To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”

28.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

Access Size: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL, RSCANnGTSCH registers can be read only in 16-bit units.

Address(es): RSCANnGTSC: <RSCFDn_base> + H'0094
RSCANnGTSCL: <RSCFDn_base> + H'0094, RSCANnGTSCH: <RSCFDn_base> + H'0096

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset.
15 to 0	TS[15:0]	All 0	R	Timestamp Value The timestamp counter value can be read. Counter Value: H'0000 to H'FFFF

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the GRSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode. This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

28.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access Size: RSCANnGTINTSTS0 register can be read only in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units

Address(es): RSCANnGTINTSTS0: <RSCFDn_base> + H'0460
RSCANnGTINTSTS0L: <RSCFDn_base> + H'0460, RSCANnGTINTSTS0H: <RSCFDn_base> + H'0462
RSCANnGTINTSTS0LL: <RSCFDn_base> + H'0460, RSCANnGTINTSTS0LH: <RSCFDn_base> + H'0461,
RSCANnGTINTSTS0HL: <RSCFDn_base> + H'0462, RSCANnGTINTSTS0HH: <RSCFDn_base> + H'0463

Initial Value: H'0000 0000

R/W	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as the value after reset.
12	THIF1	0	R*1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	0	R*1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	0	R*1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	0	R*1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	0	R*1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset.
4	THIF0	0	R*1	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	0	R*1	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	0	R*1	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Bit	Bit Name	Initial Value	R/W	Description
1	TAIF0	0	R*1	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	0	R*1	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10b (transmit completed without abort request) or 11b (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00b under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01b (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00b after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

28.3.4.7 RSCANnGFDCFG — Global FD configuration register

Access Size: RSCANnGFDCFG register can be read/written in 32-bit unit
RSCANnGFDCFGL and RSCANnGFDCFGH registers can be read/written in 16-bit unit
RSCANnGFDCFGLL, RSCANnGFDCFGLH, RSCANnGFDCFGHL, RSCANnGFDCFGHH registers can be read/written in 8-bit unit

Address(es): RSCANnGFDCFG: <RSCFDn_base> + H'0474
RSCANnGFDCFG L: <RSCFDn_base> + H'0474, RSCANnGFDCFG H: <RSCFDn_base> + H'0476
RSCANnGFDCFG LL: <RSCFDn_base> + H'0474, RSCANnGFDCFG LH: <RSCFDn_base> + H'0475,
RSCANnGFDCFG HL: <RSCFDn_base> + H'0476, RSCANnGFDCFG HH: <RSCFDn_base> + H'0477

Initial Value: H'0000 0000

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	All 0	R/W	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited
7 to 1	—	All 0	R/W	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	—	0	R/W	Reserved When read, an undefined value is returned.The write value should be the value after reset.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

28.3.5 Details of Receive Rule-related Registers

28.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access Size: RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units

Address(es): RSCANnGAFLECTR: <RSCFDn_base> + H'0098
RSCANnGAFLECTRL: <RSCFDn_base> + H'0098, RSCANnGAFLECTRH: <RSCFDn_base> + H'009A
RSCANnGAFLECTRLL: <RSCFDn_base> + H'0098, RSCANnGAFLECTRLH: <RSCFDn_base> + H'0099,
RSCANnGAFLECTRHL: <RSCFDn_base> + H'009A, RSCANnGAFLECTRHH: <RSCFDn_base> + H'009B

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	0	R/W	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	All 0	R/W	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000b) to page 7 (00111b).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. Set these bits to a value within the range of 00000b to 00111b.

28.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access Size: RSCANnGAFLCFG0 register can be read/written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8- bit units

Address(es): RSCANnGAFLCFG0: <RSCFDn_base> + H'009C
RSCANnGAFLCFG0L: <RSCFDn_base> + H'009C, RSCANnGAFLCFG0H: <RSCFDn_base> + H'009E
RSCANnGAFLCFG0LL: <RSCFDn_base> + H'009C, RSCANnGAFLCFG0LH: <RSCFDn_base> + H'009D,
RSCANnGAFLCFG0HL: <RSCFDn_base> + H'009E, RSCANnGAFLCFG0HH: <RSCFDn_base> + H'009F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RNC0[7:0]	All 0	R/W	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	All 0	R/W	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80.

RNC1[7:0] Bits

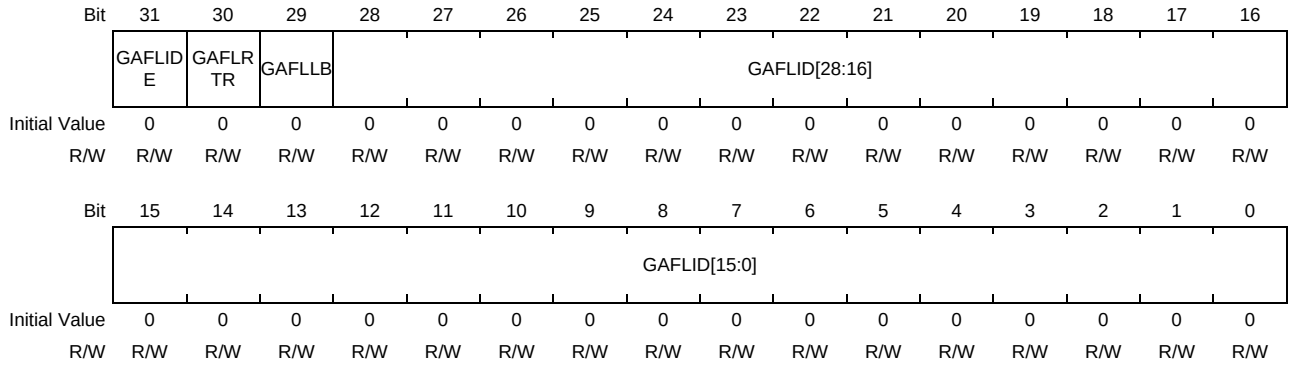
These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80.

28.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access Size: RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

Address(es): RSCANnGAFLIDj: <RSCFDn_base> + H'0500 + (H'10 × j)
RSCANnGAFLIDjL: <RSCFDn_base> + H'0500 + (H'10 × j),
RSCANnGAFLIDjH: <RSCFDn_base> + H'0502 + (H'10 × j)
RSCANnGAFLIDjLL: <RSCFDn_base> + H'0500 + (H'10 × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + H'0501 + (H'10 × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + H'0502 + (H'10 × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + H'0503 + (H'10 × j)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDE	0	R/W	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	0	R/W	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	0	R/W	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	All 0	R/W	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

28.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access Size: RSCANnGAFLMj register can be read/written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units

Address(es): RSCANnGAFLMj: <RSCFDn_base> + H'0504 + (H'10 × j)
RSCANnGAFLMjL: <RSCFDn_base> + H'0504 + (H'10 × j),
RSCANnGAFLMjH: <RSCFDn_base> + H'0506 + (H'10 × j)
RSCANnGAFLMjLL: <RSCFDn_base> + H'0504 + (H'10 × j),
RSCANnGAFLMjLH: <RSCFDn_base> + H'0505 + (H'10 × j),
RSCANnGAFLMjHL: <RSCFDn_base> + H'0506 + (H'10 × j),
RSCANnGAFLMjHH: <RSCFDn_base> + H'0507 + (H'10 × j)

Initial Value: H'0000 0000

Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDEM	R/W	R/W	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	R/W	R/W	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	—	0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM [28:0]	All 0	R/W	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

28.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access Size: RSCANnGAFLP0_j register can be read/written in 32-bit units
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

Address(es): RSCANnGAFLP0_j: <RSCFDn_base> + H'0508 + (H'10 × j)
RSCANnGAFLP0_jL: <RSCFDn_base> + H'0508 + (H'10 × j),
RSCANnGAFLP0_jH: <RSCFDn_base> + H'050A + (H'10 × j)
RSCANnGAFLP0_jLL: <RSCFDn_base> + H'0508 + (H'10 × j),
RSCANnGAFLP0_jLH: <RSCFDn_base> + H'0509 + (H'10 × j),
RSCANnGAFLP0_jHL: <RSCFDn_base> + H'050A + (H'10 × j),
RSCANnGAFLP0_jHH: <RSCFDn_base> + H'050B + (H'10 × j)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GAFLDLC [3:0]	All 0	R/W	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR [11:0]	All 0	R/W	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	0	R/W	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP [6:0]	All 0	R/W	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000b disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

28.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access Size: RSCANnGAFLP1_j register can be read/written in 32-bit units
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

Address(es): RSCANnGAFLP1_j: <RSCFDn_base> + H'050C + (H'10 × j)
RSCANnGAFLP1_jL: <RSCFDn_base> + H'050C + (H'10 × j),
RSCANnGAFLP1_jH: <RSCFDn_base> + H'050E + (H'10 × j)
RSCANnGAFLP1_jLL: <RSCFDn_base> + H'050C + (H'10 × j),
RSCANnGAFLP1_jLH: <RSCFDn_base> + H'050D + (H'10 × j),
RSCANnGAFLP1_jHL: <RSCFDn_base> + H'050E + (H'10 × j),
RSCANnGAFLP1_jHH: <RSCFDn_base> + H'050F + (H'10 × j)

Initial Value: H'0000 0000

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
13 to 8	GAFLFDP [13:8]	All 0	R/W	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP [7:0]	All 0	R/W	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/ receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00b (receive mode) or 10b (gateway mode) are selectable.

28.3.6 Details of Receive Buffer-related Registers

28.3.6.1 RSCANnRMNB — Receive Buffer Number Register

Access Size: RSCANnRMNB register can be read/written in 32-bit units
RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units
RSCANnRMNBLL, RSCANnRMNBLH, RSCANnRMNBHL, RSCANnRMNBHH registers can be read/written in 8-bit units

Address(es): RSCANnRMNB: <RSCFDn_base> + H'00A4
RSCANnRMNBL: <RSCFDn_base> + H'00A4, RSCANnRMNBH: <RSCFDn_base> + H'00A6
RSCANnRMNBLL: <RSCFDn_base> + H'00A4, RSCANnRMNBLH: <RSCFDn_base> + H'00A5,
RSCANnRMNBHL: <RSCFDn_base> + H'00A6, RSCANnRMNBHH: <RSCFDn_base> + H'00A7

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	NRXMB[7:0]	All 0	R/W	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 32.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

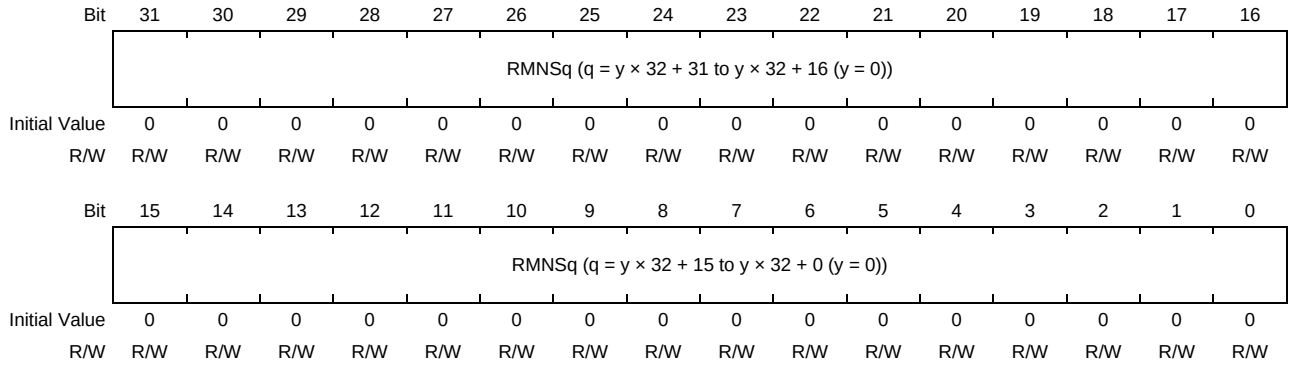
Setting these bits all to 0 makes receive buffers unavailable.

28.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register (y = 0)

Access Size: RSCANnRMNDy register can be read/written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

Address(es): RSCANnRMNDy: <RSCFDn_base> + H'00A8 + (H'04 × y)
RSCANnRMNDyL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCANnRMNDyH: <RSCFDn_base> + H'00AA + (H'04 × y)
RSCANnRMNDyLL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCANnRMNDyLH: <RSCFDn_base> + H'00A9 + (H'04 × y),
RSCANnRMNDyHL: <RSCFDn_base> + H'00AA + (H'04 × y),
RSCANnRMNDyHH: <RSCFDn_base> + H'00AB + (H'04 × y)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RMNSq	All 0	R/W	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	All 0	R/W	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write "0" to the flag and "1" to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message. These flags are cleared to 0 in global reset mode.

28.3.6.3 RSCANnRMIDq — Receive Buffer ID Register (q = 0 to 31)

Access Size: RSCANnRMIDq register can be read only in 32-bit units
RSCFDnRMIDqRSCANnRMIDqL, RSCFDnRMIDqRSCANnRMIDqH registers can be read only in 16-bit units
RSCFDnRMIDqRSCANnRMIDqLL, RSCFDnRMIDqRSCANnRMIDqLH, RSCFDnRMIDqRSCANnRMIDqHL, RSCFDnRMIDqRSCANnRMIDqHH registers can be read only in 8-bit units

Address(es): RSCANnRMIDq: <RSCFDn_base> + H'0600 + (H'10 × q)
RSCANnRMIDqL: <RSCFDn_base> + H'0600 + (H'10 × q),
RSCANnRMIDqH: <RSCFDn_base> + H'0602 + (H'10 × q)
RSCANnRMIDqLL: <RSCFDn_base> + H'0600 + (H'10 × q),
RSCANnRMIDqLH: <RSCFDn_base> + H'0601 + (H'10 × q),
RSCANnRMIDqHL: <RSCFDn_base> + H'0602 + (H'10 × q),
RSCANnRMIDqHH: <RSCFDn_base> + H'0603 + (H'10 × q)

Initial Value: H'0000 0000

30	RMRTR	0	R	Receive Buffer RTR 0: Data frame 1: Remote frame
29	—	0	R	Reserved This bit is read as the value after reset.
28 to 0	RMID[28:0]	All 0	R	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

28.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

Access Size: RSCANnRMPTRq register can be read only in 32-bit units
RSCFDnRMPTRqRSCANnRMPTRqL, RSCFDnRMPTRqRSCANnRMPTRqH registers can be read only in 16-bit units
RSCFDnRMPTRqRSCANnRMPTRqLL, RSCFDnRMPTRqRSCANnRMPTRqLH, RSCFDnRMPTRqRSCANnRMPTRqHL, RSCFDnRMPTRqRSCANnRMPTRqHH registers can be read only in 8-bit units

Address(es): RSCANnRMPTRq: <RSCFDn_base> + H'0604 + (H'10 × q)
RSCANnRMPTRqL: <RSCFDn_base> + H'0604 + (H'10 × q),

15 to 0	RMTS[15:0]	All 0	R	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

28.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31)

Access Size: RSCANnRMDF0_q register can be read only in 32-bit units
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

Address(es): RSCANnRMDF0_q: <RSCFDn_base> + H'0608 + (H'10 × q)
RSCANnRMDF0_qL: <RSCFDn_base> + H'0608 + (H'10 × q),
RSCANnRMDF0_qH: <RSCFDn_base> + H'060A + (H'10 × q)
RSCANnRMDF0_qLL: <RSCFDn_base> + H'0608 + (H'10 × q),
RSCANnRMDF0_qLH: <RSCFDn_base> + H'0609 + (H'10 × q),
RSCANnRMDF0_qHL: <RSCFDn_base> + H'060A + (H'10 × q),
RSCANnRMDF0_qHH: <RSCFDn_base> + H'060B + (H'10 × q)

Initial Value: H'0000 0000

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RMDB7[7:0]	All 0	R	Receive Buffer Data Byte 7
23 to 16	RMDB6[7:0]	All 0	R	Receive Buffer Data Byte 6
15 to 8	RMDB5[7:0]	All 0	R	Receive Buffer Data Byte 5
7 to 0	RMDB4[7:0]	All 0	R	Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000b, data bytes for which no data is set are read as H'00.

28.3.7 Details of Receive FIFO Buffer-related Registers

28.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access Size: RSCANnRFCCxregister can be read/written in 32-bit units
RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units

Address(es): RSCANnRFCCx: <RSCFDn_base> + H'00B8 + (H'04 × x)
RSCANnRFCCxL: <RSCFDn_base> + H'00B8 + (H'04 × x),
RSCANnRFCCxH: <RSCFDn_base> + H'00BA + (H'04 × x)
RSCANnRFCCxLL: <RSCFDn_base> + H'00B8 + (H'04 × x),

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	All 0	R/W	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	0	R/W	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	—	0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	RFDC[2:0]	All 0	R/W	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 2	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	0	R/W	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	0	R/W	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001b (4 messages), set the RFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000b, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnRFSTSxRSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done. This bit is cleared to 0 in global reset mode.

28.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access Size: RSCANnRFSTSx register can be read/written in 32-bit units
RSCANnRFSTSxL, RSCANnRFSTSxH registers can be read/written in 16-bit units
RSCANnRFSTSxLL, RSCANnRFSTSxLH, RSCANnRFSTSxHL, RSCANnRFSTSxHH registers can be read/written in 8-bit units

Address(es): RSCANnRFSTSx: <RSCFDn_base> + H'00D8 + (H'04 × x)
RSCANnRFSTSxL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCANnRFSTSxH: <RSCFDn_base> + H'00DA + (H'04 × x)
RSCANnRFSTSxLL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCANnRFSTSxLH: <RSCFDn_base> + H'00D9 + (H'04 × x),
RSCANnRFSTSxHL: <RSCFDn_base> + H'00DA + (H'04 × x),
RSCANnRFSTSxHH: <RSCFDn_base> + H'00DB + (H'04 × x)

Initial Value: H'0000 0001

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	RFMC[7:0]	All 0	R	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
3	RFIF	0	R/W*1	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	0	R/W*1	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	0	R	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	0	R	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCANnRFCCx register is set to 0.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

28.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access Size: RSCANnRFPCTRx register can only be written in 32-bit units
RSCANnRFPCTRxL, RSCANnRFPCTRxH registers can only be written in 16-bit units
RSCANnRFPCTRxLL, RSCANnRFPCTRxLH, RSCANnRFPCTRxHL, RSCANnRFPCTRxHH registers can only be written in 8-bit units

Address(es): RSCANnRFPCTRx: <RSCFDn_base> + H'00F8 + (H'04 × x)
RSCANnRFPCTRxL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCANnRFPCTRxH: <RSCFDn_base> + H'00FA + (H'04 × x)
RSCANnRFPCTRxLL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCANnRFPCTRxLH: <RSCFDn_base> + H'00F9 + (H'04 × x),
RSCANnRFPCTRxHL: <RSCFDn_base> + H'00FA + (H'04 × x),
RSCANnRFPCTRxHH: <RSCFDn_base> + H'00FB + (H'04 × x)

Initial Value: H'0000 0000

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	RFPC[7:0]	All 0	W	Receive FIFO Pointer Control When these bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write H'FF to the RFPC[7:0] bits.

When writing H'FF to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

28.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access Size: RSCANnRFIDx register can be read only in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

Address(es): RSCANnRFIDx: <RSCFDn_base> + H'0E00 + (H'10 × x)

28 to 0	RFID[28:0]	All 0	R	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

28.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access Size: RSCANnRFPTRx register can be read only in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

28.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

Access Size: RSCANnRFDF0_x register can be read only in 32-bit units
RSCANnRFDF0_xL, RSCANnRFDF0_xH registers can be read only in 16-bit units
RSCANnRFDF0_xLL, RSCANnRFDF0_xLH, RSCANnRFDF0_xHL, RSCANnRFDF0_xHH registers can be read only in 8-bit units

Address(es): RSCANnRFDF0_x: <RSCFDn_base> + H'0E08 + (H'10 × x)
RSCANnRFDF0_xL: <RSCFDn_base> + H'0E08 + (H'10 × x),

0	CFE	0	R/W	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 28.11** and **Table 28.12**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p. Setting the CFDC[2:0] bits to 001b or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00b (receive mode) or 10b (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001b (4 messages), set the CFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000b, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/ receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

28.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

Access Size: RSCANnCFSTSk register can be read/written in 32-bit units
RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units
RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units

Address(es): RSCANnCFSTSk: <RSCFDn_base> + H'0178 + (H'04 × k)
RSCANnCFSTSkL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCANnCFSTSkH: <RSCFDn_base> + H'017A + (H'04 × k)
RSCANnCFSTSkLL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCANnCFSTSkLH: <RSCFDn_base> + H'0179 + (H'04 × k),
RSCANnCFSTSkHL: <RSCFDn_base> + H'017A + (H'04 × k),
RSCANnCFSTSkHH: <RSCFDn_base> + H'017B + (H'04 × k)

Initial Value: H'0000 0001

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	CFMC[7:0]	All 0	R	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
4	CFTXIF	0	R/W*1	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	0	R/W*1	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	0	R/W*1	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	0	R	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	1	R	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01b (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00b (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10b (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00b: In global reset mode
- When CFM[1:0] value is 01b or 10b: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01b or 10b, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b, and the factor selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01b: A value of H’FF has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

28.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

Access Size: RSCANnCFPCTRk register can only be written in 32-bit units
RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units
RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units

Address(es): RSCANnCFPCTRk: <RSCFDn_base> + H'01D8 + (H'04 × k)
RSCANnCFPCTRkL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCANnCFPCTRkH: <RSCFDn_base> + H'01DA + (H'04 × k)
RSCANnCFPCTRkLL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCANnCFPCTRkLH: <RSCFDn_base> + H'01D9 + (H'04 × k),
RSCANnCFPCTRkHL: <RSCFDn_base> + H'01DA + (H'04 × k),
RSCANnCFPCTRkHH: <RSCFDn_base> + H'01DB + (H'04 × k)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	CFPC[7:0]	All 0	W	Transmit/Receive FIFO Pointer Control • Receive mode: Writing H'FF to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing H'FF to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

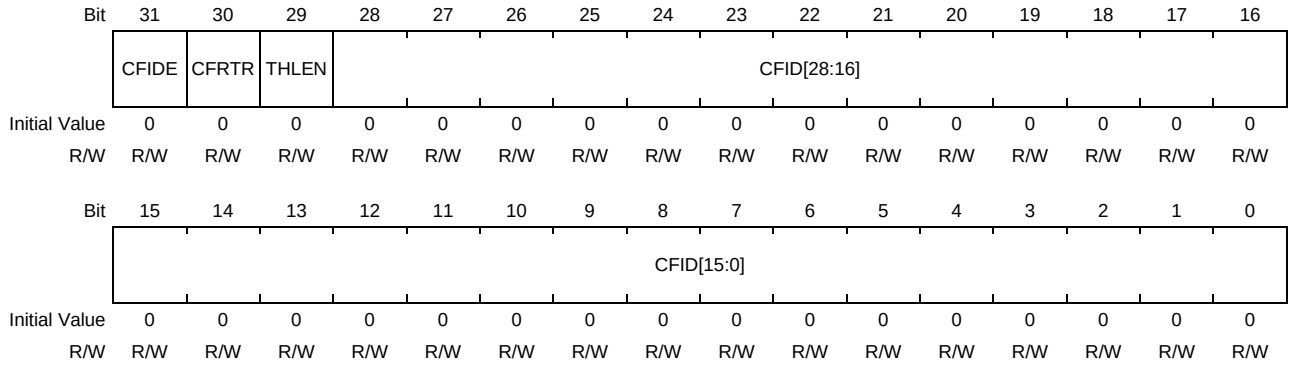
- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00b):
  Writing H'FF to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01b):
  Writing H'FF to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10b):
  Setting prohibited

28.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

Access Size: RSCANnCFIDk register can be read/written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units

Address(es): RSCANnCFIDk: <RSCFDn_base> + H'0E80 + (H'10 × k)
RSCANnCFIDkL: <RSCFDn_base> + H'0E80 + (H'10 × k),
RSCANnCFIDkH: <RSCFDn_base> + H'0E82 + (H'10 × k)
RSCANnCFIDkLL: <RSCFDn_base> + H'0E80 + (H'10 × k),
RSCANnCFIDkLH: <RSCFDn_base> + H'0E81 + (H'10 × k),
RSCANnCFIDkHL: <RSCFDn_base> + H'0E82 + (H'10 × k),
RSCANnCFIDkHH: <RSCFDn_base> + H'0E83 + (H'10 × k)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31	CFIDE	0	R/W	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	0	R/W	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	0	R/W	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01b (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	All 0	R/W	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01b (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00b (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This RSCFDnCFIDk register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, these bits are used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01b (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

When the CFM[1:0] value is 01b, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

28.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

Access Size: RSCANnCFPTRk register can be read/written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

Address(es): RSCANnCFPTRk: <RSCFDn_base> + H'0E84 + (H'10 × k)
RSCANnCFPTRkL: <RSCFDn_base> + H'0E84 + (H'10 × k),
RSCANnCFPTRkH: <RSCFDn_base> + H'0E86 + (H'10 × k)
RSCANnCFPTRkLL: <RSCFDn_base> + H'0E84 + (H'10 × k),
RSCANnCFPTRkLH: <RSCFDn_base> + H'0E85 + (H'10 × k),
RSCANnCFPTRkHL: <RSCFDn_base> + H'0E86 + (H'10 × k),
RSCANnCFPTRkHH: <RSCFDn_base> + H'0E87 + (H'10 × k)

Initial Value: H'0000 0000

Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00b (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	All 0	R/W	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00b (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001b or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00b.

28.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 5)

Access Size: RSCANnCFDF0_k register can be read/written in 32-bit units
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units

Address(es): RSCANnCFDF0_k: <RSCFDn_base> + H'0E88 + (H'10 × k)
RSCANnCFDF0_kL: <RSCFDn_base> + H'0E88 + (H'10 × k),
RSCANnCFDF0_kH: <RSCFDn_base> + H'0E8A + (H'10 × k)
RSCANnCFDF0_kLL: <RSCFDn_base> + H'0E88 + (H'10 × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + H'0E89 + (H'10 × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + H'0E8A + (H'10 × k),
RSCANnCFDF0_kHH: <RSCFDn_base> + H'0E8B + (H'10 × k)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CFDB7[7:0]	All 0	R/W	Transmit/Receive FIFO Buffer Data Byte 7
23 to 16	CFDB6[7:0]	All 0	R/W	Transmit/Receive FIFO Buffer Data Byte 6
15 to 8	CFDB5[7:0]	All 0	R/W	Transmit/Receive FIFO Buffer Data Byte 5
7 to 0	CFDB4[7:0]	All 0	R/W	Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01b (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00b (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000b, data bytes for which no data is set are read as H'00.

This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

28.3.9 Details of FIFO Status-related Registers

28.3.9.1 RSCANnFESTS — FIFO Empty Status Register

Access Size: RSCANnFESTS register can be read only in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units

Address(es): RSCANnFESTS: <RSCFDn_base> + H'0238
RSCANnFESTSL: <RSCFDn_base> + H'0238, RSCANnFESTSH: <RSCFDn_base> + H'023A
RSCANnFESTSLL: <RSCFDn_base> + H'0238, RSCANnFESTSLH: <RSCFDn_base> + H'0239,
RSCANnFESTSHL: <RSCFDn_base> + H'023A, RSCANnFESTSHH: <RSCFDn_base> + H'023B

Initial Value: H'03FF FFFF

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	H'0_0FFF	R	Reserved These bits are read as the value after reset.
13	CF5EMP	1	R	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 5)
12	CF4EMP	1	R	
11	CF3EMP	1	R	
10	CF2EMP	1	R	
9	CF1EMP	1	R	
8	CF0EMP	1	R	
7	RF7EMP	1	R	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains a unread messages. 1: Receive FIFO buffer x contains no unread message. (x = 0 to 7)
6	RF6EMP	1	R	
5	RF5EMP	1	R	
4	RF4EMP	1	R	
3	RF3EMP	1	R	
2	RF2EMP	1	R	
1	RF1EMP	1	R	
0	RF0EMP	1	R	

The RSCANnFESTS register is set to H'03FF FFFF in global reset mode.

CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

28.3.9.2 RSCANnFFSTS — FIFO Full Status Register

Access Size: RSCANnFFSTS register can be read only in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units

Address(es): RSCANnFFSTS: <RSCFDn_base> + H'023C
RSCANnFFSTSL: <RSCFDn_base> + H'023C, RSCANnFFSTSH: <RSCFDn_base> + H'023E
RSCANnFFSTSLL: <RSCFDn_base> + H'023C, RSCANnFFSTSLH: <RSCFDn_base> + H'023D,
RSCANnFFSTSHL: <RSCFDn_base> + H'023E, RSCANnFFSTSHH: <RSCFDn_base> + H'023F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset.
13	CF5FLL	0	R	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 5)
12	CF4FLL	0	R	
11	CF3FLL	0	R	
10	CF2FLL	0	R	
9	CF1FLL	0	R	
8	CF0FLL	0	R	
7	RF7FLL	0	R	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	0	R	
5	RF5FLL	0	R	
4	RF4FLL	0	R	
3	RF3FLL	0	R	
2	RF2FLL	0	R	
1	RF1FLL	0	R	
0	RF0FLL	0	R	

The RSCANnFFSTS register is cleared to H'0000 0000 in global reset mode.

CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

28.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access Size: RSCANnFMSTS register can be read only in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units

Address(es): RSCANnFMSTS: <RSCFDn_base> + H'0240
RSCANnFMSTSL: <RSCFDn_base> + H'0240, RSCANnFMSTSH: <RSCFDn_base> + H'0242
RSCANnFMSTSLL: <RSCFDn_base> + H'0240, RSCANnFMSTSLH: <RSCFDn_base> + H'0241,
RSCANnFMSTSHL: <RSCFDn_base> + H'0242, RSCANnFMSTSHH: <RSCFDn_base> + H'0243

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset.
13	CF5MLT	0	R	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 5)
12	CF4MLT	0	R	
11	CF3MLT	0	R	
10	CF2MLT	0	R	
9	CF1MLT	0	R	
8	CF0MLT	0	R	
7	RF7MLT	0	R	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	0	R	
5	RF5MLT	0	R	
4	RF4MLT	0	R	
3	RF3MLT	0	R	
2	RF2MLT	0	R	
1	RF1MLT	0	R	
0	RF0MLT	0	R	

The RSCANnFMSTS register is cleared to H'0000 0000 in global reset mode.

CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

28.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access Size: RSCANnRFISTS register can be read only in 32-bit units
RSCANnRFISTSL, RSCANnRFISTSH registers can be read only in 16-bit units
RSCANnRFISTSLL, RSCANnRFISTSLH, RSCANnRFISTSHL, RSCANnRFISTSHH registers can be read only in 8-bit units

Address(es): RSCANnRFISTS: <RSCFDn_base> + H'0244
RSCANnRFISTSL: <RSCFDn_base> + H'0244, RSCANnRFISTSH: <RSCFDn_base> + H'0246
RSCANnRFISTSLL: <RSCFDn_base> + H'0244, RSCANnRFISTSLH: <RSCFDn_base> + H'0245,
RSCANnRFISTSHL: <RSCFDn_base> + H'0246, RSCANnRFISTSHH: <RSCFDn_base> + H'0247

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as the value after reset.
7	RF7IF	0	R	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	0	R	
5	RF5IF	0	R	
4	RF4IF	0	R	
3	RF3IF	0	R	
2	RF2IF	0	R	
1	RF1IF	0	R	
0	RF0IF	0	R	

The RSCANnRFISTS register is cleared to H'0000 0000 in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

28.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access Size: RSCANnCFRISTS register can be read only in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units

Address(es): RSCANnCFRISTS: <RSCFDn_base> + H'0248
RSCANnCFRISTSL: <RSCFDn_base> + H'0248, RSCANnCFRISTSH: <RSCFDn_base> + H'024A
RSCANnCFRISTSLL: <RSCFDn_base> + H'0248, RSCANnCFRISTSLH: <RSCFDn_base> + H'0249,
RSCANnCFRISTSHL: <RSCFDn_base> + H'024A, RSCANnCFRISTSHH: <RSCFDn_base> + H'024B

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CF5RXIF	CF4RXIF	CF3RXIF	CF2RXIF	CF1RXIF	CF0RXIF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are read as the value after reset.
5	CF5RXIF	0	R	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 5)
4	CF4RXIF	0	R	
3	CF3RXIF	0	R	
2	CF2RXIF	0	R	
1	CF1RXIF	0	R	
0	CF0RXIF	0	R	

The RSCANnCFRISTS register is cleared to H'0000 0000 in global reset mode.

CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

28.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access Size: RSCANnCFTISTS register can be read only in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units

Address(es): RSCANnCFTISTS: <RSCFDn_base> + H'024C
RSCANnCFTISTSL: <RSCFDn_base> + H'024C, RSCANnCFTISTSH: <RSCFDn_base> + H'024E
RSCANnCFTISTSLL: <RSCFDn_base> + H'024C, RSCANnCFTISTSLH: <RSCFDn_base> + H'024D,
RSCANnCFTISTSHL: <RSCFDn_base> + H'024E, RSCANnCFTISTSHH: <RSCFDn_base> + H'024F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	CF5TXIF	CF4TXIF	CF3TXIF	CF2TXIF	CF1TXIF	CF0TXIF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are read as the value after reset.
5	CF5TXIF	0	R	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 5)
4	CF4TXIF	0	R	
3	CF3TXIF	0	R	
2	CF2TXIF	0	R	
1	CF1TXIF	0	R	
0	CF0TXIF	0	R	

The RSCANnCFTISTS register is cleared to H'0000 0000 in global reset mode.

CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

28.3.10 Details of Transmit Buffer-related Registers

28.3.10.1 RSCANnTMCp — Transmit Buffer Control Register (p = 0 to 31)

Access Size: RSCANnTMCp registers can be read/written in 8-bit units

Address(es): RSCANnTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	0	R/W	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	0	R/W*1	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	0	R/W*1	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

When the RSCANnTMCp register meets any of the following conditions, set it to H'00.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

Bits in the RSCANnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00b.

28.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

Access Size: RSCANnTMSTSp registers can be read/written in 8-bit units

Address(es): RSCANnTMSTSp: <RSCFDn_base> + H'02D0 + (H'01 × p)

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	0	R	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	0	R	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	All 0	R/W	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	0	R	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCANnTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00b: Transmission is in progress or no transmit request is present.

01b: Transmission from the transmit buffer was aborted.

10b: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11b: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00b to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00b to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

28.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register (p = 0 to 31)

Access Size: RSCANnTMIDp register can be read/written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

Address(es): RSCANnTMIDp: <RSCFDn_base> + H'1000 + (H'10 × p)
RSCANnTMIDpL: <RSCFDn_base> + H'1000 + (H'10 × p),
RSCANnTMIDpH: <RSCFDn_base> + H'1002 + (H'10 × p)
RSCANnTMIDpLL: <RSCFDn_base> + H'1000 + (H'10 × p),
RSCANnTMIDpLH: <RSCFDn_base> + H'1001 + (H'10 × p),
RSCANnTMIDpHL: <RSCFDn_base> + H'1002 + (H'10 × p),
RSCANnTMIDpHH: <RSCFDn_base> + H'1003 + (H'10 × p)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TMIDE	0	R/W	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	0	R/W	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	0	R/W	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	All 0	R/W	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

28.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

Access Size: RSCANnTMPTRp register can be read/written in 32-bit units
RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units
RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

Address(es): RSCANnTMPTRp: <RSCFDn_base> + H'1004 + (H'10 × p)
RSCANnTMPTRpL: <RSCFDn_base> + H'1004 + (H'10 × p),
RSCANnTMPTRpH: <RSCFDn_base> + H'1006 + (H'10 × p)
RSCANnTMPTRpLL: <RSCFDn_base> + H'1004 + (H'10 × p),
RSCANnTMPTRpLH: <RSCFDn_base> + H'1005 + (H'10 × p),
RSCANnTMPTRpHL: <RSCFDn_base> + H'1006 + (H'10 × p),
RSCANnTMPTRpHH: <RSCFDn_base> + H'1007 + (H'10 × p)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	TMDLC[3:0]	All 0	R/W	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
23 to 16	TMPTR[7:0]	All 0	R/W	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001b or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), set the data length of messages to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

28.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 31)

Access Size: RSCANnTMDF0_p register can be read/written in 32-bit units
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

Address(es): RSCANnTMDF0_p: <RSCFDn_base> + H'1008 + (H'10 × p)
RSCANnTMDF0_pL: <RSCFDn_base> + H'1008 + (H'10 × p),
RSCANnTMDF0_pH: <RSCFDn_base> + H'100A + (H'10 × p)
RSCANnTMDF0_pLL: <RSCFDn_base> + H'1008 + (H'10 × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + H'1009 + (H'10 × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + H'100A + (H'10 × p),
RSCANnTMDF0_pHH: <RSCFDn_base> + H'100B + (H'10 × p)

Initial Value: H'0000 0000

7 to 0	TMDB0[7:0]	All 0	R/W	Transmit Buffer Data Byte 0 Set the transmit buffer data.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

28.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register (p = 0 to 31)

Access Size: RSCANnTMDF1_p register can be read/written in 32-bit units
RSCANnTMDF1_pL, RSCANnTMDF1_pH registers can be read/written in 16-bit units
RSCANnTMDF1_pLL, RSCANnTMDF1_pLH, RSCANnTMDF1_pHL, RSCANnTMDF1_pHH registers can be read/written in 8-bit units

Address(es): RSCANnTMDF1_p: <RSCFDn_base> + H'100C + (H'10 × p)
RSCANnTMDF1_pL: <RSCFDn_base> + H'100C + (H'10 × p),

15 to 0	TMIEp	All 0	R/W	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 28.15 shows the bit assignment.

Table 28.15 TMIEp Bit Assignment

28.3.11 Details of Transmit Buffer Status-related Registers

28.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0)

Access Size: RSCANnTMTRSTSy register can be read only in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers can be read only in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers can be read only in 8-bit units

Address(es): RSCANnTMTRSTSy: <RSCFDn_base> + H'0350 + (H'04 × y)
RSCANnTMTRSTSyL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCANnTMTRSTSyH: <RSCFDn_base> + H'0352 + (H'04 × y)
RSCANnTMTRSTSyLL: <RSCFDn_base> + H'0350 + (H'04 × y),
RSCANnTMTRSTSyLH: <RSCFDn_base> + H'0351 + (H'04 × y),
RSCANnTMTRSTSyHL: <RSCFDn_base> + H'0352 + (H'04 × y),
RSCANnTMTRSTSyHH: <RSCFDn_base> + H'0353 + (H'04 × y)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTRSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0))															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMTRSTSp (p = y × 32 + 15 to y × 32 + 0 (y = 0))															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTRSTSp	All 0	R	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	All 0	R	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 28.16 shows the bit assignment.

28.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0)

Access Size: RSCANnTMTARSTSy register can be read only in 32-bit units
RSCANnTMTARSTSyL, RSCANnTMTARSTSyH registers can be read only in 16-bit units
RSCANnTMTARSTSyLL, RSCANnTMTARSTSyLH, RSCANnTMTARSTSyHL, RSCANnTMTARSTSyHH registers can be read only in 8- bit units

Address(es): RSCANnTMTARSTSy: <RSCFDn_base> + H'0360 + (H'04 × y)
RSCANnTMTARSTSyL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCANnTMTARSTSyH: <RSCFDn_base> + H'0362 + (H'04 × y)
RSCANnTMTARSTSyLL: <RSCFDn_base> + H'0360 + (H'04 × y),
RSCANnTMTARSTSyLH: <RSCFDn_base> + H'0361 + (H'04 × y),
RSCANnTMTARSTSyHL: <RSCFDn_base> + H'0362 + (H'04 × y),
RSCANnTMTARSTSyHH: <RSCFDn_base> + H'0363 + (H'04 × y)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMTARSTSp (p = y × 32 + 31 to y × 32 + 16 (y = 0))

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTARSTSp	All 0	R	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit abort request is present. 1: A transmit abort request is present.
15 to 0	TMTARSTSp	All 0	R	Transmit Buffer Transmit Abort Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit abort request is present. 1: A transmit abort request is present.

TMTARSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 28.17 shows the bit assignment.

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTCSTSp	All 0	R	Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: Transmission has not been completed. 1: Transmission has been completed.
15 to 0	TMTCSTSp	All 0	R	Transmit Buffer Transmit Complete Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: Transmission has not been completed. 1: Transmission has been completed.

TMTCSTSp Flags (p = 0 to 31)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to 10b (transmission has been completed (without transmit abort request)) or 11b (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1.

A TMTCSTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00b or in channel reset mode.

Table 28.18 shows the bit assignment.

28.3.12 Details of Transmit Queue-related Registers

28.3.12.1 RSCANnTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1)

Access Size: RSCANnTXQCCm register can be read/written in 32-bit units
RSCANnTXQCCmL, RSCANnTXQCCmH registers can be read/written in 16-bit units
RSCANnTXQCCmLL, RSCANnTXQCCmLH, RSCANnTXQCCmHL, RSCANnTXQCCmHH registers can be read/written in 8-bit units

Address(es): RSCANnTXQCCm: <RSCFDn_base> + H'03A0 + (H'04 × m)
RSCANnTXQCCmL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCANnTXQCCmH: <RSCFDn_base> + H'03A2 + (H'04 × m)
RSCANnTXQCCmLL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCANnTXQCCmLH: <RSCFDn_base> + H'03A1 + (H'04 × m),
RSCANnTXQCCmHL: <RSCFDn_base> + H'03A2 + (H'04 × m),
RSCANnTXQCCmHH: <RSCFDn_base> + H'03A3 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TXQIM	TXQIE	TXQDC[3:0]				—	—	—	—	—	—	—	TXQE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
13	TXQIM	0	R/W	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	0	R/W	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	All 0	R/W	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	TXQE	0	R/W	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated. Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 28.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010b or more.

28.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register (m = 0, 1)

Access Size: RSCANnTXQSTSm register can be read/written in 32-bit units
RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units
RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units

Address(es): RSCANnTXQSTSm: <RSCFDn_base> + H'03C0 + (H'04 × m)
RSCANnTXQSTSmL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCANnTXQSTSmH: <RSCFDn_base> + H'03C2 + (H'04 × m)
RSCANnTXQSTSmLL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCANnTXQSTSmLH: <RSCFDn_base> + H'03C1 + (H'04 × m),
RSCANnTXQSTSmHL: <RSCFDn_base> + H'03C2 + (H'04 × m),
RSCANnTXQSTSmHH: <RSCFDn_base> + H'03C3 + (H'04 × m)

Initial Value: H'0000 0001

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	—	All 0	R	Reserved When read, an undefined value is returned.The write value should be the value after reset.
7 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	TXQIF	0	R/W*1	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	0	R	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	1	R	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCANnTXQCCm register has occurred. The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

28.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

Access Size: RSCANnTXQPCTRm register can only be written in 32-bit units
RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units
RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units

Address(es): RSCANnTXQPCTRm: <RSCFDn_base> + H'03E0 + (H'04 × m)
RSCANnTXQPCTRmL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCANnTXQPCTRmH: <RSCFDn_base> + H'03E2 + (H'04 × m)
RSCANnTXQPCTRmLL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCANnTXQPCTRmLH: <RSCFDn_base> + H'03E1 + (H'04 × m),
RSCANnTXQPCTRmHL: <RSCFDn_base> + H'03E2 + (H'04 × m),
RSCANnTXQPCTRmHH: <RSCFDn_base> + H'03E3 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	TXQPC[7:0]	All 0	W	Transmit Queue Pointer Control Writing H'FF to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing H'FF to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31) before writing H'FF to the TXQPC[7:0] bits.

When writing H'FF to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

28.3.13 Details of Transmit history-related Registers

28.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

Access Size: RSCANnTHLCCm register can be read/written in 32-bit units
RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units

Address(es): RSCANnTHLCCm: <RSCFDn_base> + H'0400 + (H'04 × m)
RSCANnTHLCCmL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCANnTHLCCmH: <RSCFDn_base> + H'0402 + (H'04 × m)
RSCANnTHLCCmLL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCANnTHLCCmLH: <RSCFDn_base> + H'0401 + (H'04 × m),
RSCANnTHLCCmHL: <RSCFDn_base> + H'0402 + (H'04 × m),
RSCANnTHLCCmHH: <RSCFDn_base> + H'0403 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
10	THLDTE	0	R/W	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	0	R/W	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	0	R/W	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	THLE	0	R/W	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer. Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

28.3.13.2 RSCANnTHLSTSm — Transmit History Status Register (m = 0, 1)

Access Size: RSCANnTHLSTSm register can be read/written in 32-bit units
RSCANnTHLSTSmL, RSCANnTHLSTSmH registers can be read/written in 16-bit units
RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units

Address(es): RSCANnTHLSTSm: <RSCFDn_base> + H'0420 + (H'04 × m)
RSCANnTHLSTSmL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCANnTHLSTSmH: <RSCFDn_base> + H'0422 + (H'04 × m)
RSCANnTHLSTSmLL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCANnTHLSTSmLH: <RSCFDn_base> + H'0421 + (H'04 × m),
RSCANnTHLSTSmHL: <RSCFDn_base> + H'0422 + (H'04 × m),
RSCANnTHLSTSmHH: <RSCFDn_base> + H'0423 + (H'04 × m)

Initial Value: H'0000 0001

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	THLMC[4:0]	All 0	R	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
3	THLIF	0	R/W*1	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	0	R/W*1	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	0	R	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	1	R	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

28.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

Access Size: RSCANnTHLPCTRm register can only be written in 32-bit units
RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units
RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8- bit units

Address(es): RSCANnTHLPCTRm: <RSCFDn_base> + H'0440 + (H'04 × m)
RSCANnTHLPCTRmL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCANnTHLPCTRmH: <RSCFDn_base> + H'0442 + (H'04 × m)
RSCANnTHLPCTRmLL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCANnTHLPCTRmLH: <RSCFDn_base> + H'0441 + (H'04 × m),
RSCANnTHLPCTRmHL: <RSCFDn_base> + H'0442 + (H'04 × m),
RSCANnTHLPCTRmHH: <RSCFDn_base> + H'0443 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	THLPC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	All 0	W	Transmit History List Pointer Control Writing H'FF to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to H'FF, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented. Write H'FF to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

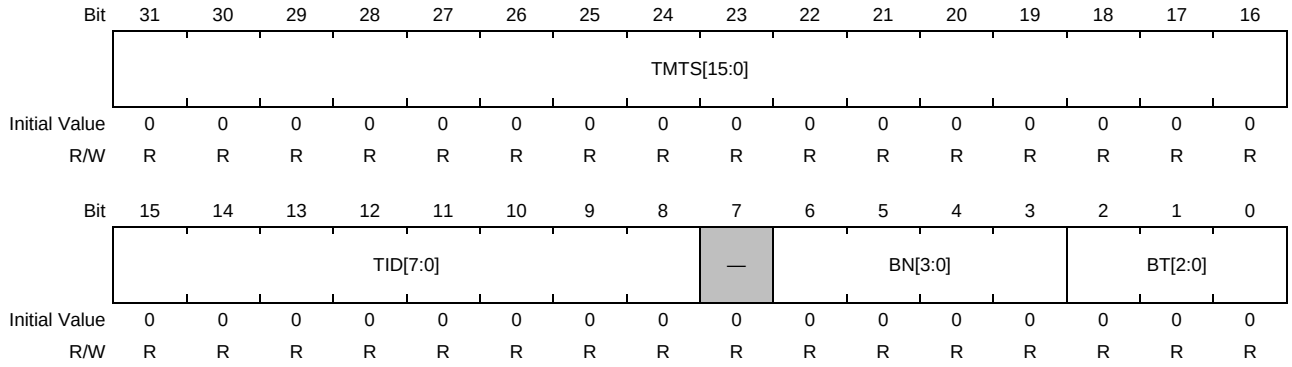
When writing H'FF to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

28.3.13.4 RSCANnTHLACCm — Transmit History Access Register (m = 0, 1)

Access Size: RSCANnTHLACCm register can be read only in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

Address(es): RSCANnTHLACCm: <RSCFDn_base> + H'1800 + (H'04 × m)
RSCANnTHLACCmL: <RSCFDn_base> + H'1800 + (H'04 × m),
RSCANnTHLACCmH: <RSCFDn_base> + H'1802 + (H'04 × m)
RSCANnTHLACCmLL: <RSCFDn_base> + H'1800 + (H'04 × m),
RSCANnTHLACCmLH: <RSCFDn_base> + H'1801 + (H'04 × m),
RSCANnTHLACCmHL: <RSCFDn_base> + H'1802 + (H'04 × m),
RSCANnTHLACCmHH: <RSCFDn_base> + H'1803 + (H'04 × m)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTS[15:0]	All 0	R	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	All 0	R	Label Data The label information of stored data can be read.
7	—	0	R	Reserved This bit is read as the value after reset.
6 to 3	BN[3:0]	All 0	R	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	All 0	R	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 0 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

28.3.14 Details of Test-related Registers

28.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register

Access Size: RSCANnGTSTCFG register can be read/written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units

Address(es): RSCANnGTSTCFG: <RSCFDn_base> + H'0468
RSCANnGTSTCFGL: <RSCFDn_base> + H'0468, RSCANnGTSTCFGH: <RSCFDn_base> + H'046A
RSCANnGTSTCFGLL: <RSCFDn_base> + H'0468, RSCANnGTSTCFGLH: <RSCFDn_base> + H'0469,
RSCANnGTSTCFGHL: <RSCFDn_base> + H'046A, RSCANnGTSTCFGHH: <RSCFDn_base> + H'046B

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
22 to 16	RTMPS[6:0]	All 0	R/W	RAM Test Page Configuration Set a value within a range of page 0 (H'00) to page 19 (H'13).
15 to 2	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
1	C1ICBCE	0	R/W	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	0	R/W	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of H'00 to H'13, inclusive.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

28.3.14.2 RSCANnGTSTCTR — Global Test Control Register

Access Size: RSCANnGTSTCTR register can be read/written in 32-bit units
RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units
RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units

Address(es): RSCANnGTSTCTR: <RSCFDn_base> + H'046C
RSCANnGTSTCTRL: <RSCFDn_base> + H'046C, RSCANnGTSTCTRH: <RSCFDn_base> + H'046E
RSCANnGTSTCTRLL: <RSCFDn_base> + H'046C, RSCANnGTSTCTRLH: <RSCFDn_base> + H'046D,
RSCANnGTSTCTRHL: <RSCFDn_base> + H'046E, RSCANnGTSTCTRHH: <RSCFDn_base> + H'046F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	RTME	0	R/W	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	—	0	R	Reserved This bit is read as the value after reset. The write value should be the value after reset.
0	ICBCTME	0	R/W	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10b (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

28.3.14.3 RSCANnGLOCKK — Global Lock Key Register

Access Size: RSCANnGLOCKK register can only be written in 32-bit units
RSCANnGLOCKKL, RSCANnGLOCKKH registers can only be written in 16-bit units

Address(es): RSCANnGLOCKK: <RSCFDn_base> + H'047C
RSCANnGLOCKKL: <RSCFDn_base> + H'047C, RSCANnGLOCKKH: <RSCFDn_base> + H'047E

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LOCK[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1	W*1

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	All 0	W*1	Lock Key These bits are key bits to release protection of test mode.

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 28.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + H'0000 to <RSCFDn_base> + H'04FF) of the CAN (except the RAM) enables the protection again.

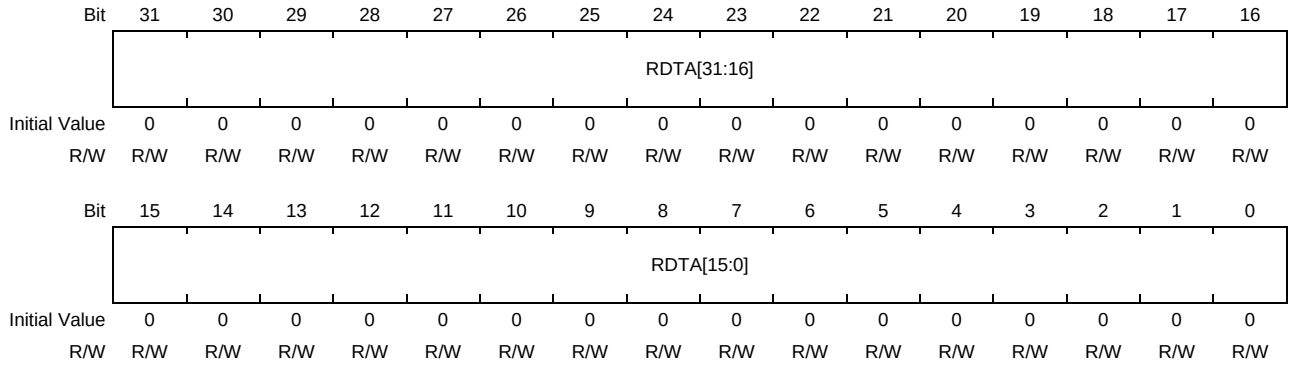
Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

28.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access Size: RSCANnRPGACCr register can be read/written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units

Address(es): RSCANnRPGACCr: <RSCFDn_base> + H'1900 + (H'04 × r)
RSCANnRPGACCrL: <RSCFDn_base> + H'1900 + (H'04 × r),
RSCANnRPGACCrH: <RSCFDn_base> + H'1902 + (H'04 × r)
RSCANnRPGACCrLL: <RSCFDn_base> + H'1900 + (H'04 × r),
RSCANnRPGACCrLH: <RSCFDn_base> + H'1901 + (H'04 × r),
RSCANnRPGACCrHL: <RSCFDn_base> + H'1902 + (H'04 × r),
RSCANnRPGACCrHH: <RSCFDn_base> + H'1903 + (H'04 × r)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDTA[31:0]	All 0	R/W	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register is readable and writable when the RTME bit is set to 1.

28.4 Registers (CANFD Mode)

This section describes all registers to be used when the RS-CANFD is used in CANFD mode.

28.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CANFD mode.

For details about <RSCFDn_base>, see **Section 28.1.2, Register Base Address**.

- **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 28.38, Registers Initialized Only in Global Reset Mode**

Table 28.20 Registers (1/3)

Module	Register	Symbol	Address
Interface mode-related register			
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCFDn_base> + H'04FC
Channel-related registers			
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCFDn_base> + H'0000 + (H'10 × m)
RSCFDn	Channel m control register	RSCFDnCFDCmCTR	<RSCFDn_base> + H'0004 + (H'10 × m)
RSCFDn	Channel m status register	RSCFDnCFDCmSTS	<RSCFDn_base> + H'0008 + (H'10 × m)
RSCFDn	Channel m error flag register	RSCFDnCFDCmERFL	<RSCFDn_base> + H'000C + (H'10 × m)
RSCFDn	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCFDn_base> + H'0500 + (H'20 × m)

28.4.2 Details of Interface Mode-related Registers

28.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

Access Size: RSCFDnCFDGRMCFG register can be read/written in 32-bit units
RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units
RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL, RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGRMCFG: <RSCFDn_base> + H'04FC
RSCFDnCFDGRMCFGL: <RSCFDn_base> + H'04FC, RSCFDnCFDGRMCFGH: <RSCFDn_base> + H'04FE
RSCFDnCFDGRMCFGLL: <RSCFDn_base> + H'04FC, RSCFDnCFDGRMCFGLH: <RSCFDn_base> + H'04FD,
RSCFDnCFDGRMCFGHL: <RSCFDn_base> + H'04FE, RSCFDnCFDGRMCFGHH: <RSCFDn_base> + H'04FF

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	0	R/W	Interface Mode Select 0: Classical CAN mode 1: CANFD mode

Note: The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 places the RS-CANFD module in classical CAN mode. Setting this bit to 1 places the RS-CANFD module in CANFD mode. To switch classical CAN mode to CANFD mode, set the value after reset in all registers and bits allocated to the register map of classical CAN mode and then modify the RSCFDnCFDGRMCFG register.

28.4.3 Details of Channel-related Registers

28.4.3.1 RSCFDnCFDCmNCFG — Channel Nominal Bit Rate Configuration Register (m = 0, 1)

Access Size: RSCFDnCFDCmNCFG register can be read/written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmNCFG: <RSCFDn_base> + H'0000 + (H'10 × m)
RSCFDnCFDCmNCFGL: <RSCFDn_base> + H'0000 + (H'10 × m),
RSCFDnCFDCmNCFGH: <RSCFDn_base> + H'0002 + (H'10 × m)
RSCFDnCFDCmNCFGLL: <RSCFDn_base> + H'0000 + (H'10 × m),

10	—	0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
9 to 0	NBRP[9:0]	All 0	R/W	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings of bit timing parameters, see **Section 28.11.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 32 Tq, inclusive.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

A value of 4 to 128 Tq is settable.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

28.4.3.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0, 1)

Access Size: RSCFDnCFDCmCTR register can be read/written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmCTR: <RSCFDn_base> + H'0004 + (H'10 × m)
RSCFDnCFDCmCTRL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCFDnCFDCmCTRH: <RSCFDn_base> + H'0006 + (H'10 × m)
RSCFDnCFDCmCTRLL: <RSCFDn_base> + H'0004 + (H'10 × m),
RSCFDnCFDCmCTRLH: <RSCFDn_base> + H'0005 + (H'10 × m),
RSCFDnCFDCmCTRHL: <RSCFDn_base> + H'0006 + (H'10 × m),
RSCFDnCFDCmCTRHH: <RSCFDn_base> + H'0007 + (H'10 × m)

Initial Value: H'0000 0005

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00b (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.

