

Si86S63x/64x/S4x/Q4x/66x: Multi-Channel Digital Isolators

Robust, High Speed Low Power Multi-Channel Digital Isolators

Skyworks' new family of robust, low-power digital isolators are CMOS devices offering substantial data rate, propagation delay, power, size, reliability, and external BOM advantages over legacy isolation technologies. All device versions have CMOS thresholds and Schmitt trigger inputs for high noise immunity and only require VDD bypass capacitors. Data rates up to 150 Mbps are supported, and all devices achieve typical propagation delays of 10 ns. This family includes SPI capable product options and options that support QSPI with a direction control pin. Enable inputs provide a single point control for enabling and disabling outputs. A new sleep mode is included that helps conserve power by shutting down active circuits when enabled. Low-power mode operation options are also included that are optimized for saving power. Other ordering options include a choice of isolation ratings (3.75 and 6.0 kV_{RMS}) and product options for fail-safe operating mode to control the default output state during power loss. All products are safety certified by UL, CSA, VDE, and CQC. Products in wide-body packages support voltages of 6.0 kV_{RMS} with 1 minute withstand capability per UL 1577. These products are certified to the latest IEC 60747-17 reinforced specification and can be safely used in high power applications like inverters and motor drives.

Industrial Application

- Industrial automation systems
- Medical electronics
- Isolated switch mode supplies
- Isolated ADC, DAC
- Motor control
- Power inverters
- Communications systems

Safety Regulatory Approvals (Pending)

- UL 1577 recognized
 - Up to 6000 V_{RMS} for 1 minute
- CSA certification conformity
 - IEC 62368-1 (reinforced insulation)
- VDE certification conformity
 - IEC 60747-17 (reinforced)
 - EN 62368-1 (reinforced insulation)
- CQC certification approval
 - GB4943.1-2011

KEY FEATURES

- High-speed operation: DC to 150 Mbps
- No start-up initialization required
- Wide Supply Voltage: 2.25 – 5.5 V
- Up to 6000 V_{RMS} isolation
- Reinforced IEC 60747-17 rating
- High electromagnetic immunity
- Low power and sleep mode options
- Tri-state outputs with enable
- Schmitt trigger + CMOS threshold inputs
- Selectable fail-safe mode
 - Default high or low output (ordering option)
- Precise timing (typical)
 - 10 ns propagation delay
 - 3.5 ns pulse width distortion
- Transient Immunity of 100 kV/μs (min)
- AEC-Q100 qualification
- Wide temperature range
 - –40 to 125 °C
- RoHS-compliant packages
 - WB SOIC-16
 - NB SOIC-16
 - QSOP-16

2. “Si” and “SI” are used interchangeably.
3. An “R” at the end of the part number denotes tape and reel packaging option.

2. Functional Description

2.1 Theory of Operation

The operation of an Si86Sx channel is analogous to that of an opto coupler, except an RF carrier is modulated instead of light. This simple architecture provides a robust isolated data path and requires no special considerations or initialization at start-up. A simplified block diagram for a single Si86Sx channel is shown in the figure below.

Figure 2.1. Simplified Channel Diagram

A channel consists of an RF Transmitter and RF Receiver separated by a semiconductor-based isolation barrier. Referring to the transmitter, input A modulates the carrier provided by an RF oscillator using on/off keying. The Receiver contains a demodulator that decodes the input state according to its RF energy content and applies the result to output B via the output driver. This RF on/off keying scheme is superior to pulse code schemes as it provides best-in-class noise immunity, low power consumption, and improved immunity to magnetic fields. See the following figure for more details.

Figure 2.2. Modulation Scheme

3. Device Operation and System Overview

Device behavior during start-up, normal operation, and shutdown is shown in [Figure 3.1 Device Behavior during Startup on page 10](#), where UVLO+ and UVLO– are the respective positive-going and negative-going thresholds. Refer to the following tables to determine outputs when power supply (VDD) is not present and for logic conditions when enable pins are used.

Table 3.1. Si86S6x/Lx/Mx Logic Operation

V _I Input ^{1, 2}	EN/SMB ³	VDDI State ^{1, 4, 5, 6}	VDDO State ^{1, 4, 5, 6}	V _O Output ^{1, 2}	Comments
H	H or open	P	P	H	Normal operation
L	H or open	P	P	L	
X	L	P	P	Hi-Z	
X	X	UP	P	L ⁶	Default low options
				H ⁶	Default high options
X	X	P	UP	UD ⁷	Upon transition of VDDO from un-powered to powered, V _O returns to correct state. ⁷

Note:

