.3 Input Capacitance at the Power Module

The converters must be connected to low AC source impedance. To avoid problems with loop stability source inductance should be low. Also, the input capacitors (Cin) should be placed close to the converter input pins to decouple distribution inductance. However, the external input capacitors are chosen for suitable ripple handling capability. Low ESR capacitors are good choice. Circuit as shown as below represents typical measurement methods for reflected ripple current. C1 and L1 simulate a typical DC source impedance. The input reflected-ripple current is measured by current probe to oscilloscope with a simulated source Inductance (L1).

L1: 12uH

C1: 330uF ESR<0.7ohm @100KHz

Cin: 330uF ESR<0.7ohm @100KHz

6.4 Convection Requirements for Cooling

To predict the approximate cooling needed for the quarter brick module, refer to the power derating curves in **section 6.6**. These derating curves are approximations of the ambient temperatures and airflows required to keep the power module temperature below its maximum rating. Once the module is assembled in the actual system, the module's temperature should be monitored to ensure it does not exceed 85°C as measured at the center of the top of the case (thus verifying proper cooling).

6.5 Thermal Considerations

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat is removed by conduction, convection, and radiation to the surrounding environment. The example is presented in **section 6.6**. The power output of the module should not be allowed to exceed rated power ($V_{o_set} \times I_{o_max}$).

CFB750-300S Series

Application Note V15 December 2020

6.6 Power Derating

The operating case temperature range of CFB750-300S series is -40°C to $+85^{\circ}\text{C}$. When operating the CFB750-300S series, proper derating or cooling is needed. The maximum case temperature under any operating condition should not exceed 85°C .

The following curve is the de-rating curve of CFB750-300S series without heat sink.

AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection	
20ft./min. (0.1m/s)	3.82 $^{\circ}\text{C/W}$
100 ft./min. (0.5m/s)	3.23 $^{\circ}\text{C/W}$
200 ft./min. (1.0m/s)	2.71 $^{\circ}\text{C/W}$
300 ft./min. (1.5m/s)	2.28 $^{\circ}\text{C/W}$
400 ft./min. (2.0m/s)	1.92 $^{\circ}\text{C/W}$
500 ft./min. (2.5m/s)	1.68 $^{\circ}\text{C/W}$
600 ft./min. (3.0m/s)	1.50 $^{\circ}\text{C/W}$
700 ft./min. (3.5m/s)	1.35 $^{\circ}\text{C/W}$
800 ft./min. (4.0m/s)	1.23 $^{\circ}\text{C/W}$

Example:

What is the minimum airflow necessary for a CFB750-300S48 operating at nominal line voltage, an output current of 11A, and a maximum ambient temperature of 25°C ?

Solution:

Given:

$$V_{in}=300V_{dc}, V_o=48V_{dc}, I_o=10A$$

Determine Power dissipation (P_d):

$$P_d = P_i - P_o = P_o(1-\eta)/\eta$$

$$P_d = 48V \times 10A \times (1-0.91)/0.91 = 47.47\text{Watts}$$

Determine airflow:

$$\text{Given: } P_d = 47.47\text{W and } T_a = 25^{\circ}\text{C}$$

Check Power Derating curve:

$$\text{Minimum airflow} = 800 \text{ ft./min.}$$

Verify:

Maximum temperature rise is

$$\Delta T = P_d \times R_{ca} = 47.47\text{W} \times 1.23 = 58.38^{\circ}\text{C.}$$

Maximum case temperature is

$$T_c = T_a + \Delta T = 83.38^{\circ}\text{C} < 85^{\circ}\text{C.}$$

Where:

