

# Infineon EiceDRIVER™ gate driver ICs

Selection guide 2019

Every switch needs a driver

Dear Customer and Partner,

Power electronics applications employ power device switches. And power device switches require optimum gate drive solutions.

Applications such as battery-driven power tools, small and major home appliances, computing and telecom servers, EV charging, solar, and robotics all have special requirements. An optimum gate drive configuration is essential for all power switches, whether they are in discrete form or in a power module. State-of-the art discrete switch families including CoolMOS™ and OptiMOS™ silicon MOSFETs, TRENCHSTOP™ IGBTs, CoolGaN™ gallium nitride HEMTs, and CoolSiC™ silicon carbide MOSFETs as well as open-frame modules such as Easy and Econo power modules, require tuning of gate drive circuits to take full advantage of their capacity and capabilities. One of the most common questions for our new wide-bandgap power devices such as CoolGaN™ or CoolSiC™ is “how do you drive one of these?”

Infineon gate drivers provide a wide range of typical output current options, from 0.1-A up to 10-A, suitable for any power device size. Robust gate drive protection features such as fast short-circuit protection, programmable dead-time, shoot-through protection, and active shutdown, make the drivers well-suited for all power devices, including CoolGaN™ and CoolSiC™. Infineon gate drivers also provide advanced features such as integrated bootstrap diodes, enable and fault reporting functions, input filters, OPAMP and DESAT functions. Active Miller clamps and separate sink and source outputs options also provide design flexibility for all applications. Infineon EiceDRIVER™ family of gate drivers makes it easier for our customers to drive all power switches and power modules. For galvanic isolation requirements, both basic and reinforced isolated product options are available.

We do what we promise. That's quality made by Infineon. With our modern and proactive quality management system, we support the operational excellence of Infineon by translating customer requirements into actions. We are committed to being the best in class on cost, quality and time to market. Our quality guidelines serve as a security fence to prevent productivity measures that compromise our quality.

Infineon is a world leader in power semiconductor solutions that make your life easier, safer, and greener. We empower the efficient generation, transmission and consumption of electrical energy. In short, we empower a world of unlimited energy. The EiceDRIVER™ Gate Driver Selection Guide 2019 provides innovative and optimum gate driver solutions to take full advantage of our state-of-the-art switch technologies to come closer to this goal.

# Infineon EiceDRIVER™ gate driver IC

## Overview

Gate driver ICs serve as the interface between control signals (digital or analog controllers) and power switches (IGBTs, MOSFETs, SiC MOSFETs, and GaN HEMTs). The integrated gate-driver solutions reduce your design complexity, development time, bill of materials (BOM), and board space while improving reliability over discretely-implemented gate-drive solutions.

Every switch needs a driver, and every driver needs a switch. Infineon offers a comprehensive portfolio of driver ICs with a variety of configurations, voltage classes, isolation levels, protection features, and package options. These flexible gate driver ICs are complementary to Infineon IGBT discretes and modules, silicon (CoolMOS™, OptiMOS™ and StrongIRFET™) and silicon carbide MOSFETs (CoolSiC™), gallium nitride HEMTs (CoolGaN™), or as part of integrated power modules (CIPOS™ IPM and iMOTION™ smart IPM).

Note 1: 1EDC Compact only

Note 2: Voltage class is defined based on different driver configurations.

1. For single high-side, high- and low-side, half bridge and three phase gate drivers, voltage class is defined as switch break down voltage in applications.

2. For low side drivers, voltage class is defined as maximum operating range supply voltage.

3. For special cases as 1EDNx550 (1EDN-TDI), common mode rejection (CMR) voltage range up to 80 V.

## Infineon gate driver IC applications

Leveraging the application expertise and advanced technologies of Infineon and International rectifier, our gate driver ICs are well-suited for many applications such as industrial motor drives, major home appliances, solar inverters, automotive applications, EV charging, UPS, switch-mode power supplies (SMPS), high-voltage lighting, battery-powered applications, and small home appliances.

## Infineon gate driver IC technologies

Low-side only	Level-shift		Galvanic isolation
● Non-isolated	● Junction isolation	● Silicon on insulator	● Coreless transformer
 <ul style="list-style-type: none"> <li>Comprehensive families of single- and dual-low-side drivers with flexible output current, logic configurations, and UVLOs</li> <li>Rugged technology of the high-voltage gate drivers, and the state-of-the-art 130-nm process</li> </ul>	 <ul style="list-style-type: none"> <li>20 years proven technology</li> <li>Largest portfolio of 200 V, 600 V, 700 V and 1200 V industry standard gate drivers using rugged proprietary HVIC process</li> </ul>	 <ul style="list-style-type: none"> <li>Infineon SOI technology for high-voltage applications with inherent integrated bootstrap diode capability and lower level-shift losses</li> <li>Industry best-in-class robustness against negative transient voltage spikes on VS pin</li> </ul>	 <ul style="list-style-type: none"> <li>Magnetically-coupled isolation technology provides galvanic isolation (functional, basic and reinforced)</li> <li>Strongest gate-drive output currents (up to 10 A) reducing need for external booster circuits</li> </ul>

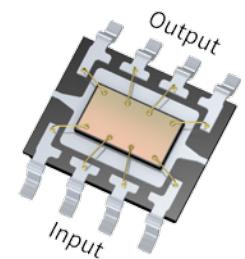

# Infineon non-isolated (N-ISO) technology

**Non-isolated (N-ISO) technology** refers to gate driver ICs utilizing low-voltage circuitry with the robust technology of high-voltage gate drivers, and the state-of-the-art 0.13- $\mu$ m process. Infineon's world-class fabrication techniques enable high-current gate drivers for high-power-density applications in industry-standard DSO-8 and small form-factor SOT23 and WSON packages. Infineon offers comprehensive families of single-low-side and dual-low-side gate driver ICs with flexible options for output current, logic configurations, packages, and protection features such as under-voltage lockout (UVLO), integrated overcurrent protection (OCP), and truly differential inputs (TDI).

## Truly differential inputs (TDI)

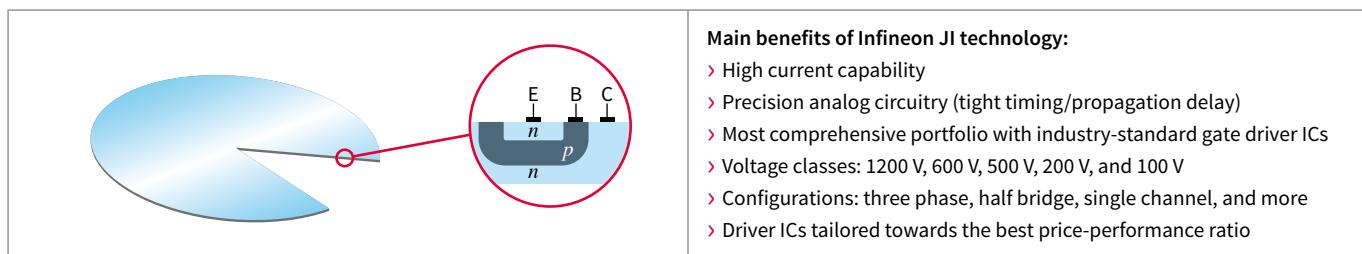

- › The input signal levels of conventional low-side gate driver ICs are referenced to the ground potential of the gate driver IC. If in the application the ground potential of the gate driver IC shifts excessively, false triggering of the gate driver IC can occur.
- › The 1EDN7550/1EDN8550 gate driver ICs have truly differential inputs. Their control signal inputs are largely independent from the ground potential. Only the voltage difference between its input contacts is relevant.
- › This prevents false triggering of power MOSFETs.

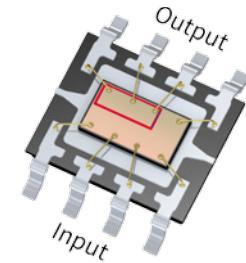

# Infineon junction-isolation (JI) technology

**Infineon p-n junction-isolation (JI) technology** is a mature, proven industry-standard MOS/CMOS fabrication technique. Infineon's proprietary HVIC and latch-immune CMOS technologies enable rugged monolithic construction. The advanced process allows monolithic high-voltage and low-voltage circuitry construction with the best price per performance for specific motor-control and switch-mode power applications.

Pioneered by International Rectifier (IR) since 1989 with the introduction of the first monolithic product, the high-voltage integrated circuit (HVIC) technology uses patented and proprietary monolithic structures integrating bipolar, CMOS, and lateral DMOS devices with breakdown voltages above 700 V and 1400 V for operating offset voltages of 600 V and 1200 V.

Using this mixed-signal HVIC technology, both high-voltage level-shifting circuits and low-voltage analog and digital circuits can be implemented. With the ability to place high-voltage circuitry (in a 'well' formed by polysilicon rings), that can 'float' 600 V or 1200 V, on the same silicon away from the rest of the low-voltage circuitry, high-side power MOSFETs or IGBTs exist in many popular off-line circuit topologies such as buck, synchronous boost, half-bridge, full-bridge and three-phase.

These HVIC gate drivers with floating switches are well-suited for topologies requiring high-side, half-bridge, and three-phase configurations.

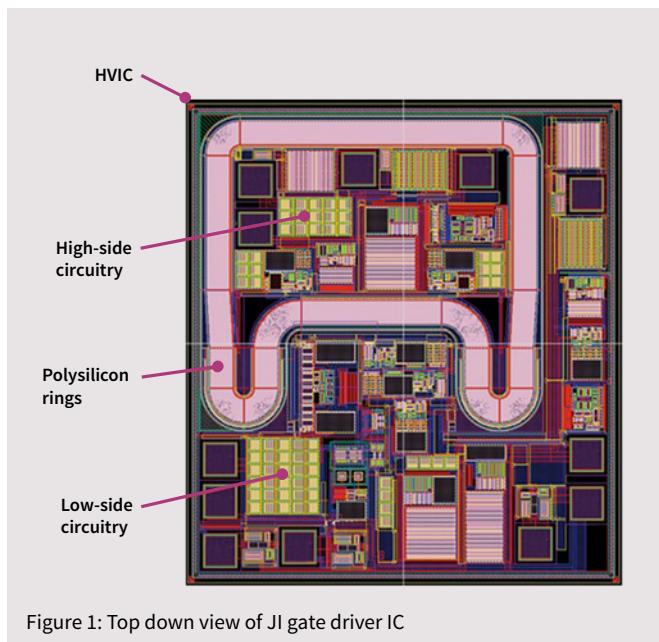

Figure 1: Top down view of JI gate driver IC

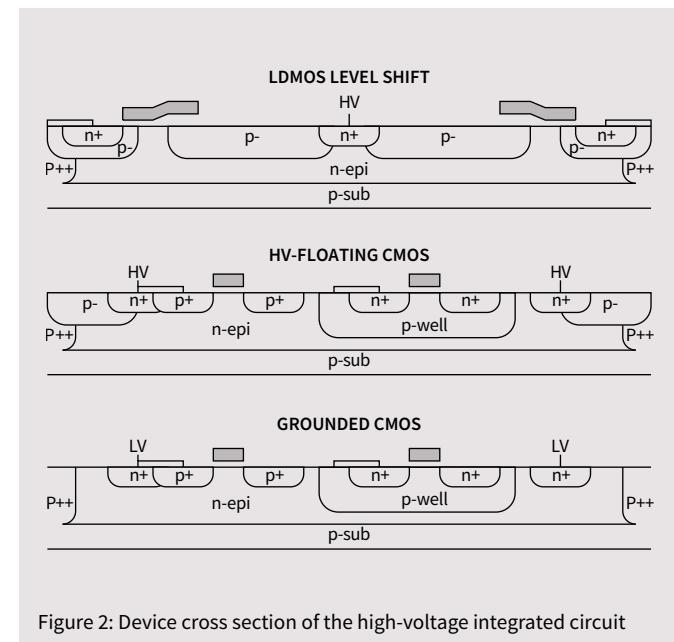

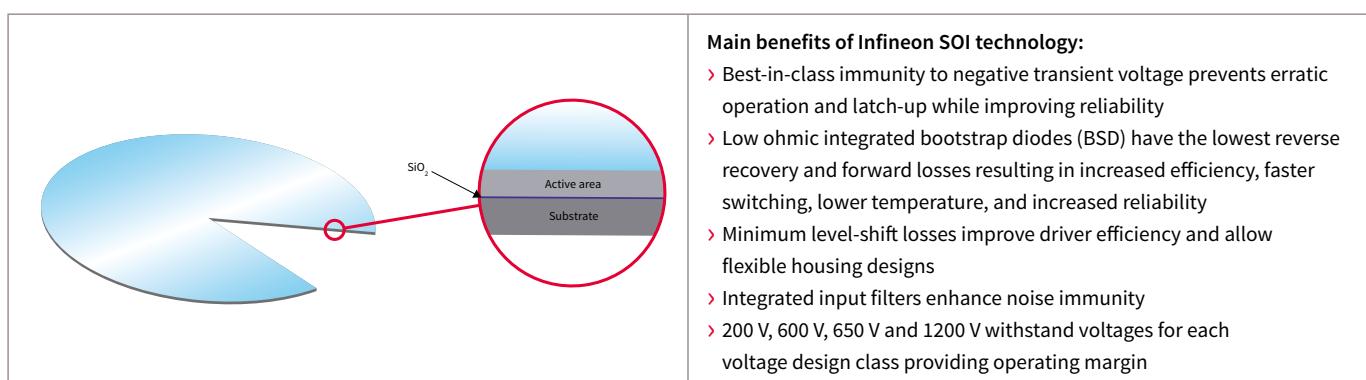

Figure 2: Device cross section of the high-voltage integrated circuit

# Infineon silicon-on-insulator (SOI) technology

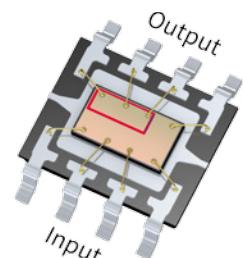

**Infineon silicon-on-insulator (SOI) technology** is a high-voltage, level-shift technology providing unique, measurable and best-in-class advantages, including integrated bootstrap-diode (BSD) and industry-best-in-class robustness to protect against negative transient voltage spikes. Each transistor is isolated by buried silicon dioxide, which eliminates the parasitic bipolar transistors that cause latch-up. This technology can also lower the level-shift power losses to minimize device-switching power dissipation. The advanced process allows monolithic high-voltage and low-voltage circuitry construction with technology-enhanced benefits.

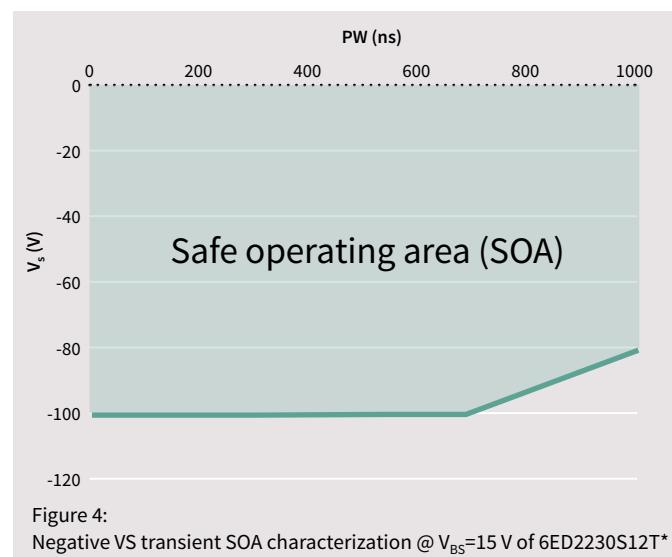

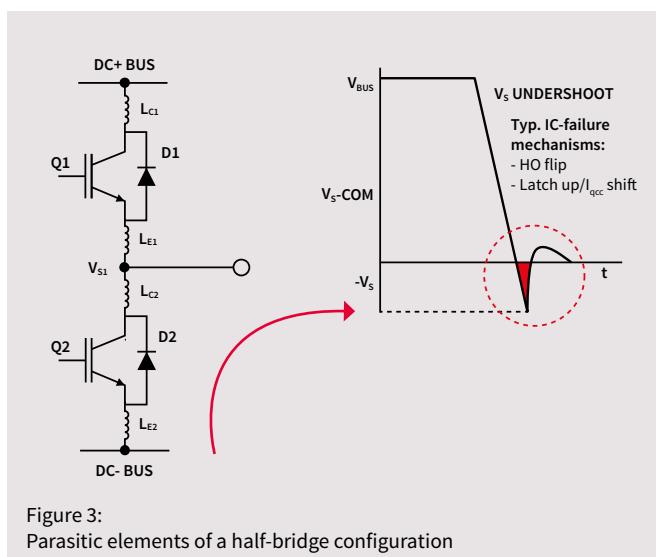

## Operation robustness of negative transient voltage at the VS pin (-VS)

Today's high-power switching inverters and drives carry a large load current. The voltage swing on VS pin does not stop at the level of the negative DC bus. It swings below the level of the negative DC bus due to the parasitic inductances in the power circuit and from the die bonding to the PCB tracks. This undershoot voltage is called "negative transient voltage".