1. V_I and V_O are the input and output terminals of any one channel. VDDI and VDDO are the power supplies on the input and output sides respectively.
2. X = Not Applicable; H = Logic High; L = Logic Low; Hi-Z = High Impedance; UD = Undetermined
3. EN1/EN2 enable pins control the state of all outputs on the same side as the pin as stated in table above. For options with sleep mode 1, EN1/EN2 enable pins also turn off circuits on that side, allowing for a low power mode. The SMB pin controls the state of all outputs on the device, including ones on the isolated side, as well as allowing the device to be in low power mode as described in Features Description Section [3.4 Device Features and System Overview](#).
4. “Powered” state (P) is defined as 2.25 V < VDD < 5.5 V.
5. “Unpowered” state (UP) is defined as VDD < 2.25V.
6. Note that an I/O can power the die for a given side through an internal diode if its source has adequate current.
7. UD =Undetermined. Refer to [Figure 3.1 Device Behavior during Startup on page 10](#), the start-up time from unpowered state, below 1.7 V (RSTB) threshold to powered state, is 0.3 ms. If VDDO only dips below 2.1 V (VDDOK level in Figure 3.1) but stays above RSTB level, the start-up time is 1 μs.

Table 3.2. Si86SS Logic Operation

V _I Input ^{1, 2}	VDDI State	VDDO State ^{1, 3, 4}	V _I Output ^{1, 2}	Comments
H	P	P	H	Normal operation
L	P	P	L	
X	UP	P	L	Default low options
			H	Default high options
X	P	UP	UD ⁵	Upon transition of VDDO from unpowered to powered, V _O returns to correct state. ⁵

Note:

1. V_I and V_O are the input and output terminals of any one channel. VDDI and VDDO are the power supplies on the input and output sides respectively.
2. X = not applicable; H = Logic High; L = Logic Low; Hi-Z = High Impedance.
3. “Powered” state (P) is defined as 2.25 V < VDD < 5.5 V.
4. “Unpowered” state (UP) is defined as VDD < 2.25 V.
5. UD = Undetermined. Refer to [Figure 3.1 Device Behavior during Startup on page 10](#), the start-up time from unpowered state, below 1.7 V (RSTB) threshold to powered state, is 0.3 ms. If VDDO only dips below 2.1 V (VDDOK level in Figure 3.1) but stays above RSTB level, the start-up time is 1 μs.

Table 3.3. Si86SQx Logic Operation

A _x ¹	B _x ¹	DIR ¹	ISO_DIR ₁	EN_A ¹	EN_B ¹	VDD1 State ^{2, 3}	VDD2 State ^{2, 3}	Notes
X	Hi-Z	H	H	X	L	P	P	Direction is set as input = A; output = B
L	L	H	H	X	H	P	P	Direction is set as input = A; output = B
H	H	H	H	X	H	P	P	Direction is set as input = A; output = B
Hi-Z	X	L	L	L	X	P	P	Direction is set as input = B; output = A
L	L	L	L	H	X	P	P	Direction is set as input = B; output = A
H	H	L	L	H	X	P	P	Direction is set as input = B; output = A
UD	X	X	L	X	X	UP	P	Direction is not set properly if any supply is UP ⁴
X	UD	X	L	X	X	P	UP	Direction is not set properly if any supply is UP ⁴

Note:

1. X = Not Applicable; H = Logic High; L = Logic Low; Hi-Z = High Impedance; UD = Undetermined.
2. “Powered” state (P) is defined as 2.25 V < VDD < 5.5 V.
3. “Unpowered” state (UP) is defined as VDD < 2.25 V.
4. 100 kΩ weak pulldown on I/O when the VDD is UP.

3.1 Device Startup, UVLO, and Reset Functionality

Outputs are held low during powerup until VDD is above the UVLO threshold for time period t_{START} . Following this, the outputs follow the states of inputs. The start-up time of the device is estimated to be 0.3 ms due to the device initialization time. During this time, the outputs will have a 100 k Ω pulldown resistor that will pull the outputs low. After stabilization, the outputs will transition to the default output state indicated by the particular product option.

Undervoltage Lockout (UVLO) is provided to prevent erroneous operation during device startup and shutdown or when VDD is below its specified operating circuits range. Side A and Side B each have their own undervoltage lockout monitors. Each side can enter or exit UVLO independently. For example, referring to the figure below, Side A unconditionally enters UVLO when VDD1 falls below VDD1(UVLO-) and exits UVLO when VDD1 rises above VDD1(UVLO+). Side B operates the same as Side A with respect to its VDD2 supply.

Along with UVLO, each side has its own self biased circuitry that can detect supply going low enough and issue a complete reset of the part. This is done to avoid loss of device configuration for the particular product option. Referring to the figure below, Side A goes into reset as soon as VDD1 goes below RSTB- (~1.7 V) and comes out of reset when VDD1 goes above RSTB+. When the supply voltage is above RSTB+ the device configuration is re-loaded. Side B operates the same as Side A with respect to its VDD2 supply.