When this bit is clear to 0, if any error is detected while the flags of bits 14-8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order. Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00b, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10b (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01b, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) are set to 10b and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to H’00.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10b, the CHMDC[1:0] bits are set to 10b and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H’00.

When the BOM[1:0] bits are set to 11b and the CHMDC[1:0] bits are set to 10b while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H’00. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10b, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01b or at bus off end when the BOM[1:0] bits are 10b), the program’s writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to H’00 and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00b (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.

Clearing this bit to 0 makes the channel exit channel stop mode.

This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Figure 28.5**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode.

Do not set the CHMDC[1:0] bits to 11b. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become 10b.

28.4.3.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0, 1)

Access Size: RSCFDnCFDCmSTS register can be read/written in 32-bit units
RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDCmSTS: <RSCFDn_base> + H'0008 + (H'10 × m)
RSCFDnCFDCmSTSL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + H'000A + (H'10 × m)
RSCFDnCFDCmSTSLL: <RSCFDn_base> + H'0008 + (H'10 × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + H'0009 + (H'10 × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + H'000A + (H'10 × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + H'000B + (H'10 × m)

Initial Value: H'0000 0005

Bit	Bit Name	Initial Value	R/W	Description
2	CSLPSTS	1	R	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	0	R	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	1	R	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag becomes 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

28.4.3.4 RSCFDnCFDCmERFL — Channel Error Flag Register (m = 0, 1)

Access Size: RSCFDnCFDCmERFL register can be read/written in 32-bit units
RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/writ- ten in 8-bit units

Address(es): RSCFDnCFDCmERFL: <RSCFDn_base> + H'000C + (H'10 × m)
RSCFDnCFDCmERFLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCFDnCFDCmERFLH: <RSCFDn_base> + H'000E + (H'10 × m)
RSCFDnCFDCmERFLLL: <RSCFDn_base> + H'000C + (H'10 × m),
RSCFDnCFDCmERFLLH: <RSCFDn_base> + H'000D + (H'10 × m),
RSCFDnCFDCmERFLHL: <RSCFDn_base> + H'000E + (H'10 × m),

9	FERR	0	R/W*1	Form Error Flag 0: No form error is detected. 1: Form error is detected.
8	SERR	0	R/W*1	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	0	R/W*1	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	0	R/W*1	Bus Lock Flag 0: No channel bus is detected. 1: Channel bus is detected.
5	OVLF	0	R/W*1	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	0	R/W*1	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	0	R/W*1	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	0	R/W*1	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	0	R/W*1	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	0	R/W*1	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CANFD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01b (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01b (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10b (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11b (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0, 1) set to 01b (transition to channel halt mode at bus off entry).

EPF Flag

This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127).

This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

28.4.3.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0, 1)

Access Size: RSCFDnCFDCmDCFG register can be read/written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmDCFG: <RSCFDn_base> + H'0500 + (H'20 × m)
RSCFDnCFDCmDCFGL: <RSCFDn_base> + H'0500 + (H'20 × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + H'0502 + (H'20 × m)
RSCFDnCFDCmDCFGLL: <RSCFDn_base> + H'0500 + (H'20 × m),
RSCFDnCFDCmDCFGLH: <RSCFDn_base> + H'0501 + (H'20 × m),

7 to 0	DBRP[7:0]	All 0	R/W	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 28.11.1, Initial Settings**.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. A value of 1 to 8 Tq is settable. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate. Allowed values are 2 Tq to 8 Tq, inclusive.

Set a value smaller than the value of the DTSEG1[3:0] bits.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

A value of 2 to 16 Tq is settable.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Make sure to set the same value in the NBRP[9:0] bits and the DBRP[7:0] bits. To set the nominal bit rate and data bit rate of different values, change the NTSEG 1 bit and NTSEG 2 bit in the RSCFDnCFDCmNCFG register and the DTSEG 1 bit and DTSEG 2 bit in the RSCFDnCFDCmDCFG register to the desired bit rate values respectively. When the TDCE bit of the RSCFDnCFDCmFDCFG register is 1 (transmission delay correction enabled), set the same value of 1 or less to the NBRP [9:0] and DBRP [7:0] bits.

28.4.3.6 RSCFDnCFDCmFDCFG — Channel CANFD Configuration Register (m = 0, 1)

Access Size: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmFDCFG: <RSCFDn_base> + H'0504 + (H'20 × m)
RSCFDnCFDCmFDCFGL: <RSCFDn_base> + H'0504 + (H'20 × m),

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CANFD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CANFD frame to be transmitted by the gateway function is set. Write 0 to this bit to clear the GWBRS bit to 0. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CANFD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10b (gateway mode).

Setting this bit to 1 enables the CAN-CANFD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001b or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000b.

While this bit is 1, do not perform routing the following frames by using the gateway function.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is 1, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.
- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

Table 28.25 shows the settings and formats of transmit frame and receive frame while the CAN-CANFD gateway is enabled.

Table 28.25 Operation when the CAN-CANFD Gateway is Enabled

Receive Frame				Transmit Frame		
Format	BRS Bit	Received DLC Value	GWFDF Bit	Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000b	0	Classical CAN	None	Not replaced
		DLC > 1000b				
CANFD	Arbitrary	DLC ≤ 1000b				
Classical CAN	None	DLC ≤ 1000b	1	CANFD	According to GWBRS bit setting	Not replaced
		DLC > 1000b				Replaced with 1000b
CANFD	Arbitrary	DLC ≤ 1000b				Not replaced

TDCO[6:0] Bits

These bits are set to the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded to the nearest integer Tq).

When the TDCOC bit is 1, the transmitter delay compensation result equals to the TDCO[6:0] value. The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 28.26 ESI Value to Be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is 1, the SSP position is defined only by the SSP offset value. Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

28.4.3.7 RSCFDnCFDCmFDCTR — Channel CANFD Control Register (m = 0, 1)

Access Size: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCTRLL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL, RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmFDCTR: <RSCFDn_base> + H'0508 + (H'20 × m)
RSCFDnCFDCmFDCTRL: <RSCFDn_base> + H'0508 + (H'20 × m),
RSCFDnCFDCmFDCTRH: <RSCFDn_base> + H'050A + (H'20 × m)
RSCFDnCFDCmFDCTRLL: <RSCFDn_base> + H'0508 + (H'20 × m),

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	0	R/W	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	0	R/W	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

28.4.3.8 RSCFDnCFDCmFDSTS — Channel CANFD Status Register (m = 0, 1)

Access Size: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCmFDSTS: <RSCFDn_base> + H'050C + (H'20 × m)

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SOC[7:0]	All 0	R	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	All 0	R	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
9	SOCO	0	R/W*1	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	0	R/W*1	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	0	R/W*1	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	All 0	R	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches H'FF. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches H'FF.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached H'FF. This flag is 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached H'FF. This flag is 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 Tq (CANm bit time and Tq are the values of data bit rate).

This flag is 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

This flag is updated at a falling edge between the FDF bit and res bit when the TDCE bit (transmitter delay compensation enable) in the RSCFDnCFDCmFDCFG register is set to 1 and also the TDCOC bit (transmitter delay compensation measurement select) in the RSCFDnCFDCmFDCFG register is set to 0.

This flag is 0 in channel reset mode.

28.4.3.9 RSCFDnCFDCmFDCRC — Channel CANFD CRC Register (m = 0, 1)

Access Size: RSCFDnCFDCmFDCRC register can be read only in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDCmFDCRC: <RSCFDn_base> + H'0510 + (H'20 × m)
RSCFDnCFDCmFDCRCL: <RSCFDn_base> + H'0510 + (H'20 × m),
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + H'0512 + (H'20 × m)

31 to 28	—	All 0	R	Reserved These bits are read as the value after reset.
27 to 24	SCNT[3:0]	All 0	R	Stuff count Indicate a value of the stuff count in a CANFD frame. Bits 25 to 27 indicate the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27.
23 to 21	—	All 0	R	Reserved These bits are read as the value after reset.
20 to 0	CRCREG [20:0]	All 0	R	CRC Calculation Data (CRC Length:17 Bits or 21 Bits) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CANFD frame can be read if a message transmitted/received is a CANFD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. This flag is updated at the first bit in the CRC field of the CANFD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CANFD frame (CRC length = 17 or 21 bits), this flag is updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

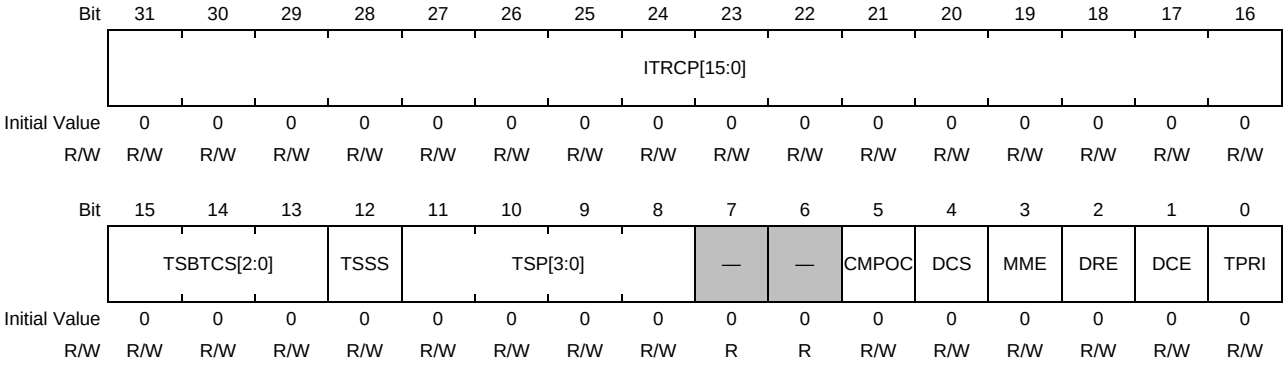
28.4.4 Details of Global-related Registers

28.4.4.1 SCFDnCFDGCFG — Global Configuration Register

Access Size: RSCFDnCFDGCFG register can be read/written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGCFG: <RSCFDn_base> + H'0084
RSCFDnCFDGCFGL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFGH: <RSCFDn_base> + H'0086
RSCFDnCFDGCFGLL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFGLH: <RSCFDn_base> + H'0085,
RSCFDnCFDGCFGHL: <RSCFDn_base> + H'0086, RSCFDnCFDGCFGHH: <RSCFDn_base> + H'0087

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	ITRCP[15:0]	All 0	R/W	Interval Timer Prescaler Set When these bits are set to M, the pclk is divided by M. Setting H'0000 is prohibited when the interval timer is in use.
15 to 13	TSBTCS[2:0]	All 0	R/W	Timestamp Clock Source Select b15 b14 b13 0 0 0: Channel 0 nominal bit time clock 0 0 1: Channel 1 nominal bit time clock 0 1 0: Channel 2 nominal bit time clock 0 1 1: Channel 3 nominal bit time clock 1 0 0: Channel 4 nominal bit time clock 1 0 1: Channel 5 nominal bit time clock 1 1 0: Setting prohibited 1 1 1: Setting prohibited
12	TSSS	0	R/W	Timestamp Source Select 0: pclk/2*1 1: Nominal bit time clock

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	TSP[3:0]	0	R/W	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768
7, 6	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
5	CMPOC	0	R/W	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	0	R/W	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	0	R/W	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	0	R/W	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	0	R/W	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	0	R/W	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000b.

Note 2. For the CAN clock frequency settings, see **Section 28.1.3, Clock Supply**.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 28.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CANFD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 28.6, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in this LSI**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of H’00 is stored in each data byte beyond the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000b before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.

While the transmit queue is in use, this bit should be set to 0.

28.4.4.2 RSCFDnCFDGCTR — Global Control Register

Access Size: RSCFDnCFDGCTR register can be read/written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGCTR: <RSCFDn_base> + H'0088
RSCFDnCFDGCTRL: <RSCFDn_base> + H'0088, RSCFDnCFDGCTRH: <RSCFDn_base> + H'008A
RSCFDnCFDGCTRLL: <RSCFDn_base> + H'0088, RSCFDnCFDGCTRLH: <RSCFDn_base> + H'0089,
RSCFDnCFDGCTRHL: <RSCFDn_base> + H'008A, RSCFDnCFDGCTRHH: <RSCFDn_base> + H'008B

Initial Value: H'0000 0005

8	DEIE	0	R/W	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	GSLPR	1	R/W	Global Stop Mode 0: Other than global stop mode 1: Global stop mode

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GMDC[1:0]	01b	R/W	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to H'0000.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.

Clearing this bit to 0 makes the RSCAN module leave from global stop mode.

This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 28.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

28.4.4.3 RSCFDnCFDGSTS — Global Status Register

Access Size: RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units
RSCFDnCFDGSTSLL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDGSTS: <RSCFDn_base> + H'008C
RSCFDnCFDGSTSL: <RSCFDn_base> + H'008C, RSCFDnCFDGSTSH: <RSCFDn_base> + H'008E
RSCFDnCFDGSTSLL: <RSCFDn_base> + H'008C, RSCFDnCFDGSTSLH: <RSCFDn_base> + H'008D,
RSCFDnCFDGSTSHL: <RSCFDn_base> + H'008E, RSCFDnCFDGSTSHH: <RSCFDn_base> + H'008F

Initial Value: H'0000 000D

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are read as the value after reset.
3	GRAMINIT	1	R	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	1	R	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	0	R	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	1	R	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

28.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access Size: RSCFDnCFDGERFL register can be read/written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDGERFL: <RSCFDn_base> + H'0090
RSCFDnCFDGERFLL: <RSCFDn_base> + H'0090, RSCFDnCFDGERFLH: <RSCFDn_base> + H'0092
RSCFDnCFDGERFLLL: <RSCFDn_base> + H'0090, RSCFDnCFDGERFLLH: <RSCFDn_base> + H'0091,
RSCFDnCFDGERFLHL: <RSCFDn_base> + H'0092, RSCFDnCFDGERFLHH: <RSCFDn_base> + H'0093

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14, 7, 6, 4	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
13 to 8, 5	—	All 0	R	Reserved When read, an undefined value is returned.The write value should be the value after reset.
3	CMPOF	1	R/W*1	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	1	R	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	0	R	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	1	R/W*1	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0, 1), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0, 1) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 5) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

Note

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

28.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access Size: RSCFDnCFDGTSC register can be read only in 32-bit units
RSCFDnCFDGTSCL, RSCFDnCFDGTSCH registers can be read only in 16-bit units

Address(es): RSCFDnCFDGTSC: <RSCFDn_base> + H'0094
RSCFDnCFDGTSCL: <RSCFDn_base> + H'0094, RSCFDnCFDGTSCH: <RSCFDn_base> + H'0096

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset.
15 to 0	TS[15:0]	All 0	R	Timestamp Value The timestamp counter value can be read. Counter Value: H'0000 to H'FFFF

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode. This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

28.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access Size: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units

Address(es): RSCFDnCFDGTINTSTS0: <RSCFDn_base> + H'0460
RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + H'0460,
RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + H'0462
RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + H'0460,
RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + H'0461,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + H'0462,

3	CFTIF0	0	R*1	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.

Bit	Bit Name	Initial Value	R/W	Description
2	TQIF0	0	R*1	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	0	R*1	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	0	R*1	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 10b (transmit completed without abort request) or 11b (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00b under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01b (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00b after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

28.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register

Access Size: RSCFDnCFDGFDCFG register can be read/written in 32-bit units
RSCFDnCFDGFDCFG L, RSCFDnCFDGFDCFG H registers can be read/written in 16-bit units
RSCFDnCFDGFDCFG LL, RSCFDnCFDGFDCFG LH, RSCFDnCFDGFDCFG HL, RSCFDnCFDGFDCFG HH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGFDCFG: <RSCFDn_base> + H'0474
RSCFDnCFDGFDCFG L: <RSCFDn_base> + H'0474, RSCFDnCFDGFDCFG H: <RSCFDn_base> + H'0476
RSCFDnCFDGFDCFG LL: <RSCFDn_base> + H'0474, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + H'0475,
RSCFDnCFDGFDCFG HL: <RSCFDn_base> + H'0476, RSCFDnCFDGFDCFG HH: <RSCFDn_base> + H'0477

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R/W	Reserved These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	All 0	R/W	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit.*1 1 1: Setting prohibited.
7 to 1	—	All 0	R/W	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	PRED	0	R/W	Protocol exception event detection disabled bit 0: Protocol exception event detection enabled 1: Protocol exception event detection disabled

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG[1:0] Bits

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

PRED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame is output. Modify this bit only in global reset mode.

28.4.5 Details of Receive Rule-related Registers

28.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access Size: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL, RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGAFLECTR: <RSCFDn_base> + H'0098
RSCFDnCFDGAFLECTRL: <RSCFDn_base> + H'0098,
RSCFDnCFDGAFLECTRH: <RSCFDn_base> + H'009A
RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + H'0098,
RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + H'0099,
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + H'009A,
RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + H'009B

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	0	R/W	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	All 0	R/W	Receive Rule Table Page Number Configuration A page number can be selected from a range of page 0 (00000b) to page 7 (00111b).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. Set these bits to a value within the range of 00000b to 00111b.

28.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access Size: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL, RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGAFLCFG0: <RSCFDn_base> + H'009C
RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + H'009C,
RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + H'009E
RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + H'009C,
RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + H'009D,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + H'009E,
RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + H'009F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RNC0[7:0]	All 0	R/W	Number of Rules for Channel 0 Set the number of receive rules exclusively used for channel 0.
23 to 16	RNC1[7:0]	All 0	R/W	Number of Rules for Channel 1 Set the number of receive rules exclusively used for channel 1.
15 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80.

28.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

Access Size: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGAFLIDj: <RSCFDn_base> + H'1000 + (H'10 × j)
RSCFDnCFDGAFLIDjL: <RSCFDn_base> + H'1000 + (H'10 × j),
RSCFDnCFDGAFLIDjH: <RSCFDn_base> + H'1002 + (H'10 × j)
RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + H'1000 + (H'10 × j),
RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + H'1001 + (H'10 × j),
RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + H'1002 + (H'10 × j),
RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + H'1003 + (H'10 × j)

Initial Value: H'0000 0000

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDE	0	R/W	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	0	R/W	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	0	R/W	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	All 0	R/W	ID Set Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

28.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

Access Size: RSCFDnCFDGAFLMj register can be read/written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGAFLMj: <RSCFDn_base> + H'1004 + (H'10 × j)
RSCFDnCFDGAFLMjL: <RSCFDn_base> + H'1004 + (H'10 × j),
RSCFDnCFDGAFLMjH: <RSCFDn_base> + H'1006 + (H'10 × j)
RSCFDnCFDGAFLMjLL: <RSCFDn_base> + H'1004 + (H'10 × j),
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + H'1005 + (H'10 × j),
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + H'1006 + (H'10 × j),
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + H'1007 + (H'10 × j)

Initial Value: H'0000 0000

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAFLIDM[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GAFLIDEM	0	R/W	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	0	R/W	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared
29	—	0	R	Reserved This bit is read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM [28:0]	All 0	R/W	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

28.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)

Access Size: RSCFDnCFDGAFLP0_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP0_jL, RSCFDnCFDGAFLP0_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP0jLL, RSCFDnCFDGAFLP0jLH, RSCFDnCFDGAFLP0jHL, RSCFDnCFDGAFLP0jHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGAFLP0_j: <RSCFDn_base> + H'1008 + (H'10 × j)
RSCFDnCFDGAFLP0_jL: <RSCFDn_base> + H'1008 + (H'10 × j),

27 to 16	GAFLPTR [11:0]	All 0	R/W	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	0	R/W	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP [6:0]	All 0	R/W	Receive Buffer Number Select Set the receive buffer number to store receive messages.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check.

Setting these bits to 0000b disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

28.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)

Access Size: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL, RSCFDnCFDGAFLP1_jHH registers can be read/ written in 8-bit units

Address(es): RSCFDnCFDGAFLP1_j: <RSCFDn_base> + H'100C_H + (H'10 × j)
RSCFDnCFDGAFLP1_jL: <RSCFDn_base> + H'100C_H + (H'10 × j),
RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + H'100E_H + (H'10 × j)

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
13 to 8	GAFLFDP [13:8]	All 0	R/W	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP [7:0]	All 0	R/W	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[13:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00b (receive mode) or 10b (gateway mode) are selectable.

28.4.6 Details of Receive Buffer-related Registers

28.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access Size: RSCFDnCFDRMNB register can be read/written in 32-bit units
RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDRMNB: <RSCFDn_base> + H'00A4
RSCFDnCFDRMNBL: <RSCFDn_base> + H'00A4, RSCFDnCFDRMNBH: <RSCFDn_base> + H'00A6
RSCFDnCFDRMNBLL: <RSCFDn_base> + H'00A4, RSCFDnCFDRMNBLH: <RSCFDn_base> + H'00A5,
RSCFDnCFDRMNBHL: <RSCFDn_base> + H'00A6, RSCFDnCFDRMNBHH: <RSCFDn_base> + H'00A7

Initial Value: H'0000 0000

7 to 0	NRXMB[7:0]	All 0	R/W	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 32.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

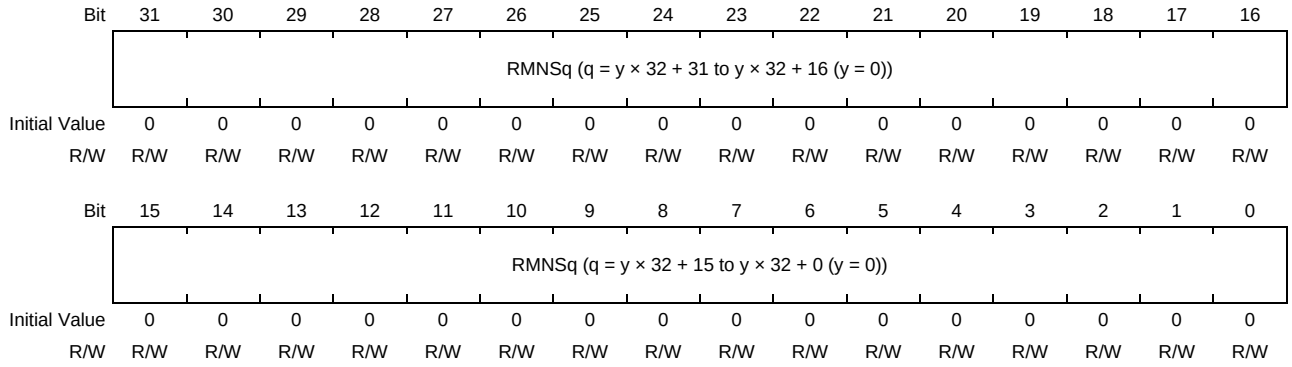
Setting these bits all to 0 makes receive buffers unavailable.

28.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0)

Access Size: RSCFDnCFDRMNDy register can be read/written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDRMNDy: <RSCFDn_base> + H'00A8 + (H'04 × y)
RSCFDnCFDRMNDyL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCFDnCFDRMNDyH: <RSCFDn_base> + H'00AA + (H'04 × y)
RSCFDnCFDRMNDyLL: <RSCFDn_base> + H'00A8 + (H'04 × y),
RSCFDnCFDRMNDyLH: <RSCFDn_base> + H'00A9 + (H'04 × y),
RSCFDnCFDRMNDyHL: <RSCFDn_base> + H'00AA + (H'04 × y),
RSCFDnCFDRMNDyHH: <RSCFDn_base> + H'00AB + (H'04 × y)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RMNSq	All 0	R/W	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	All 0	R/W	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write "0" to the flag and "1" to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00b (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11b (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

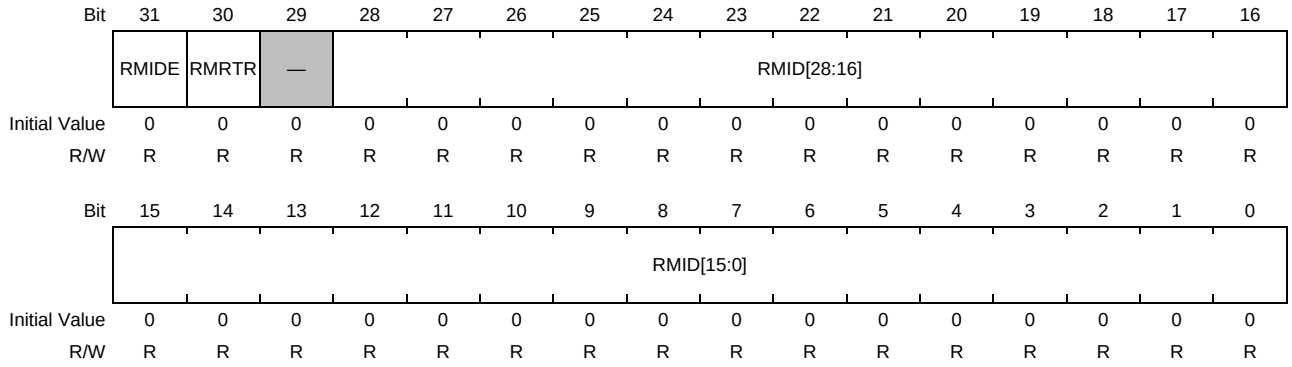
These flags are cleared to 0 in global reset mode.

28.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)

Access Size: RSCFDnCFDRMIDq register can be read only in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRMIDq: <RSCFDn_base> + H'2000 + (H'20 × q)
RSCFDnCFDRMIDqL: <RSCFDn_base> + H'2000 + (H'20 × q),
RSCFDnCFDRMIDqH: <RSCFDn_base> + H'2002 + (H'20 × q)
RSCFDnCFDRMIDqLL: <RSCFDn_base> + H'2000 + (H'20 × q),
RSCFDnCFDRMIDqLH: <RSCFDn_base> + H'2001 + (H'20 × q),
RSCFDnCFDRMIDqHL: <RSCFDn_base> + H'2002 + (H'20 × q),
RSCFDnCFDRMIDqHH: <RSCFDn_base> + H'2003 + (H'20 × q)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31	RMIDE	0	R	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	0	R	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CANFD frame The RRS bit value of the received message can be read.
29	—	0	R	Reserved This bit is read as the value after reset.
28 to 0	RMID[28:0]	All 0	R	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

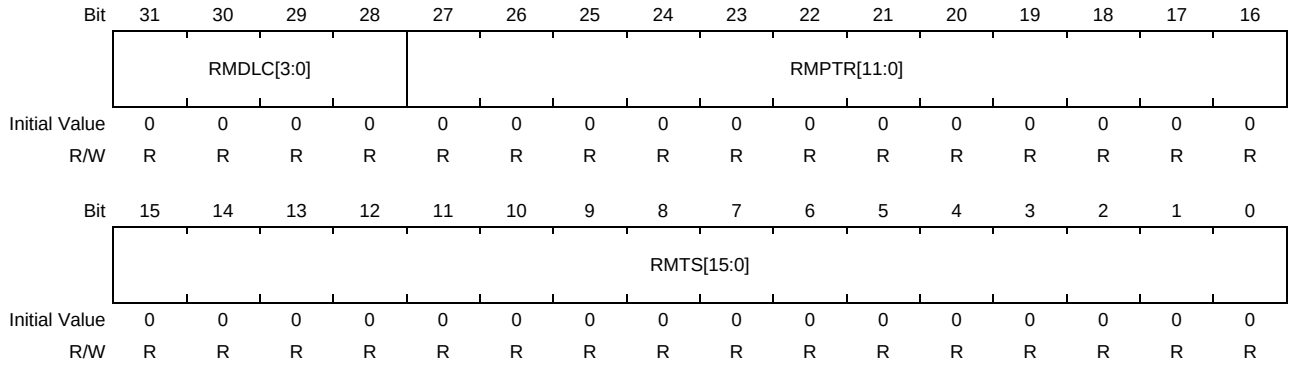
These bits contain the ID of the message stored in the receive buffer.