EiceDRIVER™ high-voltage level-shift gate driver IC products using Infineon SOI technology have the best-in-the-industry operational robustness. In Figure 4, the safe operating line of 6ED2230S12T\* is shown at  $V_{BS} = 15$  V for pulse widths up to 1000 ns. In the green area, the products do not show unwanted functional anomalies or permanent damage to the IC.

# Infineon silicon-on-insulator (SOI) technology

## Integrated bootstrap diode (BSD)

The bootstrap power supply is one of the most common techniques for supplying power to the high-side driver circuitry due to its simplicity and low cost. As shown in Figure 5, the bootstrap power supply consists of a bootstrap diode and capacitor. The floating channel of level-shift gate drivers is typically designed for bootstrap operation. Infineon SOI drivers feature excellent integrated ultra-fast bootstrap diodes. The low diode resistance of  $R_{BS} \leq 40 \Omega$  enables a wide operating range.

The Infineon SOI drivers with this feature can drive larger IGBTs without the risk of self-heating, minimize BOM count, and reduce system cost.

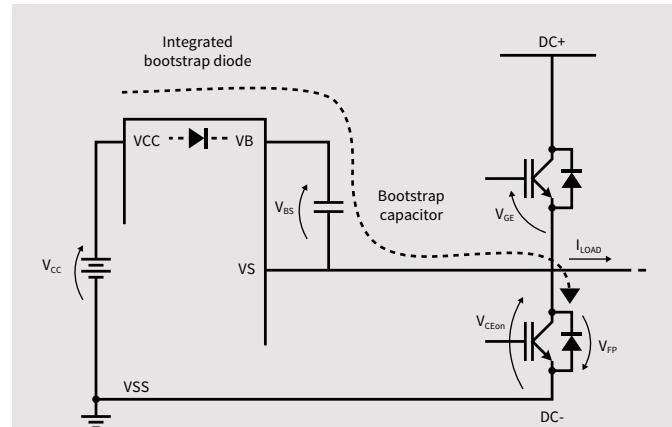

Figure 5:  
Typical connection diagram with integrated bootstrap diode (BSD)

## Low level-shift losses

Level-shift losses count as a significant part when the operating frequency increases. A level-shift circuit is used to transmit the switching information from the low-side to the high-side. The necessary charge of the transmission determines the level-shift losses.

IceDRIVER™ high-voltage level-shift gate driver IC products using the Infineon SOI technology require a very low charge to transmit the information. Minimizing level-shifting power consumption allows the design flexibility of higher frequency operations, as well as longer lifetime, improved system efficiency and application reliability.

In Figure 6, the thermal diagrams on the same PCB board show a temperature difference of 55.6°C lower in the power dissipation of the Infineon SOI-based products (2ED2106S06F\*).

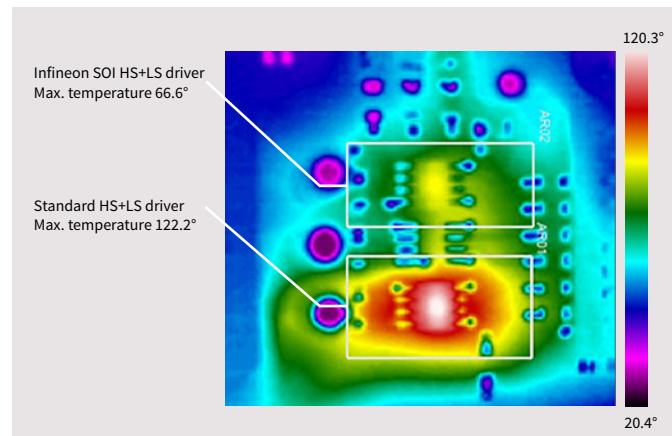

Figure 6:  
DC Bus voltage = 300 V; With CoolMOS™ P7 in D-Pak; 300 kHz switching frequency

# Infineon galvanically isolated coreless transformer (CT) technology

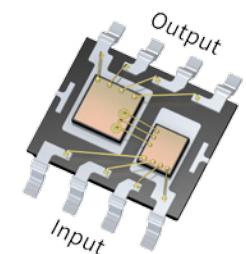

**Infineon coreless transformer (CT) technology** is a magnetically coupled, galvanically isolated technology which uses semiconductor manufacturing processes to integrate an on-chip transformer consisting of metal spirals and silicon oxide insulation. The on-chip coreless transformers are used for transmitting switching information between the input chip and output chip(s) and other signals. The technology provides short propagation delays, excellent delay matching, and strong robustness for driving SiC MOSFETs and state-of-the-art IGBTs.

	<b>Main benefits of Infineon CT technology:</b> <ul style="list-style-type: none"><li>› Galvanic isolation (functional, basic, reinforced)</li><li>› Allows very large voltage swings of <math>\pm 1200</math> V or larger</li><li>› Immunity against negative and positive transients</li><li>› Increases reliability of the end product</li><li>› Low power losses for switching frequencies into MHz range</li><li>› Flexible configurations and options such as<ul style="list-style-type: none"><li>- Output current (up to 10 A)</li><li>- DESAT protection</li><li>- Active Miller clamp</li><li>- Short-circuit clamp</li><li>- Isolation rating and certification</li><li>- 150 mil and 300 mil packages</li></ul></li></ul>
--	---

## Robustness

- › Extremely robust signal transfer independent of common mode noise
- › Common mode transit immunity (CMTI) up to 100 V/ns
- › Tight propagation-delay matching: tolerance improves application robustness without variations due to aging, current, and temperature

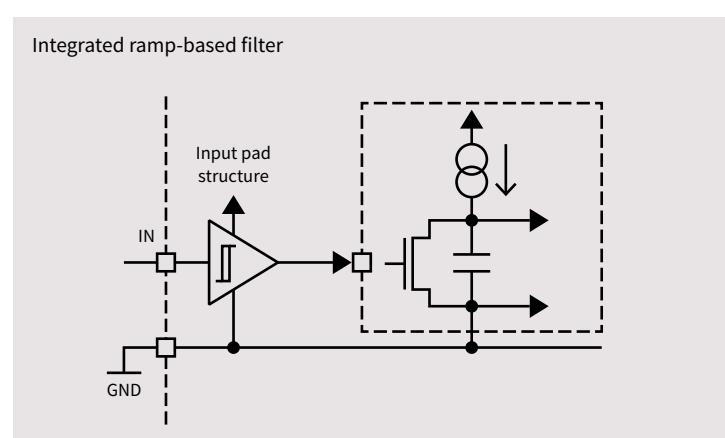

## Design flexibility

- › Wide range of gate voltages up to 40 V, including negative gate voltage
- › CT technology is ready for use with silicon carbide (SiC) MOSFETs
- › Closed-loop gate current control option

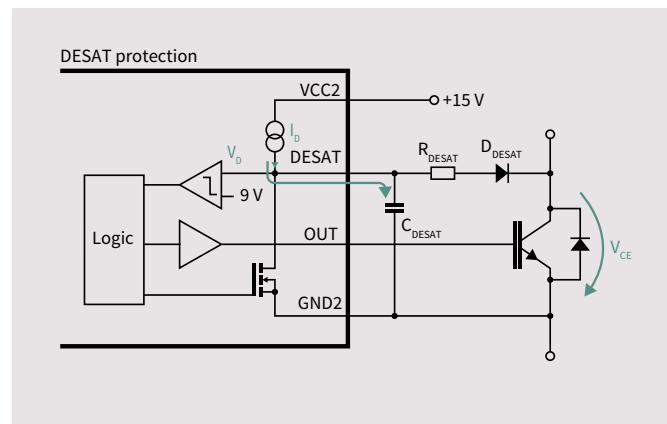

## Precise timing control

- › Precise, integrated filters reduce propagation-delay variation over a wide range of operating conditions
- › Integrated filters reduce the need of external filters
- › Tight propagation delay allows minimum deadtime improving system efficiency and decreasing harmonic distortion

## Protection

- › Reliable short-circuit detection via accurate desaturation (DESAT) detection circuits (current source and comparator) protects the power switches from damage during short-circuit condition
- › Two-level turn-off (TLTO) for short-circuit current protection to lower collector-emitter voltage overshoot
- › Active Miller clamping option protects against parasitic turn-on due to high  $dV/dt$
- › Built in short-circuit clamping limits the gate voltage during short circuit

## Safety certification

- › Safety certification available for VDE 0884 and UL 1577

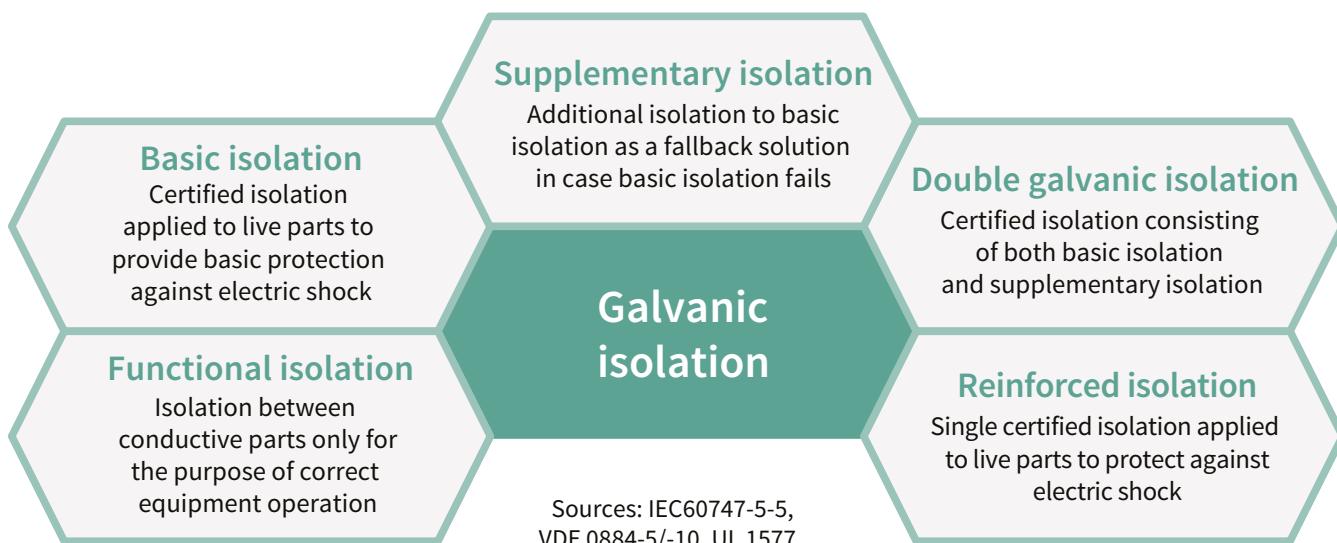

## For SiC MOSFET switching

- › Ideal for ultra-fast switching 1200 V and 650 V silicon carbide power transistors such as CoolSiC™ MOSFETs
- › The drivers incorporate most important key features and parameters for SiC driving:
  - DESAT for short circuit protection
  - Active Miller clamp

- Tight propagation delay matching
- Precise input filters
- Wide output side supply range
- Negative gate voltage capability
- Extended common mode transient immunity (CMTI) capability

# Infineon power switch and iMOTION™ technologies

## OptiMOS™ and StrongIRFET™ power MOSFET

### Highest quality and performance

Infineon's semiconductors are designed to bring more efficiency, power density and cost effectiveness. The full range of OptiMOS™ and StrongIRFET™ power MOSFETs enables innovation and performance in applications such as switch mode power supplies (SMPS), motor control and drives, inverters and computing.

Infineon's highly innovative OptiMOS™ and StrongIRFET™ families consistently meet the highest quality and performance demands in key specifications for power system design such as on-state resistance and figure-of-merit characteristics.

OptiMOS™ power MOSFETs provide excellent best-in-class performance. Features include ultra-low  $R_{DS(on)}$ , as well as low charge for high switching-frequency applications. StrongIRFET™ power MOSFETs are designed for rugged applications, and are ideal for designs with a low switching frequency as well as those that require a high current-carrying capability.

OptiMOS™	StrongIRFET™
Best-in-class technology	Robust and excellent price/performance ratio
Designed for high performance applications	Product validation according to JEDEC standard
Optimized for high switching frequency	Optimized for low switching frequency
Industry's best figure-of-merit	High current carrying capability
High efficiency and power density	Rugged silicon
	

# CoolMOS™ SJ MOSFETs

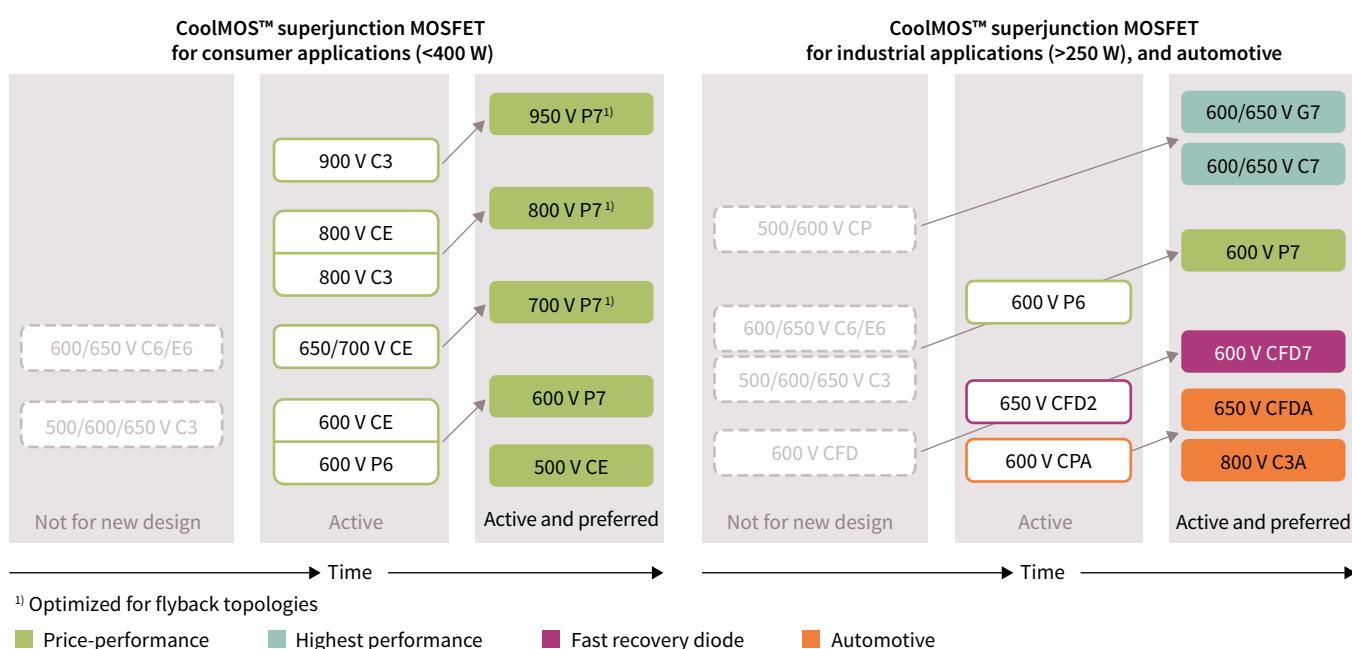

Trusted leader in high voltage MOSFETs

The revolutionary CoolMOS™ power MOSFET family sets new standards in the field of energy efficiency. Our CoolMOS™ products offer a significant reduction of conduction, switching and driving losses, and enable high power density and efficiency for superior power conversion systems.

High voltage superjunction MOSFETs address consumer applications, such as smartphone/tablet chargers, notebook adapters, LED lighting, PC Power, as well as audio and TV power supplies. Increasingly, customers replace standard MOSFETs by superjunction MOSFETs to benefit from higher efficiency and less power consumption for the end users. CoolMOS™ P7 sets a new benchmark by offering high performance and competitive price all at once.

Also for industrial applications such as server, telecom, PC power, solar, UPS, EV-charging and others, Infineon's latest CoolMOS™ 7 superjunction MOSFETs with C7, G7, CFD7 and P7 product families offer what you need - from highest efficiency to best price performance. Infineon meanwhile has also complemented the portfolio with first CoolGaN™ e-mode HEMTs products to further optimize efficiency and system cost.

Infineon's CoolMOS™ superjunction MOSFET offering is complemented by the automotive qualified series 600 V CPA, 650 V CFDA and 800 V C3A. Gain your momentum in the rapidly growing on-board charger and DC-DC converter markets with our excellent performing automotive series with proven outstanding quality standards that go well beyond AEC Q101.