Figure 3.1. Device Behavior during Startup

Figure 3.2. Device Behavior during Normal Operation

3.2 Layout Considerations

To ensure safety in the end-user application, high-voltage circuits (i.e., circuits with >30 VAC) must be physically separated from the safety extra-low-voltage circuits (SELV is a circuit with <30 VAC) by a certain distance (creepage/clearance). If a component, such as a digital isolator, straddles this isolation barrier, it must meet those creepage/clearance requirements and provide a sufficiently large high-voltage breakdown protection rating (commonly referred to as working voltage protection). [Table 4.7 Insulation and Safety-Related Specifications on page 48](#) and [Table 4.9 IEC 60747-17 Insulation Characteristics for Si86Sx¹ on page 49](#) detail the working voltage and creepage/clearance capabilities of the Si86Sx. These tables also detail the component standards (UL1577, IEC 60747-17), which are readily accepted by certification bodies to provide proof for end-system specifications requirements. Refer to the end-system specification (61010-1, 62368-1, 60601-1, etc.) requirements before starting any design that uses a digital isolator.

3.2.1 Supply Bypass

The Si86Sx family requires a 0.1 μF bypass capacitor between VDD1 and GND1 and VDD2 and GND2. The capacitor should be placed as close as possible to the package. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy.

3.2.2 Output Pin Termination

The nominal output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled impedance PCB traces.

3.3 Fail-Safe Operating Mode

Si86Sx devices feature a selectable (by ordering option) mode whereby the default output state (when the input supply is unpowered) can either be a logic high or logic low when the output supply is powered. See [Table 3.1 Si86S6x/Lx/Mx Logic Operation on page 8](#) and [Section 1. Ordering Guide](#) for more information.

3.4 Device Features and System Overview

3.4.1 Low Power Mode Operation

The Si86SLx devices are optimized for lower-power operation compared to the Si86S6x options. Typically, they consume 0.25 mA per channel less current in quiescent mode. The pinouts are no different than the Si86S6x options. This mode is always turned for these devices. The architecture is tuned in favor of power savings rather than higher performance in terms of timing specifications.

3.4.2 Sleep Mode Operation

This new feature is very useful for power savings without compromising on performance. Instead of trading off data rate or CMTI performance for power savings, these options provide an SMB pin that can be used to put the device in sleep mode when not in operation. For example, the Si86SM42 is a four-channel device with two forward channels and two reverse channels. The left, “A”, side of the device has an SMB pin which when driven high (or left unconnected) enables the device but when driven low puts the device into sleep mode with 750 μ A per side. In this mode, one isolation channel is always active to read the status of the SMB pin and to restart the entire device when SMB is driven high or left open, including the isolated side.

Figure 3.3. Sleep Mode Operation

3.4.3 SPI Operation for Si86SSx

The Si86SS41 is a four-channel device with three forward channels and one reverse channel. The non-isolated or main (controller) side input pins are MCSB (main side SPI chip select), MCLK (main side SPI clock), and MO (main side SPI MOSI). The non-isolated or main side output pin is MI (main side SPI MISO). The isolated or secondary (peripheral) side output pin is SCSB (secondary side SPI chip select), SCLK (secondary side SPI clock), and SI (secondary side SPI MOSI). The isolated or secondary side input pin is SO (secondary side SPI MISO).

Figure 3.4. Basic SPI

Figure 3.5. SPI Arrangement with Buffered MI

3.4.4 Custom QSPI Implementation Mode

The Si86SQ44 is a five-channel device with four reversible channels and one forward direction channel (DIR_IN). The DIR_IN pin when driven high configures the device for signal flow from Side A to Side B. The DIR_OUT pin provides an isolated copy of the DIR_IN state. The DIR_IN pin when driven low configures the device for signal flow from B to A. Each side of the device also has an enable pin (EN_A, EN_B) which when driven high enables the transmitter and receiver circuits, and when driven low configures the outputs as tristate. A 10 k Ω pull up resistor to the corresponding VDD is recommended for each enable pin.

The direction control feature of the Si86SQ44 can be useful in implementing a bi-directional (reversible) isolated bus.

Quad SPI is commonly used for faster data transfer from low pin count external memory. It is similar to SPI, but it has four data lines instead of two (MOSI and MISO), and the data lines operate in half-duplex mode with all four lines either reading or writing four bits of data on the same clock edge. Because QSPI operates in half-duplex, the Si86SQ44 can be used for the data lines as it provides direction control of four isolated channels.

Figure 3.6. Si86SQ44 Configuration

3.4.5 Input Noise Filters with Deglitch Times of 30 ns

This product family is orderable with input deglitch filters which have delay times of 30 ns. These filters remove undesirable noise pulses (glitches) from the input signal so that the isolator only produces an output for a valid input. Any input pulse which lasts less than the deglitch time will not be passed by the filter. Any other input pulse will be passed by the filter and delayed by the filter delay time. Please see figures below.