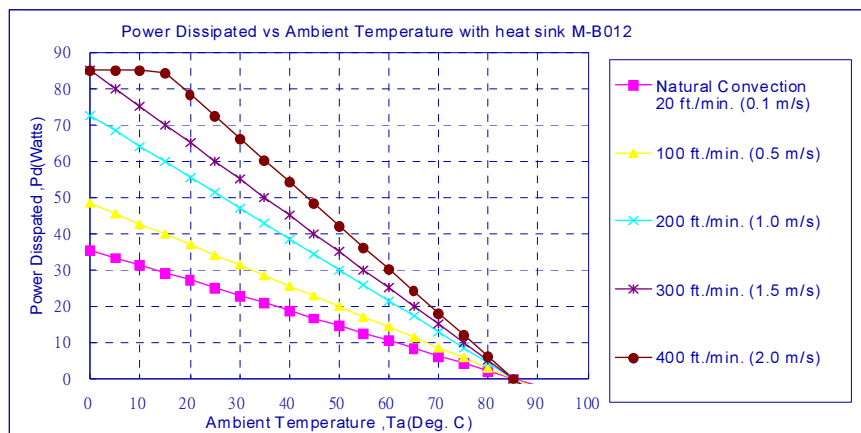

The R_{ca} is thermal resistance from case to ambient environment.

T_a is ambient temperature and T_c is case temperature.

CFB750-300S Series

Application Note V15 December 2020

AIR FLOW RATE	TYPICAL R_{ca}
Natural Convection 20ft./min. (0.1m/s)	2.4 °C/W
100 ft./min. (0.5m/s)	1.76 °C/W
200 ft./min. (1.0m/s)	1.17 °C/W
300 ft./min. (1.5m/s)	1.00 °C/W
400 ft./min. (2.0m/s)	0.83 °C/W

Example with heat sink FBL254 (M-B012):

What is the minimum airflow necessary for a CFB750-300S48 operating at nominal line voltage, an output current of 15.6A, and a maximum ambient temperature of 20°C?

Solution:

Given:

$$V_{in}=300V_{dc}, V_o=48V_{dc}, I_o=15.6A$$

Determine Power dissipation (P_d):

$$P_d = P_i - P_o = P_o(1 - \eta)$$

$$P_d = 48 \times 15.6 \times (1 - 0.91) / 0.91 = 74.1 \text{ Watts}$$

Determine airflow:

$$\text{Given: } P_d = 74.1 \text{ W and } T_a = 20^\circ\text{C}$$

Check above Power de-rating curve:

Minimum airflow= 400 ft./min

Verify:

$$\text{Maximum temperature rise is } \Delta T = P_d \times R_{ca} = 74.1 \times 0.83 = 61.5^\circ\text{C}$$

$$\text{Maximum case temperature is } T_c = T_a + \Delta T = 81.5^\circ\text{C} < 85^\circ\text{C}$$

Where:

The R_{ca} is thermal resistance from case to ambient environment.

T_a is ambient temperature and T_c is case temperature.

CFB750-300S Series

Application Note V15 December 2020

6.8 Efficiency VS. Load

CFB750-300S Series

Application Note V15 December 2020

6.9 Test Set-Up

The basic test set-up to measure parameters such as efficiency and load regulation is shown below. When testing the modules under any transient conditions please ensure that the transient response of the source is sufficient to power the equipment under test. We can calculate:

- Efficiency
- Load regulation and line regulation.

The value of efficiency is defined as:

$$\eta = \frac{V_o \times I_o}{V_{in} \times I_{in}} \times 100\%$$

Where:

V_o is output voltage,
 I_o is output current,
 V_{in} is input voltage,
 I_{in} is input current.

The value of load regulation is defined as:

$$Load.reg = \frac{V_{FL} - V_{NL}}{V_{NL}} \times 100\%$$

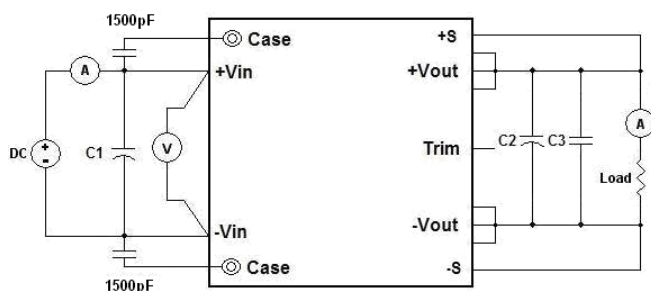

Where:

V_{FL} is the output voltage at full load
 V_{NL} is the output voltage at no load

The value of line regulation is defined as:

$$Line.reg = \frac{V_{HL} - V_{LL}}{V_{LL}} \times 100\%$$

Where: V_{HL} is the output voltage of maximum input voltage at full load. V_{LL} is the output voltage of minimum input voltage at full load.