## The following Infineon gate driver ICs are recommended as most suitable for Infineon MOSFETs

Application	Power switch family	Gate driver configuration	Typically recommended gate driver part number
PFC	CoolMOS™ C7/P7	Single low-side	1ED44176N01F <b>NEW</b> , 1EDN8550B <b>NEW</b> , IRS44273L, 1EDN8511B
		Dual low-side	IRS4427S, 2EDN8524F
		Half-bridge	2EDF7175F <b>NEW</b> , 2EDF7275F <b>NEW</b> , 2EDL23N06PJ
Battery powered application – inverter	StrongIRFET™ OptiMOS™ 3/5	High and low-side	IRS2005S/M, IRS2011S, IRS2301S, IRS2186S
		Half-bridge	IRS2008S/M <b>NEW</b> , IRS2007S/M <b>NEW</b> , 2EDL05N06PF, IRS2302S, 2EDL8xxx*
		Three-phase	6EDL04N02PR, 6ED003L02-F2, 6ED003L06-F2, 6EDL04N06PT
Major home appliance – inverter	CoolMOS™ P7	Half-bridge	IRS2183S, 2EDL23N06PJ
		Half-bridge	2ED2304S06F <b>NEW</b> , IRS2890DS
		Dual low-side	2EDN8524F, IRS4427S
Major home appliance – SMPS	CoolMOS™ P7	High and low-side	IRS2186(4)S
		Half-bridge	IRS2153(1)DS
		Single high-side	IRS10752L, IRS20752L, IRS2117S, IRS25752L
Lighting	CoolMOS™ P7	Half-bridge	2ED2304S06F <b>NEW</b> , 2EDL05N06PF, IRS2153(1)DS, 2ED2106S06F*
		Single high-side	IRS2127S
Drives – inverter <3.5 kW	StrongIRFET™ OptiMOS™ 3/5	Dual low-side	2EDN8524F
		High and low-side	IRS2186(4)S, 2ED2106S06F*, 2ED218xS06F/J*
EV charging – DC-DC	CoolMOS™ CFD7	Single high-side	1EDI20112AF, IR2214SS, 1EDI40112AF, 1EDI60112AF, 1EDS20112SV <b>NEW</b>
		High and low-side	IRS2113S, IRS2186(4)S, 2ED218xS06F/J*, 2EDS8265H <b>NEW</b> , 2EDS8165H <b>NEW</b>
EV-Charging – PFC	CoolMOS™ P7/C7/ CFD2/CFD7	Single high-side	1EDI20N12AF, 1EDF5673F <b>NEW</b>
		Dual high-side	2EDF7275F <b>NEW</b>
		Single low-side	1ED44176N01F <b>NEW</b> , IRS44273L, 1EDN8511B, 1EDN8550B <b>NEW</b>
		Dual low-side	IRS4427S, 2EDN8524F
Solar inverter – boost/SMPS	CoolMOS™ C7	Single low-side	1ED44176N01F <b>NEW</b> , IRS44273L
		Dual low-side	IRS4427S, 2EDN8524F
		Single high-side	1EDI20N12AF, 1EDI60112AF
Solar – micro inverter	OptiMOS™ 5 CoolMOS™ C7/CFD2	Single high-side	1EDI20N12AF
		Half-bridge	2ED2304S06F <b>NEW</b> , IR2114SS, 2EDL05N06PJ, 2EDF7175F <b>NEW</b> , 2EDF7275F <b>NEW</b>
Solar – string/central inverter	OptiMOS™ 5	Single high-side	1EDI60N12AF, 1ED020112-F2
		Dual high-side	2ED020112-F2
		High and low-side	IR2213S
		Half-bridge	IR2214SS
UPS – main inverter	StrongIRFET™	Half-bridge	2EDL23N06PJ
		High and low-side	IRS2186(4)S, 2ED2106S06F*, 2ED218xS06F/J*
UPS – active bridge rectifier	CoolMOS™ P7/C7	Single high-side	1ED020112-F2, 1ED020112-FT
SMPS – Vienna rectifier	CoolMOS™ C7/P7	Dual high-side	2EDF7175F <b>NEW</b> , 2EDF7275F <b>NEW</b>
SMPS – Sync rectifier	OptiMOS™ 5	Single low-side	1ED44176N01F <b>NEW</b> , 1EDN7550B <b>NEW</b>
		Dual low-side	IR11688S (synchronous rectification), 2EDN7524F
		Dual high-side	2EDF7275K <b>NEW</b>
	CoolGaN™	Single high-side	1EDF5673K <b>NEW</b>
SMPS – LLC/ZVS PSFB	CoolGaN™	Single high-side	1EDS5663H <b>NEW</b>
	CoolMOS™ P7/CFD7	Dual high-side	2EDS8165H <b>NEW</b> , 2EDS8265H <b>NEW</b>
		Dual low-side	2EDN7524F, 2EDN8524F
		High and low-side	IRS2186(4)S
Electric and hybrid vehicle – on-board charger & DC-DC converter	CoolMOS™ CFDA	High and low-side	AUIRS2113S, AUIRS2181/4S, AUIRS2191S
		Single low-side	AUIRS1170S (synchronous rectification)
		Dual low-side	AUIRB24427S
		Half-bridge	AUIR2085S
		Dual high-side	2ED020112FA
Electric and hybrid vehicle – wireless in-cabin phone charging	OptiMOS™ 5	High and low-side	AUIRS2301S

# Discrete IGBTs

Nomenclature: IGBT

IKpccNvvvH3 – IGBT + diode

IGpccNvvvH3 – Single IGBT

**p** = package

**c** = current

**v** = voltage

**d** = diode

## Frequency range

8 kHz – 60 kHz

RC series (monolithic)

RC-Drives (monolithic)

2 kHz – 40 kHz

TRENCHSTOP™ /  
TRENCHSTOP™ Performance

IGBT

Diode commutation

Soft

NEW!

TRENCHSTOP™ IGBT6

## Voltage range

600 V, 650 V, 1100 V, 1200 V,  
1350 V, 1600 V

600 V

600 V, 1200 V

650 V, 1200 V

## Part number

IHpccNvvvR5  
IHpccNvvvR2  
IHpccNvvvR3  
IHpccN60R/RF  
IHpccNvvvE1

IKpccN60R  
IKpccN60RF

IKpccN60T  
IKpccN60TP  
IKpccN120T2  
IKpccN120CT2  
  
IGpccN60T  
IGpccN60dTP  
IGpccT120  
IGpccN120T2

IKpccN120BH6  
IKpccN120CS6  
IKpccN65ET6

## Applications

Induction cooking  
Microwave  
Multifunction printers  
Half-bridge resonant  
(Current resonance > 650 V)

Single switch  
(Voltage resonance > 650 V)

Conduction loss optimized

Solar inverter  
Asymmetrical bridge  
Symmetrical full-bridge  
3-level type I or 3-level type II converter

Motor control  
Three-phase inverter  
Full-bridge inverter

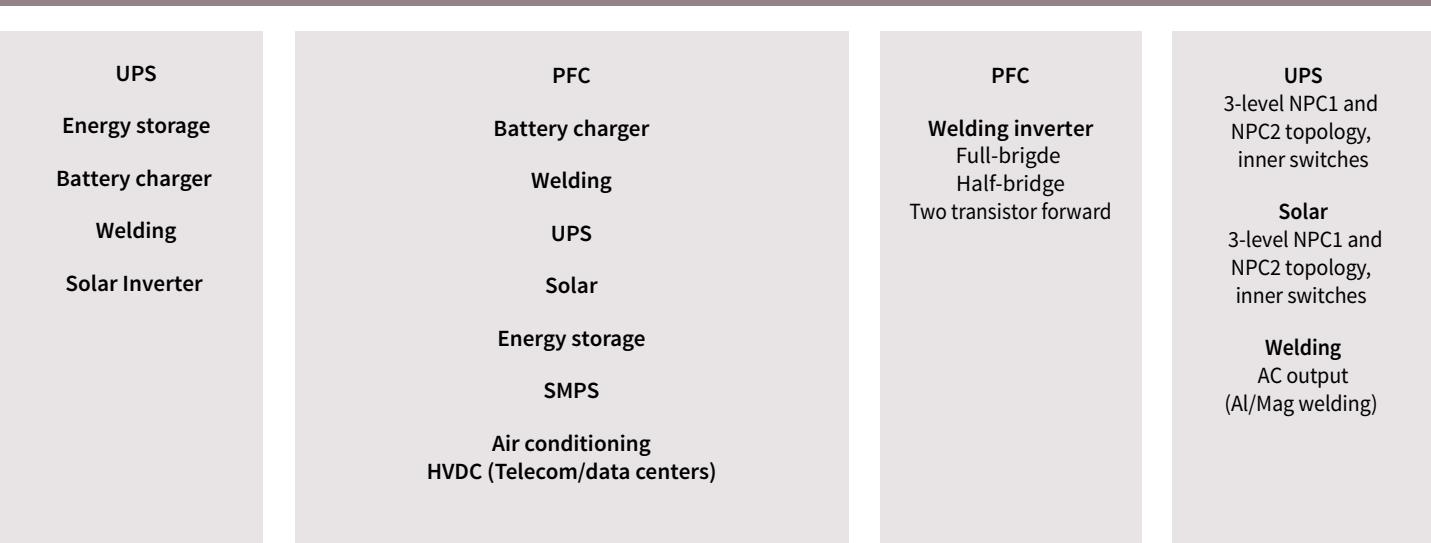

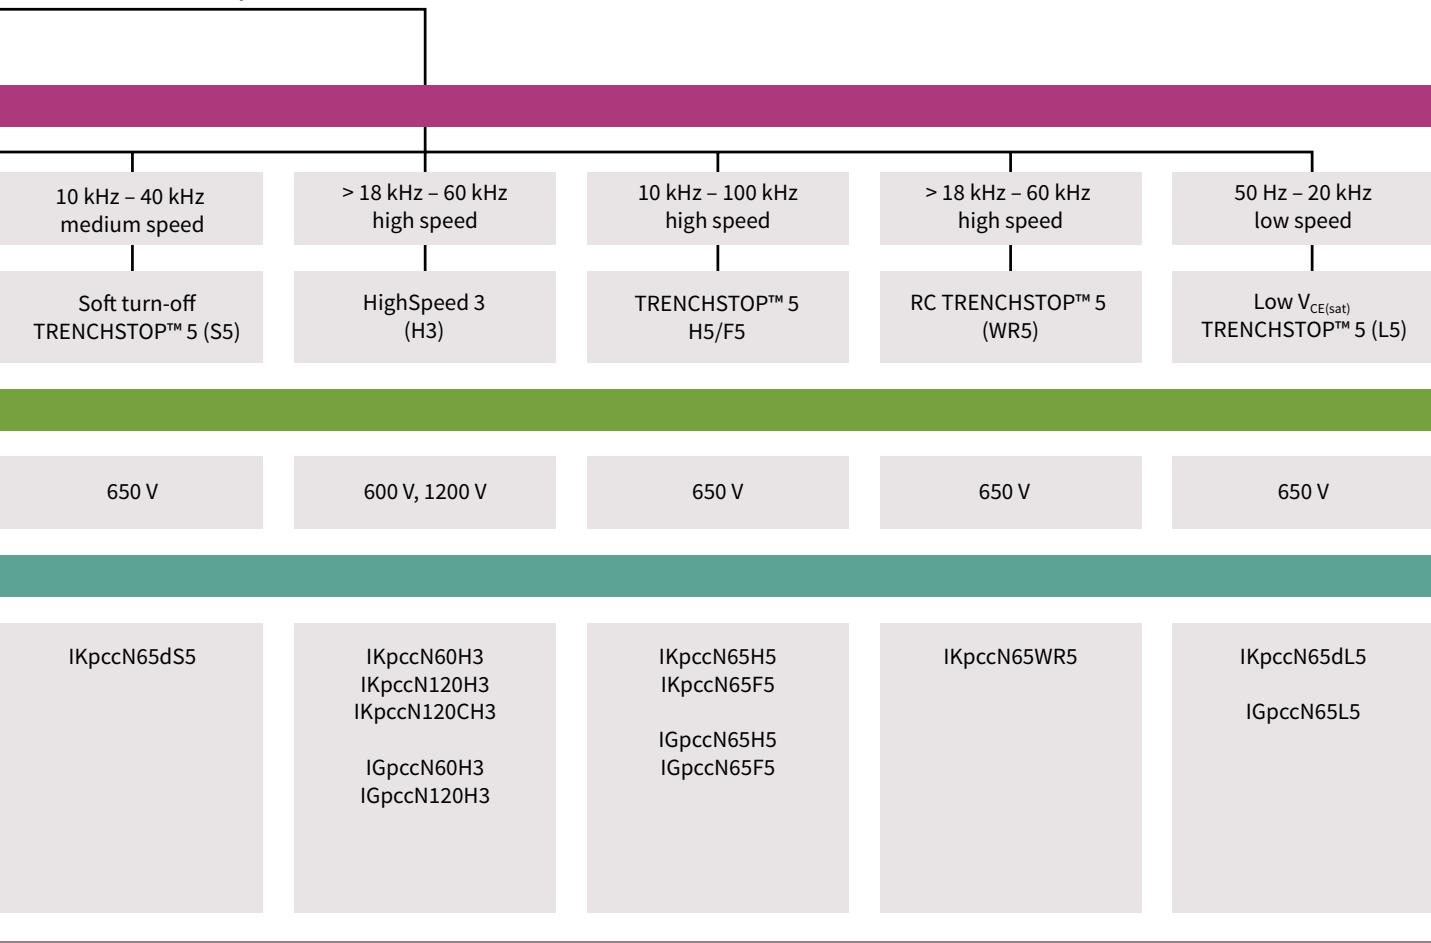

Uninterruptable power supply  
UPS bridge  
3-level type II converter

Major and small home appliance  
Symmetrical full-bridge

## Market leadership through groundbreaking innovation and application focus

From the low-power applications such as motor drives for fans to multi-megawatt applications of wind and traction, Infineon provides a comprehensive IGBT family of 600 V, 650 V, and 1200 V technologies in multiple package choices. Our new IGBT chip technologies, combined with innovative packaging, use trench structures and a field stop concept, and are partially empowered by SiC freewheeling diodes. The technologies guarantee robust and reliable devices with maximum power integration and minimum power losses.

### Hard/no diode for IGBT\*\* parts

# Low to medium power modules

## The EasyPIM™/EasyPACK™ and the EconoPIM™/EconoPACK™ families

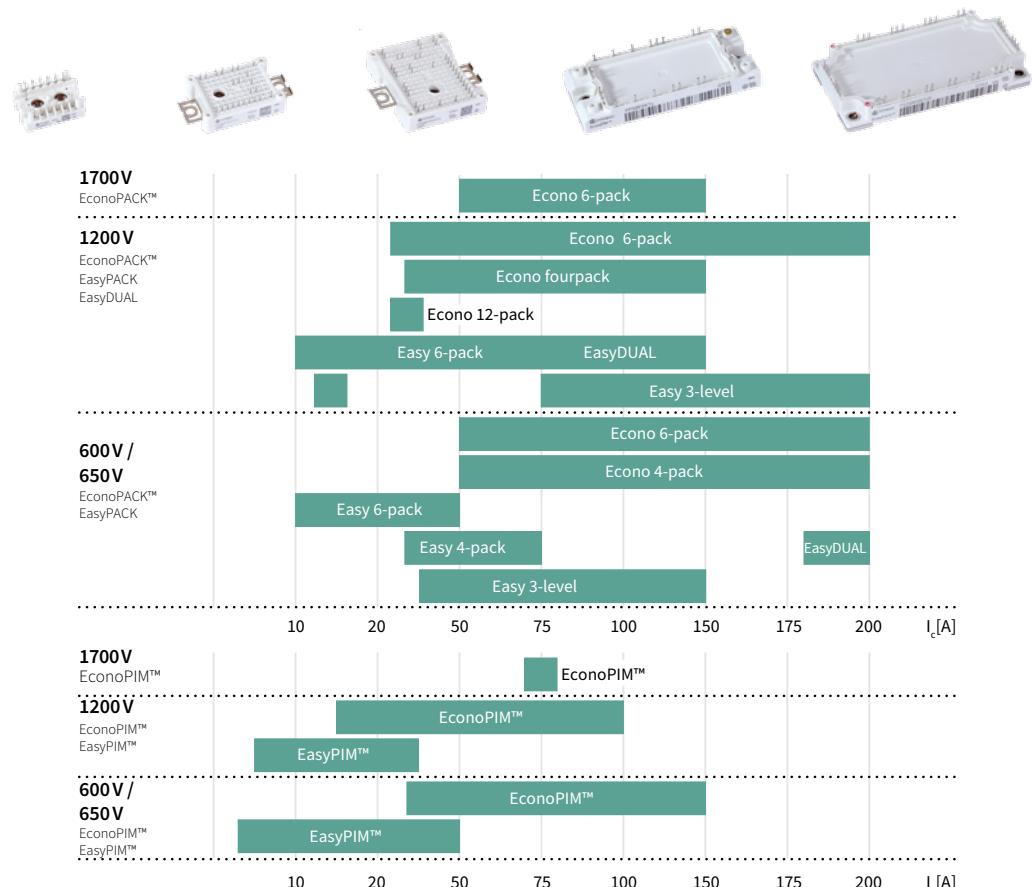

The EasyPIM™/EasyPACK™ as well as the EconoPIM™/EconoPACK™ families have been developed to provide a cost-effective, compact design as well as simplified and reliable assembly. With these modules, we offer an optimized product generation for low- and medium-power industrial drives.