Figure 3.7. Input Noise Filter Functionality

4. Electrical Specifications

Table 4.1. Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Junction Operating Temperature	T_J	—	—	150	°C
Ambient Operating Temperature ¹	T_A	−40	25	125	°C
Supply Voltage	VDD1, VDD2	2.25	—	5.5	V

Note:

- The maximum ambient temperature is dependent on data frequency, output loading, number of operating channels, and supply voltage.

Table 4.2. Electrical Characteristics

$T_A = -40$ to 125°C ; VDD1, VDD2 as specified in Recommended Operating Conditions Table above.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
VDD Undervoltage Threshold	VDD _{UV+}	VDD1, VDD2 rising	2.14	2.18	2.25	V
VDD Undervoltage Threshold	VDD _{UV−}	VDD1, VDD2 falling	2.01	2.05	2.10	V
VDD Undervoltage Hysteresis	VDD _{HYS}		105	131	150	mV
Input Hysteresis	V _{HYS}		0.15*VDDx	—	—	V
High Level Input Voltage	V _{IH}		0.7*VDDx	—	—	V
Low Level Input Voltage	V _{IL}		—	—	0.3*VDDx	V
High Level Output Voltage	V _{OH}	I _{oh} = −4 mA	VDD1, VDD2−0.4	—	—	V
Low Level Output Voltage	V _{OL}	I _{ol} = 4 mA	—	—	0.4	V
Output Impedance	Z _O		—	50	—	Ω

Note:

- The nominal output impedance of an isolator driver channel is approximately 50 Ω, ±40%, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled-impedance PCB traces.
- t_{PSK(P-P)} is the magnitude of the difference in propagation delay times measured between different units operating at the same supply voltages, load, and ambient temperature.

Table 4.3. Electrical CharacteristicsVDD1 = 5.0 V $\pm$ 10%, VDD2 = 5.0 V $\pm$ 10%, T_A = –40 to 125°C

Timing Characteristics						
Data Rate Si86Sx (no deglitch)			—	—	150	Mbps

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Data Rate Si86Sx (with 30 ns deglitch)			—	—	10	Mbps
Pulse Width Si86S6x (no deglitch)			6.7	—	—	ns
Pulse Width Si86S6X (with 30 ns deglitch)			100	—	—	ns
Propagation Delay (no deglitch)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	7	9	14	ns
Pulse Width Distortion (no deglitch) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	2	ns
Propagation Delay Skew (no deglitch)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (no deglitch)	t_{PSK}		—	0.8	2	ns
Propagation Delay (30 ns deglitch)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	32	36	42	ns
Pulse Width Distortion (30 ns deglitch) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	2	ns
Propagation Delay Skew (30 ns deglitch)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (30 ns deglitch)	t_{PSK}		—	1.5	4	ns
Propagation Delay Skew (Si86SLx, low power mode)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	8.5	11.5	18	ns
Pulse Width Distortion (Si86SLx, low power mode) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	7	ns
Propagation Delay Skew (Si86SLx, low power mode)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (Si86SLx, low power mode)	t_{PSK}		—	1.5	7	ns
Direction Transition Delay (Si86SQx)	t_{DIR}		36	55	80	ns
Output Rise Time	t_r	CL = 15 pF See Figure 4.2 Propagation Delay Timing on page 43 .	—	2.5	—	ns
Output Fall Time	t_f	CL = 15 pF See Figure 4.2 Propagation Delay Timing on page 43 .	—	2.5	—	ns
Peak Eye Diagram Jitter	$t_{JIT(PK)}$	See Figure 2.3 Eye Diagram on page 7	—	350	—	ps

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Common Mode Transient Immunity	CMTI	See Figure 4.4 Common-Mode Transient Immunity Test Circuit on page 44				
Si86Sx (no deglitch)		$V_I = V_{DD} \text{ or } 0 \text{ V}$	100	—	—	kV/ μ s
Si86Sx (with 30 ns deglitch)		$V_{CM} = \pm 1500 \text{ V}$	150	—	—	
Enable to Data Valid	t_{en1}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	12	20	ns
SMB to Sleep Mode Delay (Si86SMx)	t_{SM}	See Figure 4.3 SMB Timing on page 44	—	14	23	ns
Enable to Data Tri-State	t_{en2}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	11	17	ns
SMB to Wake-Up from Sleep Mode	t_{WU}	See Figure 4.3 SMB Timing on page 44	—	700	1500	ns
Input power loss to valid default output	t_{SD}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	8.0	12	ns
Start-up Time	t_{SU}		—	—	300	μ s
Input Leakage Current	I_L		—	—	± 8	μ A
EN, SMB, MCSB, DIR Input Current	I_{ENH}, I_{ENL}	$V_{ENx} = V_{IH} \text{ or } V_{IL}$	—	—	90	μ A

Note:

1. The nominal output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled-impedance PCB traces.
2. $t_{PSK(P-P)}$ is the magnitude of the difference in propagation delay times measured between different units operating at the same supply voltages, load, and ambient temperature.
3. Start-up time is the time period from the application of power to the appearance of valid data at the output. The device initialization time is included in the 300 μ s specification.