28.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 31)

Access Size: RSCFDnCFDRMPTRq register can be read only in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRMPTRq: <RSCFDn_base> + H'2004 + (H'20 × q)
RSCFDnCFDRMPTRqL: <RSCFDn_base> + H'2004 + (H'20 × q),
RSCFDnCFDRMPTRqH: <RSCFDn_base> + H'2006 + (H'20 × q)
RSCFDnCFDRMPTRqLL: <RSCFDn_base> + H'2004 + (H'20 × q),
RSCFDnCFDRMPTRqLH: <RSCFDn_base> + H'2005 + (H'20 × q),
RSCFDnCFDRMPTRqHL: <RSCFDn_base> + H'2006 + (H'20 × q),
RSCFDnCFDRMPTRqHH: <RSCFDn_base> + H'2007 + (H'20 × q)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	RMDLC[3:0]	All 0	R	Receive Buffer DLC Data

b31	b30	b29	b28	Classical CAN Frame	CANFD Frame
0	0	0	0	0 data bytes	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes

1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	RMPTR[11:0]	All 0	R	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	All 0	R	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

28.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CANFD Status Register (q = 0 to 31)

Access Size: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units
RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL, RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRMFDSTSq: <RSCFDn_base> + H'2008 + (H'20 × q)
RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + H'2008 + (H'20 × q),
RSCFDnCFDRMFDSTSqH: <RSCFDn_base> + H'200A + (H'20 × q)
RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + H'2008 + (H'20 × q),
RSCFDnCFDRMFDSTSqLH: <RSCFDn_base> + H'2009 + (H'20 × q),
RSCFDnCFDRMFDSTSqHL: <RSCFDn_base> + H'200A + (H'20 × q),
RSCFDnCFDRMFDSTSqHH: <RSCFDn_base> + H'200B + (H'20 × q)

Initial Value: H'0000 0000

0	RMESI	0	R	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is 0, this bit is always read as 0.

28.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 31)

Access Size: RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRMDFb_q: <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q)
RSCFDnCFDRMDFb_qL: <RSCFDn_base> + H'200C + (H'04 × b) + (H'20 × q),

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RMDB4 × b + 3 [7:0]	All 0	R	Receive Buffer Data Byte 4 × b + 3
				Receive Buffer Data Byte 4 × b + 2
23 to 16	RMDB4 × b + 2 [7:0]	All 0	R	Receive Buffer Data Byte 4 × b + 1
				Receive Buffer Data Byte 4 × b + 0
15 to 8	RMDB4 × b + 1 [7:0]	All 0	R	Data for a message stored in the receive buffer can be read.
7 to 0	RMDB4 × b + 0 [7:0]	All 0	R	

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area larger than the specified size.

28.4.7 Details of Receive FIFO Buffer-related Registers

28.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

Access Size: RSCFDnCFDRFCCx register can be read/written in 32-bit units
RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDRFCCx: <RSCFDn_base> + H'00B8 + (H'04 × x)
RSCFDnCFDRFCCxL: <RSCFDn_base> + H'00B8 + (H'04 × x),

0	RFE	0	R/W	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001b (4 messages), set the RFIGCV[2:0] bits to 001b, 011b, 101b, or 111b. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000b, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

28.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7)

Access Size: RSCFDnCFDRFSTSx register can be read/written in 32-bit units
RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units
RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDRFSTSx: <RSCFDn_base> + H'00D8 + (H'04 × x)
RSCFDnCFDRFSTSxL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCFDnCFDRFSTSxH: <RSCFDn_base> + H'00DA + (H'04 × x)
RSCFDnCFDRFSTSxLL: <RSCFDn_base> + H'00D8 + (H'04 × x),
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + H'00D9 + (H'04 × x),
RSCFDnCFDRFSTSxHL: <RSCFDn_base> + H'00DA + (H'04 × x),
RSCFDnCFDRFSTSxHH: <RSCFDn_base> + H'00DB + (H'04 × x)

Initial Value: H'0000 0001

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	RFMC[7:0]	All 0	R	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	—	All 0	R	Reserved These bits are read as the value after reset. When writing to these bits, write the value after reset.
3	RFIF	0	R/W*1	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	0	R/W*1	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	0	R	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	1	R	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is H'00 in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

28.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Access Size: RSCFDnCFDRFPCTRx register can only be written in 32-bit units
RSCFDnCFDRFPCTRxL, RSCFDnCFDRFPCTRxH registers can only be written in 16-bit units
RSCFDnCFDRFPCTRxLL, RSCFDnCFDRFPCTRxLH, RSCFDnCFDRFPCTRxHL, RSCFDnCFDRFPCTRxHH registers can only be written in 8-bit units

Address(es): RSCFDnCFDRFPCTRx: <RSCFDn_base> + H'00F8 + (H'04 × x)
RSCFDnCFDRFPCTRxL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCFDnCFDRFPCTRxH: <RSCFDn_base> + H'00FA + (H'04 × x)
RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + H'00F8 + (H'04 × x),
RSCFDnCFDRFPCTRxLH: <RSCFDn_base> + H'00F9 + (H'04 × x),
RSCFDnCFDRFPCTRxHL: <RSCFDn_base> + H'00FA + (H'04 × x),
RSCFDnCFDRFPCTRxHH: <RSCFDn_base> + H'00FB + (H'04 × x)

Initial Value: H'0000 0000

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	RFPC[7:0]	All 0	W	Receive FIFO Pointer Control When these bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to H'FF, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write H'FF to the RFPC[7:0] bits. When writing H'FF to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

28.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)

Access Size: RSCFDnCFDRFIDx register can be read only in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRFIDx: <RSCFDn_base> + H'3000 + (H'80 × x)
RSCFDnCFDRFIDxL: <RSCFDn_base> + H'3000 + (H'80 × x),

28 to 0	RFID[28:0]	All 0	R	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CANFD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

28.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)

Access Size: RSCFDnCFDRFPTRx register can be read only in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8- bit units

0	RFESI	0	R	ESI 0: Error active node 1: Error passive node

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is 0, this bit is always read as 0.

28.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)

Access Size: RSCFDnCFDRFDFd_x register can be read only in 32-bit units
RSCFDnCFDRFDFd_xL, RSCFDnCFDRFDFd_xH registers can be read only in 16-bit units
RSCFDnCFDRFDFd_xLL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRFDFd_x: <RSCFDn_base> + H'300C + (H'04 × d) + (H'80 × x)

				Receive Buffer Data Byte 4 × d + 0
15 to 8	RFDB4 × d + 1 [7:0]	All 0	R	Data for a message stored in the receive buffer can be read.
7 to 0	RFDB4 × d + 0 [7:0]	All 0	R	

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register.

Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area larger than the specified size.

28.4.8 Transmit/Receive FIFO Buffer-related Registers

28.4.8.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

Access Size: RSCFDnCFDCFCCk register can be read/written in 32-bit units
RSCFDnCFDCFCCkL, RSCFDnCFDCFCCkH registers can be read/written in 16-bit units
RSCFDnCFDCFCCkLL, RSCFDnCFDCFCCkLH, RSCFDnCFDCFCCkHL, RSCFDnCFDCFCCkHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDCFCCk: <RSCFDn_base> + H'0118 + (H'04 × k)

2	CFTXIE	0	R/W	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	0	R/W	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	0	R/W	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01b (transmit mode) or 10b (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]).

See **Table 28.11** and **Table 28.12**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p. Setting the CFDC[2:0] bits to 001b or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel that does not handle the CANFD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00b (receive mode) or 10b (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001b (4 messages), set the CFIGCV[2:0] bits to 001b, 011b, 101b, or 111b.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000b, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 makes transmit/receive FIFO buffers available.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/ receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

28.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)

Access Size: RSCFDnCFDCFSTSk register can be read/written in 32-bit units
RSCFDnCFDCFSTSkL, RSCFDnCFDCFSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFSTSkLL, RSCFDnCFDCFSTSkLH, RSCFDnCFDCFSTSkHL, RSCFDnCFDCFSTSkHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCFSTSk: <RSCFDn_base> + H'0178 + (H'04 × k)
RSCFDnCFDCFSTSkL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCFDnCFDCFSTSkH: <RSCFDn_base> + H'017A + (H'04 × k)
RSCFDnCFDCFSTSkLL: <RSCFDn_base> + H'0178 + (H'04 × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + H'0179 + (H'04 × k),
RSCFDnCFDCFSTSkHL: <RSCFDn_base> + H'017A + (H'04 × k),
RSCFDnCFDCFSTSkHH: <RSCFDn_base> + H'017B + (H'04 × k)

Initial Value: H'0000 0001

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
15 to 8	CFMC[7:0]	All 0	R	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. When writing to these bits, write the value after reset.
4	CFTXIF	0	R/W*1	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	0	R/W*1	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	0	R/W*1	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	0	R	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	0	R	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values that depend on the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01b (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00b (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10b (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00b: In global reset mode
- When CFM[1:0] value is 01b or 10b: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01b or 10b, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00b: In global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01b or 10b: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00b or 10b: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01b: A value of H’FF has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

28.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5)

Access Size: RSCFDnCFDCFPCTRk register can only be written in 32-bit units
RSCFDnCFDCFPCTRkL, RSCFDnCFDCFPCTRkH registers can only be written in 16-bit units
RSCFDnCFDCFPCTRkLL, RSCFDnCFDCFPCTRkLH, RSCFDnCFDCFPCTRkHL, RSCFDnCFDCFPCTRkHH registers can only be written in 8-bit units

Address(es): RSCFDnCFDCFPCTRk: <RSCFDn_base> + H'01D8 + (H'04 × k)
RSCFDnCFDCFPCTRkL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCFDnCFDCFPCTRkH: <RSCFDn_base> + H'01DA + (H'04 × k)
RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + H'01D8 + (H'04 × k),
RSCFDnCFDCFPCTRkLH: <RSCFDn_base> + H'01D9 + (H'04 × k),
RSCFDnCFDCFPCTRkHL: <RSCFDn_base> + H'01DA + (H'04 × k),
RSCFDnCFDCFPCTRkHH: <RSCFDn_base> + H'01DB + (H'04 × k)

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	CFPC[7:0]	All 0	W	Transmit/Receive FIFO Pointer Control • Receive mode: Writing H'FF to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing H'FF to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

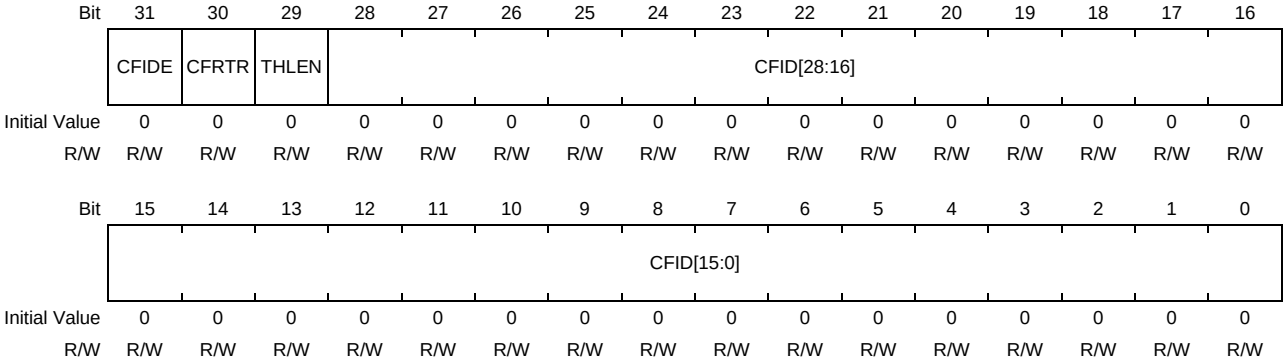
- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00b):
  Writing H'FF to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b):
  Writing H'FF to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing H'FF to the CFPC[7:0] bits.
  When writing H'FF to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10b):
  Setting prohibited

28.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)

Access Size: RSCFDnCFDCFIDk register can be read/written in 32-bit units
RSCFDnCFDCFIDkL, RSCFDnCFDCFIDkH registers can be read/written in 16-bit units
RSCFDnCFDCFIDkLL, RSCFDnCFDCFIDkLH, RSCFDnCFDCFIDkHL, RSCFDnCFDCFIDkHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCFIDk: <RSCFDn_base> + H'3400 + (H'80 × k)
RSCFDnCFDCFIDkL: <RSCFDn_base> + H'3400 + (H'80 × k),
RSCFDnCFDCFIDkH: <RSCFDn_base> + H'3402 + (H'80 × k)
RSCFDnCFDCFIDkLL: <RSCFDn_base> + H'3400 + (H'80 × k),
RSCFDnCFDCFIDkLH: <RSCFDn_base> + H'3401 + (H'80 × k),
RSCFDnCFDCFIDkHL: <RSCFDn_base> + H'3402 + (H'80 × k),
RSCFDnCFDCFIDkHH: <RSCFDn_base> + H'3403 + (H'80 × k)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31	CFIDE	0	R/W	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	0	R/W	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01b (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CANFD frame Write 0 to this bit. • When the CFM[1:0] value is 00b (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CANFD frame The RRS bit value of the received message can be read.
29	THLEN	0	R/W	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01b (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.

Bit	Bit Name	Initial Value	R/W	Description
28 to 0	CFID[28:0]	All 0	R/W	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01b (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00b (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. If the received message is a CANFD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01b, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CANFD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01b (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

When the CFM[1:0] value is 01b, this bit is used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

28.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5)

Access Size: RSCFDnCFDCFPTRk register can be read/written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCFPTRk: <RSCFDn_base> + H'3404 + (H'80 × k)
RSCFDnCFDCFPTRkL: <RSCFDn_base> + H'3404 + (H'80 × k),

1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 16	CFPTR[11:0]	All 0	R/W	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01b (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00b (receive mode): The label information of the received message can be read.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CFTS[15:0]	All 0	R/W	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00b (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b.

When the CFM[1:0] value is 01b, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001b or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CANFD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000b to 1111b is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00b. When the CFM[1:0] value is 01b, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer. These bits are valid when the CFM[1:0] value is 00b.

28.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CANFD Configuration/ Status Register (k = 0 to 5)

Access Size: RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units
RSCFDnCFDCFFDCSTSkL, RSCFDnCFDCFFDCSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFFDCSTSkLL, RSCFDnCFDCFFDCSTSkLH, RSCFDnCFDCFFDCSTSkHL, RSCFDnCFDCFFDCSTSkHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + H'3408 + (H'80 × k)
RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + H'3408 + (H'80 × k),
RSCFDnCFDCFFDCSTSkH: <RSCFDn_base> + H'340A + (H'80 × k)
RSCFDnCFDCFFDCSTSkLL: <RSCFDn_base> + H'3408 + (H'80 × k),
RSCFDnCFDCFFDCSTSkLH: <RSCFDn_base> + H'3409 + (H'80 × k),
RSCFDnCFDCFFDCSTSkHL: <RSCFDn_base> + H'340A + (H'80 × k),
RSCFDnCFDCFFDCSTSkHH: <RSCFDn_base> + H'340B + (H'80 × k)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CFFDF	CFBRS	CFESI
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as the value after reset.
2	CFFDF	0	R/W	FDF 0: Classical CAN frame 1: CANFD frame
1	CFBRS	0	R/W	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFESI	0	R/W	ESI 0: Error active node 1: Error passive node

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). Do not read or write this register when the CFM[1:0] value is 10b (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00b, this bit indicates the FD format (classical CAN frame or CANFD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01b, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00b, if the CFFDF bit is 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

When the CFM[1:0] value is 01b, if the CFFDF bit is 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00b, if the CFFDF bit is 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is 0, this bit is always read as 0.

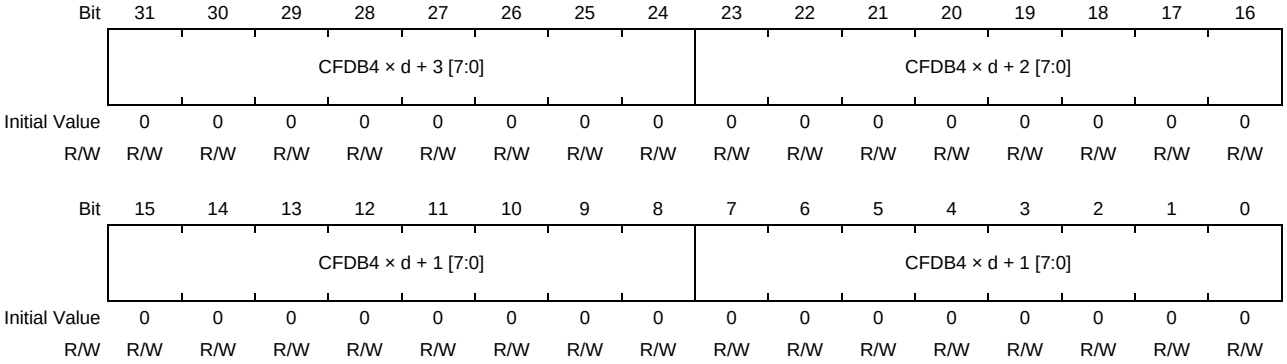
When the CFM[1:0] value is 01b, if the CFFDF bit is 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is 0, write 0 to this bit.

28.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5)

Access Size: RSCFDnCFDCFDFd_k register can be read/written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/writ- ten in 8-bit units

Address(es): RSCFDnCFDCFDFd_k: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k)
RSCFDnCFDCFDFd_kL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kH: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k)
RSCFDnCFDCFDFd_kLL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kLH: <RSCFDn_base> + H'340D + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kHL: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k),
RSCFDnCFDCFDFd_kHH: <RSCFDn_base> + H'340F + (H'04 × d) + (H'80 × k)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CFDB4 × d + 3 [7:0]	All 0	R/W	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01b (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00b (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	All 0	R/W	
15 to 8	CFDB4 × d + 1 [7:0]	All 0	R/W	
7 to 0	CFDB4 × d + 0 [7:0]	All 0	R/W	

This register is writable only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01b (transmit mode). This register is readable only when the CFM[1:0] value is 00b (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as H'00.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area larger than the specified size.

This register should not be read or written when the CFM[1:0] value is 10b (gateway mode).

28.4.9 Details of FIFO Status-related Registers

28.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Access Size: RSCFDnCFDFESTS register can be read only in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDFESTS: <RSCFDn_base> + H'0238
RSCFDnCFDFESTSL: <RSCFDn_base> + H'0238, RSCFDnCFDFESTSH: <RSCFDn_base> + H'023A
RSCFDnCFDFESTSLL: <RSCFDn_base> + H'0238, RSCFDnCFDFESTSLH: <RSCFDn_base> + H'0239,
RSCFDnCFDFESTSHL: <RSCFDn_base> + H'023A, RSCFDnCFDFESTSHH: <RSCFDn_base> + H'023B

Initial Value: H'03FF FFFF

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	H'0_0FFF	R	Reserved These bits are read as the value after reset.
13	CF5EMP	1	R	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 5)
12	CF4EMP	1	R	
11	CF3EMP	1	R	
10	CF2EMP	1	R	
9	CF1EMP	1	R	
8	CF0EMP	1	R	
7	RF7EMP	1	R	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	1	R	
5	RF5EMP	1	R	
4	RF4EMP	1	R	
3	RF3EMP	1	R	
2	RF2EMP	1	R	
1	RF1EMP	1	R	
0	RF0EMP	1	R	

This RSCFDnCFDFESTS register is set to 03FF H'FFFF in global reset mode.

CFkEMP Flag (k = 0 to 5)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

28.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

Access Size: RSCFDnCFDFFSTS register can be read only in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDFFSTS: <RSCFDn_base> + H'023C
RSCFDnCFDFFSTSL: <RSCFDn_base> + H'023C, RSCFDnCFDFFSTSH: <RSCFDn_base> + H'023E
RSCFDnCFDFFSTSLL: <RSCFDn_base> + H'023C, RSCFDnCFDFFSTSLH: <RSCFDn_base> + H'023D,
RSCFDnCFDFFSTSHL: <RSCFDn_base> + H'023E, RSCFDnCFDFFSTSHH: <RSCFDn_base> + H'023F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	RF3FLL	0	R	
2	RF2FLL	0	R	
1	RF1FLL	0	R	
0	RF0FLL	0	R	

The RSCFDnCFDFFSTS register is cleared to H'0000 0000 in global reset mode.

CFkFLL Flag (k = 0 to 5)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).

When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

28.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Access Size: RSCFDnCFDFMSTS register can be read only in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDFMSTS: <RSCFDn_base> + H'0240
RSCFDnCFDFMSTSL: <RSCFDn_base> + H'0240, RSCFDnCFDFMSTSH: <RSCFDn_base> + H'0242
RSCFDnCFDFMSTSLL: <RSCFDn_base> + H'0240, RSCFDnCFDFMSTSLH: <RSCFDn_base> + H'0241,
RSCFDnCFDFMSTSHL: <RSCFDn_base> + H'0242, RSCFDnCFDFMSTSHH: <RSCFDn_base> + H'0243

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3	RF3MLT	0	R	
2	RF2MLT	0	R	
1	RF1MLT	0	R	
0	RF0MLT	0	R	

The RSCFDnCFDFMSTS register is cleared to H'0000 0000 in global reset mode.

CFkMLT Flag (k = 0 to 5)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

28.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access Size: RSCFDnCFDRFISTS register can be read only in 32-bit units
RSCFDnCFDRFISTSL, RSCFDnCFDRFISTSH registers can be read only in 16-bit units
RSCFDnCFDRFISTSLL, RSCFDnCFDRFISTSLH, RSCFDnCFDRFISTSHL, RSCFDnCFDRFISTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDRFISTS: <RSCFDn_base> + H'0244
RSCFDnCFDRFISTSL: <RSCFDn_base> + H'0244, RSCFDnCFDRFISTSH: <RSCFDn_base> + H'0246
RSCFDnCFDRFISTSLL: <RSCFDn_base> + H'0244, RSCFDnCFDRFISTSLH: <RSCFDn_base> + H'0245,
RSCFDnCFDRFISTSHL: <RSCFDn_base> + H'0246, RSCFDnCFDRFISTSHH: <RSCFDn_base> + H'0247

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are read as the value after reset.
7	RF7IF	0	R	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	0	R	
5	RF5IF	0	R	
4	RF4IF	0	R	
3	RF3IF	0	R	
2	RF2IF	0	R	
1	RF1IF	0	R	
0	RF0IF	0	R	

The RSCFDnCFDRFISTS register is cleared to H'0000 0000 in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

28.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access Size: RSCFDnCFDCFRISTS register can be read only in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers can be read only in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL, RSCFDnCFDCFRISTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDCFRISTS: <RSCFDn_base> + H'0248
RSCFDnCFDCFRISTSL: <RSCFDn_base> + H'0248, RSCFDnCFDCFRISTSH: <RSCFDn_base> + H'024A

3	CF3RXIF	0	R	
2	CF2RXIF	0	R	
1	CF1RXIF	0	R	
0	CF0RXIF	0	R	

The RSCFDnCFDCFRISTS register is cleared to H'0000 0000 in global reset mode.

CFkRXIF Flag (k = 0 to 5)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

28.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access Size: RSCFDnCFDCFTISTS register can be read only in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers can be read only in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL, RSCFDnCFDCFTISTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDCFTISTS: <RSCFDn_base> + H'024C
RSCFDnCFDCFTISTSL: <RSCFDn_base> + H'024C, RSCFDnCFDCFTISTSH: <RSCFDn_base> + H'024E
RSCFDnCFDCFTISTSLL: <RSCFDn_base> + H'024C, RSCFDnCFDCFTISTSLH: <RSCFDn_base> + H'024D,
RSCFDnCFDCFTISTSHL: <RSCFDn_base> + H'024E, RSCFDnCFDCFTISTSHH: <RSCFDn_base> + H'024F

Initial Value: H'0000 0000

3	CF3TXIF	0	R	
2	CF2TXIF	0	R	
1	CF1TXIF	0	R	
0	CF0TXIF	0	R	

The RSCFDnCFDCFTISTS register is cleared to H'0000 0000 in global reset mode.

CFkTXIF Flag (k = 0 to 5)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

28.4.10 Details of FIFO DMA-related Registers

28.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register

Access Size: RSCFDnCFDCDTCT register can be read/written in 32-bit units
RSCFDnCFDCDTCTL, RSCFDnCFDCDTCTH registers can be read/written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH, RSCFDnCFDCDTCTHL, RSCFDnCFDCDTCTHH registers can be read/written in 8- bit units

Address(es): RSCFDnCFDCDTCT: <RSCFDn_base> + H'0490
RSCFDnCFDCDTCTL: <RSCFDn_base> + H'0490
RSCFDnCFDCDTCTH: <RSCFDn_base> + H'0492
RSCFDnCFDCDTCTLL: <RSCFDn_base> + H'0490, RSCFDnCFDCDTCTLH: <RSCFDn_base> + H'0491,
RSCFDnCFDCDTCTHL: <RSCFDn_base> + H'0492, RSCFDnCFDCDTCTHH: <RSCFDn_base> + H'0493

Initial Value: H'0000 0000

3	RFDMAE3	0	R/W	
2	RFDMAE2	0	R/W	
1	RFDMAE1	0	R/W	
0	RFDMAE0	0	R/W	

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00b (receive mode). Set this bit to 0 when the CFM[1:0] value is 01b (transmit mode) or 10b (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

28.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register

Access Size: RSCFDnCFDCDTSTS register can be read only in 32-bit units
RSCFDnCFDCDTSTSL, RSCFDnCFDCDTSTSH registers can be read only in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH, RSCFDnCFDCDTSTSHL, RSCFDnCFDCDTSTSHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDCDTSTS: <RSCFDn_base> + H'0494
RSCFDnCFDCDTSTSL: <RSCFDn_base> + H'0494
RSCFDnCFDCDTSTSH: <RSCFDn_base> + H'0496
RSCFDnCFDCDTSTSLL: <RSCFDn_base> + H'0494, RSCFDnCFDCDTSTSLH: <RSCFDn_base> + H'0495,
RSCFDnCFDCDTSTSHL: <RSCFDn_base> + H'0496, RSCFDnCFDCDTSTSHH: <RSCFDn_base> + H'0497

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

2	RFDMASTS2	0	R	
1	RFDMASTS1	0	R	
0	RFDMASTS0	0	R	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMAEx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area)

These bits are cleared to 0 in global reset mode.

28.4.11 Details of Transmit Buffer-related Registers

28.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31)

Access Size: RSCFDnCFDTMCp registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	0	R/W	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	0	R/W*1	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	0	R/W*1	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to H'00.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0, 1) register (p = (m × 16 + 15) to (m × 16 + 15 . the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2, (m × 16) + 4, or (m × 16) + 5) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration loss has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00b.

28.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

Access Size: RSCFDnCFDTMSTSp registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMSTSp: <RSCFDn_base> + H'02D0 + (H'01 × p)

Initial Value: H'00

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Initial Value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	0	R	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	0	R	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	All 0	R/W	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	0	R	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

The RSCFDnCFDTMSTSp register is cleared to all 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00b: Transmission is in progress or no transmit request is present.

01b: Transmission from the transmit buffer was aborted.

10b: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11b: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00b to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00b to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

28.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 31)

Access Size: RSCFDnCFDTMIDp register can be read/written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMIDp: <RSCFDn_base> + H'4000 + (H'20 × p)
RSCFDnCFDTMIDpL: <RSCFDn_base> + H'4000 + (H'20 × p),
RSCFDnCFDTMIDpH: <RSCFDn_base> + H'4002 + (H'20 × p)
RSCFDnCFDTMIDpLL: <RSCFDn_base> + H'4000 + (H'20 × p),
RSCFDnCFDTMIDpLH: <RSCFDn_base> + H'4001 + (H'20 × p),
RSCFDnCFDTMIDpHL: <RSCFDn_base> + H'4002 + (H'20 × p),
RSCFDnCFDTMIDpHH: <RSCFDn_base> + H'4003 + (H'20 × p)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TMID[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TMIDE	0	R/W	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	0	R/W	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CANFD frame Write 0 to this bit.
29	THLEN	0	R/W	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	All 0	R/W	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CANFD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

28.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

Access Size: RSCFDnCFDTMPTRp register can be read/written in 32-bit units
RSCFDnCFDTMPTRpL, RSCFDnCFDTMPTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMPTRpLL, RSCFDnCFDTMPTRpLH, RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMPTRp: <RSCFDn_base> + H'4004 + (H'20 × p)
RSCFDnCFDTMPTRpL: <RSCFDn_base> + H'4004 + H'(20 × p),
RSCFDnCFDTMPTRpH: <RSCFDn_base> + H'4006 + (H'20 × p)
RSCFDnCFDTMPTRpLL: <RSCFDn_base> + H'4004 + (H'20 × p),
RSCFDnCFDTMPTRpLH: <RSCFDn_base> + H'4005 + (H'20 × p),
RSCFDnCFDTMPTRpHL: <RSCFDn_base> + H'4006 + (H'20 × p),
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + H'4007 + (H'20 × p)

Initial Value: H'0000 0000

1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

27 to 24	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
23 to 16	TMPTR[7:0]	All 0	R/W	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001b or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the MFDF bit is 1 (CANFD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000b to 1111b is settable. If a value larger than 1100b is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number p = (m × 16) + 0 or (m × 16) + 3, a value of 0000b to 1111b is settable. In other cases, set a value of 0000b to 1011b (20 data bytes).