The Easy family with its EasyPIM™, EasyPACK™ and EasyDUAL™ configurations covers the full power range from  $I_c$  6 A up to 200 A at 600 V, 650 V, and 1200 V. The modules are without base plates, and include the latest IGBT4 technology. The screw clamp provides a new, fast and reliable, low-cost mounting concept.

This series has been extended to include the Easy1B and Easy2B sizes to offer more flexibility, with reduced height from 17 mm to 12 mm, and injected screw clamps for mounting.

The Econo family extends the power range from 15 A up to 300 A with nominal current at 600 V, 650 V, 1200 V and 1700 V. The available configurations are the well-known EconoPIM™ and EconoPACK™ series. The Econo housing features a copper base plate for optimized heat spread, and includes a thermistor (NTC). The Econo modules are available with solderable pins or PressFIT pins, and an increasing number of Econo modules are available with pre-applied TIM.

Besides the standard planar IGBT chip technology for low switching losses, saturation voltage and high-switching frequency, the Econo family also includes the optimized IGBT4 in 650 V, 1200 V and 1700 V. For ease of design, IGBTs with 10  $\mu$ s short-circuit robustness are now available in 650 V, 1200 V and 1700 V in the same mechanical design. Selected Econo modules feature integrated shunts for accurate and cost-efficient current sensing.

The following Infineon gate driver ICs are recommended as most suitable for Infineon IGBT discretes and modules.

Application	Power switch family	Gate driver configuration	Typically recommended gate driver part number

# CoolSiC™ Silicon Carbide MOSFET

A revolution to rely on

## Infineon's CoolSiC™ technology enables radical new product designs

Infineon's CoolSiC™ silicon carbide (SiC) MOSFETs open up new degrees of freedom for designers to improve efficiency and system flexibility.

The CoolSiC™ MOSFET offers advantages of the low gate charge and device capacitance levels in 1200 V switches, negligible reverse-recovery losses of the internal body diode, temperature-independent low switching losses. Infineon's unique 1200 V SiC MOSFET adds additional advantages of superior gate-oxide reliability enabled by state-of-the-art trench design, best-in-class switching and conduction losses, highest transconductance (gain), and short-circuit robustness at gate voltage at 15 V.

The result is a robust SiC MOSFET which is ideal for hard and resonant-switching topologies. It can be driven like an IGBT using standard drivers delivering the highest level efficiency at switching frequencies unreachable by Si-based switches, which allows for system size reduction, higher power density and improved lifetime.

### CoolSiC™ MOSFET features

- › Revolutionary semiconductor material - Silicon Carbide
- › Very low switching losses
- › Threshold-free on state characteristic
- › Wide gate-source voltage range
- › Benchmark gate threshold voltage,  $V_{GS(th)} = 4.5$  V
- › Fully controllable dV/dt
- › Commutation robust body diode, ready for synchronous rectification
- › Temperature independent turn-off switching losses

### Benefits

- › Best-in-class system performance
- › Efficiency improvement and reduced cooling effort
- › Significant reduction in junction temperature for longer lifetime and higher reliability
- › Enables higher frequency operation for reduction in system costs
- › Allows for increase in power density
- › 2-level can replace 3-level topologies with the same efficiency at lower complexity and cost
- › Excellent for hard-switching and resonant-switching topologies like LLC and ZVS

Sales product	$R_{DS(on)}$	$V_{DS}$	Package
IMW120R045M1*	45 mΩ	1200 V	TO-247 3pin
IMZ120R045M1*	45 mΩ	1200 V	TO-247 4pin

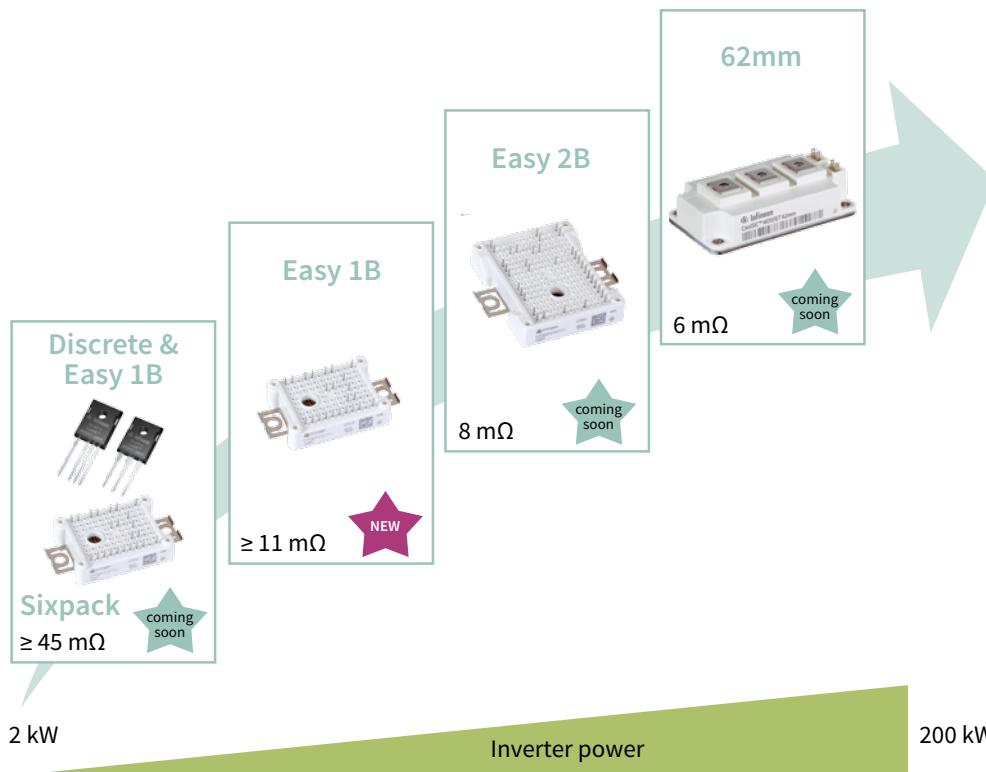

\* Coming soon

The TO-247 4-pin package contains an additional connection to the source (Kelvin connection) that is used as a reference potential for the gate-driving voltage, thereby eliminating the effect of voltage drops over the source inductance. The result is even lower switching losses than for the TO-247 3-pin version, especially at higher currents and higher switching frequencies.

## CoolSiC™ Silicon Carbide MOSFET Modules

Based on our experience and expertise in the area of compatibility, Infineon has introduced the revolutionary CoolSiC™ MOSFET technology, which enables radically new product designs. Easy1B modules, for example, offer a very good thermal interface, a low stray inductance and robust design as well as PressFIT connections.

Easy 1B (Sixpack, booster, Half-bridge)	Easy 2B (Half-bridge)	62 mm (Half-bridge)
FF11MR12W1M1_B11 DF11MR12W1M1_B11 FF23MR12W1M1_B11 DF23MR12W1M1_B11 FS45MR12W1M1_B11	FF8MR12W2M1_B11	FF6MR12KM1

## Silicon carbide MOSFET gate driver ICs

Ultra-fast switching 1200 V power transistors such as CoolSiC™ MOSFETs can be more easily handled by means of isolated gate output sections. Therefore, the following EiceDRIVER™ galvanically isolated gate-driver ICs based on Infineon's core-less transformer technology are recommended as most suitable.

For a larger selection of isolated gate drivers, refer to the page 14 of this selection guide. These drivers incorporate most important key features and parameters for SiC MOSFET driving such as tight propagation delay matching, precise input filters, wide output-side supply range, negative gate voltage capability, extended CMTI capability, active Miller clamp, and DESAT short circuit protection.

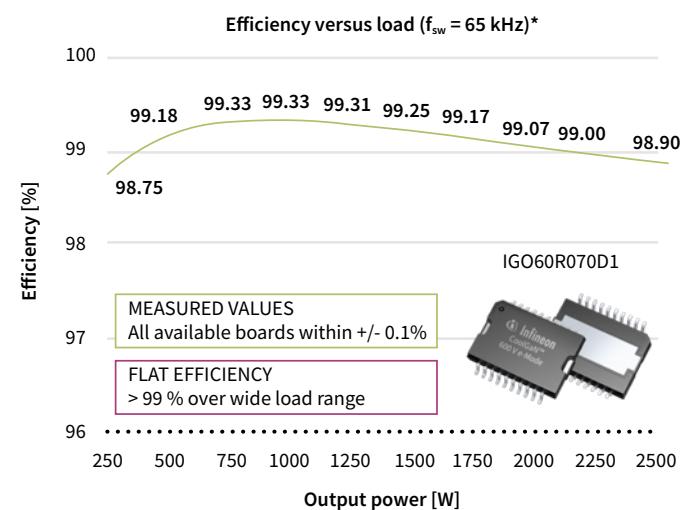

Product	Part number	Typ. peak drive current	VCC2-VEE2	Typ. UVLO thresholds	Typ. prop. delay	Active Miller clamp	Other key features	Package
1ED Compact Isolated high-side Driver Family	1EDI20I12MF	3.5 A	20 V	11.9 V / 11 V	≤ 300 ns	Yes	Functional isolation	DSO-8 
	1EDC20H12AH NEW	3.5 A	35 V	12 V / 11.1 V	≤ 125 ns	No	8 mm creepage clearance; UL 1577-certified with $V_{ISO} = 2500$ V(rms) for 1 min	DSO-8

# CoolGaN™ e-mode HEMTs

Tailor-made for the highest efficiency and power density in switch mode power supplies

CoolGaN™ – in comparison to the next best silicon alternative – enables higher power density through the ability to switch at high frequencies and highest efficiency, especially in the partial load range, through novel topologies such as the CCM totem pole PFC stage. GaN enhancement mode (e-mode) HEMT performance features low reverse recovery charge and excellent dynamic performance in reverse conduction compared to silicon FET solutions. This enables more efficient operation at existing frequencies, and much higher frequency operation which can improve power density by shrinking the size of passive components in power electronics. CoolGaN™ enables doubled output power in a given energy storage slot size, freeing up space and realizing higher efficiency at the same time.

Infineon's CoolGaN™ is the one of most reliable and globally qualified GaN solutions in the market. During the quality management process not only the device is tested, but also its behavior in the application. The performance of CoolGaN™ goes beyond other GaN products in the market. It offers a predicted lifetime of more than 15 years, with a failure rate less than 1 FIT.

\* No external power supplies – everything included.  
 $V_{in} = 230 \text{ V}_{AC}$ ,  $V_{out} = 390 \text{ V}_{DC}$ ,  $t_{ambient} = 25 \text{ }^{\circ}\text{C}$

# Infineon solid-state relays (SSR) technologies

Using Infineon power-switch technologies, Infineon solid-state relays (SSRs) are remotely controlled switches (on/off) with complete galvanic isolation from input to output. No power supply is needed on the output.

## Two main sub-groups:

- › Photovoltaic isolators (PVI)
  - Isolated, low-power DC voltage sources capable of driving MOSFET or IGBT gates directly
- › Photovoltaic relays (PVR)
  - PVI plus internal power MOSFET

## Main benefits of Infineon SSR technology:

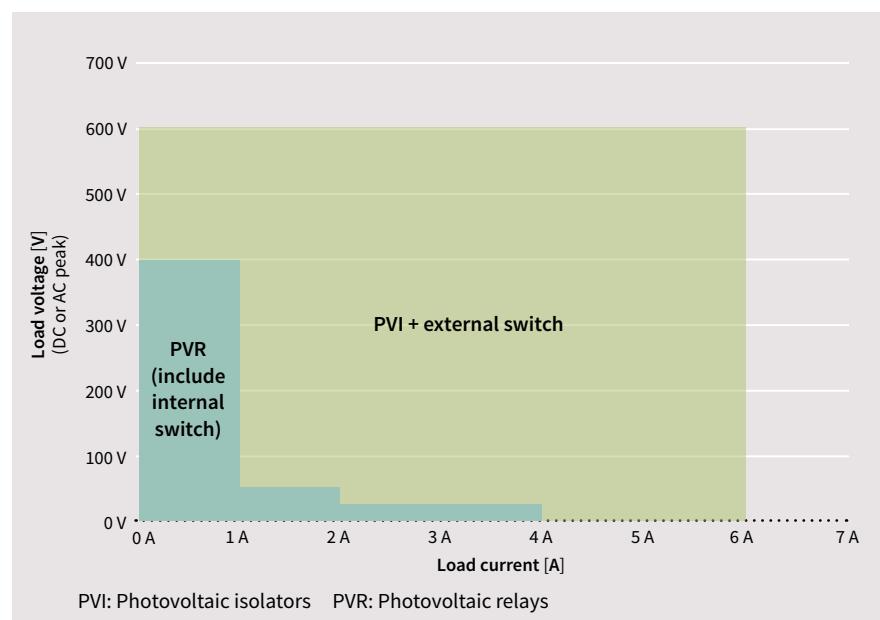

- › Optically isolated technology provides galvanic isolation for **safety** applications
- › Wide range of applications from industrial automation to test equipment
- › Established and reliable products with **over 20 years of history**

## Key advantages over electromechanical relays:

- › Silent operation
- › No contact bounce
- › Compact solution
- › Fast response time
- › High input sensitivity
- › High reliability with long operational life
- › Insensitivity to stray EMF, shock and vibration
- › Stable contact resistance over life

## Infineon SSRs can be used in a wide range of applications:

- › Electro-mechanical relay (EMR) replacement
- › Battery management systems
- › UPS
- › Automatic test equipment
- › Instrumentation systems
- › Industrial automation
- › Thermostats
- › Programmable logic controllers

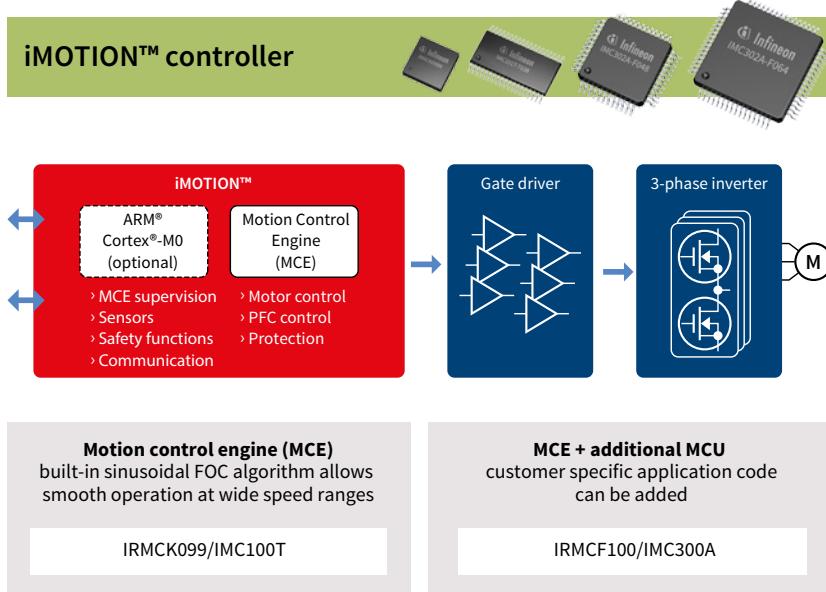

# Infineon iMOTION™ technologies

Flexible and scalable platform for motor control solutions

iMOTION™ products are highly integrated devices used to control variable speed drives. By integrating both the required hardware and algorithms to perform control of Permanent Magnet Synchronous Motors (PMSM), they provide the shortest time-to-market and highest efficiency for inverterized motor systems at the lowest system and development cost.

## iMOTION™ product offering

### Market requirements

- › Energy-efficiency regulations drive inverterization rate
- › Shorter design cycles are driven by reduced product life cycles
- › Focus on key differentiators drives trend to outsourcing
- › Increased price pressure requires system cost reduction

### Key benefits

- › Easy to use – no special motor control know-how required
- › High performance and energy-optimized solution
- › Simplify the system solution by eliminating the Hall sensor for control
- › Fastest time-to-market

# Typical gate-driver applications

A system is a set of interacting or independent components forming an integrated whole.