Table 4.4. Electrical CharacteristicsVDD1 = 3.3 V $\pm$ 10%, VDD2 = 3.3 V $\pm$ 10%, T_A = –40 to 125 °C

Timing Characteristics						
Data Rate Si86Sx (no deglitch)			—	—	150	Mbps

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Data Rate Si86Sx (with 30 ns deglitch)			—	—	10	Mbps
Pulse Width Si86S6X (with 30 ns deglitch)			100	—	—	ns
Propagation Delay (no deglitch)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	6	9	15	ns
Pulse Width Distortion (no deglitch) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	3	ns
Propagation Delay Skew (no deglitch)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (no deglitch)	t_{PSK}		—	0.9	3	ns
Propagation Delay (30 ns deglitch)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	31	36	42	ns
Pulse Width Distortion (30 ns deglitch) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	3	ns
Propagation Delay Skew (30 ns deglitch)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (30 ns deglitch)	t_{PSK}		—	1.5	3.5	ns
Propagation Delay (Si86SLx low-power mode)	t_{PHL}, t_{PLH}	See Figure 4.2 Propagation Delay Timing on page 43 .	7	12	18	ns
Pulse Width Distortion (Si86SLx, low-power mode) $ t_{PLH} - t_{PHL} $	PWD	See Figure 4.2 Propagation Delay Timing on page 43 .	—	—	7	ns
Propagation Delay Skew (Si86SLx, low-power mode)	$t_{PSK(P-P)}$		—	2.0	4.5	ns
Channel-Channel Skew (Si86SLx, low-power mode)	t_{PSK}		—	1.5	5.5	ns
Direction Transition Delay (Si86SQx)	t_{DIR}		37	57	83	ns
Output Rise Time	t_r	CL = 15 pF See Figure 4.2 Propagation Delay Timing on page 43 .	—	2.5	—	ns
Output Fall Time	t_f	CL = 15 pF See Figure 4.2 Propagation Delay Timing on page 43 .	—	2.5	—	ns
Peak Eye Diagram Jitter	$t_{JIT(PK)}$	See Figure 2.3 Eye Diagram on page 7	—	350	—	ps
Common Mode Transi- ent Immunity		See Figure 4.4 Common-Mode Transient Immunity Test Cir- cuit on page 44				
Si86Sx (no deglitch)	CMTI	VI = VDD or 0 V	100	—	—	kV/ μ s
Si86Sx (with 30 ns de- glitch)		VCM = ± 1500 V	150	—	—	

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Enable to Data Valid	t_{en1}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	17	27	ns
SMB to Sleep Mode Delay (Si86SMx)	t_{SM}	See Figure 4.3 SMB Timing on page 44	—	15	25	ns
Enable to Data Tri-State	t_{en2}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	12	19	ns
SMB to Wake-Up from Sleep Mode	t_{WU}	See Figure 4.3 SMB Timing on page 44	—	1100	1800	ns
Input power loss to valid default output	t_{SD}	See Figure 4.1 ENABLE Timing Diagram on page 43	—	8.0	12	ns
Start-up Time	t_{SU}		—	—	300	μs
Input Leakage Current	I_L		—	—	± 6	μA
EN, SMB, MCSB, DIR Input Current	I_{ENH}, I_{ENL}	$V_{ENx} = V_{IH} \text{ or } V_{IL}$	—	—	60	μA

Note:

1. The nominal output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled-impedance PCB traces.
2. $t_{PSK(P-P)}$ is the magnitude of the difference in propagation delay times measured between different units operating at the same supply voltages, load, and ambient temperature.
3. Start-up time is the time period from the application of power to the appearance of valid data at the output. The device initialization time is included in the 300 μs specification.

Table 4.5. Electrical CharacteristicsVDD1 = 2.5 V $\pm$ 10%, VDD2 = 2.5 V $\pm$ 10%, T_A = –40 to 125°C

Input Leakage Current	I_L		—	—	±6	μA

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
EN, SMB, MCSB, DIR Input Current	I_{ENH}, I_{ENL}	$V_{ENx} = V_{IH} \text{ or } V_{IL}$	—	—	45	μA

Note:

- 1. The nominal output impedance of an isolator driver channel is approximately 50 Ω , $\pm 40\%$, which is a combination of the value of the on-chip series termination resistor and channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be appropriately terminated with controlled-impedance PCB traces.
- 2. $t_{PSK(P-P)}$ is the magnitude of the difference in propagation delay times measured between different units operating at the same supply voltages, load, and ambient temperature.
- 3. Start-up time is the time period from the application of power to the appearance of valid data at the output. The OTP initialization time is included in the 300 μs specification.