CFB750-300S Series Test Setup

C1: 330uF/450V ESR<0.7Ω

C2: 1000uF aluminum capacitor.

C3: 1uF/ 1210 ceramic capacitor

6.10 Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down according to the trim range specification (60% to 110% of nominal output). This is accomplished by connecting an external resistor

between the +Vout and +Sense pin for trim up and between the TRIM and -Sense pin for trim down, This is shown:

The Trim pin should be left open if trimming is not being used. The output voltage can be determined by the following equations:

$$V_f = \frac{1.24 \times \left(\frac{R_t \times 33}{R_t + 33} \right)}{7.68 + \frac{R_t \times 33}{R_t + 33}}$$

$$V_{out} = (V_o + VR) \times V_f$$

R_t , VR Unit: KΩ

V_o : Nominal Output Voltage

Recommend $R_t=6.8K\Omega$

For example, to trim-up the output voltage of 24V module (CFB750-300S24) by 5% to 25.2V, to trim-down by 20% to 19.2V,

The value R_{trim_up} is calculated as follows:

$R_t=6.8K\Omega$, $V_f=0.525V$,

$$V_f = \frac{1.24 \times \left(\frac{6.8 \times 33}{6.8 + 33} \right)}{7.68 + \frac{6.8 \times 33}{6.8 + 33}} = 0.525$$

$$25.2 = (24 + VR) \times 0.525, VR = 24K\Omega$$

The value of R_{trim_down} defined as:

$$19.2 = (24 + VR) \times 0.525, VR = 12.57K\Omega$$

CFB750-300S Series

Application Note V15 December 2020

The output voltage can also be adjustment by using external DC voltage, This is shown:

$$\text{Output Voltage} = \text{TRIM Terminal Voltage} * \text{Nominal Output Voltage}$$

6.11 Output Remote Sensing

The CFB750-300S series converter has the capability to remotely sense both lines of its output. This feature moves the effective output voltage regulation point from the output of the unit to the point of connection of the remote sense pins. This feature automatically adjusts the real output voltage of the CFB750-300S series in order to compensate for voltage drops in distribution and maintain a regulated voltage at the point of load. The remote-sense voltage range is:

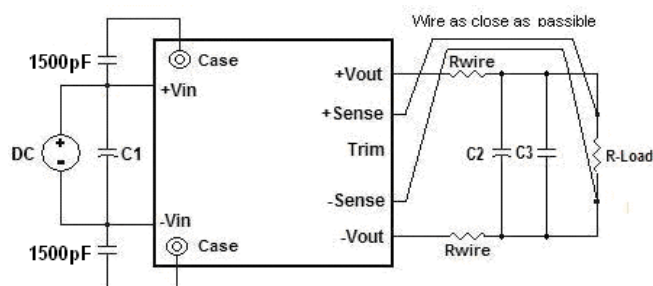

$$[(+V_{out}) - (-V_{out})] - [(+Sense) - (-Sense)] \leq 10\% \text{ of } V_{o_nominal}$$

When remote sense is in use, the sense should be connected by twisted-pair wire or shield wire. If the sensing patterns short, heavy current flows and the pattern may be damaged. Output voltage might become unstable because of impedance of wiring and load condition when length of wire is exceeding 400mm. This is shown in the schematic below.

CFB750-300S Series

Application Note V15 December 2020

If the remote sense feature is not to be used, the sense pins should be connected locally. The +Sense pin should be connected to the +Vout pin at the module and the -Sense pin should be connected to the -Vout pin at the module. Wire between +Sense and +Vout and between -Sense and -Vout as short as possible. Loop wiring should be avoided. The converter might become unstable by noise coming from poor wiring. This is shown in the schematic below.

Note: Although the output voltage can be varied (increased or decreased) by both remote sense and trim, the maximum variation for the output voltage is the larger of the two values not the sum of the values. The output power delivered by the module is defined as the voltage at the output terminals multiplied by the output current. Using remote sense and trim can cause the output voltage to increase and consequently increase the power output of the module if output current remains unchanged. Always ensure that the output power of the module remains at or below the maximum rated power. Also be aware that if $V_{o.set}$ is below nominal value, $P_{out.max}$ will also decrease accordingly because $I_{o.max}$ is an absolute limit. Thus, $P_{out.max} = V_{o.set} \times I_{o.max}$ is also an absolute limit.

