40 deg C

Operating Temperature Horizontal. Alternate Q Active.

60 deg C

60 deg C

*Relay outputs must be alternate

**DC outputs can be derated

Operating Temperature Vertical. All Q Active.

Operating Temperature Vertical. Alternate Q Active.

45 deg C

40 deg C

*only DC/DC/DC
Relay not possible

50 deg C

50 deg C

*Relay outputs must be alternate

**DC outputs can be derated

Example

For a S7-1200 G2 CPU 1212C DC/DC/DC in a vertical position, operation can be done at up to 50 degrees C if the following conditions are met:

- 1. Maximum of 500mA expansion module supply is used of the 1000mA available (5vDC)
- 2. Maximum of 150mA sensor supply is used of the available 300mA (24vDC)
- 3. Maximum of 250mA used of the 0.5A available for output signaling (1A of the 2A possible for relay outputs).
- 4. Only alternate inputs and/or outputs are switched.

If any of the above points is exceeded, then you are limited to 40 degrees C in a vertical position.

	G1	G2	Difference	Notes
Horizontal (All IO)	50	40	-10	Derating applies to IO switching on G1 but includes further parameters on G2. Can be 55 deg depending upon module.
Horizontal (Alternate IO)	60	60	0	Derating applies to IO switching on G1 but includes further parameters on G2. Can be 55 deg depending upon module.
Vertical (All IO)	45	40	-5	G2 module dependant de-rating - G1 not applicable due to differing standards.
Vertical (Alternate IO)	50	50	0