Table 4.6. Regulatory Information¹

CSA
The Si86Sx is certified under CSA. For more details, see Master Contract Number 232873.
62368-1: Up to 600 V _{RMS} reinforced insulation working voltage; up to 1000 V _{RMS} basic insulation working voltage.
60601-1: Up to 250 V _{RMS} working voltage and 2 MOPP (Means of Patient Protection).
VDE
The Si86Sx is certified under VDE. For more details, see File 5006301.
IEC60747-17: Up to 2121 V _{peak} for reinforced insulation working voltage.
62368-1: Up to 600 V _{RMS} reinforced insulation working voltage; up to 1000 V _{RMS} basic insulation working voltage.
UL
The Si86Sx is certified under UL1577 component recognition program. For more details, see File E257455.
Rated up to 6.0 kV _{RMS} , V _{ISO} isolation voltage for basic protection.
CQC
The Si86Sx is certified under GB4943.1-2011.
Rated up to 250 V _{RMS} reinforced insulation working voltage at 5000 meters tropical climate.
Note:
1. Regulatory Certifications apply to >2.5 kV _{RMS} rated devices which are production tested to 3.0 kV _{RMS} for 1 sec. Regulatory Certifications apply to 3.75 kV _{RMS} rated devices which are production tested to 4.5 kV _{RMS} for 1 sec. Regulatory Certifications apply to 6.0 kV _{RMS} rated devices which are production tested to 7.2 kV _{RMS} for 1 sec. For more information, see Section 1. Ordering Guide .

Table 4.7. Insulation and Safety-Related Specifications

Parameter	Symbol	Test Condition	Value			Unit
			WB SOIC-16	NB SOIC-16	QSOP-16	
Nominal External Air Gap (Clearance)	CLR		8.0	3.9	3.6	mm
Nominal External Tracking (Creepage)	CRP		8.0	3.9	3.6	mm
Minimum Internal Gap (Internal Clearance)	DTI		0.036	0.036	0.036	mm
Tracking Resistance	CTI or PTI	IEC60112	600	600	600	V _{RMS}
Erosion Depth	ED		0.019	0.019	0.031	mm
Resistance (Input-Output) ¹	RIO	Test voltage = 500 V	10 ¹²	10 ¹²	10 ¹²	Ω
Capacitance (Input-Output) ¹	CIO	f = 1 MHz	2.0	2.0	2.0	pF
Input Capacitance ²	CI		4.0	4.0	4.0	pF

Note:

1. To determine resistance and capacitance, the Si86Sx is converted into a 2-terminal device. Pins on Side A are shorted together to form the first terminal and pins on Side B are shorted together to form the second terminal. The parameters are then measured between these two terminals.
2. Measured from input pin to ground.

Table 4.8. IEC 60664-1 Ratings

Parameter	Test Conditions	Specification		
		WB SOIC-16	NB SOIC-16	QSOP-16
Basic Isolation Group	Material Group	I	I	I
Installation Classification	Rated Mains Voltages < 150 V _{RMS}	I-IV	I-IV	I-IV
	Rated Mains Voltages < 300 V _{RMS}	I-IV	I-III	I-III
	Rated Mains Voltages < 600 V _{RMS}	I-IV	I-II	I-II
	Rated Mains Voltages < 1000 V _{RMS}	I-III	I	I

Table 4.9. IEC 60747-17 Insulation Characteristics for Si86Sx¹

Parameter	Symbol	Test Condition	Characteristic			Unit
			WB SOIC-16	NB SOIC-16	QSOP-16	
Maximum Working Insulation Voltage	V_{IOWM}		1500	1500	1500	V_{RMS}
Maximum Repetitive Isolation Voltage	V_{IORM}	Method b1 ($V_{IORM} \times 1.875 = V_{PR}$, 100% Production Test, $t_m = 1$ sec, Partial Discharge < 5 pC)	2121	630	630	V_{peak}
Input to Output Test Voltage	V_{PR}	Method b1 ($V_{IORM} \times 1.875 = V_{PR}$, 100% Production Test, $t_m = 1$ sec, Partial Discharge < 5 pC)	3977	1181	1181	V_{peak}
Maximum Transient Isolation Voltage	V_{IOTM}	$t = 60$ s	8000	4000	4000	V_{peak}
Maximum Surge Isolation Voltage	V_{IOSM}	Tested with 10400 V_{peak} and 1.2 μ s/50 μ s profile	8000	8000	8000	V_{peak}
Maximum Impulse Voltage	V_{IOSM}	Tested with 8000 V_{peak} and 1.2 μ s/50 μ s profile	8000	8000	8000	V_{peak}
Pollution Degree		DIN VDE 0110	2	2	2	
Insulation Resistance	R_S	$T_{AMB} = T_S$, $V_{IO} = 500$ V	$>10^9$	$>10^9$	$>10^9$	Ω

Note:

1. Maintenance of the safety data is ensured by protective circuits. The Si86Sx provides a climate classification of 40/125/21.