6.12 Output Ripple and Noise

Output ripple and noise measured with 1000uF aluminum and 1uF ceramic capacitor across output. A 20 MHz bandwidth oscilloscope is normally used for the measurement.

The conventional ground clip on an oscilloscope probe should never be used in this kind of measurement. This clip, when placed in a field of radiated high frequency energy, acts as an antenna or inductive pickup loop, creating an extraneous voltage that is not part of the output noise of the converter.

Another method is shown in below, in case of coaxial-cable/BNC is not available. The noise pickup is eliminated by pressing scope probe ground ring directly against the -Vout terminal while the tip contacts the +Vout terminal. This makes the shortest possible connection across the output terminals.

CFB750-300S Series

Application Note V15 December 2020

6.13 Output Capacitance

The CFB750-300S series converters provide unconditional stability with or without external capacitors. For good transient response, low ESR output capacitors should be located close to the point of load (<100mm). PCB design emphasizes low resistance and inductance tracks in consideration of high current applications. Output capacitors with their associated ESR values have an impact on loop stability and bandwidth. Cincon's converters are designed to work with load capacitance to see technical specifications.

6.14 Remote On/Off Circuit

The converter remote On/Off circuit built-in on input side. The ground pin of input side remote On/Off circuit is $-V_{in}$ pin. Refer to 5.5 for more details. Connection examples see below.

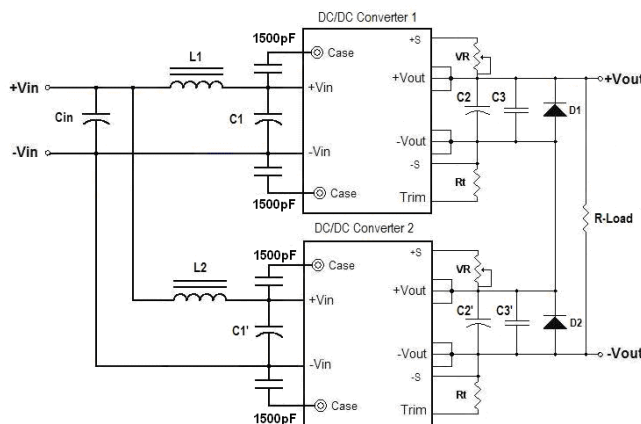

External connection examples see below.

Remote On/Off Connection Example

6.15 Series Operation

Series operation is possible by connecting the outputs two or more units. Connection is shown in below. The output current in series connection should be lower than the lowest rate current in each power module.

Simple Series Operation Connect Circuit

$L1, L2: 1.0\mu H$

$C_{in}, C1, C1': 330\mu F/450V$ ESR<0.7Ω

$C2, C2': 1000\mu F$

$C3, C3': 1\mu F$ MLCC

Note:

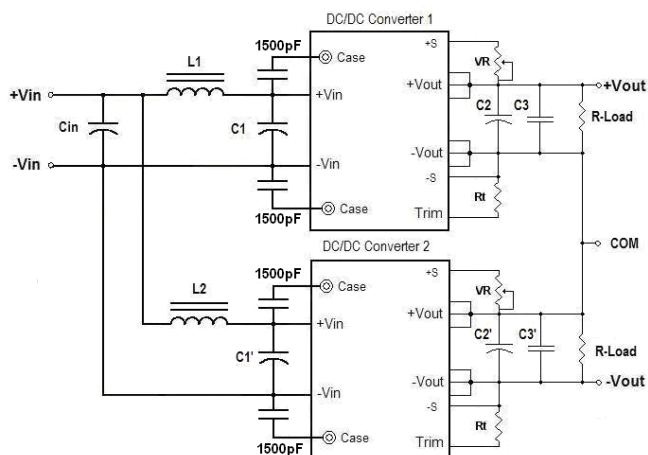

1. If the impedance of input line is high, C_{in} , $C1$ capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than $-20^\circ C$
2. Recommend Schottky diode ($D1, D2$) be connected across the output of each series connected converter, so that if one converter shuts down for any reason, then the output stage won't be thermally overstressed. Without this external diode, the output stage of the shut-down converter could carry the load current provided by the other series converters, with its MOSFETs conducting through the body diodes. The MOSFETs could then be overstressed and fail. The external diode should be capable of handling the full load current for as long as the application is expected to run with any unit shut down.