From product thinking to system understanding, Infineon enables total solutions which make generation, transmission and conversion of electrical energy more efficient and reliable.

The following pages describe typical applications using Infineon gate drivers, power switches and modules.

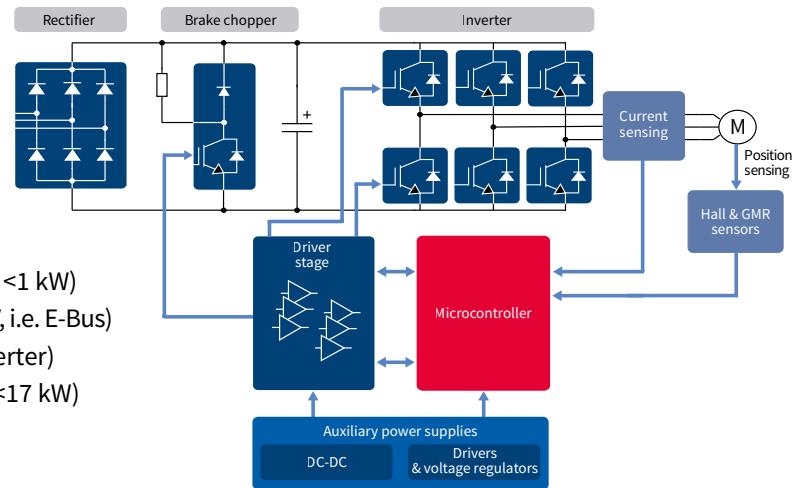

# Drives

## Electronic speed-control systems for energy and performance gains

Infineon's gate driver ICs are the expert's choice. With the breadth and depth of the portfolio, customers can quickly design and build efficient and robust systems for motor drive application.

### Drive applications

- › Commercial sewing machines
- › Elevators/escalators
- › Fans and pumps (PFC, inverter)
- › General purpose drives
- › Heavy duty drives (<200 kW)
- › Servo and stepper motors
- › Automatic gate and door opening system (inverter <1 kW)
- › Commercial, construction & agricultural vehicles (CAV, i.e. E-Bus)
- › Forklift trucks (hydraulic pump inverter, motor inverter)
- › Commercial air-conditioner (CAC compressor, fan <17 kW)
- › Robotics

# Electric vehicles and hybrid vehicles

In (hybrid) electric vehicles, efficiency is a key success factor for extending the range of the vehicle, which also applies to auxiliary applications. Our automotive-qualified gate driver ICs help simplify design, and optimize performance in all MOSFETs and IGBTs driving stages.

**(Hybrid) electric vehicles applications**

- On-board charger
- HV/LV DC-DC converter
- Auxiliary loads
- Wireless in-cabin phone charging

## Recommended gate drivers (Electric vehicles & hybrid vehicles)

# Electric vehicles and hybrid vehicles – main inverter

Typical application diagram - main inverter

In vehicles with an electric drive train, the inverter controls the electric motor, and is a key component in the car, as it determines driving behavior. Regardless of whether the motor is synchronous, asynchronous or brushless DC, the inverter is controlled by an integrated PCB, which should be designed to minimize switching losses and maximize thermal efficiency, as the range of the vehicle is directly related to the efficiency of the main inverter. The Infineon EiceDRIVER™ gate driver family includes single and dual-channel automotive IGBT driver ICs that provide galvanic isolation and bidirectional signal transmission. These products are ideal for the main inverter systems in automotive applications where efficiency, space savings and monitoring functions are priorities. Our automotive-qualified gate driver ICs help simplify design and optimize performance in all MOSFETs and IGBTs driving stages.

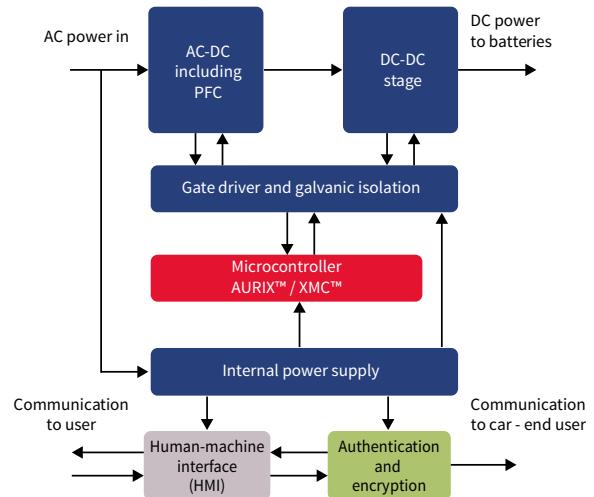

## Recommended gate drivers (Electric vehicles & hybrid vehicles - main inverter)

Application	Driver voltage class [V]	Driver configuration	Part number	Output current [A]	Packages	Description	Suitable power switches
Main inverter	400	Single high-side	1EBN1001AE	15	DSO-14	IGBT / MOSFET gate driver booster for automotive motor drives above 10 kW, peak current up to $\pm 15$ A, support for active clamping with very fast reaction time, active clamping disable, ASC Input signals	IGBT3 / TRENCHSTOP™ (AIKW75N60CT, AIKQ100N60CT, AIKQ120N60CT, AUIRGPS407D0)
		Single high-side	1EDI2001AS	2	DSO-36	On-chip galvanic insulation (up to 6 kV), support of 5 V logic levels, 16-bit standard SPI interface (up to 2 MBaud) with daisy chain support, enable input pin, pseudo-differential inputs for critical signals. Power-on reset pin, debug mode, pulse suppressor, TLTO

# EV Charging

As electro-mobility increasingly becomes part of our daily lives, there is a growing need for more efficient charging solutions. Today, a DC charger with 150 kW can supply an EV with a 200 km charge in around 15 minutes. As fast-charging and battery technologies continue to evolve and improve, experts anticipate that charging time will drop even further. The unique expertise in e-mobility and power supplies makes Infineon the natural partner for advancing DC electric vehicle charging in terms of efficiency, performance, optimal cost and innovation.

## Recommended gate drivers (EV charging)

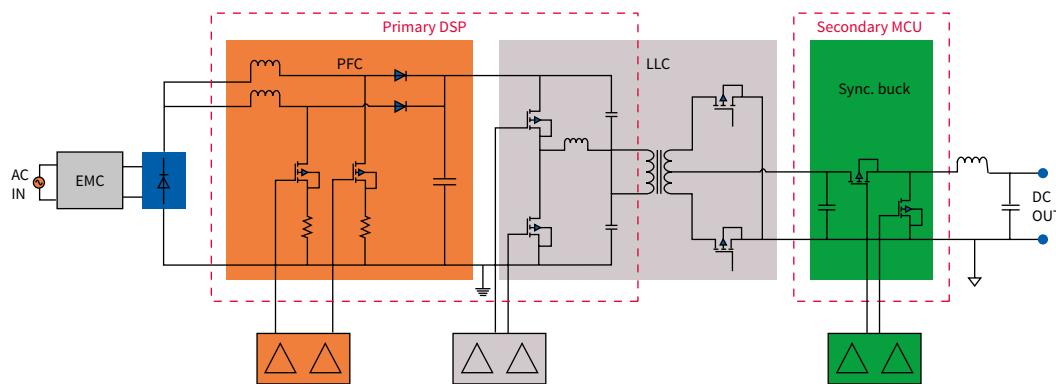

Application	Driver Voltage class [V]	Driver configuration	Part number	Source/Sink current typ. [A]	Packages	Description	Suitable power switches and modules
DC-DC (<3 kW)	600	High and low-side	IRS2113S/M	2.5/2.5	DSO-16 300mil, VQFN-14	600 V high and low-side gate driver with SD	TRENCHSTOP™ IGBT+Diode (IKB40N65EH5, IKW75N65EH5, IKZ75N65EH5) CoolMOS™ MOSFET (IPP65R110CFD, IPP65R310CFD, IPP65R420CFD, IPP65R660CFD, IPW60R105CFD7, IPW60R145CFD7, IPW60R170CFD7, IPP60R280CFD7)
			IRS2186(4)S	4/4	DSO-14, DSO-8	600 V high and low-side driver with high current	
DC-DC (<30 kW)	1200	Single high-side	1EDI05I12AF	1.3/0.9	DSO-8	Functional isolation, $\geq 100 \text{ kV}/\mu\text{s}$ CMTI, separate sink/source output, short circuit clamping	TRENCHSTOP™ IGBT+Diode (IKW40N120H3) CoolMOS™ MOSFET (IPP65R110CFD, IPP65R310CFD, IPP65R420CFD, IPP65R660CFD, IPW60R105CFD7, IPW60R170CFD7, IPP60R280CFD7)
DC-DC (<60 kW)	1200	Single high-side	1EDC20H12AH NEW	4/3.5	DSO-8 300 mil	Functional isolation, $\geq 100 \text{ kV}/\mu\text{s}$ CMTI, separate sink/source output, short circuit clamping, 125-ns propagation delay	CoolSiC™ SiC MOSFET (IMW120R045M1* - 3-pin, IMZ120R045M1* - 4-pin) TRENCHSTOP™ IGBT+Diode (IKQ50N120CH3, IKQ75N120CS6)
			1EDI40I12AF	7.5/6.8	DSO-8	Functional isolation, $\geq 100 \text{ kV}/\mu\text{s}$ CMTI, separate sink/source output, short circuit clamping	
	650	Dual high-side	2EDS8265H NEW	4/8	DSO-16 300 mil	Reinforced isolation, 150 $\text{kV}/\mu\text{s}$ CMTI, EN	CoolMOS™ MOSFET (IPW65R041CFD, IPW65R080CFD, IPW60R018CFD7, IPW60R040CFD7, IPW60R070CFD7, IPW60R090CFD7, IPL60R060CFD7)
PFC	1200	Single high-side	1EDC60H12AH NEW	10/9.4	DSO-8	Functional isolation, $\geq 100 \text{ kV}/\mu\text{s}$ CMTI, separate sink/source output, short circuit clamp, 125-ns propagation delay	CoolSiC™ SiC MOSFET module (FF11MR12W1M1_B11; FF23MR12W1M1_B11; DF11MR12W1M1_B11; DF23MR12W1M1_B11) EasyPack™ 1B/2B module (F4-3L50R07W2H3F_B11) EconoPIM™ 2 module (FP50R07N2E4_B11) EconoPACK™ 2/3/4 module (FS75R12K4_B15, FS100R12K4G(P)_B11, FS200R12K4R(P)_B11, FS225R120E4) EconoDUAL™ 3 module (FF225R12ME4_B11) 34mm module (FF50R12RT4, FF150R12RT4) 62mm module (FF200R12KE4)
			1EDS20I12SV NEW	SRC/2	DSO-36	Reinforced isolation, VDE 0884-10, $V_{IORM} = 1420 \text{ V}$ , $V_{IOTM} = 8000 \text{ V}$ ; UL 1577, $V_{ISO} = 5000 \text{ V(rms)}$ ; slew rate control, soft shutdown, DESAT, FAULT-RPT, OCP, TLTO	
	650	Dual high-side	2EDF7275F NEW	4/8	DSO-16 150mil	Dual-channel galvanically isolated gate-driver ICs	
	1200	Single high-side	1EDI40I12AH	7.5/6.8	DSO-8 300 mil	Functional isolation, $\geq 100 \text{ kV}/\mu\text{s}$ separate sink/source output, short circuit clamping	TRENCHSTOP™ 5 H5 (IKW50N65EH5, IKZ50N65EH5, IKW75N65EH5, IKZ75N65EH5)
	20 <sup>1</sup>	Single low-side	1EDN8550B NEW	4/8	SOT23-6	20 V non-inverting signal Low-side driver with truly differential inputs, especially for kelvin source 4 pin device in PFC boost	CoolMOS™ MOSFET (IPP60R060P7, IPP60R120P7, IPP60R180P7, IPP60R360P7, IPW65R019C7, IPW65R065C7, IPW65R125C7, IPW65R190C7)
	20	Single low-side	1EDN8511B	4/8	SOT23-6	20 V non-inverting single low-side driver with CMOS inputs in small 6-pin SOT-23 package	
	25	Dual low-side	IRS4427S	2.3/3.3	DSO-8	25 V non-inverting dual low-side driver with CMOS inputs	

Note<sup>1</sup>: Common mode rejection (CMR) voltage range up to 80 V.

# Small home appliances and battery-powered applications

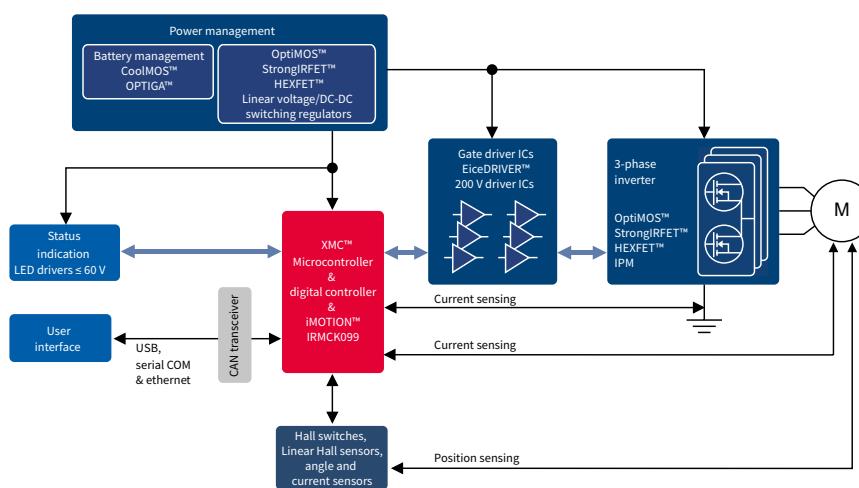

Typical small home appliance application diagram

## Small home appliance applications

- › Vacuum cleaner (SR motor, BLDC, PFC)
- › Hair dryers
- › Induction heating (half bridge-topology)
- › Microwave ovens
- › Fans (hood fans, ceiling fans, freezer fans)
- › Battery chargers (PFC)

Typical battery powered three-phase system: a one-stop-shop for battery powered drives

## Battery-powered applications

- › Drones / multicopters (<1 kW)
- › Lawn mower (<1 kW)
- › Cordless power tools (<1 kW)
- › Service robotics (<1 kW)
- › Cordless vacuum cleaners (<1 kW)
- › Toys (RC cars) (<1 kW)
- › Fast battery chargers

## Recommended gate drivers (Small home appliances and battery-powered applications)

Application	Driver voltage class [V]	Driver configuration	Part number	Source/Sink current typ. [A]	Packages	Description	Suitable power switches and controllers

# Driver configuration overview

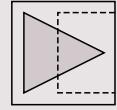

## Single-channel low-side driver

Allows low offset of the voltage between input and output

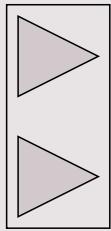

## Single-channel high-side driver

Allows high voltage offset between input and output

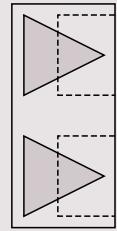

## Dual-channel low-side driver

Both channels allow individual low voltage offsets, no interlock

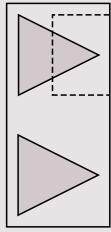

## Dual-channel high-side driver

Both channels allow individual high voltage offsets, no interlock

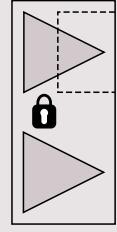

## High and low-side driver

Two non-interlocked channels, one for high, one for low voltage offsets

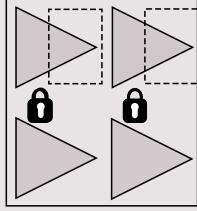

## Half-bridge driver

Two interlocked channels where one of the channel allows a high voltage offset

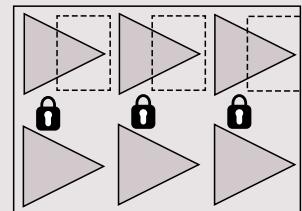

## Full-bridge driver

Four channels in a package with two independent half bridges

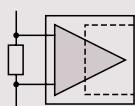

## Three-phase bridge

Six channels in a package with three independent half bridges

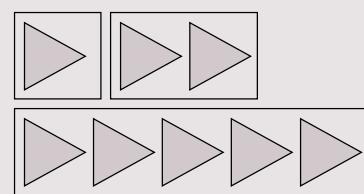

## Current sense

Current sensing across a high-voltage offset between sense input and data output

## Synchronous-buck driver

High speed drivers for dual high side and low side MOSFETs in synchronous rectified buck converters

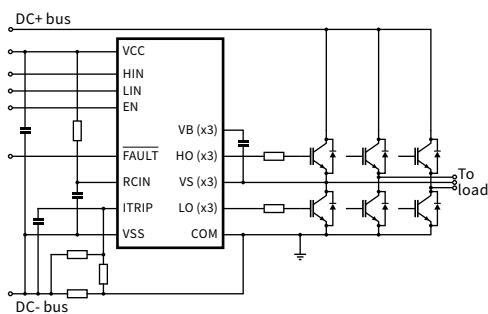

# Product portfolio overview

Infineon's gate driver IC solutions are the expert's choice. With more than 500 reliable and efficient gate driver solutions, we provide a comprehensive portfolio for virtually any application. To ease the selection process, this overview is structured along the configurations of the gate driver ICs, as opposed to application topology.