When the TMRTR bit is 1 (remote frame), set the data length of a message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

28.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CANFD Configuration Register (p = 0 to 31)

Access Size: RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units
RSCFDnCFDTMFDCTRpL, RSCFDnCFDTMFDCTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMFDCTRpLL, RSCFDnCFDTMFDCTRpLH, RSCFDnCFDTMFDCTRpHL, RSCFDnCFDTMFDCTRpHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMFDCTRp: <RSCFDn_base> + H'4008 + (H'20 × p)
RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + H'4008 + (H'20 × p),
RSCFDnCFDTMFDCTRpH: <RSCFDn_base> + H'400A + (H'20 × p)
RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + H'4008 + (H'20 × p),
RSCFDnCFDTMFDCTRpLH: <RSCFDn_base> + H'4009 + (H'20 × p),
RSCFDnCFDTMFDCTRpHL: <RSCFDn_base> + H'400A + (H'20 × p),
RSCFDnCFDTMFDCTRpHH: <RSCFDn_base> + H'400B + (H'20 × p)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	0	R/W	FDF 0: Classical CAN frame 1: CANFD frame
1	TMBRS	0	R/W	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	0	R/W	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is 0, write 0 to this bit.

28.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 31)

Access Size: RSCFDnCFDTMDFb_p register can be read/written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTMDFb_p: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p)
RSCFDnCFDTMDFb_pL: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + H'400E + (H'04 × b) + (H'20 × p)
RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + H'400C + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + H'400D + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + H'400E + (H'04 × b) + (H'20 × p),
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + H'400F + (H'04 × b) + (H'20 × p)

Initial Value: H'0000 0000

15 to 0	TMIEp	All 0	R/W	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 28.27 shows the bit assignment.

15 to 0	TMTRSTSp	All 0	R	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 28.28 shows the bit assignment.

TMTARSTSp Flags (p = 0 to 31)

These flags indicate the status of the TMTAR bit in the RSCFDnCFDTMCp register.

When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1.

The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 28.29 shows the bit assignment.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTASTSp	All 0	R	Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: Transmission is not aborted 1: Transmission is aborted
15 to 0	TMTASTSp	All 0	R	Transmit Buffer Transmit Abort Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: Transmission is not aborted. 1: Transmission is aborted.

TMTASTSp Flags (p = 0 to 31)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to 01b (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1.

A TMTASTSp flag is cleared to 0 when the corresponding TMTRF[1:0] flag is set to 00b or in channel reset mode.

Table 28.31 shows the bit assignment.

Table 28.31 TMTASTSp Bit Assignment

28.4.13 Details of Transmit Queue-related Registers

28.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0, 1)

Access Size: RSCFDnCFDTXQCCm register can be read/written in 32-bit units
RSCFDnCFDTXQCCmL, RSCFDnCFDTXQCCmH registers can be read/written in 16-bit units
RSCFDnCFDTXQCCmLL, RSCFDnCFDTXQCCmLH, RSCFDnCFDTXQCCmHL, RSCFDnCFDTXQCCmHH registers can be read/ written in 8-bit units

Address(es): RSCFDnCFDTXQCCm: <RSCFDn_base> + H'03A0 + (H'04 × m)
RSCFDnCFDTXQCCmL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCFDnCFDTXQCCmH: <RSCFDn_base> + H'03A2 + (H'04 × m)
RSCFDnCFDTXQCCmLL: <RSCFDn_base> + H'03A0 + (H'04 × m),
RSCFDnCFDTXQCCmLH: <RSCFDn_base> + H'03A1 + (H'04 × m),
RSCFDnCFDTXQCCmHL: <RSCFDn_base> + H'03A2 + (H'04 × m),
RSCFDnCFDTXQCCmHH: <RSCFDn_base> + H'03A3 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	TXQIM	TXQIE	TXQDC[3:0]				—	—	—	—	—	—	—	TXQE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
13	TXQIM	0	R/W	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	0	R/W	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	All 0	R/W	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1)-buffer transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
0	TXQE	0	R/W	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0). For examples of how buffer allocation is done, see **Figure 28.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010b or more.

28.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0, 1)

Access Size: RSCFDnCFDTXQSTSm register can be read/written in 32-bit units
RSCFDnCFDTXQSTSmL, RSCFDnCFDTXQSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTXQSTSmLL, RSCFDnCFDTXQSTSmLH, RSCFDnCFDTXQSTSmHL, RSCFDnCFDTXQSTSmHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTXQSTSm: <RSCFDn_base> + H'03C0 + (H'04 × m)
RSCFDnCFDTXQSTSmL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCFDnCFDTXQSTSmH: <RSCFDn_base> + H'03C2 + (H'04 × m)
RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + H'03C0 + (H'04 × m),
RSCFDnCFDTXQSTSmLH: <RSCFDn_base> + H'03C1 + (H'04 × m),
RSCFDnCFDTXQSTSmHL: <RSCFDn_base> + H'03C2 + (H'04 × m),
RSCFDnCFDTXQSTSmHH: <RSCFDn_base> + H'03C3 + (H'04 × m)

Initial Value: H'0000 0001

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
12 to 8	—	All 0	R	Reserved When read, the undefined value is returned. When writing to these bits, write the value after reset.
7 to 3	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
2	TXQIF	0	R/W*1	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	0	R	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	1	R	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

TXQIF Flag

The TXQIF flag is set to 1 when the event specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages set for the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is set for the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

28.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0, 1)

Access Size: RSCFDnCFDTXQPCTRm register can only be written in 32-bit units
RSCFDnCFDTXQPCTRmL, RSCFDnCFDTXQPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTXQPCTRmLL, RSCFDnCFDTXQPCTRmLH, RSCFDnCFDTXQPCTRmHL, RSCFDnCFDTXQPCTRmHH registers can only be written in 8-bit units

Address(es): RSCFDnCFDTXQPCTRm: <RSCFDn_base> + H'03E0 + (H'04 × m)
RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCFDnCFDTXQPCTRmH: <RSCFDn_base> + H'03E2 + (H'04 × m)
RSCFDnCFDTXQPCTRmLL: <RSCFDn_base> + H'03E0 + (H'04 × m),
RSCFDnCFDTXQPCTRmLH: <RSCFDn_base> + H'03E1 + (H'04 × m),
RSCFDnCFDTXQPCTRmHL: <RSCFDn_base> + H'03E2 + (H'04 × m),
RSCFDnCFDTXQPCTRmHH: <RSCFDn_base> + H'03E3 + (H'04 × m)

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should be the value after reset.
7 to 0	TXQPC[7:0]	All 0	W	Transmit Queue Pointer Control Writing H'FF to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing H'FF to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request of the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15 and 31) before writing H'FF to the TXQPC[7:0] bits.

When writing H'FF to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

28.4.14 Details of Transmit History-related Registers

28.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0, 1)

Access Size: RSCFDnCFDTHLCCm register can be read/written in 32-bit units
RSCFDnCFDTHLCCmL, RSCFDnCFDTHLCCmH registers can be read/written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH, RSCFDnCFDTHLCCmHL, RSCFDnCFDTHLCCmHH registers can be read/writ- ten in 8-bit units

Address(es): RSCFDnCFDTHLCCm: <RSCFDn_base> + H'0400 + (H'04 × m)
RSCFDnCFDTHLCCmL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCFDnCFDTHLCCmH: <RSCFDn_base> + H'0402 + (H'04 × m)
RSCFDnCFDTHLCCmLL: <RSCFDn_base> + H'0400 + (H'04 × m),
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + H'0401 + (H'04 × m),
RSCFDnCFDTHLCCmHL: <RSCFDn_base> + H'0402 + (H'04 × m),

R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
10	THLDTE	0	R/W	Transmit History Target Buffer Select 0: Entry from transmit/receive FIFO buffers and transmit queue 1: Entry from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	0	R/W	Transmit History Interrupt Source Select 0: When 12 sets of data have been stored in the transmit history buffer 1: When a single set of transmit history data has been stored
8	THLIE	0	R/W	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	—	All 0	R	Reserved When read, the value after reset is returned. When writing to these bits, write the value after reset.
0	THLE	0	R/W	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit set to 0.

THLE Bit

Setting this bit to 1 makes the transmit history buffer available. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

28.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0, 1)

Access Size: RSCFDnCFDTHLSTSm register can be read/written in 32-bit units
RSCFDnCFDTHLSTSmL, RSCFDnCFDTHLSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTHLSTSmLL, RSCFDnCFDTHLSTSmLH, RSCFDnCFDTHLSTSmHL, RSCFDnCFDTHLSTSmHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDTHLSTSm: <RSCFDn_base> + H'0420 + (H'04 × m)
RSCFDnCFDTHLSTSmL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCFDnCFDTHLSTSmH: <RSCFDn_base> + H'0422 + (H'04 × m)
RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + H'0420 + (H'04 × m),
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + H'0421 + (H'04 × m),
RSCFDnCFDTHLSTSmHL: <RSCFDn_base> + H'0422 + (H'04 × m),
RSCFDnCFDTHLSTSmHH: <RSCFDn_base> + H'0423 + (H'04 × m)

Initial Value: H'0000 0001

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
12 to 8	THLMC[4:0]	All 0	R	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer.
7 to 4	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
3	THLIF	0	R/W*1	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	0	R/W*1	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	0	R	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	1	R	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state

THLMC[4:0] Bits

These bits indicate the number of unread data sets stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

28.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0, 1)

Access Size: RSCFDnCFDTHLPCTRm register can only be written in 32-bit units
RSCFDnCFDTHLPCTRmL, RSCFDnCFDTHLPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTHLPCTRmLL, RSCFDnCFDTHLPCTRmLH, RSCFDnCFDTHLPCTRmHL, RSCFDnCFDTHLPCTRmHH registers can only be written in 8-bit units

Address(es): RSCFDnCFDTHLPCTRm: <RSCFDn_base> + H'0440 + (H'04 × m)
RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCFDnCFDTHLPCTRmH: <RSCFDn_base> + H'0442 + H'(04 × m)
RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + H'0440 + (H'04 × m),
RSCFDnCFDTHLPCTRmLH: <RSCFDn_base> + H'0441 + (H'04 × m),
RSCFDnCFDTHLPCTRmHL: <RSCFDn_base> + H'0442 + (H'04 × m),
RSCFDnCFDTHLPCTRmHH: <RSCFDn_base> + H'0443 + (H'04 × m)

Initial Value: H'0000 0000

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When writing to these bits, write the value after reset.
7 to 0	THLPC[7:0]	All 0	W	Transmit History List Pointer Control Writing H'FF to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to H'FF, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented. Write H'FF to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

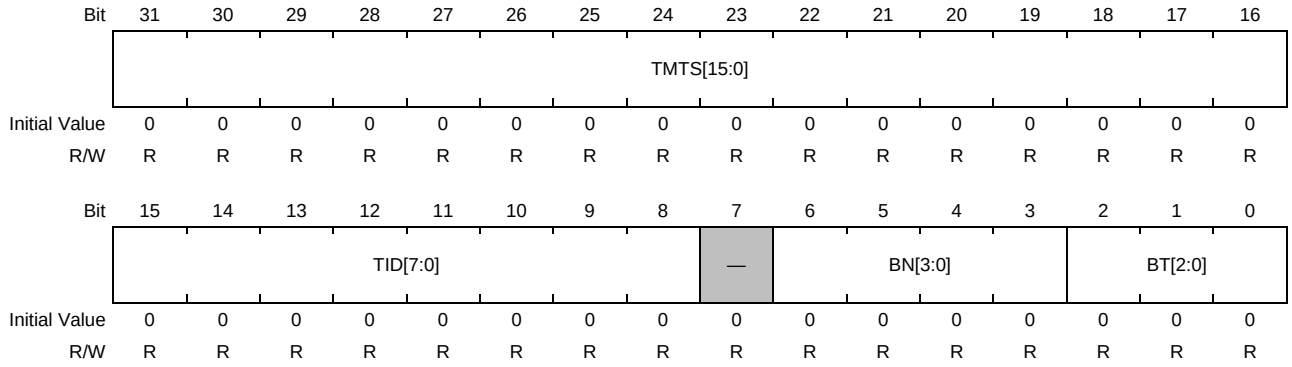
When writing H'FF to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

28.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0, 1)

Access Size: RSCFDnCFDTHLACCm register can be read only in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL, RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units

Address(es): RSCFDnCFDTHLACCm: <RSCFDn_base> + H'6000 + (H'04 × m)
RSCFDnCFDTHLACCmL: <RSCFDn_base> + H'6000 + (H'04 × m),
RSCFDnCFDTHLACCmH: <RSCFDn_base> + H'6002 + (H'04 × m)
RSCFDnCFDTHLACCmLL: <RSCFDn_base> + H'6000 + (H'04 × m),
RSCFDnCFDTHLACCmLH: <RSCFDn_base> + H'6001 + (H'04 × m),
RSCFDnCFDTHLACCmHL: <RSCFDn_base> + H'6002 + (H'04 × m),
RSCFDnCFDTHLACCmHH: <RSCFDn_base> + H'6003 + (H'04 × m)

Initial Value: H'0000 0000



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TMTS[15:0]	All 0	R	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	All 0	R	Label Data The label information of stored data can be read.
7	—	All 0	R	Reserved This bit is read as the value after reset.
6 to 3	BN[3:0]	All 0	R	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	All 0	R	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

28.4.15 Details of Test-related Registers

28.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

Access Size: RSCFDnCFDGTSTCFG register can be read/written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGLH, RSCFDnCFDGTSTCFGHL, RSCFDnCFDGTSTCFGHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGTSTCFG: <RSCFDn_base> + H'0468
RSCFDnCFDGTSTCFGL: <RSCFDn_base> + H'0468, RSCFDnCFDGTSTCFGH: <RSCFDn_base> + H'046A
RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + H'0468, RSCFDnCFDGTSTCFGLH: <RSCFDn_base> + H'0469,
RSCFDnCFDGTSTCFGHL: <RSCFDn_base> + H'046A, RSCFDnCFDGTSTCFGHH: <RSCFDn_base> + H'046B

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	C1ICBCE	C0ICBCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
22 to 16	RTMPS[6:0]	All 0	R/W	RAM Test Page Configuration Set a value within a range of page 0 (H'00) to page 27 (H'1B).
15 to 2	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
1	C1ICBCE	0	R/W	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	0	R/W	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of H'00 to H'1B, inclusive. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is H'1B).

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

28.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

Access Size: RSCFDnCFDGTSTCTR register can be read/written in 32-bit units
RSCFDnCFDGTSTCTRL, RSCFDnCFDGTSTCTRH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCTRLL, RSCFDnCFDGTSTCTRLH, RSCFDnCFDGTSTCTRHL, RSCFDnCFDGTSTCTRHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDGTSTCTR: <RSCFDn_base> + H'046C
RSCFDnCFDGTSTCTRL: <RSCFDn_base> + H'046C, RSCFDnCFDGTSTCTRH: <RSCFDn_base> + H'046E
RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + H'046C, RSCFDnCFDGTSTCTRLH: <RSCFDn_base> + H'046D,
RSCFDnCFDGTSTCTRHL: <RSCFDn_base> + H'046E, RSCFDnCFDGTSTCTRHH: <RSCFDn_base> + H'046F

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are read as the value after reset. The write value should be the value after reset.
2	RTME	0	R/W	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	—	0	R	Reserved This bit is read as the value after reset. The write value should be the value after reset.
0	ICBCTME	0	R/W	Communication Test between Channels Enable 0: Communication test between channels disabled 1: Communication test between channels enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode. This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10b (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0, 1) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

28.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Access Size: RSCFDnCFDGLOCKK register can only be written in 32-bit units
RSCFDnCFDGLOCKKL, RSCFDnCFDGLOCKKH registers can only be written in 16-bit units

Address(es): RSCFDnCFDGLOCKK: <RSCFDn_base> + H'047C
RSCFDnCFDGLOCKKL: <RSCFDn_base> + H'047C, RSCFDnCFDGLOCKKH: <RSCFDn_base> + H'047E

Initial Value: H'0000 0000

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	All 0	W*1	Lock Key These bits are key bits to release protection of test mode.

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 28.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + H'0000 to <RSCFDn_base> + H'05FF) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

28.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63)

Access Size: RSCFDnCFDRPGACCr register can be read/written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL, RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units

Address(es): RSCFDnCFDRPGACCr: <RSCFDn_base> + H'6400 + (H'04 × r)
RSCFDnCFDRPGACCrL: <RSCFDn_base> + H'6400 + (H'04 × r),
RSCFDnCFDRPGACCrH: <RSCFDn_base> + H'6402 + (H'04 × r)
RSCFDnCFDRPGACCrLL: <RSCFDn_base> + H'6400 + (H'04 × r),
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + H'6401 + (H'04 × r),
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + H'6402 + (H'04 × r),
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + H'6403 + (H'04 × r)

Initial Value: H'0000 0000

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDTA[31:0]	All 0	R/W	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

28.5 Interrupt Sources and DMA Trigger

28.5.1 Interrupt Sources

The RS-CANFD module has 8 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):

  Receive FIFO interrupt

  Global error interrupt

- Channel interrupts (3 sources/channel):

  CANm transmit interrupt (m = 0, 1)

  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)

  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 28.32 lists the CAN interrupt sources. **Figure 28.2** shows the CAN global interrupt block diagram. **Figure 28.3** shows the CAN channel interrupt block diagram.

Table 28.32 List of CAN Interrupt Sources (1/2)

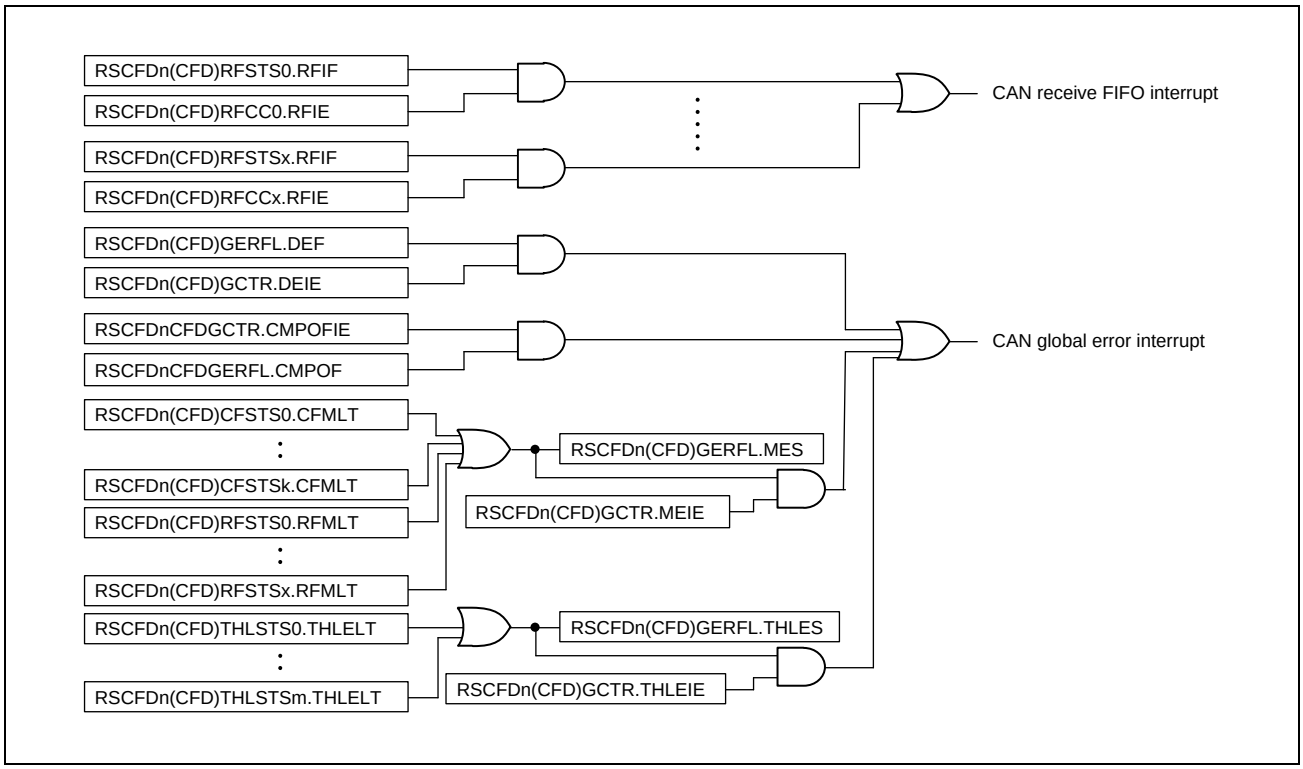

Figure 28.2 CAN Global Interrupt Block Diagram

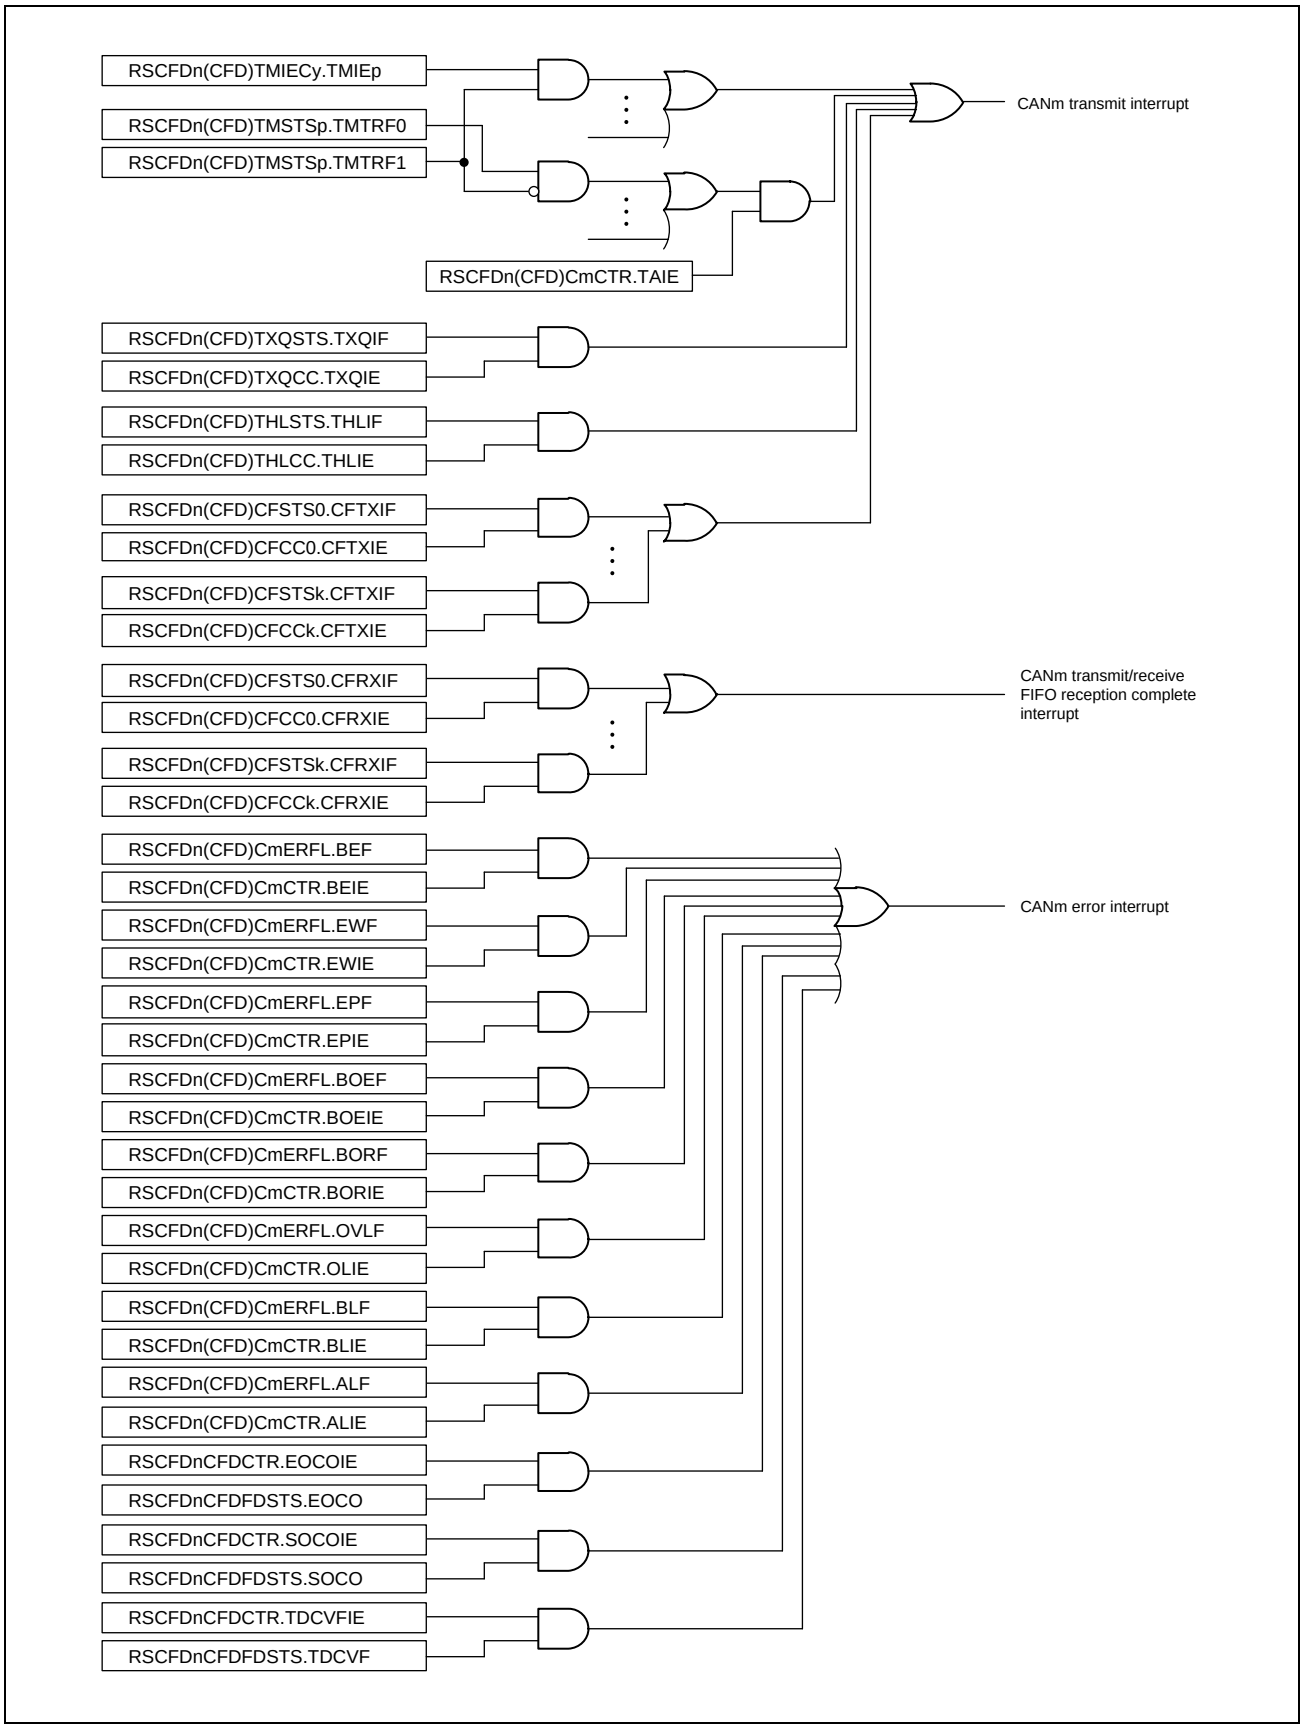

Figure 28.3 CAN Channel Interrupt Block Diagram

28.5.2 DMA Trigger (Only in CANFD Mode)

In CANFD mode, receive FIFO buffers can be related to DMA channels. The following 10 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0, 1) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

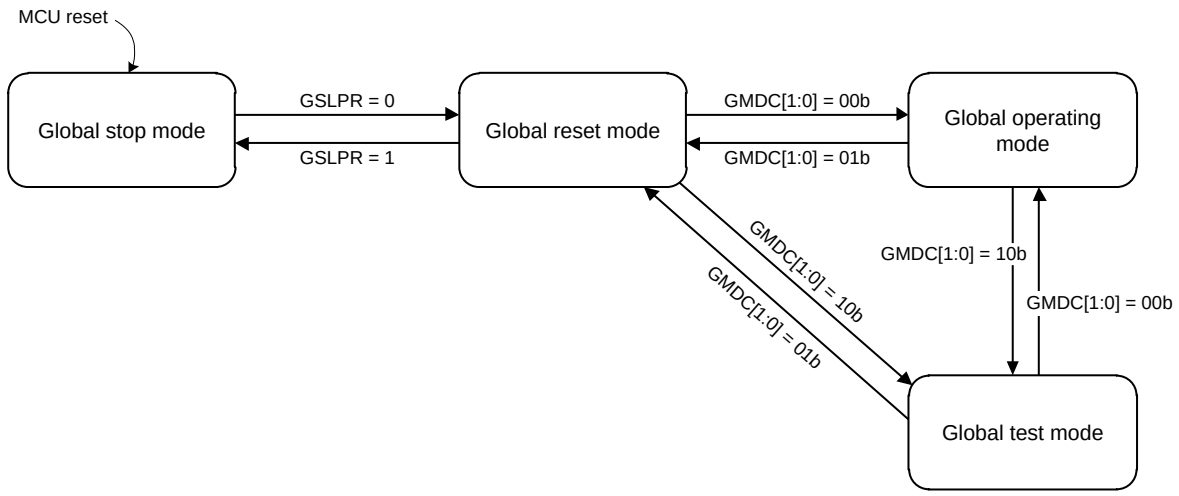
28.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 28.6.1, Global Modes**, and details of channel modes are described in **Section 28.6.2**, **Figure 28.5, Channel Mode State Transition Chart**.