Series for \pm output operation is possible by connecting the outputs two units, as shown in the schematic below.

CFB750-300S Series

Application Note V15 December 2020

Simple \pm Output Operation Connect Circuit

L1, L2: 1.0uH

Cin, C1, C1': 330uF/450V ESR<0.7Ω

C2, C2': 1000uF

C3, C3': 1uF MLCC

Note:

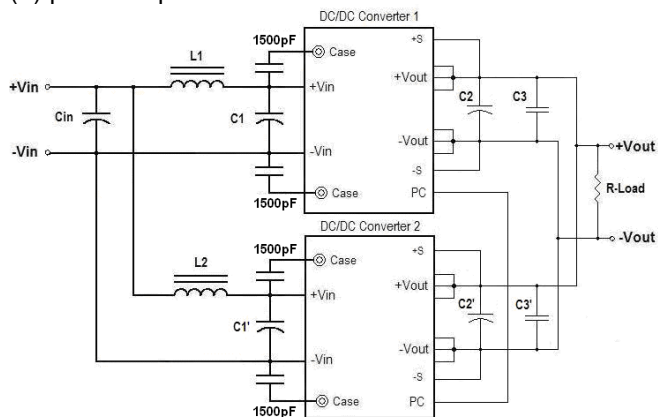

If the impedance of input line is high, Cin, C1 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than -20 °C

6.16 Parallel/Redundant Operation

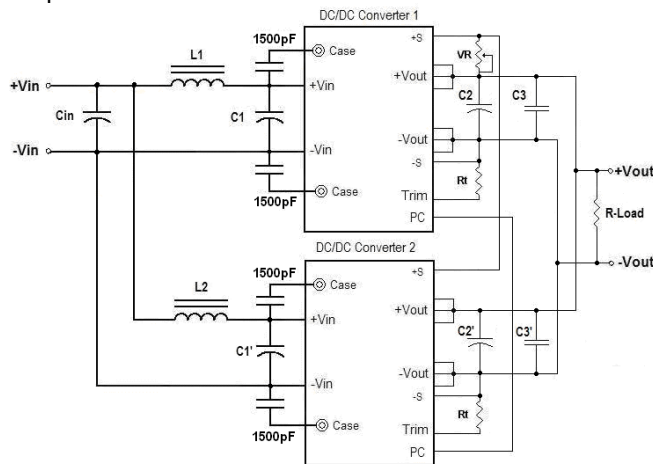

The CFB750-300S series are also designed for parallel operation. When paralleled, the load current can be equally shared between the modules by connecting the PC pins together.

There are two different parallel operations for CFB750-300S series, one is parallel operation when load can't be supplied by only one power unit; the other is the N+1 redundant operation which is high reliable for load of N units by using N+1 units.