Table 4.10. IEC 60747-17 Safety Limiting Values¹

Parameter	Symbol	Test Condition	Max			Unit
			WB SOIC-16	NB SOIC-16	QSOP-16	
Safety Temperature	T_S		150	150	150	$^{\circ}\text{C}$
Safety Input, Output, or Supply Current	I_S	Refer to θ_{JA} in Table 4.11 Thermal Characteristic on page 50 ,	350	339	316	mA
Safety Input, Output, or Total Power	P_S	$V_I = 5.5$ V, $T_J = 150$ $^{\circ}\text{C}$, $T_A = 25$ $^{\circ}\text{C}$	1925	1865	1738	mW

Note:

1. Maximum value allowed in the event of a failure; also see the thermal derating curve in [Figure 4.15 \(WB SOIC-16\) Thermal Derating Curve, Dependence of Safety Limiting Current on page 50](#).
2. The Si86Sx is tested with $IDD1 = IDD2 = 5.5$ V; $T_J = 150^{\circ}\text{C}$; $CL = 15$ pF, input a 150 Mbps 50% duty cycle square wave.

Table 4.11. Thermal Characteristic

Parameter	Symbol	WB SOIC-16	NB SOIC-16	QSOP-16	Unit
IC Junction-to-Air Thermal Resistance	θ_{JA}	70	67	73	°C/W
IC Junction-to-board Thermal Resistance	θ_{JB}	35	30	43	
IC Junction-to-Case Thermal Resistance	θ_{JC}	24	20	31	
Thermal characterization parameter to report the difference between junction temperature and the temperature of the board measured at the top surface of the board	Ψ_{JB}	33	29	43	

Figure 4.15. (WB SOIC-16) Thermal Derating Curve, Dependence of Safety Limiting Current

Figure 4.17. (QSOP-16) Thermal Derating Curve, Dependence of Safety Limiting Current

Table 4.12. Absolute Maximum Ratings¹

Parameter	Symbol	Min	Max	Unit
Storage Temperature	TSTG	–65	150	°C
Operating Temperature	T _A	–40	125	°C
Junction Temperature	T _J	—	150	°C
Supply Voltage	VDD1, VDD2	–0.5	7.0	V
Supply Voltage Ramp-up	VDD1, VDD2	-	1	V/μs
Input Voltage	V _I	–0.5	VDD + 0.5	V
Output Voltage	V _O	–0.5	VDD + 0.5	V
Output Current Drive Channel	I _O	—	10	mA
ESD	HBM	—	6	kV
ESD	CDM	—	0.5	kV
ESD ²	IEC 61000-4-2 contact discharge	—	8000	V
Lead Solder Temperature (10 s)		—	260	°C

Note:

1. Permanent device damage may occur if the absolute maximum ratings are exceeded. Functional operation should be restricted to conditions as specified in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may degrade performance.
2. This test is performed across the isolation barrier with device in a two terminal configuration, with pins on each side shorted together. Tested per IEC 61000-4-2 contact discharge.

3. This drawing conforms to the JEDEC Solid State Outline MO-137, Variation AB.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

7. Land Pattern

7.1 Land Pattern (WB SOIC-16)

The figure below illustrates the recommended land pattern details for the Si86Sx in a 16-pin wide-body SOIC package. The table lists the values for the dimensions shown in the illustration.

Figure 7.1. WB SOIC-16 PCB Land Pattern

Table 7.1. WB SOIC-16 Land Pattern Dimensions

Dimension	Feature	(mm)
C1	Pad Column Spacing	9.40
E	Pad Row Pitch	1.27
X1	Pad Width	0.60
Y1	Pad Length	1.90

- Note:**
- 1. This Land Pattern Design is based on IPC-7351 pattern SOIC127P1032X265-16AN for Density Level B (Median Land Protrusion).
 - 2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.

7.2 Land Pattern (NB SOIC-16)

The figure below illustrates the recommended land pattern details for the Si86Sx in a 16-pin narrow-body SOIC package. The table lists the values for the dimensions shown in the illustration.

Figure 7.2. NB SOIC-16 PCB Land Pattern

Table 7.2. NB SOIC-16 Land Pattern Dimensions^{1, 2}

Dimension	Feature	(mm)
C1	Pad Column Spacing	5.40
E	Pad Row Pitch	1.27
X1	Pad Width	0.60
Y1	Pad Length	1.55

Note:

- 1. This Land Pattern Design is based on IPC-7351 pattern SOIC127P600X165-16N for Density Level B (Median Land Protrusion).
- 2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.