## Three-phase gate driver ICs

### Typical connection

# Features

Addressing various application requirements, Infineon delivers solutions with an assortment of features intended to optimize performance, minimize size and reduce cost. Below is a table of additional gate driver IC features available in the current portfolio.

Features	Abbreviation	Benefits
Active Miller clamp	M-CLAMP	Protection against inadvertent dynamic turn-on because of parasitic Miller effects
Active shutdown	SD-ACT	Ensures a safe IGBT off-state in case the output chip is not connected to the power supply or an undervoltage lockout is in effect
Brake chopper	BRAKE	Integrated brake IGBT driver with protection
Comparator	CMP	General purpose comparator included
Current sense	CS	Senses the motor phase current through an external shunt resistor, converts from analog to digital signal, and transfers the signal to the low side
Dedicated JFET control	JFETDRIVE	Optimized to drive SiC JFET
Desaturation protection	DESAT	Protects the IGBT at short circuit
Enable	EN	Dedicated pin terminates all outputs
Fault reporting	FAULT-RPT	Indicates an overcurrent or under-voltage shutdown has occurred
Fault reset	FAULT-RST	Dedicated pin resets the DESAT-FAULT-state of the chip
High-voltage start-up	HVSTART	Provides easy and fast circuit start-up while enabling low circuit standby losses
Integrated bootstrap diode	BSD	Integrated bootstrap reduces BOM
Operational amplifier	OPAMP	An independent op-amp for current measurement or overcurrent detection
Self-oscillating (oscillator)	OSC	Integrated front end oscillator
Over-current protection (ITRIP)	OCP	Ensures safe application operation in case of overcurrent
Over temperature shutdown	SD-OT	Internal over temperature protection circuit protects the IC against excessive power loss and overheating
Programmable deadtime	DT-PROG	Deadtime is programmable with external resistor for flexible design
Programmable fault clear time	FLTC	The length of the fault clear time period ( $t_{FLTC}$ ) is programmed by external capacitor which connected between FLTC and VSS ( $C_{FLTC}$ ).
Programmable shutdown	SD-PROG	A shutdown feature has been designed into a pin
Separate pin for logic ground	SEP-GND	Dedicated pin or logic ground for improved noise immunity
Separate sink/source outputs	SEP-OUT	Simplifies gate resistor selection, reduces BOM, and improves dV/dt control
Shoot-through protection	STP	Additional shoot-through protection logic such as interlock
Short-circuit clamping	SC-CLAMP	During short circuit the IGBT's gate voltage tends to rise because of the feedback via the Miller capacitance. An additional protection circuit connected to OUT+ limits this voltage to a value slightly higher than the supply voltage.
Shutdown	SD	Dedicated pin disables the IC outputs
Soft overcurrent shutdown	SD-SOFT	Dedicated pin turns off the desaturated transistor, preventing overvoltages
Truly Differential Inputs	TDI	$\pm 70\text{ V}_{\text{DC}}$ and $\pm 150\text{ V}_{\text{AC}}$ ground-shift robustness of low-side gate driver ICs
Two-level turn-off	TLTO	Lowers VCE overshoots at turn-off during short circuits or overcurrent events
UL 1577	UL	Double galvanic isolation certification
Undervoltage lockout	UVLO	Ensures safe application operation by avoiding unexpected driver behavior at low voltages
VDE 0884-10 or VDE 0884-11	VDE	Reinforced galvanic isolation certifications for non-optical couplers

## Complementary: Opto-isolated solid state relays

Typical connection

Microelectronic relays (MER) are power MOSFET or IGBT output photovoltaic relays where the output switch is controlled by radiation from a GaAlAs light emitting diode (LED) optically isolated from the output. MERs are a good choice to replace mechanical relays.

## Complementary: Opto-isolated gate drivers/voltage sources

Typical connection

Photovoltaic isolators generate an electrically isolated DC voltage upon receipt of a DC input signal and are capable of directly driving MOSFET or IGBT gates. The output is controlled by radiation from a GaAlAs light emitting diode (LED) optically isolated from the output

# New product highlights

1EDC Compact - 1200 V single-channel, galvanically isolated gate driver family in 300 mil package with UL certification **NEW**

Infineon's new EiceDRIVER™ 1EDC Compact galvanically isolated family is recognized under UL 1577 with an insulation test voltage of  $V_{ISO} = 2500$  V(rms) for 1 min. The galvanically isolated 1EDI Compact 150 mil and 300 mil families without UL certification are also available.

1EDC Compact	Typ. output current [A]	Output configuration	Prop. delay [ns]
1EDC60I12AH	10 / -9.4	Separate sink/source outputs	300
1EDC40I12AH	7.5 / -6.8		300
1EDC20I12AH	4 / -3.5		300
1EDC05I12AH	1.3 / -0.9		300
1EDC60H12AH	10 / -9.4		125
1EDC20H12AH	4 / -3.5		125
1EDC30I12MH	5.9 / -6.2	Active Miller clamp	300
1EDC20I12MH	4.4 / -4.1		300
1EDC10I12MH	2.2 / -2.3		300

## Product features

- › 1200 V input-to-output isolation voltage
- › Functional isolation
- › DSO-8 300 mil wide body package with 8 mm creepage distance
- › For 600 V/1200 V IGBT, MOSFET and SiC MOSFET devices and modules
- › Up to 10 A typical peak rail-to-rail output
- › More than 100 kV/μs CMTI
- › Suitable for operation at high ambient temperature
- › Separate source and sink outputs or active Miller clamp
- › Optimized pin-out for low inductance power supply
- › No need to adapt signal voltage levels between microcontroller and driver
- › Short-circuit clamping
- › Active shutdown

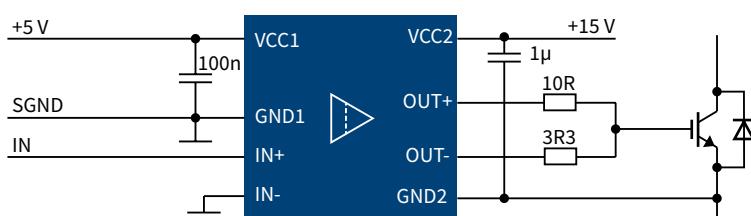

## Potential applications

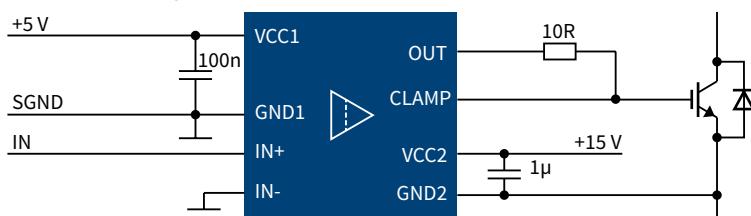

- › Photovoltaic string inverters, EV charging
- › Industrial drives, AC and brushless DC motor drives, high-voltage DC-DC converter and DC-AC inverter
- › UPS systems
- › Active shutdown

## Typical application diagram

### Separate sink/source outputs

### Active Miller clamp

Evaluation board available:  
EVAL-1EDC20H12AH-SiC

## 1EDS-SRC - 1200 V single-channel, reinforced-isolated driver family with slew-rate control **NEW**

The new EiceDRIVER™ slew-rate control (SRC) family serves the latest generation of highly efficient low-EMI electric drive systems with improved efficiency. This is the first high-voltage isolated gate driver on the market with dynamic slew-rate control (SRC) which allows on-the-fly dV/dt control of electric drives through precise gate current control, providing the best trade-off between minimum power dissipation and minimum EMI depending on operating conditions.

### Product features

- › Real-time adjustable gate current control
- › DESAT short circuit protection
- › Overcurrent protection
- › Soft turn-off shut-down
- › Two-level turn-off
- › Drive power modules up to 900 A
- › Unique: NPC1 short-circuit protection for three-level inverters
- › Low EMI during low-load conditions and high efficiency during high-load conditions
- › Reduction or elimination of dV/dt filter

### Potential applications

- › AC and brushless DC motor drives
- › High-voltage DC-DC converters
- › UPS systems
- › Welding
- › Servo drives

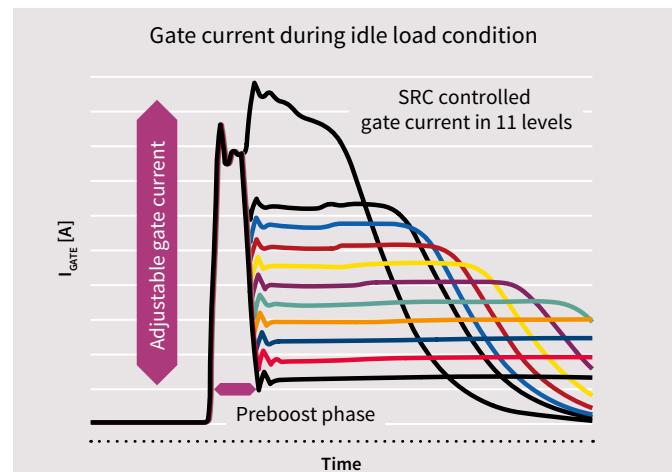

Evaluation board available:

EVAL-1EDS20I12SV

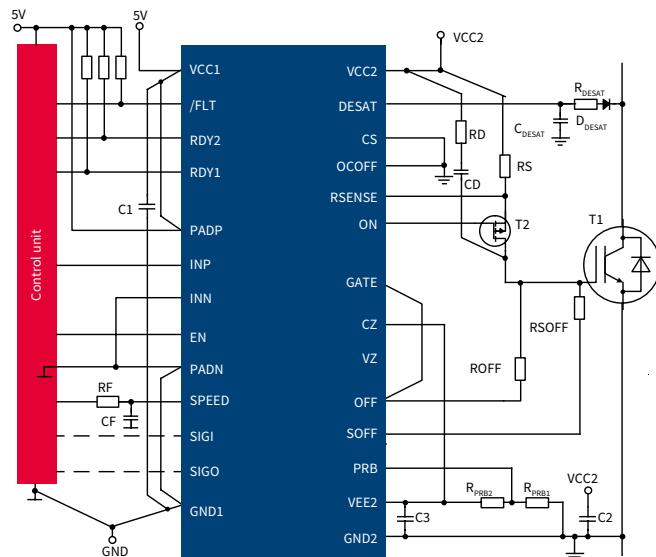

[www.infineon.com/SRC](http://www.infineon.com/SRC)

Part number	Isolation rating
1EDS20I12SV	Reinforced isolation according VDE 0884-10 ( $V_{IORM} = 1420$ V) and UL 1577 certified with $V_{ISO} = 5$ kV(rms) for 1 min
1EDU20I12SV	UL 1577 certified with $V_{ISO} = 5$ kV(rms) for 1 min
1EDI20I12SV	Functional isolation

### Feature - real time gate current control:

### Simplified application diagram

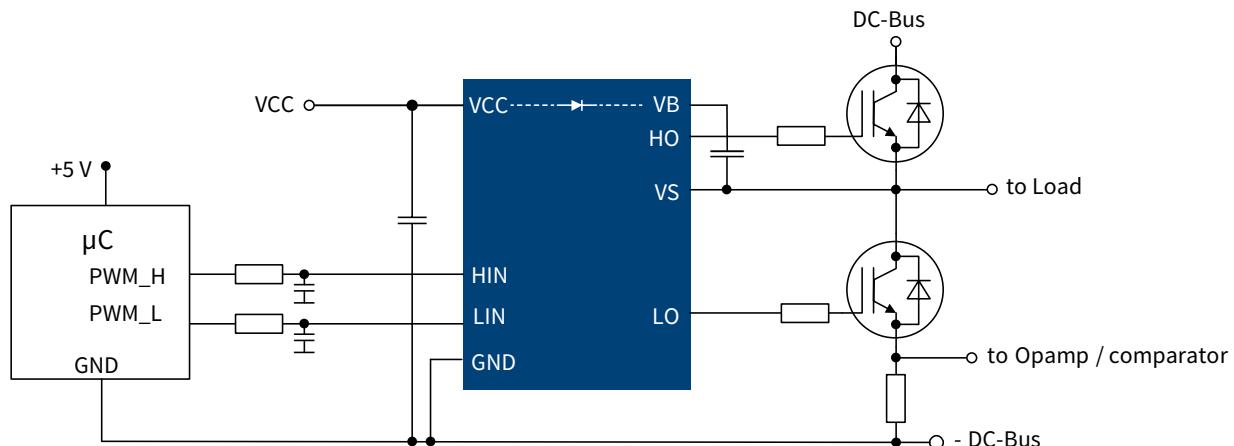

## 2ED2304S06F - 650 V Half-bridge gate driver with integrated bootstrap diode (BSD) **NEW**

The 2ED2304S06F is a 650-V Half-bridge gate driver. Its Infineon thin-film-SOI technology provides excellent ruggedness and noise immunity. The output drivers features a high pulse current buffer stage designed for minimum driver cross-conduction. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration which operates up to 650 V. Additionally, the offline clamping function provides an inherent protection of the parasitic turn-on by floating gate conditions when IC is not supplied.

### Typical application diagram

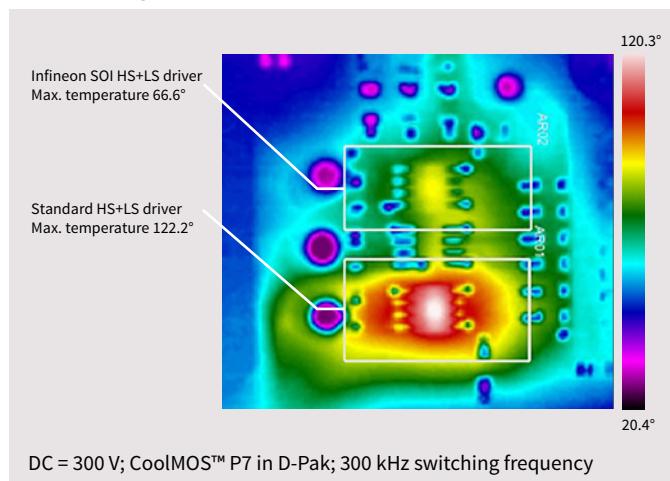

### Product features

- › Infineon thin-film-SOI-technology
- › Fully operational to +650 V
- › Floating channel designed for bootstrap operation
- › Output source/sink current capability +0.36 A/-0.7 A
- › Integrated ultra-fast, low RDS(ON) Bootstrap Diode
- › Tolerant to negative transient voltage up to 100 V (pulse width is up 300 ns) given by SOI-technology
- › 10 ns typ., 60 ns max. propagation delay matching
- › dV/dt immune  $\pm 50$  V
- › Gate drive supply range from 10 V to 20 V
- › Undervoltage lockout for both channels
- › 3.3 V, 5 V and 15 V input logic compatible
- › RoHS compliant

### Potential applications

- › Motor drives, general purpose inverters
- › Refrigeration compressors
- › Half-bridge and full-bridge converters in offline AC-DC power supplies for telecom and lighting

### Power dissipation of Infineon SOI

## 6ED2230S12T - 1200 V Three-phase gate driver with integrated bootstrap diodes (BSD) and overcurrent protection (OCP)\*

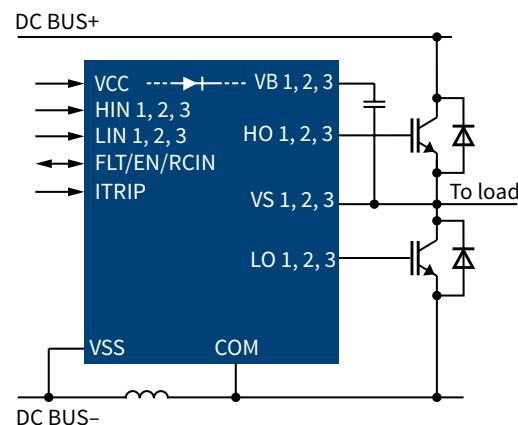

The 6ED2230S12T is a 1200-V Three-phase SOI gate driver with integrated bootstrap diode and overcurrent protection, with typical 0.35 A source and 0.65 A sink currents in a DSO-24 package (DSO-28 with 4 pins removed) for driving IGBTs. Proprietary HVIC and latch-immune CMOS technologies enable a robust monolithic design. A current-trip function which terminates all six outputs can also be derived from this resistor. An open-drain FAULT signal is provided to indicate that an overcurrent or undervoltage shutdown has occurred. Fault conditions are cleared automatically after a delay programmed externally via an RC network. The output drivers feature a high-pulse current buffer stage designed for minimum driver cross conduction. Propagation delays are matched to simplify the driver's use in high-frequency applications.