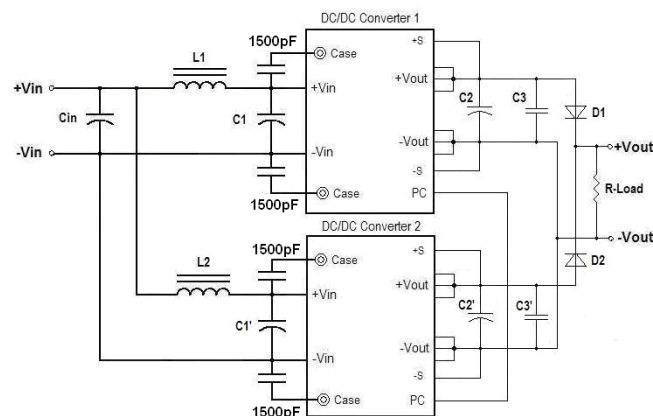

(a) parallel operation

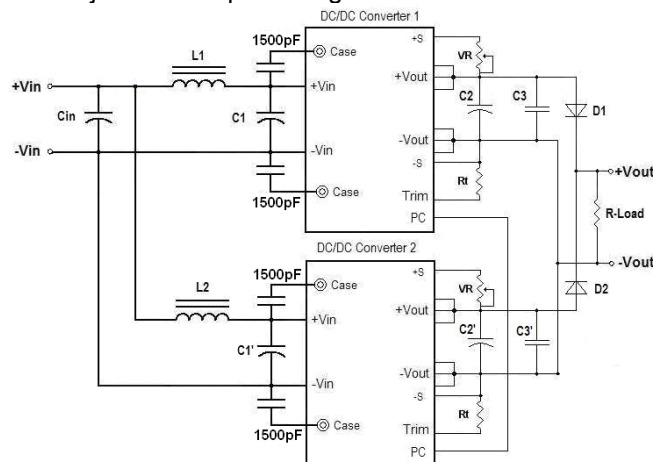

(b) Parallel operation with programmed and adjustable output

(c) N+1 redundant connection

(d) N+1 redundant connection with programmed output and adjustable output voltage

L1, L2: 1.0uH

C2, C2': 1000uF

C3, C3': 1uF MLCC

CFB750-300S Series

Application Note V15 December 2020

Note:

If the impedance of input line is high, C_{in} , C_1 capacitance must be more than above. Use more than two recommended capacitor above in parallel when ambient temperature becomes lower than -20°C

6.17 IOG Signal

Normal and abnormal operation of the converter can be monitored by using the I.O.G signal. Output of this signal monitor is located at the secondary side and is open collector output, you can use the signal by the internal aux power supply or the the external DC supply as the following figures. the ground reference is the – Sense.

By internal AUX

By external DC supply

This signal is LOW when the converter is normally operating and HIGH when the converter is disabled or when the converter is abnormally operating.

6.18 Auxiliary Power for Output Signal

The auxiliary power supply output is within 7-13V with maximum current of 20 mA. Ground reference is the – sense Pin.

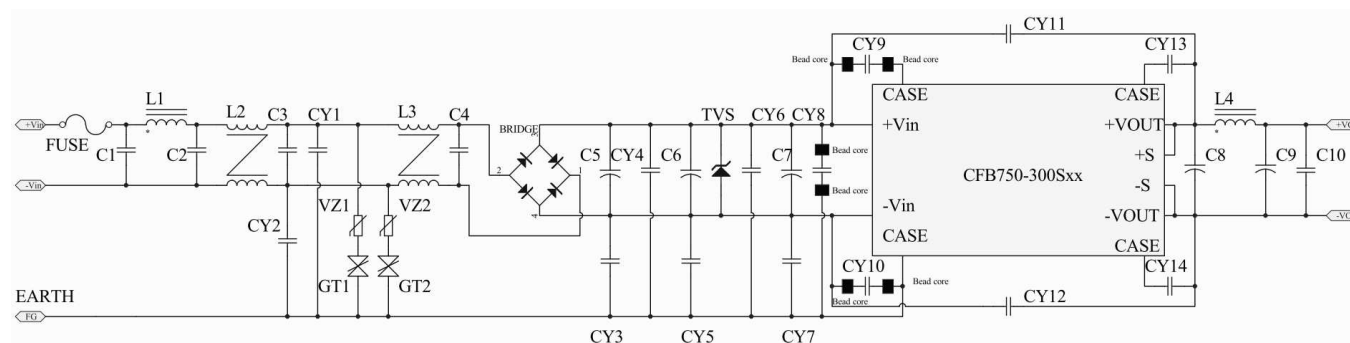

CFB750-300S Series

Application Note V15 December 2020

7. Safety & EMC

7.1 Input Fusing and Safety Considerations

The CFB750-300S series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 10A fast acting fuse for all models. It is recommended that the circuit have a transient voltage suppressor diode (TVS) across the input terminal to protect the unit against surge or spike voltage and input reverse voltage (as shown).

The external circuit is required if CFB750-300SXX series has to meet EN61000-4-4, EN61000-4-5.

The CFB750-300SXX recommended components are shown below.

C5, C6, C7: 330uF/450V aluminum capacitor (Nippon Chemi-Con KMR series).

VZ1, VZ2: TVR10471KSV TKS

GT1, GT2: B5G3000 BENCENT