7.3 Land Pattern (QSOP-16)

The figure below illustrates the recommended land pattern details for the Si86Sx in a 16-pin QSOP package. The table lists the values for the dimensions shown in the illustration.

Figure 7.3. QSOP-16 PCB Land Pattern

Table 7.3. QSOP-16 Land Pattern Dimensions^{1, 2}

Dimension	Feature	(mm)
C1	Pad Column Spacing	5.40
E	Pad Row Pitch	0.635
X1	Pad Width	0.40
Y1	Pad Length	1.55

Note:

- 1. This Land Pattern Design is based on IPC-7351 pattern SOP63P602X173-16N for Density Level B (Median Land Protrusion).
- 2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.

Figure 8.3. QSOP-16 Top Marking

Table 8.3. QSOP-16 Top Marking Explanation

Line 1 marking:	Base part number ordering options (See 1. Ordering Guide for more information)	SiS = Si86S Isolator product series F = product family 6 = Industry standard footprint L = Low power mode M = Sleep mode S = SPI compatible Q = Custom QSPI implementation X = Total # of channels Y = Total # of reverse channels (right to left) U = Default and deglitch option B = Output default low, no deglitch E = Output default high, no deglitch F = Output default low, 30 ns deglitch H = Output default high, 30 ns deglitch V = Isolation rating B = 2.5 kV_{RMS} C = 3.75 kV_{RMS} E = 6.0 kV_{RMS}
Line 2 marking:	TTTTTT	Manufacturing code from assembly house purchase order form
Line 3 marking:	YY	Year of manufacturing at assembly house
	WW	Work week of manufacturing at assembly house

9. Revision History

Revision 0.2

October, 2021

- Added 4-channel and 6-channel OPNs to [1. Ordering Guide](#).
- Added spec tables for IDD1/2 for new OPNs.

Revision 0.1

May, 2020

- Initial release.

Information in this document is provided in connection with Skyworks Solutions, Inc. ("Skyworks") products or services. These materials, including the information contained herein, are provided by Skyworks as a service to its customers and may be used for informational purposes only by the customer. Skyworks assumes no responsibility for errors or omissions in these materials or the information contained herein. Skyworks may change its documentation, products, services, specifications or product descriptions at any time, without notice. Skyworks makes no commitment to update the materials or information and shall have no responsibility whatsoever for conflicts, incompatibilities, or other difficulties arising from any future changes.

No license, whether express, implied, by estoppel or otherwise, is granted to any intellectual property rights by this document. Skyworks assumes no liability for any materials, products or information provided hereunder, including the sale, distribution, reproduction or use of Skyworks products, information or materials, except as may be provided in Skyworks' Terms and Conditions of Sale.

THE MATERIALS, PRODUCTS AND INFORMATION ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, WHETHER EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE, INCLUDING FITNESS FOR A PARTICULAR PURPOSE OR USE, MERCHANTABILITY, PERFORMANCE, QUALITY OR NON-INFRINGEMENT OF ANY INTELLECTUAL PROPERTY RIGHT; ALL SUCH WARRANTIES ARE HEREBY EXPRESSLY DISCLAIMED. SKYWORKS DOES NOT WARRANT THE ACCURACY OR COMPLETENESS OF THE INFORMATION, TEXT, GRAPHICS OR OTHER ITEMS CONTAINED WITHIN THESE MATERIALS. SKYWORKS SHALL NOT BE LIABLE FOR ANY DAMAGES, INCLUDING BUT NOT LIMITED TO ANY SPECIAL, INDIRECT, INCIDENTAL, STATUTORY, OR CONSEQUENTIAL DAMAGES, INCLUDING WITHOUT LIMITATION, LOST REVENUES OR LOST PROFITS THAT MAY RESULT FROM THE USE OF THE MATERIALS OR INFORMATION, WHETHER OR NOT THE RECIPIENT OF MATERIALS HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

Skyworks products are not intended for use in medical, lifesaving or life-sustaining applications, or other equipment in which the failure of the Skyworks products could lead to personal injury, death, physical or environmental damage. Skyworks customers using or selling Skyworks products for use in such applications do so at their own risk and agree to fully indemnify Skyworks for any damages resulting from such improper use or sale.

Customers are responsible for their products and applications using Skyworks products, which may deviate from published specifications as a result of design defects, errors, or operation of products outside of published parameters or design specifications. Customers should include design and operating safeguards to minimize these and other risks. Skyworks assumes no liability for applications assistance, customer product design, or damage to any equipment resulting from the use of Skyworks products outside of Skyworks' published specifications or parameters.