### Product features

- › Infineon thin-film SOI technology
- › Fully operational to +1200 V
- › Floating channel designed for bootstrap operation
- › Output source/sink current capability +0.35 A/-0.65 A
- › Integrated ultra-fast, low RDS(ON) bootstrap diode
- › Tolerant to negative transient voltage up to -100 V (pulse width is up 700 ns) given by SOI-technology
- › Undervoltage lockout for both channels
- › 3.3 V, 5 V, and 15 V input logic compatible
- › Overcurrent protection (ITRIP  $\pm 5\%$  reference)
- › Fault reporting, automatic fault clear and enable function on the same pin (RFE)
- › Matched propagation delay for all channels
- › Integrated 460 ns deadtime protection
- › Shoot-through (cross-conduction) protection
- › 2.5 kV HBM ESD protection

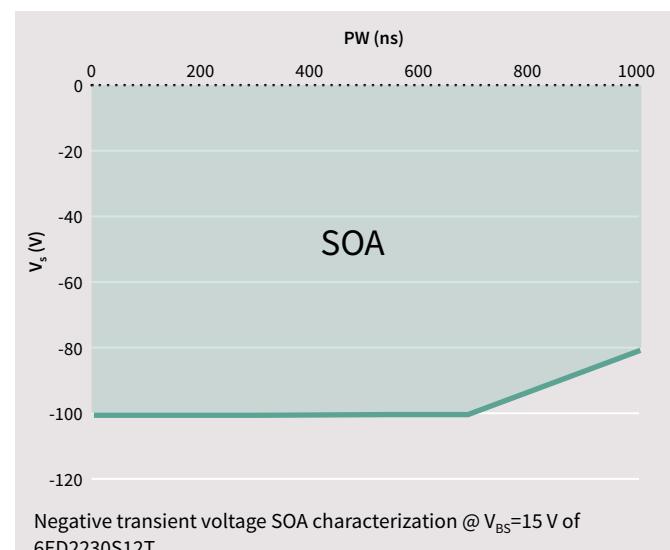

### Typical application diagram

### Typical applications

- › Industrial drives, motor control, general purpose inverters
- › Commercial air-conditioning (CAC)

## 2ED2106/08/09/091S06 Gate driver family\*

## 2ED2181/82/83/84S06 High-current gate driver family\*

## 650 V Half-bridge &amp; high and low-side gate driver with integrated BSD

The 2ED2106/08/09/091S06 gate driver family and 2ED2181/83/84S06 high-current gate driver family are high-voltage power MOSFET and IGBT driver families with Half-bridge & high and low-side configuration. Based on SOI-technology, this device has excellent robustness and noise immunity with the capability to maintain operational logic at negative voltages of up to  $-11\text{ V}_{\text{DC}}$  on the VS pin ( $\text{V}_{\text{CC}}=15\text{ V}$ ) on transient voltages. With no parasitic structures, the device is immune to parasitic latch-up at all temperature and voltage conditions. The logic input is compatible with standard CMOS or LSTTL output, down to 3.3 V logic. The output drivers feature a high-pulse current buffer stage designed for minimum driver cross-conduction. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high-side configuration which operates up to 650 V.

## Product features

- › Infineon 650 V thin-film SOI-technology
- › Ultra-fast bootstrap diode integration
- › Tolerant to negative transient voltage at least  $-80\text{ V}$  with 500 ns pulse width
- ›  $\text{dV/dt}$  immune to  $\pm 50\text{ V}$
- › Logic input withstands swing to  $-5\text{ V}$
- › Logic and power ground  $\pm 5\text{ V}$  offset
- › Gate drive supply range from 10 to 20 V
- › Undervoltage lockout for both channels
- › 3.3 V, 5 V and 15 V input logic compatible
- › Schmitt trigger inputs with hysteresis and pull-up or pull-down

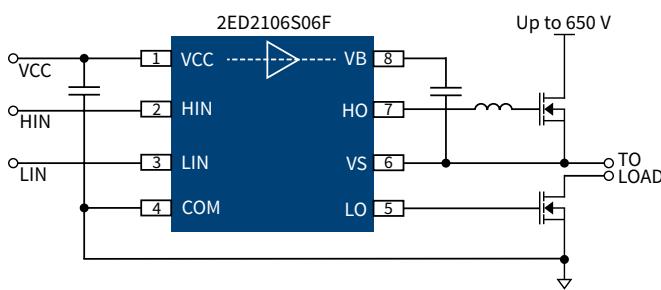

## Potential applications

- › Motor drives, general purpose inverter drives
- › Half-bridge and full-bridge converters in offline AC-DC power supplies for telecom and lighting
- › Solar inverter and UPS drives

## 1ED44176N01F - 25 V Low-side gate driver with integrated overcurrent protection, fault reporting, and enable functionality **NEW**

The 1ED44176N01F is a low-voltage, non-inverting gate driver designed for ground-referenced applications such as digitally controlled power-factor correction (PFC) circuits requiring overcurrent protection (OCP). OCP is typically implemented using a current measurement circuit with a comparator such as LM293 and a network of resistors and capacitors. 1ED44176N01F provides up to 20% cost and 50% space savings by integrating the OCP comparator, which features an accurate current-sensing threshold tolerance of  $\pm 5\%$ . 1ED44176N01F also integrates fault-output reporting to the controller and driver enable functionality on the same pin. The driver IC also has separate logic and power ground pins for operational robustness.

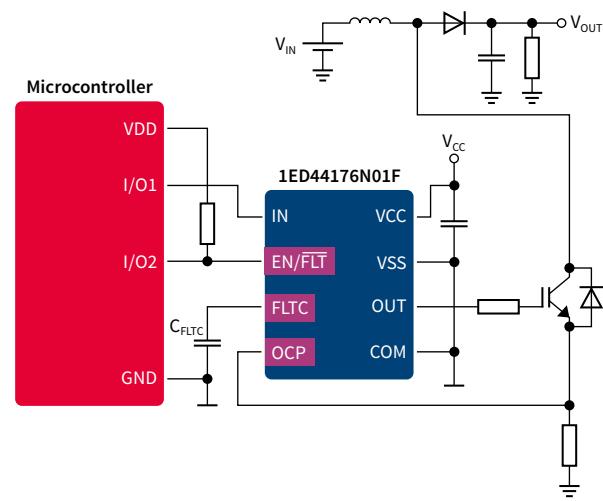

### Product features

- › Overcurrent detection with positive voltage input
- ›  $+0.8\text{ A}/-1.75\text{ A}$  output source/sink current capability
- ›  $+0.5\text{ V}$  overcurrent threshold with  $\pm 5\%$  tolerance
- › Single pin for fault output and enable function
- › Programmable fault clear time
- › CMOS Schmitt-triggered inputs
- ›  $3.3\text{ V}, 5\text{ V}$  and  $15\text{ V}$  input logic-compatible
- › Output in phase with input
- › Separate logic and power ground
- ›  $2\text{ kV}$  ESD HBM

### Potential applications

- › General purpose low-side gate driver for single-ended topologies (e.g. digitally controlled PFC or digital power supplies)
- › Residential and commercial air conditioners
- › Home appliances
- › Industrial applications

### Simplified application diagram

Application note, PSPICE or SiMetrix models, and evaluation board, **EVAL-1ED44176N01F** are available at [www.Infineon.com/1ED44176](http://www.Infineon.com/1ED44176)

Key features	Key specifications	System benefits
› Integrated overcurrent protection comparator with accurate OCP threshold	› $0.5\text{ V}$ overcurrent threshold with accurate $\pm 5\%$ percent tolerance	› Potential space savings up to 50 percent and cost savings up to 20 percent compared to the discrete solution
› Single pin for fault output and enable function	› Internal Schmitt trigger comparator for the enable function	› Flexible fault clear time set-up for different microcontroller processing speeds
› Programmable fault clear time	› External capacitor ( $C_{FLT}$ ) sets the length of the fault clear time	› Minimizes power consumption
› Low quiescent supply current	› Max $I_{QCC}$ : $750\text{ }\mu\text{A}$	› Avoids noise coupling from output to input which improves noise immunity
› Separate logic ground and gate driver return	› VSS and COM pins	› Eliminates switching loss at low $V_{CC}$ supply voltage
› Undervoltage lockout (UVLO) protection	› Specific UVLO level for IGBTs (typ. on/off = $11.9\text{ V} / 11.4\text{ V}$ )	

## 1EDN7550 and 1EDN8550 - 1-channel low-side gate driver family with truly differential inputs prevents false triggering of power MOSFETs **NEW**

The input signal levels of conventional low-side gate driver ICs are referenced to the ground potential of the gate driver IC. If in the application the ground potential of the gate driver IC shifts excessively false triggering of the gate driver IC can occur.

The 1EDN7550/1EDN8550 gate driver ICs have truly differential inputs. Their control signal inputs are largely independent from the ground potential. Only the voltage difference between its input contacts is relevant. This prevents false triggering of power MOSFETs.

### Product features

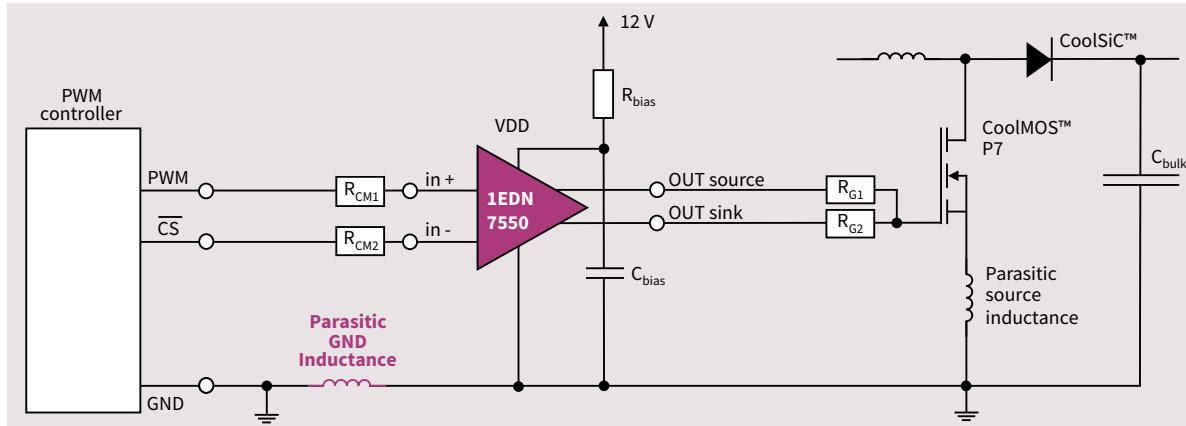

- › Truly differential inputs
- › 4 A source current
- › 8 A sink current
- › Separate source/sink outputs
- › Low-ohmic output stage
- › 29 ns input minimum pulse width
- › 7 ns propagation delay accuracy
- › 5 A reverse current robustness of the outputs
- › 4 V and 8 V UVLO versions
- › SOT-23 package, 6 pins

### Potential applications

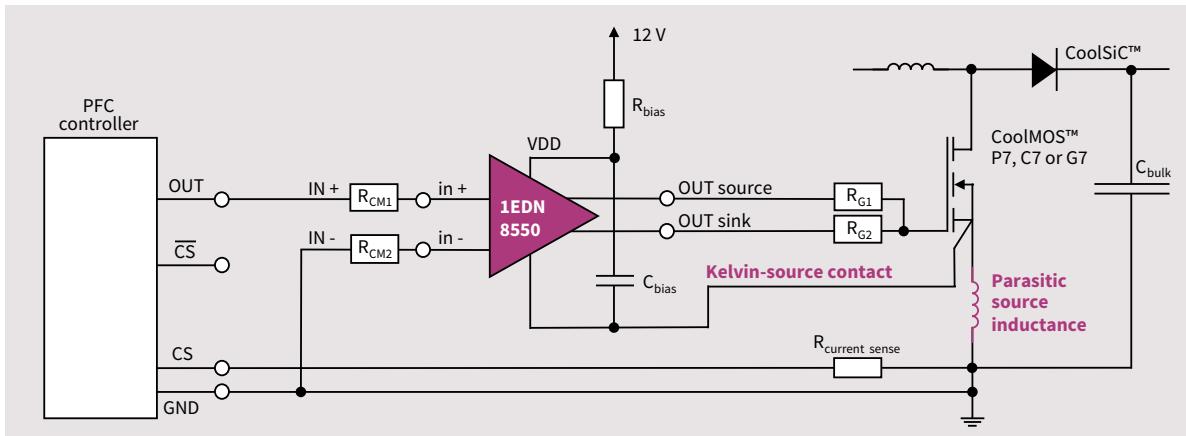

- › Servers
- › Telecom
- › DC-DC converters
- › Telecom bricks
- › Power tools
- › Industrial SMPS
- › Wireless charging
- › Solar micro inverters

### 1EDN7550 driving CoolMOS™ SJ MOSFET on 1-layer PCB

### 1EDN8550 driving Kelvin source CoolMOS™ superjunction (SJ) MOSFET in boost PFC

## GaN EiceDRIVER™ family NEW

Single-channel isolated gate driver ICs for high voltage GaN switches

CoolGaN™ e-mode HEMTs are best driven by Infineon's EiceDRIVER™ ICs, the 1EDF5673K, 1EDF5673F and 1EDS5663H. They ensure robust and highly efficient high voltage GaN switch operation whilst concurrently minimizing R&D efforts and shortening time-to-market.

### Product features

- › Low ohmic outputs:

Source:  $0.85\ \Omega$

Sink:  $0.35\ \Omega$

- › Single-channel galvanic isolation:

Functional:  $V_{IO} = 1500\ V_{DC}$

$V_{IOWM} = 510\ V_{rms}$  (16-pin DSO)

$V_{IOWM} = 460\ V_{rms}$  (LGA 5x5)

Reinforced:  $V_{IOTM} = 8000\ V_{pk}$

(VDE 0884-10 pending)

$V_{IOWM} = 1420\ V_{DC}$

CMTI min:  $200\ V/ns$

- › Timing:

Minimum output pulse width: 18 ns

Propagation delay accuracy: 13 ns

### Potential applications

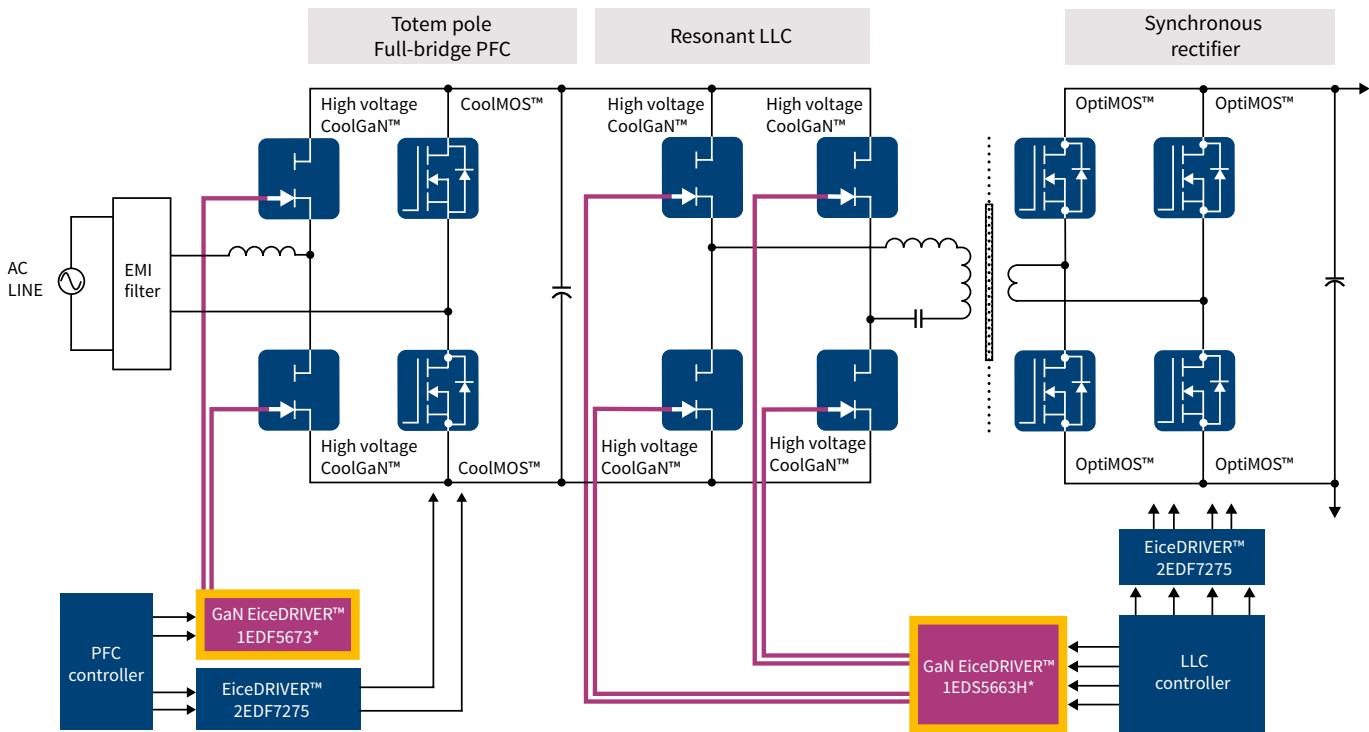

- › Totem-pole PFCs
- › Vienna rectifiers
- › Multi-level topologies
- › Resonant LLC