- Global stop mode:Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode:Performs initial settings for the entire module.
- Global test mode:Performs test settings and performs the RAM test.
- Global operating mode:Makes the entire module operable.
- Channel stop mode:Stops the channel clock.
- Channel reset mode:Performs initial settings for the channels.
- Channel halt mode:Stops CAN communication and allows channel testing.
- Channel communication mode:Performs CAN communication.

28.6.1 Global Modes

Figure 28.4 shows the transitions of global modes.



Note: GSLPR, GMDC[1:0]: Bits in the RSCFDn(CFD)GCTR register

Figure 28.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 28.33** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 28.33 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00b GSLPR = 0 (Global Operation)	GMDC[1:0] = 10b GSLPR = 0 (Global Test)	GMDC[1:0] = 01b GSLPR = 0 (Global Reset)	GMDC[1:0] = 01b GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 28.34 shows the global mode transition time.

Table 28.34 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1 *2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1 *2
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CANFD mode, this time value is the CAN bit time of the nominal bit rate.

28.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

28.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 28.38, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01b sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0, 1) to 01b (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01b).

28.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10b sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to 10b (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

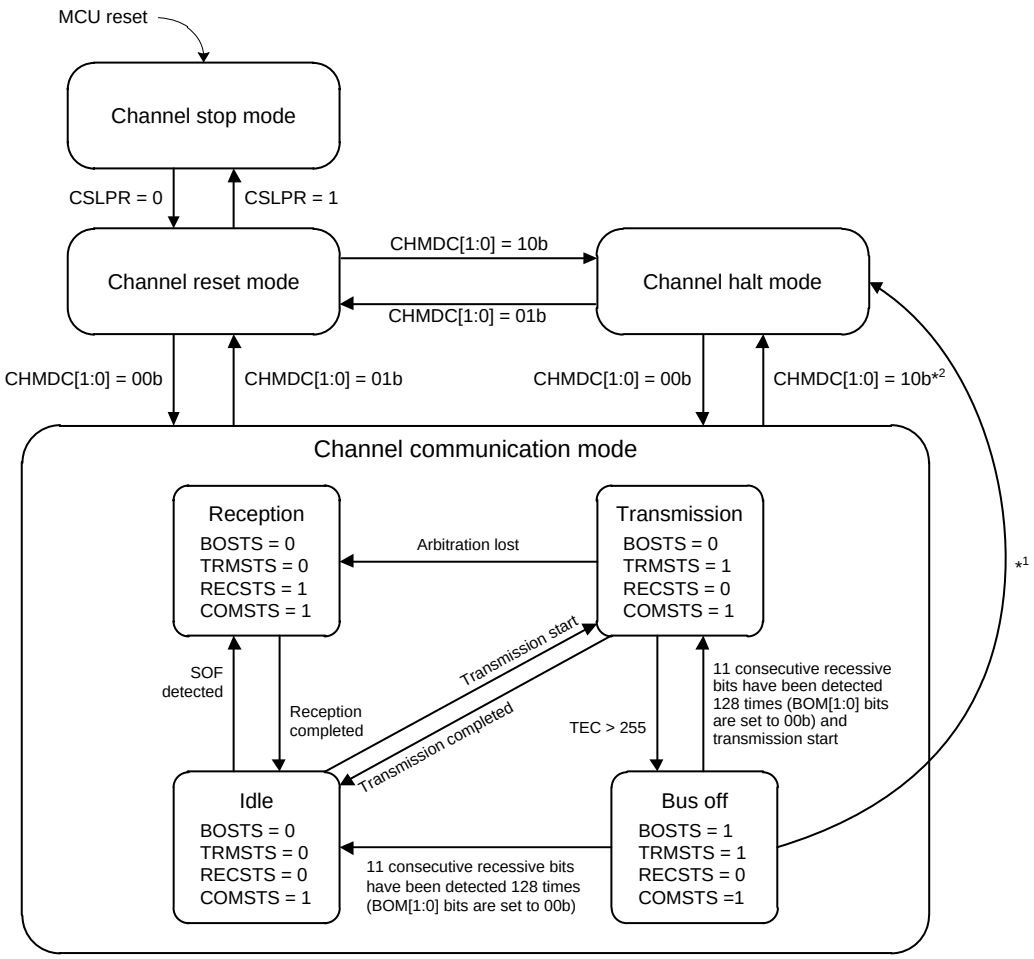
28.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00b, the RS-CANFD module transitions to global operating mode.

28.6.2 Channel Modes

Figure 28.5 shows a channel mode state transition chart. **Table 28.35** shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 1) BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01b: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10b: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11b: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10b

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Figure 28.5 Channel Mode State Transition Chart

Table 28.35 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CANFD mode, this time value is the CANm bit time of the nominal bit rate.

28.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the GSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0, 1) is set to 1 (channel stop mode) in channel reset mode. The GSLPR bit should not be modified in channel communication mode and channel halt mode.

28.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel- related registers are initialized. For registers to be initialized, see **Table 28.37, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01b (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 28.36** shows the operation when the CHMDC[1:0] bits are set to 01b (channel reset mode) during CAN communication.

28.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 28.36 shows operation when the CHMDC[1:0] bits are set to 10b (channel halt mode) during CAN communication.

Table 28.36 Operation in Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01b)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10b)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00b] Transitions to channel halt mode (CHMDC[1:0] = 10b) only after bus off recovery. [When BOM[1:0] = 01b] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10b] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11b] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10b before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10b and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01b.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then shift to channel halt mode. In CANFD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

28.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00b, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0, 1) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

28.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00b:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to H’00, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10b (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01b:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10b and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10b:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10b. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11b:
  When the CHMDC[1:0] bits are set to 10b in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H’00, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to 10b.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01b or 10b is made only when the CHMDC[1:0] bits are 00b (channel communication mode). Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to H’00. Write 1 to the RTBO bit only when the BOM[1:0] value is 00b. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

28.6.3 Initializing Registers by Transition to CAN Mode

Table 28.37 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 28.38** lists bits and flags to be initialized only by a transition to global reset mode.

Table 28.37 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit/Flag
RSCFDn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCFDn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]
RSCFDn(CFD)CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCFDnCFDCmFDCTR register	EOCCLR, SOCCLR
RSCFDnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RSCFDnCFDCmFDCRC register	CRCREG[20:0], SCNT[3:0]
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCFDn(CFD)CFTISTS register	CFkTXIF
RSCFDn(CFD)TMCp register	TMOM, TMTAR, TMTR
RSCFDn(CFD)TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCFDn(CFD)TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TXQCCm register	TXQE
RSCFDn(CFD)TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCFDn(CFD)THLCCm register	THLE
RSCFDn(CFD)THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCFDn(CFD)GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m =0, 1)

Note: Bits and flags in parentheses exist only in registers for use in CANFD mode.

Table 28.38 Registers Initialized Only in Global Reset Mode

Register	Bit/Flag
RSCFDn(CFD)GSTS register	GHLTSTS
RSCFDn(CFD)GERFL register	EEF0, EEF1, (CMPOF), THLES, MES, DEF
RSCFDn(CFD)GTSC register	TS[15:0]
RSCFDn(CFD)RMNDy register	RMNSq
RSCFDn(CFD)RFCCx register	RFE
RSCFDn(CFD)RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCFDn(CFD)FESTS register	CFkEMP, RFxEMP
RSCFDn(CFD)FFSTS register	CFkFLL, RFxFLL
RSCFDn(CFD)FMSTS register	CFkMLT, RFxMLT
RSCFDn(CFD)RFISTS register	RFxIF
RSCFDn(CFD)CFRISTS register	CFkRXIF
RSCFDnCFDCDTCT register	CFDMAEm, RFDMAEx
RSCFDnCFDCDTSTS register	CFDMASTSm, RFDMASTSx
RSCFDn(CFD)GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE
RSCFDn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers for use in CANFD mode.

28.7 Reception Function

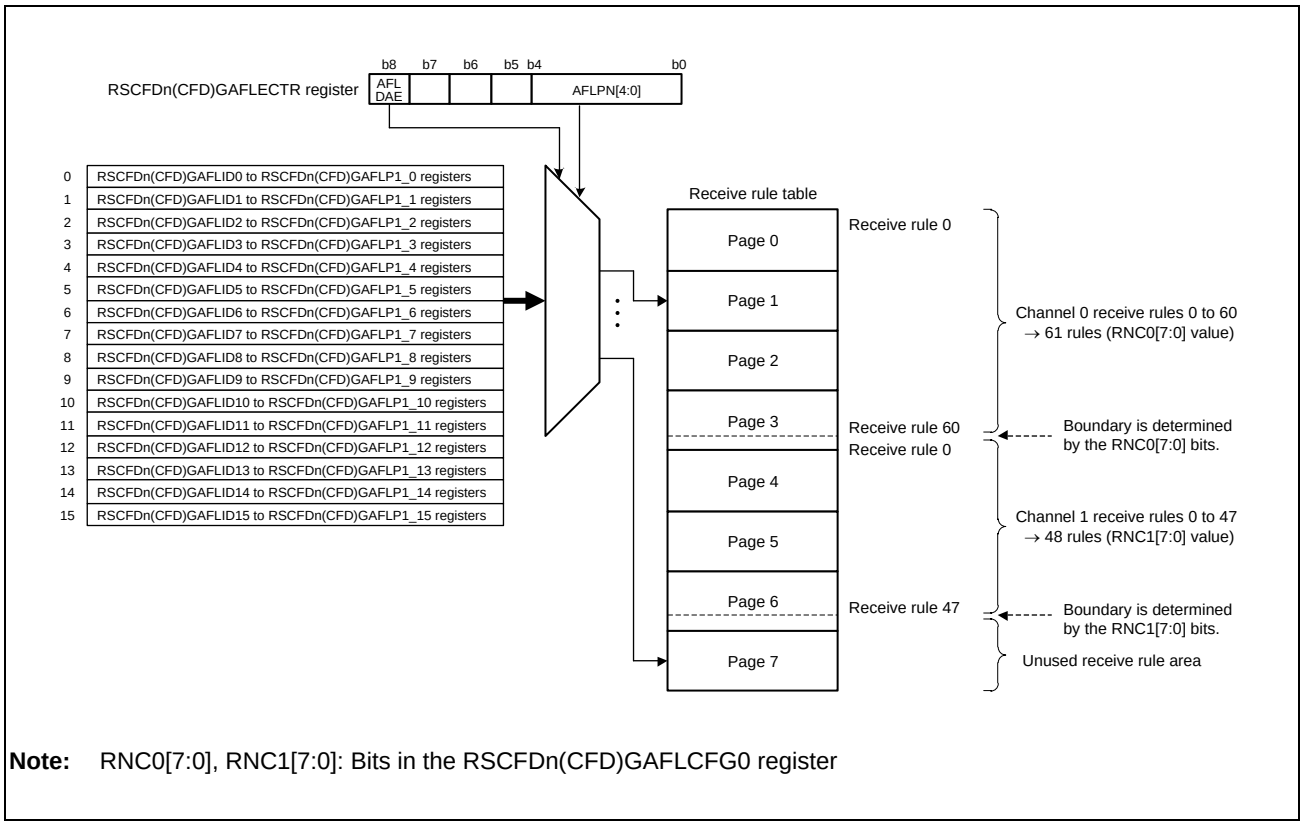
There are two reception types.

- Reception by receive buffers:
  Zero to 32 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

28.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 128 receive rules can be registered in this module that has two channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 28.6** illustrates how receive rules are registered.



Note: RNC0[7:0], RNC1[7:0]: Bits in the RSCFDn(CFD)GAFLCFG0 register

Figure 28.6 Entry of Receive Rules (for Setting Channels 0 and 1)

NOTE

Receive rules for each channel must be set in contiguous blocks.

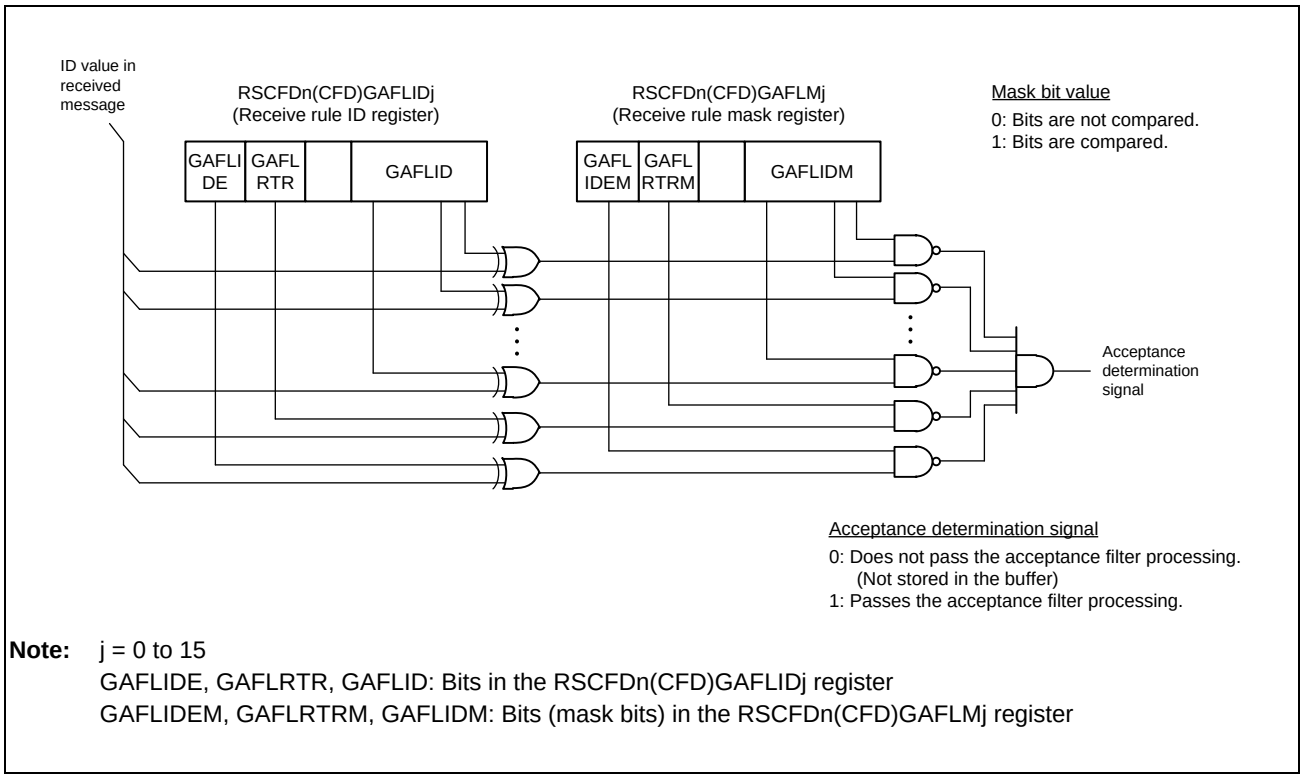
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

28.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.



Note: j = 0 to 15
GAFLIDE, GAFLRTR, GAFLID: Bits in the RSCFDn(CFD)GAFLIDj register
GAFLIDEM, GAFLRTRM, GAFLIDM: Bits (mask bits) in the RSCFDn(CFD)GAFLMj register

Figure 28.7 Acceptance Filter Function

28.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of H'00 is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

28.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CANFD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded.

28.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

28.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

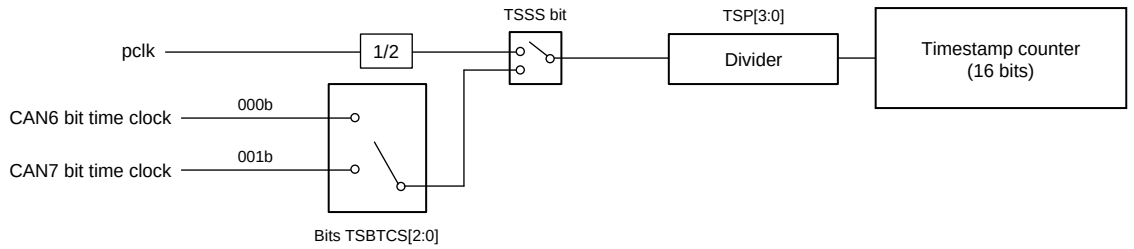
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

28.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0, 1). In CANFD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CANFD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to H'0000 by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.



Note: TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register
When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000b.

Figure 28.8 Timestamp Function Block Diagram

28.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CANFD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CANFD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CANFD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CANFD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 28.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

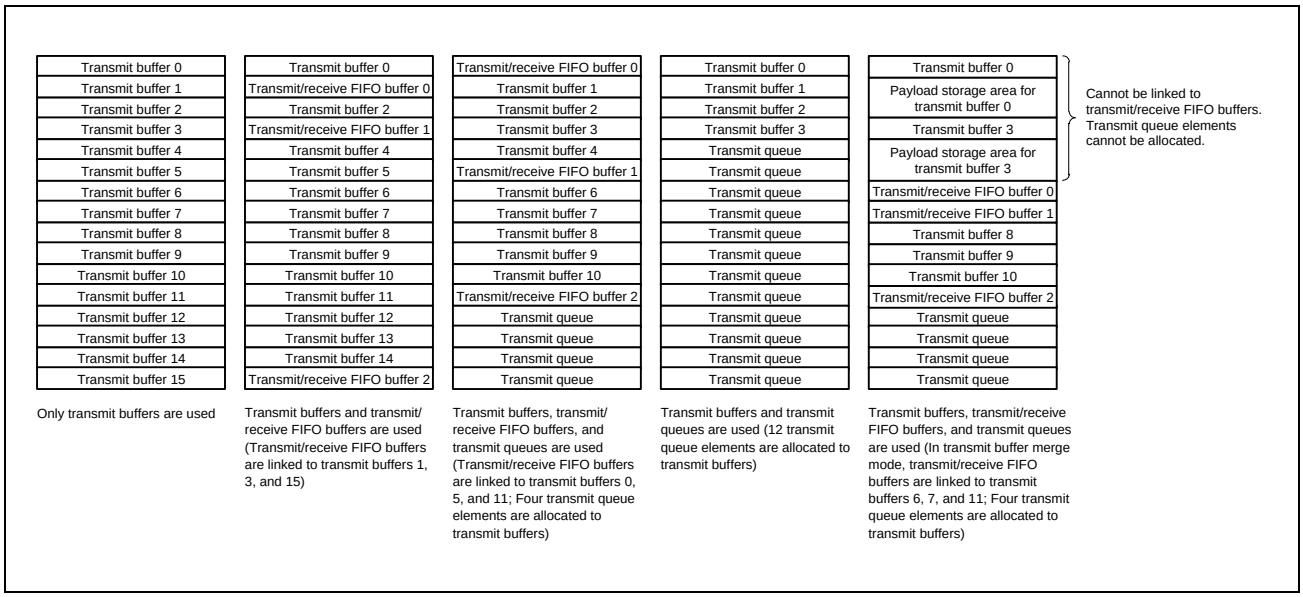


Figure 28.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

28.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit.

28.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 31). When transmit completes successfully, the TMTRF[1:0] flag is set to 10b (transmission has been completed (without transmit abort request)) or 11b (transmission has been completed (with transmit abort request)).

28.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01b (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

28.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10b or 11b. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01b (transmit abort has been completed).

28.8.2.3 Transmit Buffer Merge Mode (Only in CANFD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to the merged buffers or allocate it to the transmit queue.

28.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

28.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to H’00.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to 00b, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10b, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register × 10). When the CFITR and CFITSS bits are set to x1b, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CANFD mode. Use this count source only for the channel that does not handle the CANFD frames. The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00b:

$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10b:

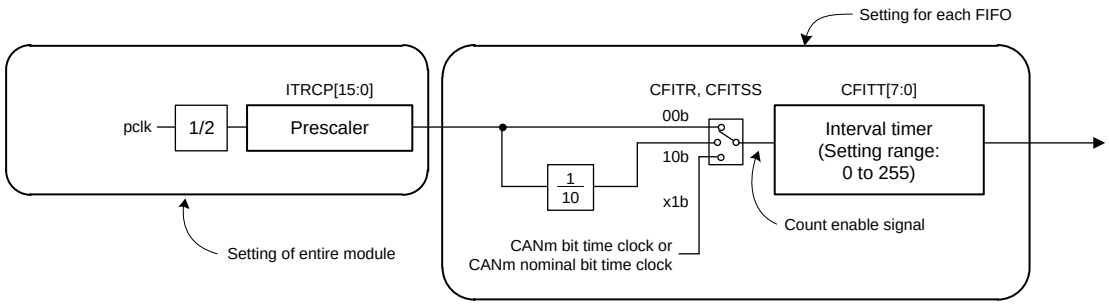
$$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = x1b:

$$\text{Classical CAN mode: } \frac{1}{\text{CANm bit time clock frequency}} \times N$$

$$\text{CANFD mode: } \frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$$

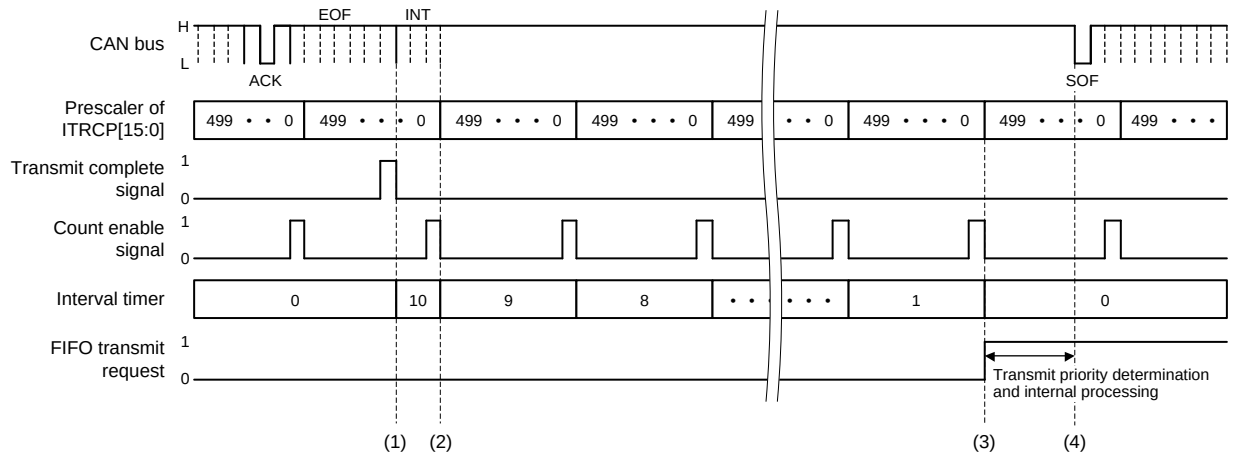
Figure 28.10 shows the interval timer block diagram.



Note: ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register
m = 0, 1, k = 0 to 5

Figure 28.10 Interval Timer Block Diagram

Figure 28.11 shows the interval timer timing diagram.



$$\text{Interval time (logical value)} = \frac{2}{\text{pclk frequency}} \times \text{(set ITRCP[15:0] value)} \times \text{set CFITT[7:0] value}$$

Note: ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register (The set value is 500 in this figure.)
CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 28.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 644 cycles of the pclk may be generated.

28.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

28.8.5 Transmit Data Padding (Only in CANFD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CCH.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

28.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 5) determines whether transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CANFD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 128 cycles of pclk in classical CAN mode or 396 cycles of pclk in CANFD mode.

- Buffer type: 001b: Transmit buffer
  010b: Transmit/receive FIFO buffer
  100b: Transmit queue
- Buffer number: Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer.
  This number depends on buffer types. See **Table 28.39**.
- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message
  (When the TMTSCE bit is 1 in classical CAN mode)

Table 28.39 Transmit History Data Buffer Numbers

Buffer Type Buffer No.	001b	010b	100b
0000b	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001b	Transmit buffer 16 × m + 1		
0010b	Transmit buffer 16 × m + 2		
0011b	Transmit buffer 16 × m + 3		
0100b	Transmit buffer 16 × m + 4		
0101b	Transmit buffer 16 × m + 5		
0110b	Transmit buffer 16 × m + 6		
0111b	Transmit buffer 16 × m + 7		
1000b	Transmit buffer 16 × m + 8		
1001b	Transmit buffer 16 × m + 9		
1010b	Transmit buffer 16 × m + 10		
1011b	Transmit buffer 16 × m + 11		
1100b	Transmit buffer 16 × m + 12		
1101b	Transmit buffer 16 × m + 13		
1110b	Transmit buffer 16 × m + 14		
1111b	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 28.7.1.6, Timestamp**.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

28.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10b (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

28.9.1 CAN-CANFD Gateway (Only in CANFD Mode)

When the gateway function is used in CANFD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CANFD frame.

Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CANFD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001b or more and the GWFDF bit is 1 (CANFD frame), the DLC value is replaced with 1000b.

When the CAN-CANFD gateway is enabled, do not perform routing for the following frames.

- CANFD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CANFD gateway is enabled, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frames should be transmitted.
- When GWFDF bit is set to 1, only CANFD frames should be transmitted.

28.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CANFD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

28.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CANFD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 28.10.6.1, CRC Error Test**.

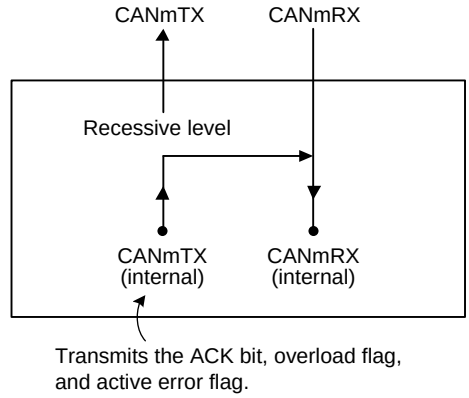
28.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 28.12 shows the connection when listen-only mode is selected.



Note: m = 0, 1

Figure 28.12 Connection when Listen-Only Mode is Selected

28.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

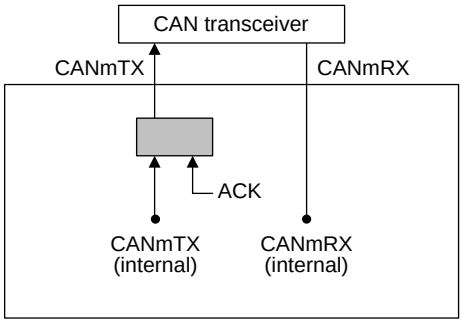
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

28.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 28.13 shows the connection when self-test mode 0 is selected.



Note: m = 0, 1

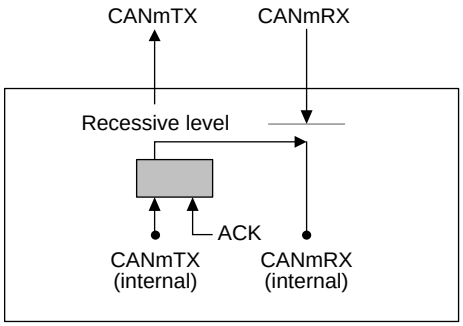
Figure 28.13 Connection when Self-Test Mode 0 is Selected

28.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0, 1) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 28.14 shows the connection when self-test mode 1 is selected.



Note: m = 0, 1

Figure 28.14 Connection when Self-Test Mode 1 is Selected

28.10.4 Restricted Operation Mode (Only in CANFD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

28.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 5120 bytes (H'1400) in classical CAN mode or 7104 bytes (H'1BC0) in CANFD mode. Do not access the RAM area higher than the 192th byte on the last page (the setting of the RTMPS bit is H'1B) in CANFD mode.

28.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Figure 28.15 shows the connection for inter-channel communication test.

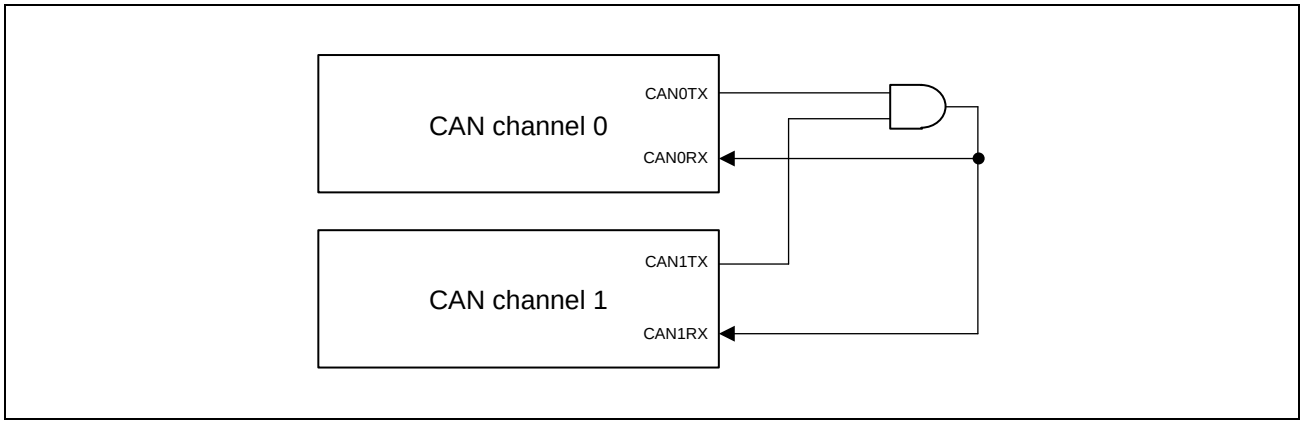


Figure 28.15 Connection for Inter-Channel Communication Test

28.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

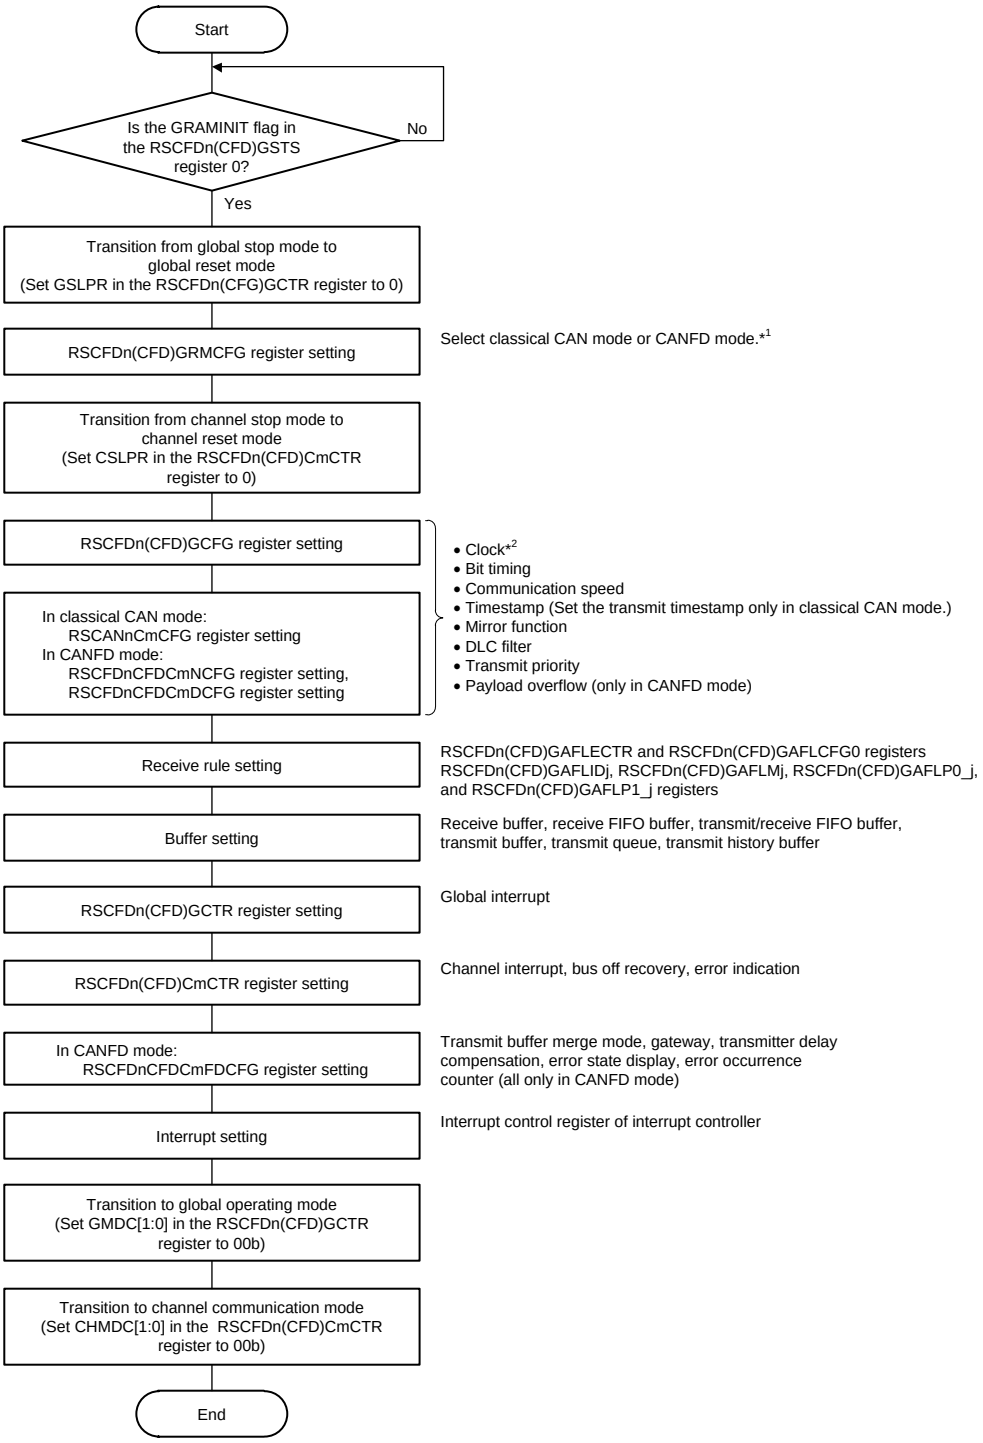
The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID’s upper 5-bit value is 10000b or ID’s upper 6-bit value is 011111b is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

28.11 RS-CANFD Setting Procedure

28.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 2530 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 28.16** shows the CAN setting procedure after the MCU is reset.



Note: m = 0, 1, j = 0 to 15

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Note 2. For the setting of CAN clock frequency, see **Section 28.1.3, Clock Supply**.

Figure 28.16 CAN Setting Procedure after the MCU is Reset

28.11.1.1 Clock Setting

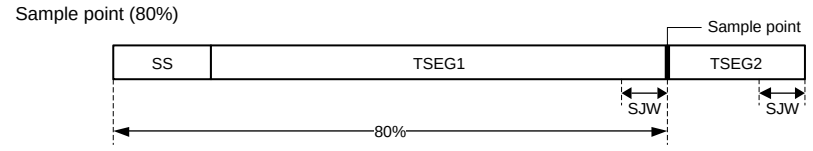
Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

28.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CANFD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CANFD mode (CANmTq(N) clock and CANmTq(D) clock). Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0]. To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

Figure 28.17 shows the bit timing chart. **Table 28.40** shows an example of bit timing setting.



Classical CAN mode:
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 4 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 > TSEG2 ≥ SJW

CANFD mode:

<Nominal bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 128 Tq
- Set TSEG2 to a range of 2 Tq to 32 Tq
- Set SJW to a range of 1 Tq to 32 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
- TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 2 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 8 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 28.17 Bit Timing Chart

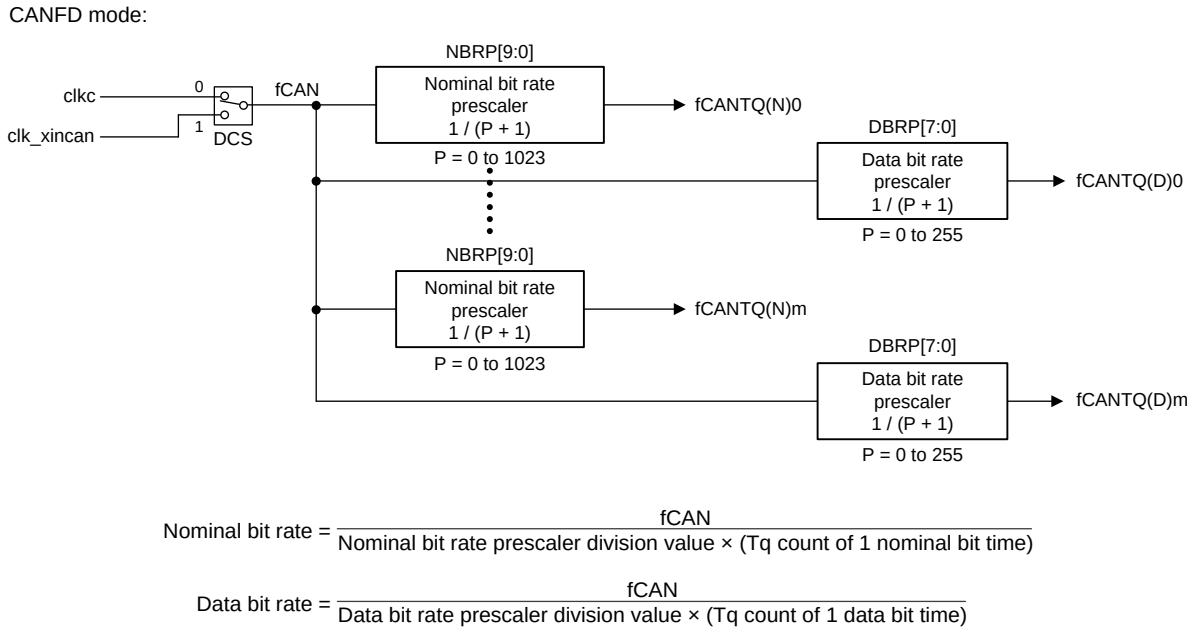
Table 28.40 Example of Bit Timing Setting

1 Bit	Set Value (Tq)				Sample Point (%) *Note*: See **Figure 28.17**.
	SS	TSEG1	TSEG2	SJW	
	1	4	3	1	62.50
8 Tq	1	5	2	1	75.00
	1	6	3	1	70.00
10 Tq	1	7	2	1	80.00
	1	10	5	1	68.75
16 Tq	1	11	4	1	75.00
	1	12	7	1	65.00
20 Tq	1	13	6	1	70.00
50 Tq*1	1	39	10	4	80.00

Note 1. Only in CANFD mode

28.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CANFD mode, set two types of transmission rate (arbitration phase and data phase) for each channel. **Figure 28.18** shows the CAN clock control block diagram, and **Table 28.41** and **Table 28.42** show examples of the communication speed setting.



$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

Note: m = 0, 1
DCS: Bit in the RSCFDn(CFD)GCFG register
BRP[9:0]: Bits in the RSCFDnCmCFG RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register

Table 28.42 Example of Transmission Rate Setting (Nominal Bit Rate and Data Bit Rate in CANFD Mode)

fCAN / Communication Speed	32 MHz	16 MHz
Nominal bit rate 1 Mbps Data bit rate 4 Mbps	Nominal bit rate 32 Tq (1) Data bit rate 8 Tq (1)	None
Nominal bit rate 500 Kbps Data bit rate 2 Mbps	Nominal bit rate 64 Tq (1) Data bit rate 16 Tq (1)	Nominal bit rate 32 Tq (1) Data bit rate 8 Tq (1)

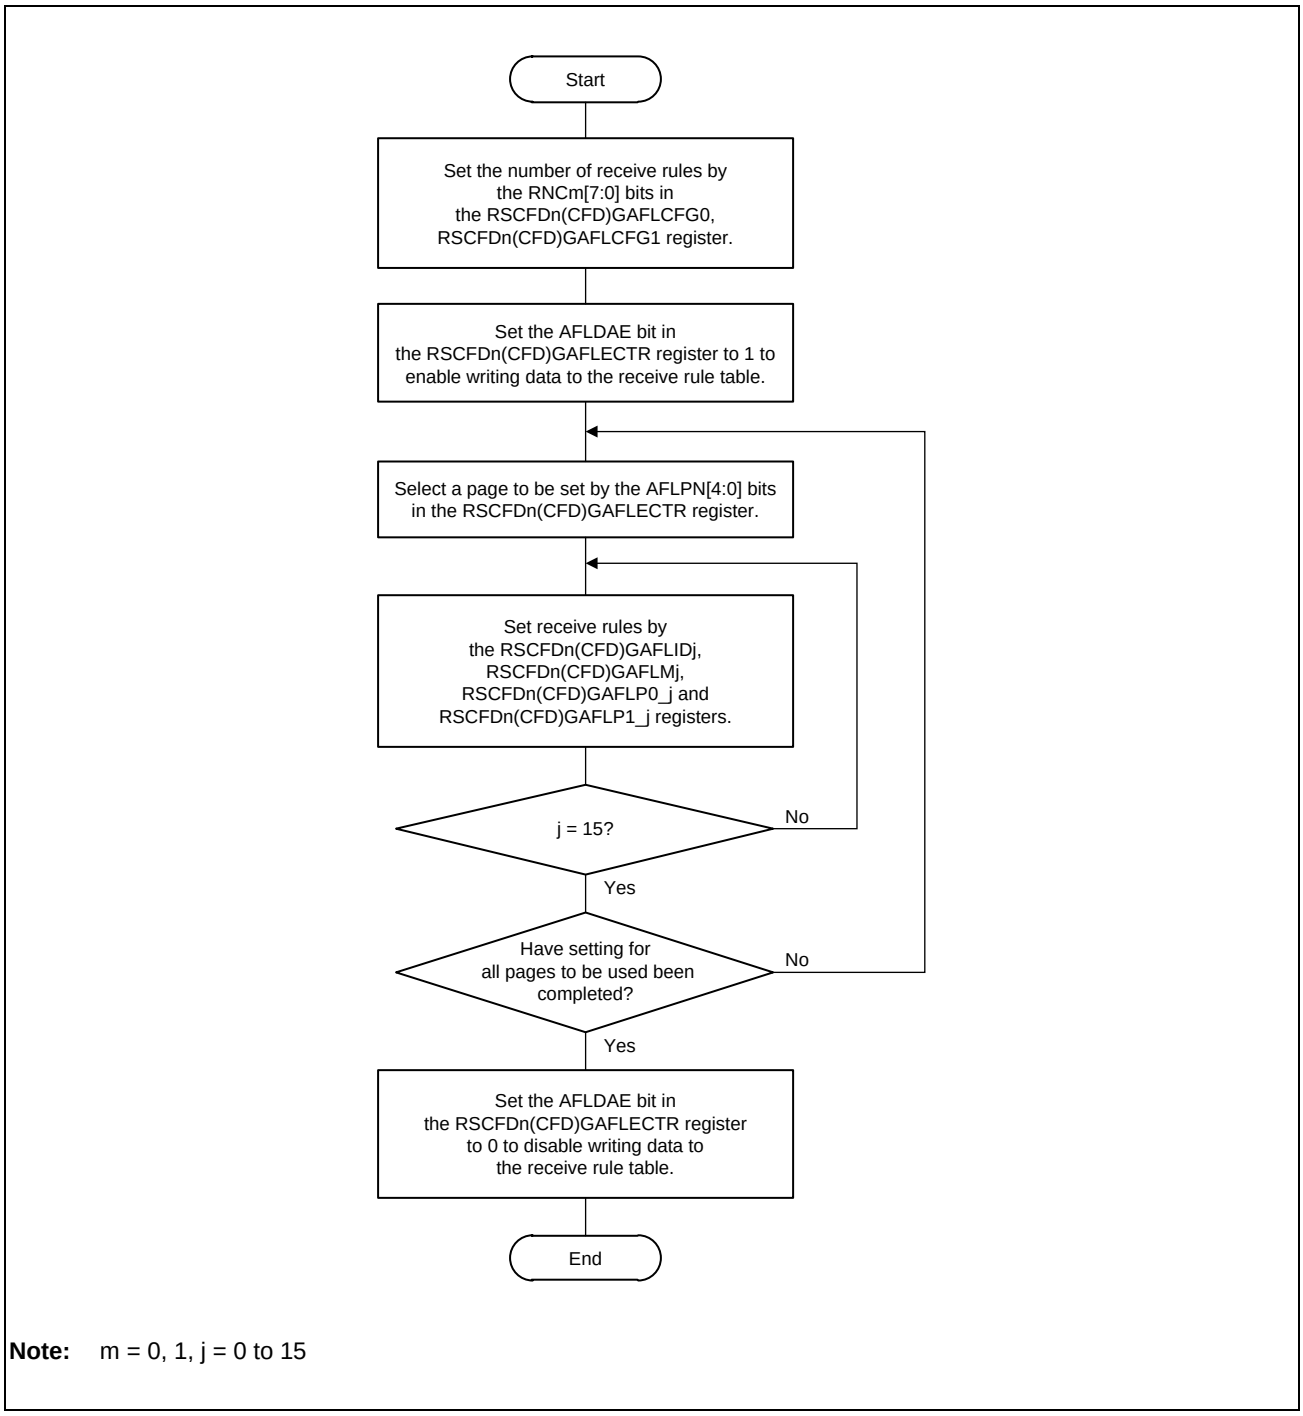
Note: Values in ( ) are baud rate prescaler division values.

28.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (for 6-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 28.19 shows the receive rule setting procedure.



Note: m = 0, 1, j = 0 to 15

Figure 28.19 Receive Rule Setting Procedure

28.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CANFD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

In classical CAN mode, up to 2048 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 128 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

Number of receive buffers + total number of depth of receive FIFO buffers x + total number of depth of transmit/receive FIFO buffers k ≤ 128 buffers

In CANFD mode, up to 3584 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k ≤ 3584 bytes

Figure 28.20 shows the buffer configuration. **Figure 28.21** shows the buffer setting procedure.

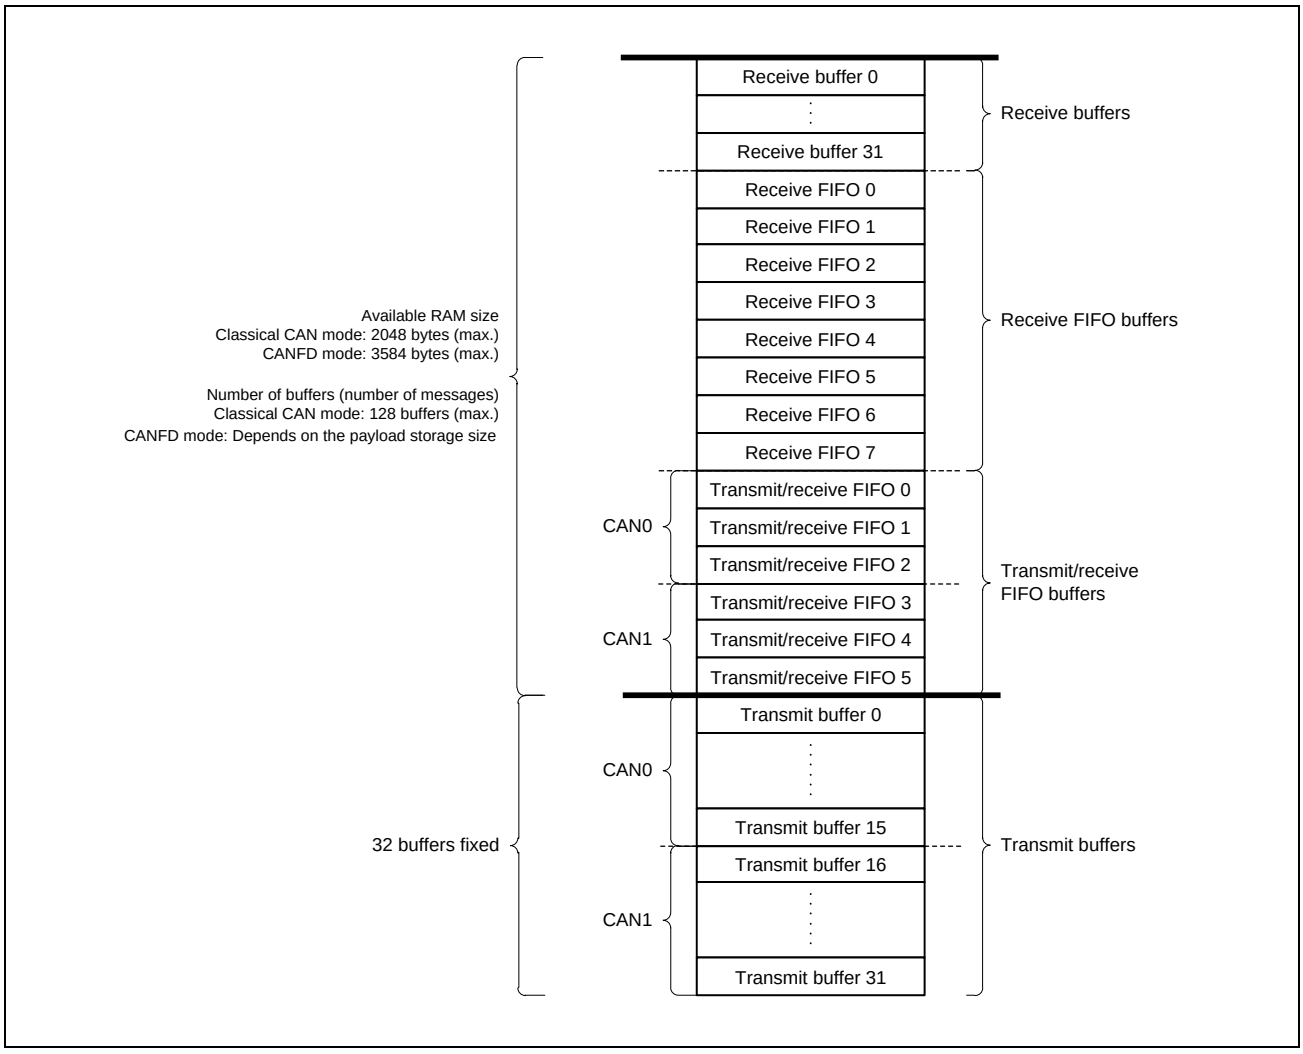


Figure 28.20 Buffer Configuration

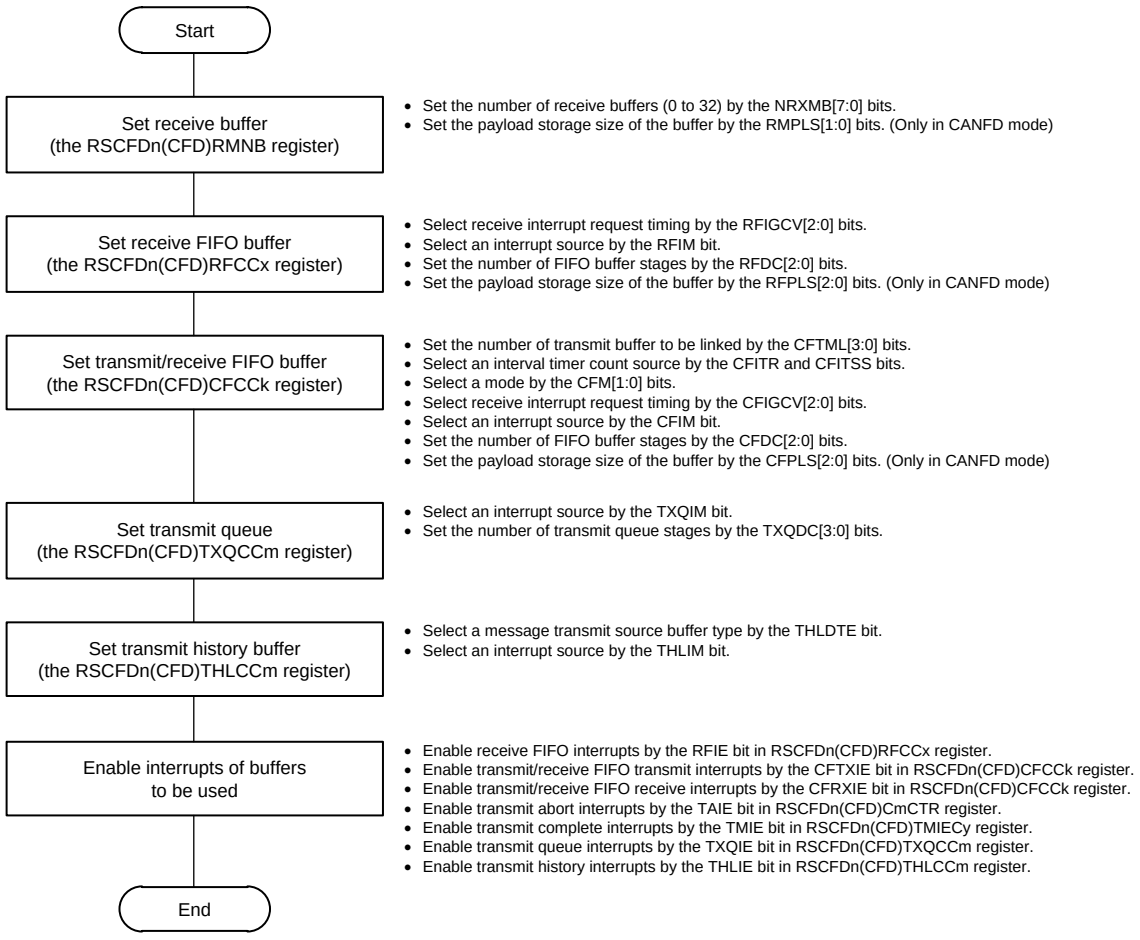
NOTE

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



Note: k = 0 to 5, x = 0 to 7

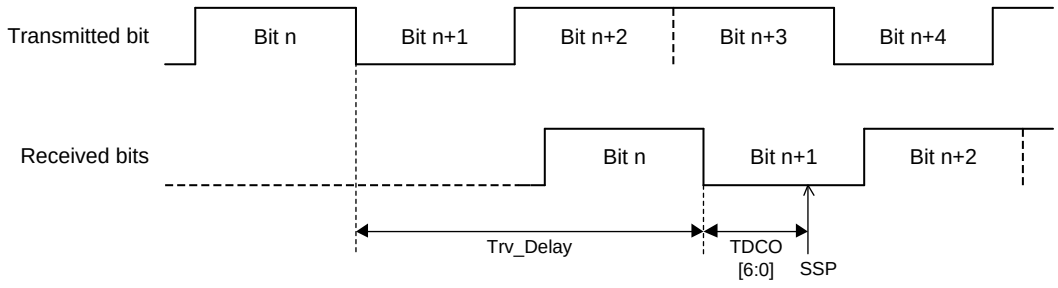
Figure 28.21 Buffer Setting Procedure

28.11.1.6 Transmitter Delay Compensation (Only in CANFD Mode)

A high baud rate is used in CANFD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.



Note: Bit n: arbitrary bit of data phase
TDCO[6:0]: RSCFDnCFDCmFDCFG register bits

Figure 28.22 SSP Timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

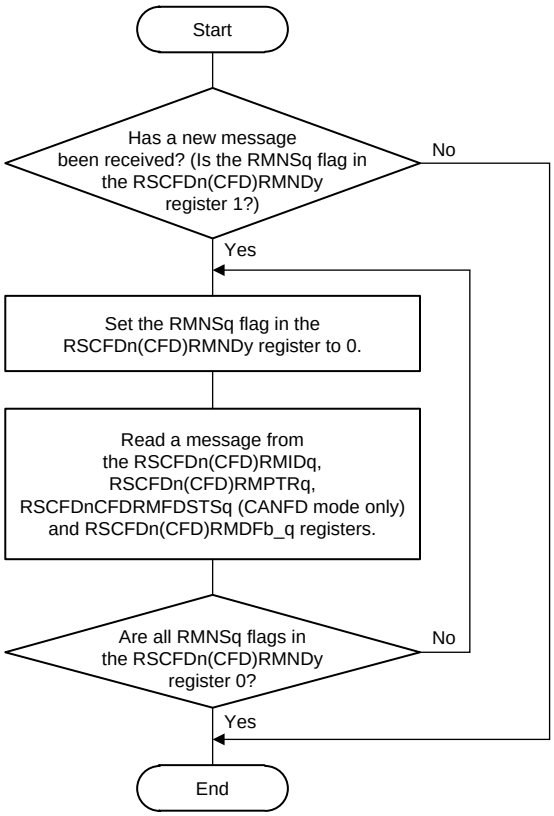
The RS-CANFD module compensates a delay up to (3 CANm bit time − 2 Tq). (Both CANm bit time and Tq are data bit rate values.)