Evaluation board available:

**EVAL\_1EDF\_G1\_HB\_GAN**

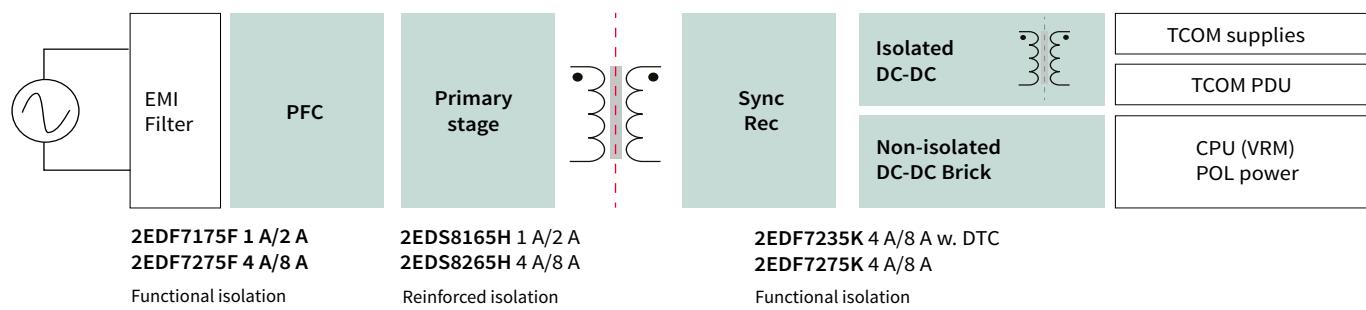

### High power SMPS application example

\*GaN EiceDRIVER™ ICs are single-channel products

## 2EDI Dual-channel functional and reinforced-isolated gate driver family for MOSFETs with accurate and stable timing **NEW**

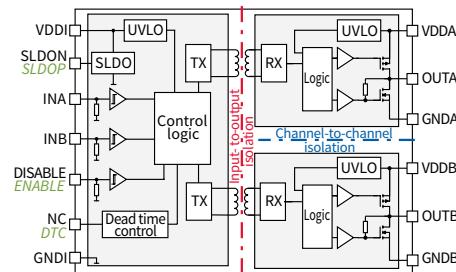

The EiceDRIVER™ 2EDI product family is designed for use in high-performance power-conversion applications. Very strong 4 A/8 A source/sink dual-channel gate drivers increase efficiency in CoolMOS™ and OptiMOS™ MOSFET Half-bridges. The low propagation delay of 37 ns, combined with highly accurate and stable timing over temperature and production, enables further efficiency gains within and across galvanically isolated power stages or in multi-phase/multi-level topologies. The availability of functional and reinforced isolated drivers in different packages makes these a perfect fit for both primary-side and (safe) secondary-side control. Gate driver outputs come with a high 5 A reverse-current capability and 150 V/ns CMTI robustness for high dV/dt power loops. For slower switching or driving smaller MOSFETs, 1 A/2 A peak current product variants are available as well.

### Product features

- › Easy-to-use small form factor driver + isolation in one package
- › Stable and high-resolution PWM timing accuracy within and across power stages for optimizing full and light-load efficiency
- › Galvanic isolation with 150 V/ns CMTI robustness for noisy high-voltage MOSFET power-switching environment
- › Competitive overall system-component cost with improved protection
- › Faster time to market with planned UL 1577, VDE 0884-1x, IEC 60950/62386 reinforced safety certifications

### Device overview

### Potential applications

› Telecom DC-DC	› Batteries

## 1EDI2004AS\* - EiceDRIVER™ SIL 1200 V galvanically isolated automotive gate driver IC

1EDI2004AS is a high-voltage IGBT gate driver designed for automotive motor drives above 5 kW. It is based on Infineon's coreless transformer (CT) technology, providing galvanic isolation between low-voltage and high-voltage domains. The device has been designed to support 400 V, 600 V and 1200 V IGBTs. 1EDI2004AS can be connected on the low-voltage side (primary side) to 5 V logic.

A standard SPI interface allows the logic to configure and to control the advanced functions implemented in the driver. On the high-voltage side (secondary side), it is dimensioned to drive an external booster stage, or directly, small IGBTs. Short propagation delays and controlled internal tolerances lead to minimal distortion of the PWM signal. The 1EDI2004AS can be used optimally with 1EBN100XAE 'EiceDRIVER™ Boost' booster stage family.

### Product features

- › Low-propagation delay and minimal PWM distortion
- › Support of 5 V logic levels (primary side)
- › 16-bit standard SPI interface (up to 2 MBaud) with daisy-chain support (primary side)
- › Fully programmable active clamping inhibit signal (secondary side)
- › Operation with unipolar secondary supply possible
- › Automotive-qualified (as per AEC Q100)

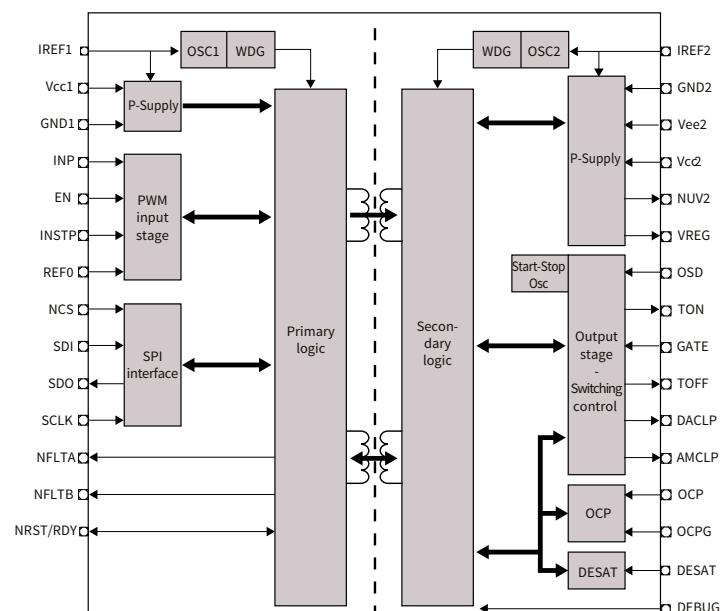

### Safety features

- › Desaturation monitoring
- › Overcurrent protection
- › Fully programmable two-level turn-off
- › Support for active short-circuit (ASC) strategies
- › Compliant to ISO 26262 standard - ASIL A (suitable for systems up to ASIL D requirements)

### Potential applications

- › Main inverters for automotive (hybrid) electric vehicles
- › High-voltage DC-DC converter
- › Industrial drive

### Simplified application diagram

## AUIR2x14SS\* – 1200 V Half-bridge automotive gate driver IC

The AUIR2x14SS gate driver family is suited to drive a single half bridge in automotive power-switching applications. These drivers provide high gate-driving capability (2 A source, 3 A sink) and require low quiescent current, which allows for the use of bootstrap power supply techniques in medium power systems. These drivers feature full short-circuit protection by means of power-transistor desaturation detection, and manage all Half-bridge faults by smoothly turning off the desaturated transistor via the dedicated soft shutdown pin, therefore preventing over-voltages and reducing electromagnetic emissions.

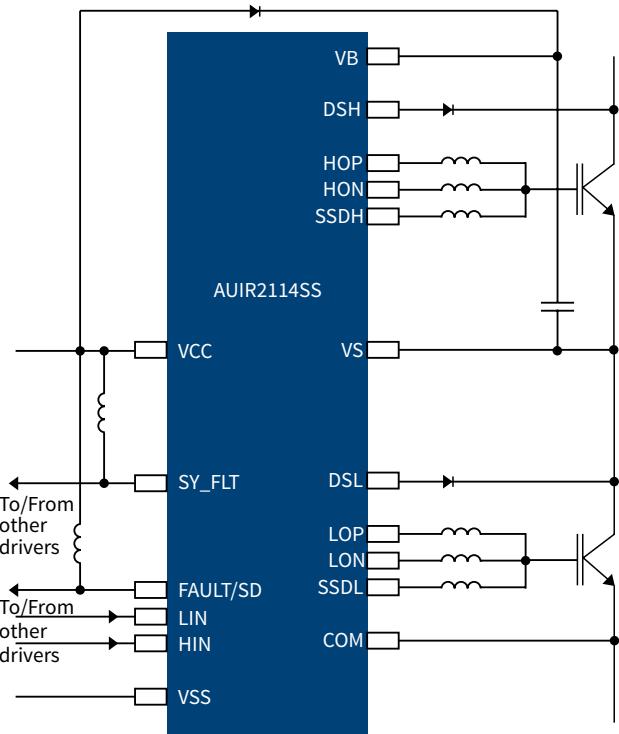

### Product features

- › First Q100-qualified single-die 1200 V device
- › Floating channel up to 700 V (AUIR2114SS) or 1200V (AUIR2214SS)
- › Soft overcurrent shutdown
- › Synchronization signal to synchronize shutdown with the other phases
- › Integrated desaturation detection circuit
- › Two-stage turn-on output for di/dt control
- › Separate pull-up/pull-down output drive pins
- › Matched delay outputs
- › Undervoltage lockout with hysteresis band

### Potential applications

- › Automotive auxiliaries
- › Fans
- › (Heat) Pumps
- › HVAC compressors
- › Brushless automotive applications

### Simplified application diagram

## Gate driver IC forum

Discuss your technical topics directly with Infineon gate driver experts.  
[www.infineon.com/gdforum](http://www.infineon.com/gdforum)

[www.infineon.com/gdforum](http://www.infineon.com/gdforum)

The screenshot shows the Infineon Gate driver IC forum interface. At the top, there is a navigation bar with links for Infineon.com, Forum, News/Announcement, Technical Center, Events, and Support. Below the navigation bar, there is a search bar and a user login area. The main content area is titled "Forum: Gate driver IC Forum" and shows a list of threads. The threads include:

- ↳ [Solved] Gate driver IC FAQ (Started by: infineon@user, Oct 24th, 2018 05:13 AM) - 1 / 2 / 3
- ↳ [Solved] Infineon Gate driver IC Information (Started by: infineon@user, Oct 24th, 2018 04:57 AM)
- ↳ [Solved] Bioscope Circuit (Started by: Huikun, Nov 13th, 2017 07:06 AM)
- ↳ [Solved] Gate driver IC (R2019) (Started by: Chuanlin, Dec 28th, 2018 00:04 AM)

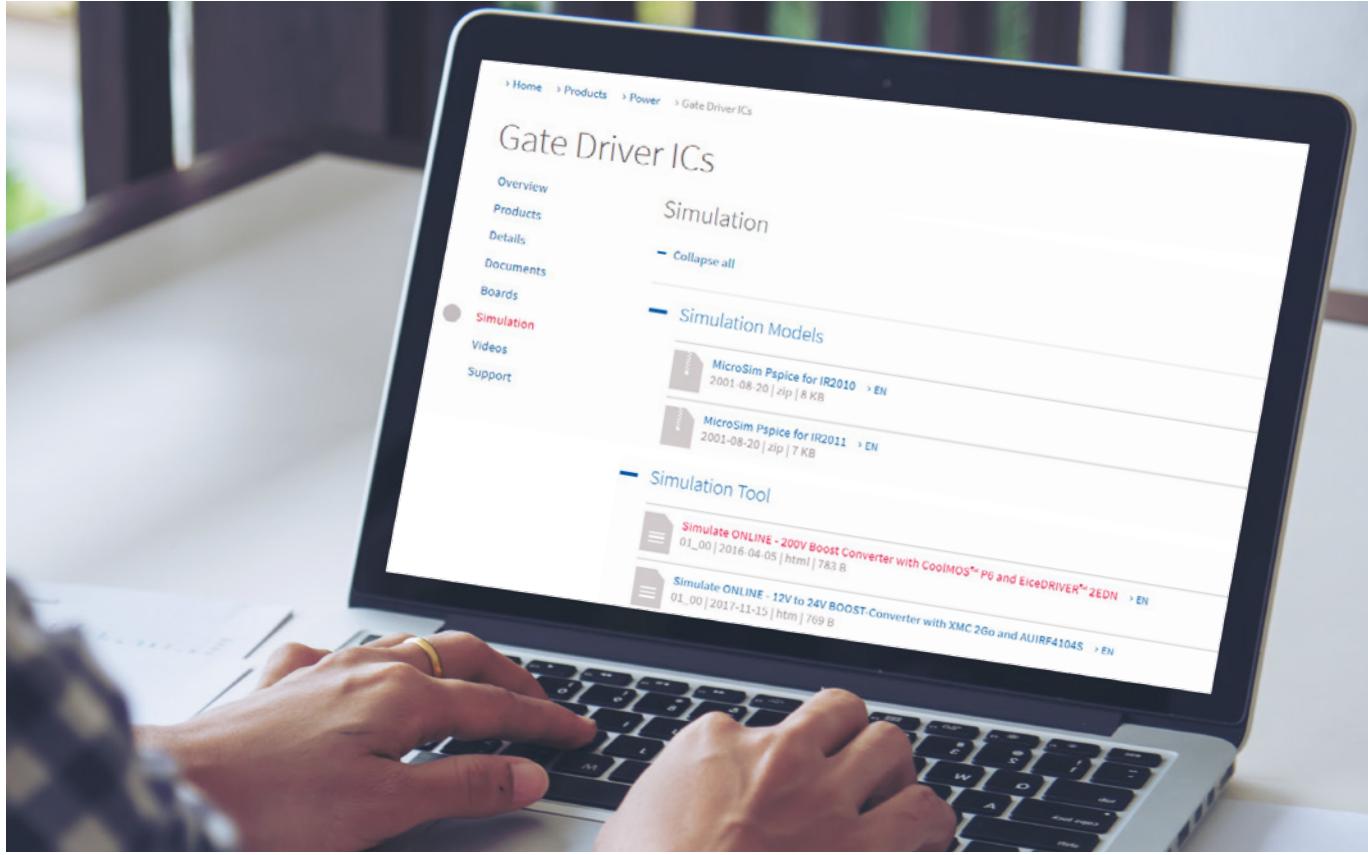

At the bottom of the forum page, there are links for "Forum Tools" and "Search Forum".

## Infineon Designer

Gate driver prototypes are available on [www.infineon.com/ifxdesigner](http://www.infineon.com/ifxdesigner). Infineon Designer is an online prototyping engine combining analog and digital simulation functionalities in an Internet application. Requiring a web browser only, it is a perfect match for supporting customers in selecting the right product for a defined application.

[www.infineon.com/ifxdesigner](http://www.infineon.com/ifxdesigner)

Welcome to Infineon Designer

Infineon Designer is the first online prototyping engine combining analog and digital simulation functionalities in an Internet application. Requiring a web browser only, it is a perfect match for supporting customers in selecting the right product for a defined application. Infineon Designer works intuitively in a very short time, and neither installation nor licenses are needed. Please start with one of the following application circuits.

Start here >

be smart. prototype online.

LOGIC BOARD V2 with IR2010 Driver and BSC0925ND OptiMOS™

This circuit is used to drive brushed DC-motors in a半桥 configuration via logic and pulse commands. The maximum speed is determined by the motor parameters and the driver's current limit. The driver's current limit is set to 1.00 A. The IR2010 can high voltage, high current power MOSFET and IGBT drivers with integrated logic and low side driver logic channel.

# Gate driver selection tool

To simplify the gate driver selection process, Infineon offers an online easy-to-use gate driver selection tool. By selecting a few key parameters, the tool quickly guides you in finding the right driver for your application.

Visit the gate driver selection tool by going to [www.infineon.com/gdfinder](http://www.infineon.com/gdfinder)