When the TDCE bit in RSCFDnCFDCmFDCFG register is 1 (transmitter delay compensation is enabled), set bits NBRP[9:0] and DBRP[7:0] to the same value that is less than 1.

28.11.2 Reception Procedure

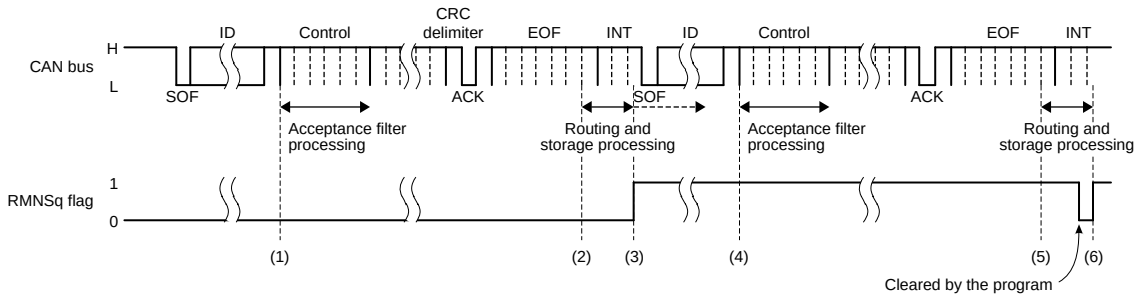
28.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, q = 0 to 31) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CANFD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CANFD mode). **Figure 28.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.



Note: y = 0, q = 0 to 31, b = 0 or 1 (classical CAN mode), 0 to 4 (CANFD mode)

Figure 28.23 Receive Buffer Reading Procedure



Note: y = 0, q = 0 to 31
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 28.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

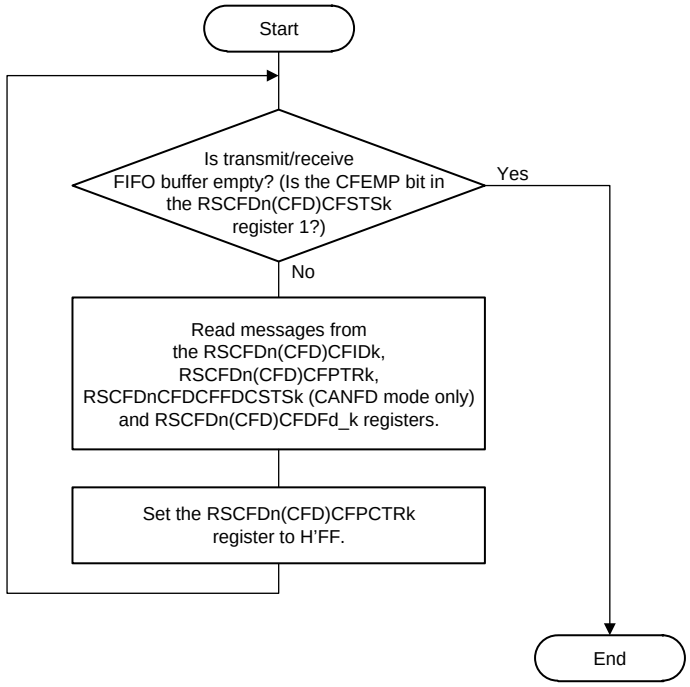
28.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 17)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CANFD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CANFD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CANFD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



Note: k = 0 to 5, d = 0 or 1 (classical CAN mode), 0 to 15 (CANFD mode)

Figure 28.25 Transmit/Receive FIFO Buffer Reading Procedure

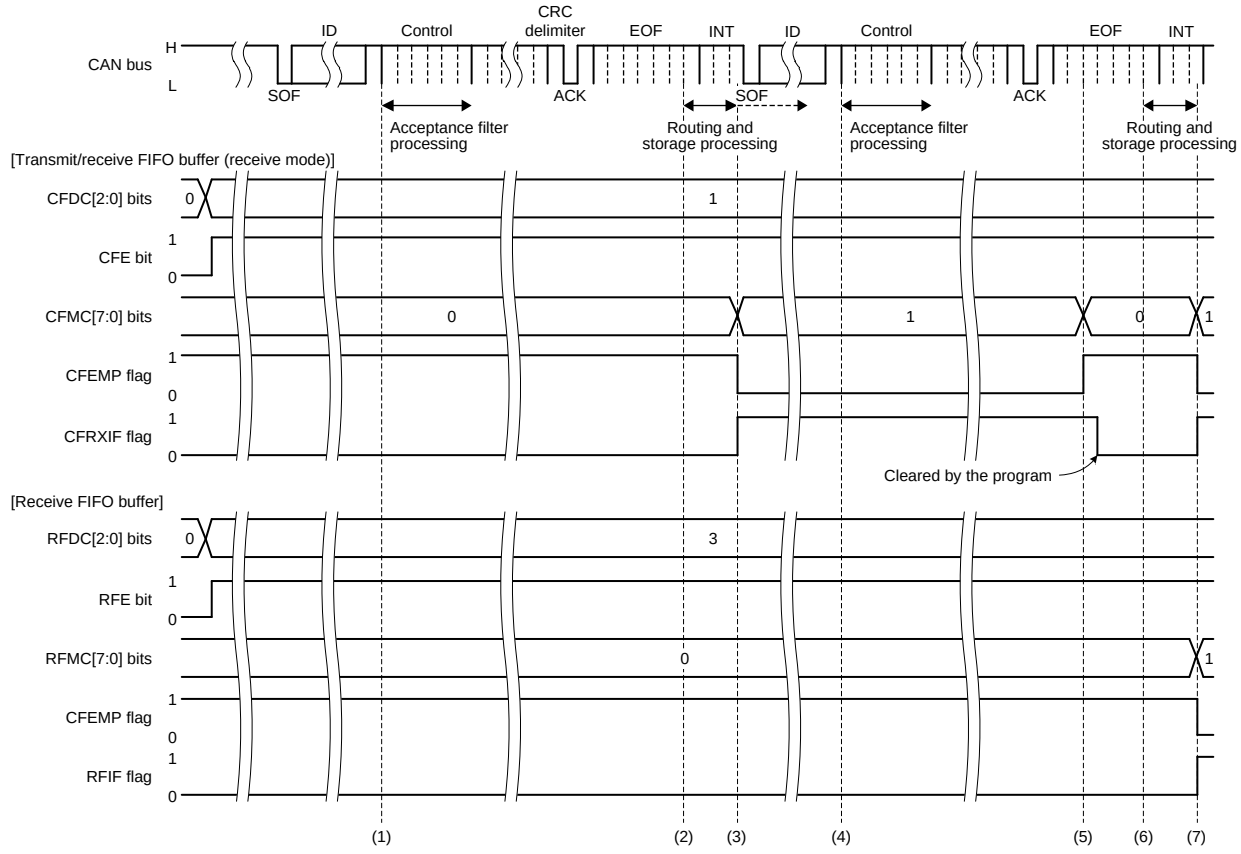
When reading a message in CANFD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 28.43 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000b	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001b	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010b	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011b	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100b	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101b	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110b	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111b	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 28.44 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000b	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001b	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010b	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011b	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100b	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101b	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110b	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111b	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



Note: CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register
k = 0 to 5, x = 0 to 7

Figure 28.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001b or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes H'01. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write H'FF to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes H'00, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001b or more. The CFMC[7:0] bit value is incremented by 1 to be H'01. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001b or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to H'01 by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

28.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CANFD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0, 1)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

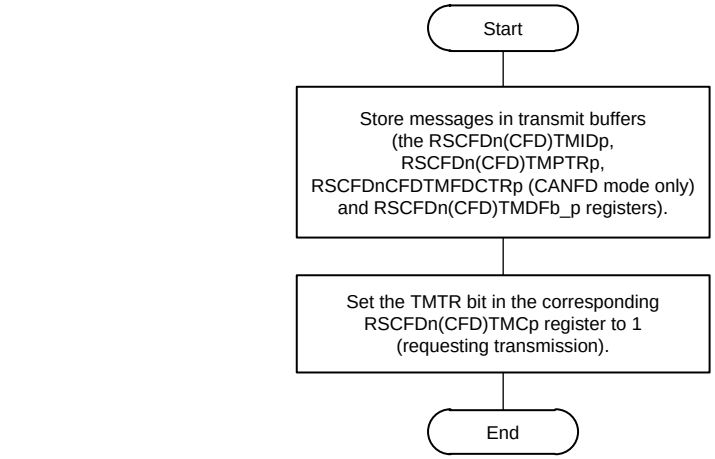
When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

28.11.3 Transmission Procedure

28.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 28.27 shows the procedure for transmission from transmit buffers.

Figure 28.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 28.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



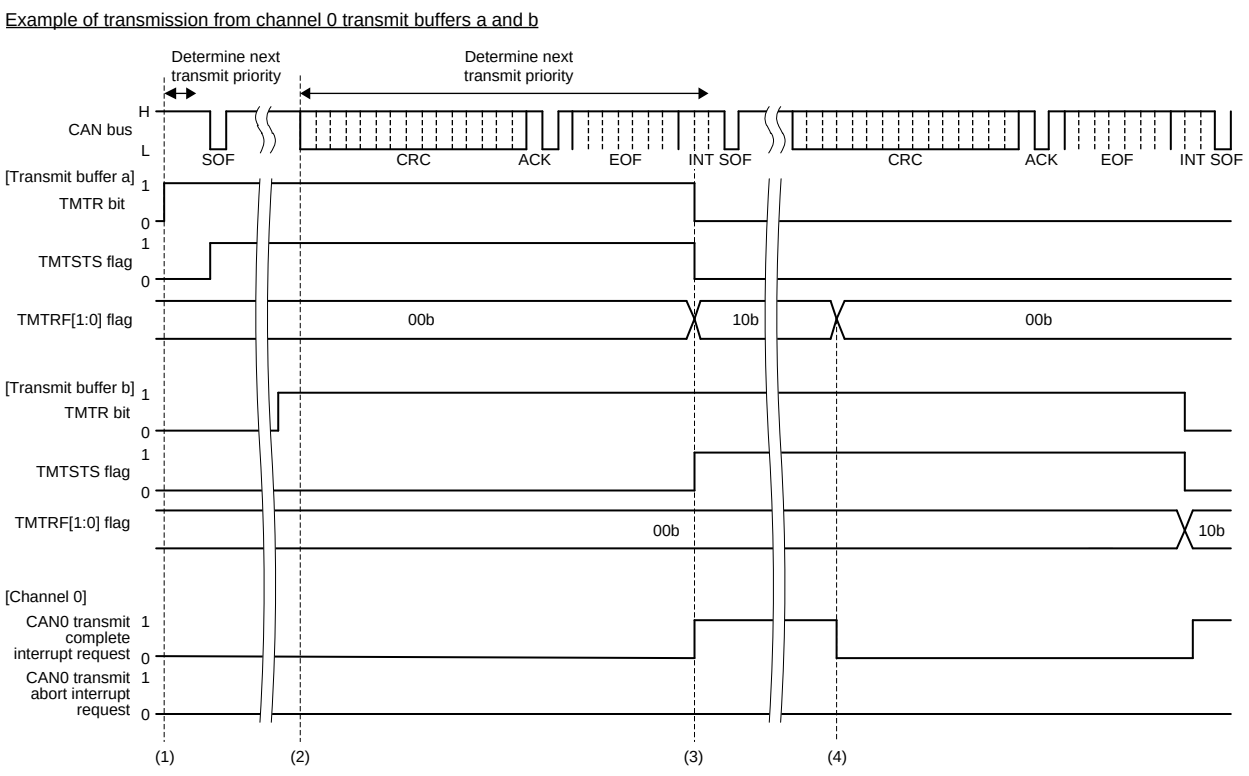
Note: p = 0 to 31, b = 0 or 1 (classical CAN mode), 0 to 4 (CANFD mode)

Figure 28.27 Procedure for Transmission from Transmit Buffers

In CANFD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 28.45** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

Table 28.45 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	H'4000	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	H'4004	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	H'4008	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	H'400C to H'401C	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	H'4020	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	H'4024	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	H'4028	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	H'402C to H'403C	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	H'4040	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	H'4044	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	H'4048	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	H'404C to H'405C	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used



Note: a = 0 to 15, b = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 28.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

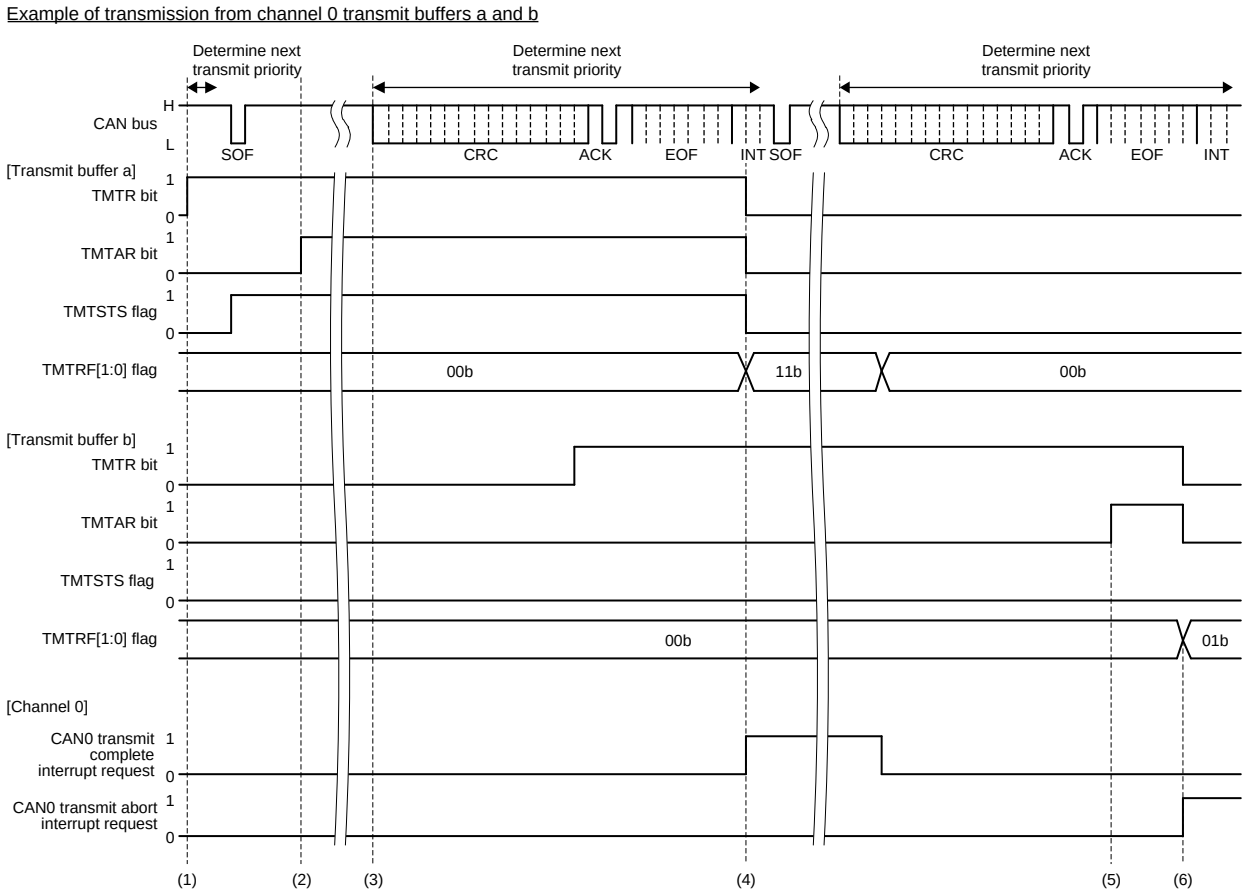
(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 10b (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00b. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00b.

If an arbitration-lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.



Note: a = 0 to 15, b = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 28.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to 11b (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register

is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

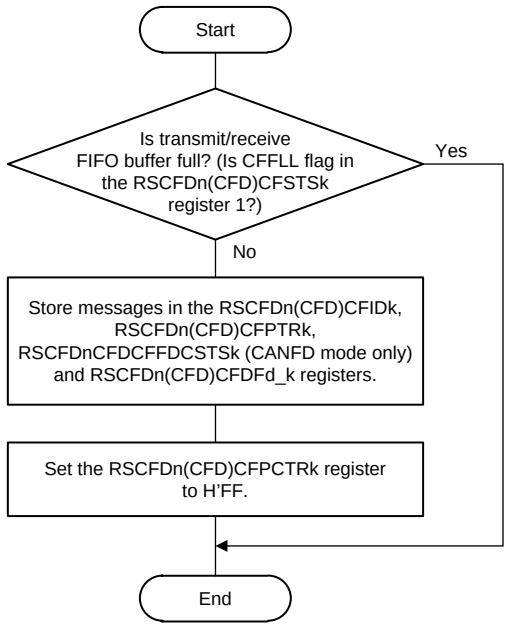
(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01b. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01b. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00b.

If an arbitration loss has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

28.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 28.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 28.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 28.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



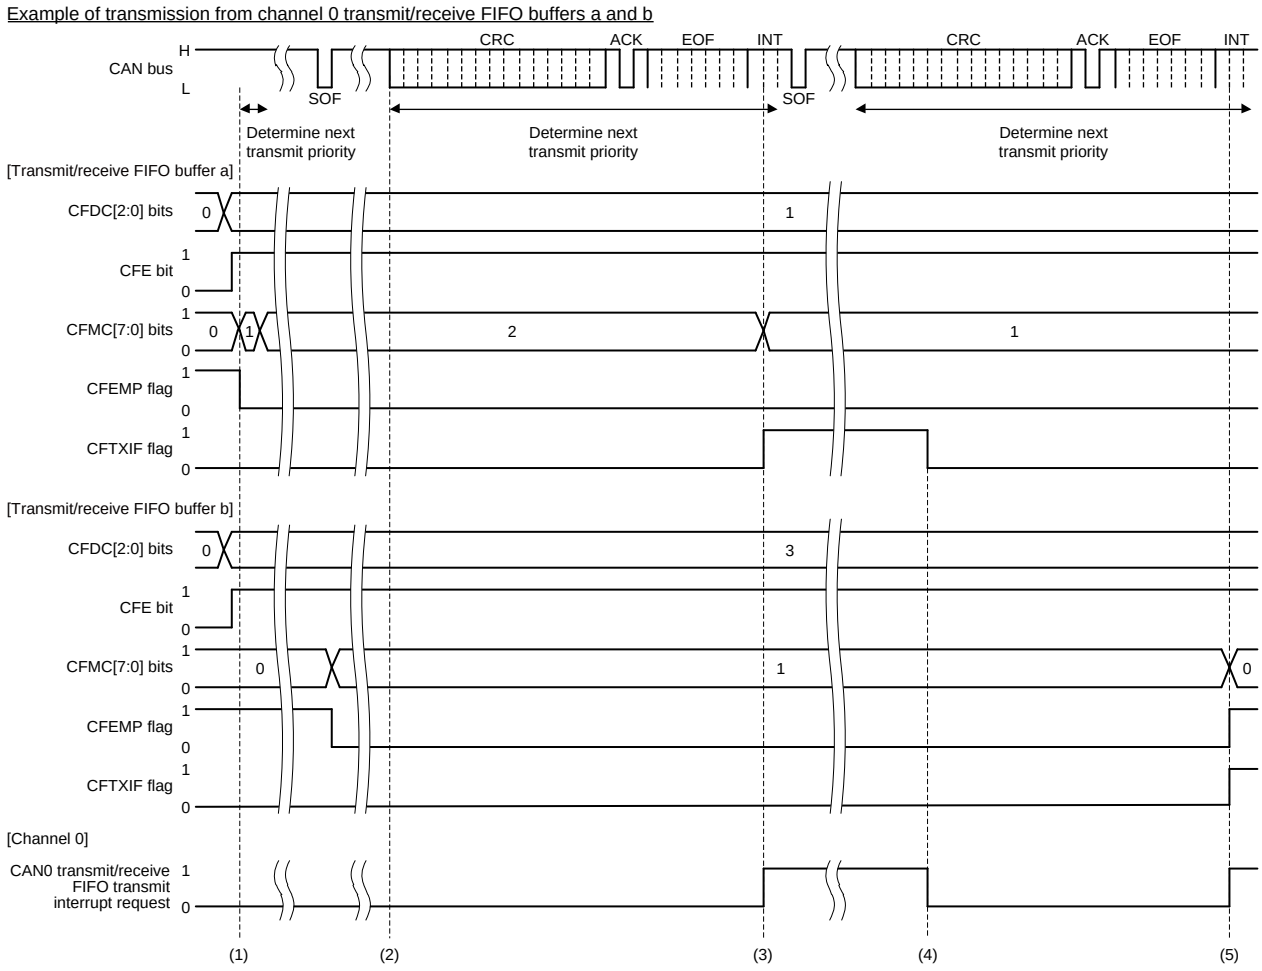
Note: k = 0 to 5, d = 0 or 1 (classical CAN mode), 0 to 15 (CANFD mode)

Figure 28.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 28.46 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000b	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001b	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010b	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011b	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100b	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101b	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110b	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111b	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0],CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 28.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001b (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H'01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

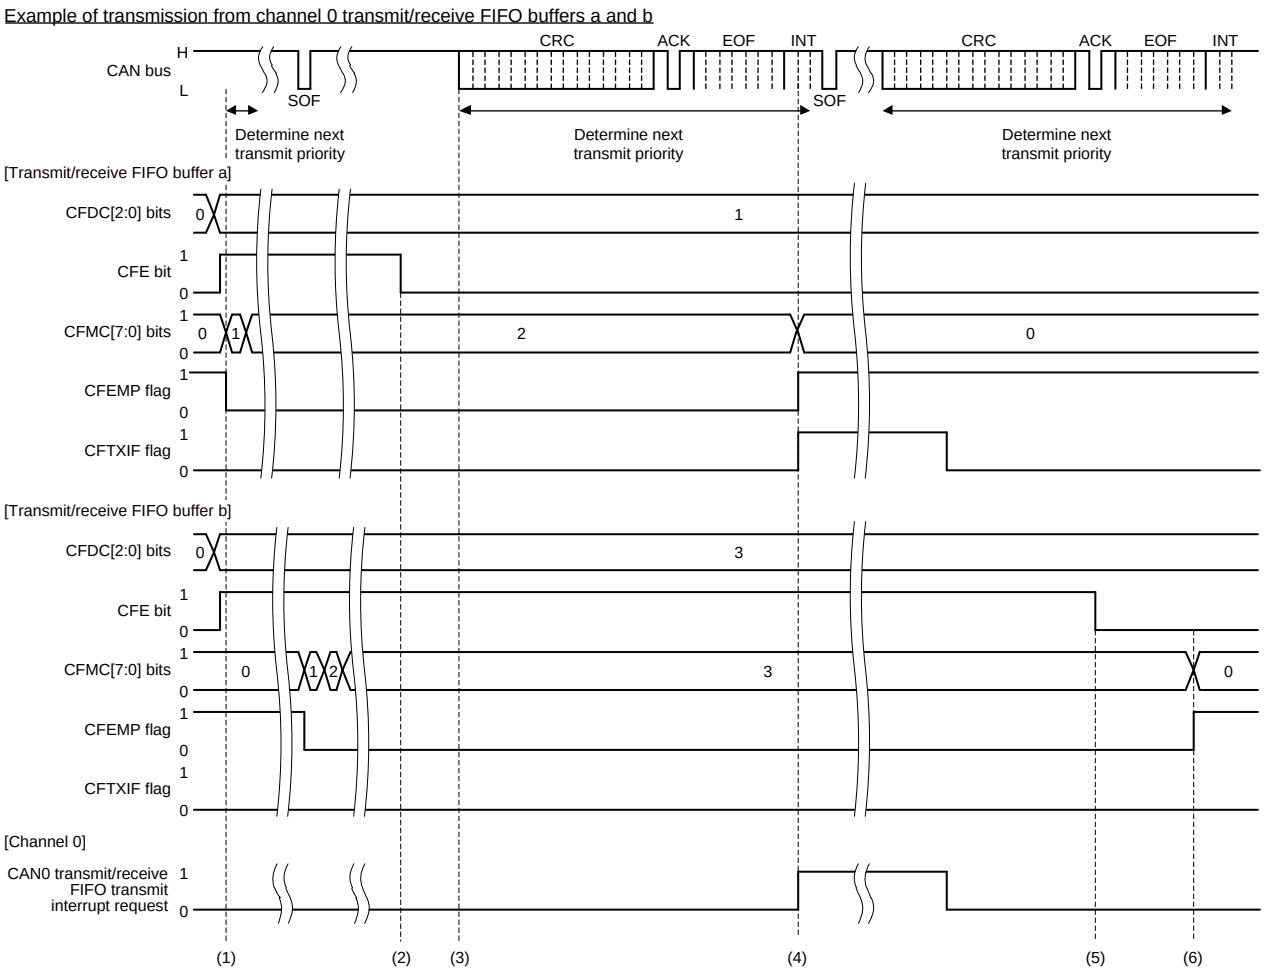
(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is

generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSb register is decremented. The CFMC[7:0] bits are cleared to H'00 and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/ receive FIFO buffer is full).



Note: a = 0 to 2, b = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 28.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is 001b (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H’01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

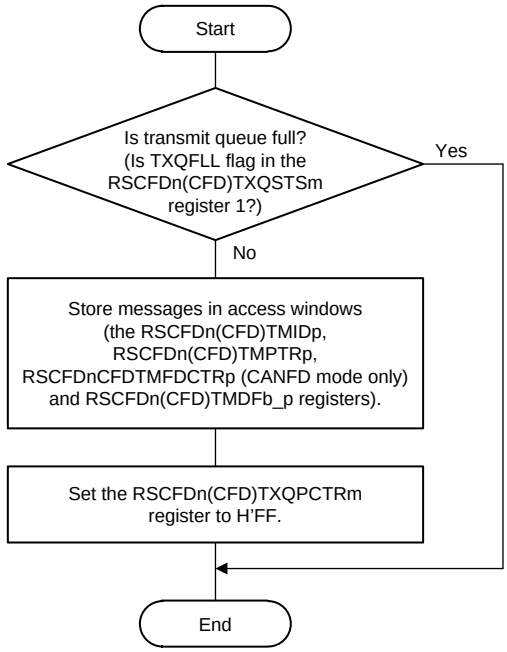
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to H’00. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to H’00 and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to H’00 and the CFEMP flag is set to 1.)

28.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 28.33 shows the procedure for transmission from the transmit queue.

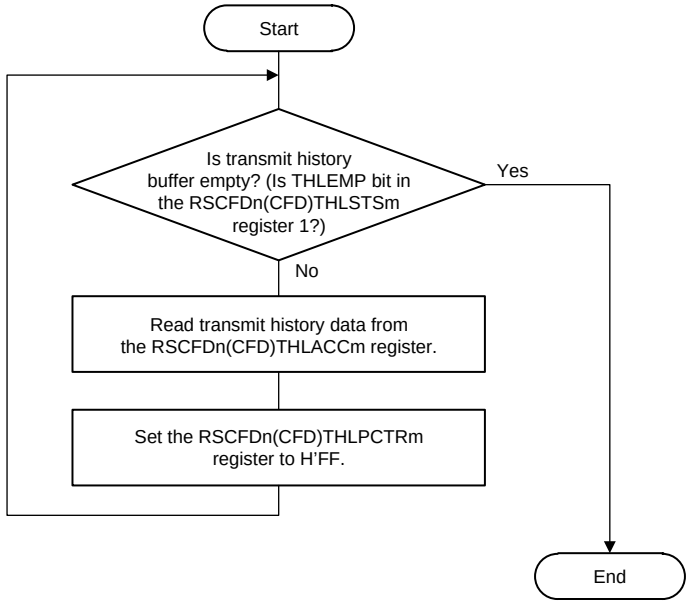


Note: p = m × 16 + 15, m = 0, 1

Figure 28.33 Procedure for Transmission from the Transmit Queue

28.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing H'FF to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0, 1) after reading a set of data. **Figure 28.34** shows the transmit history buffer reading procedure.



Note: m = 0, 1

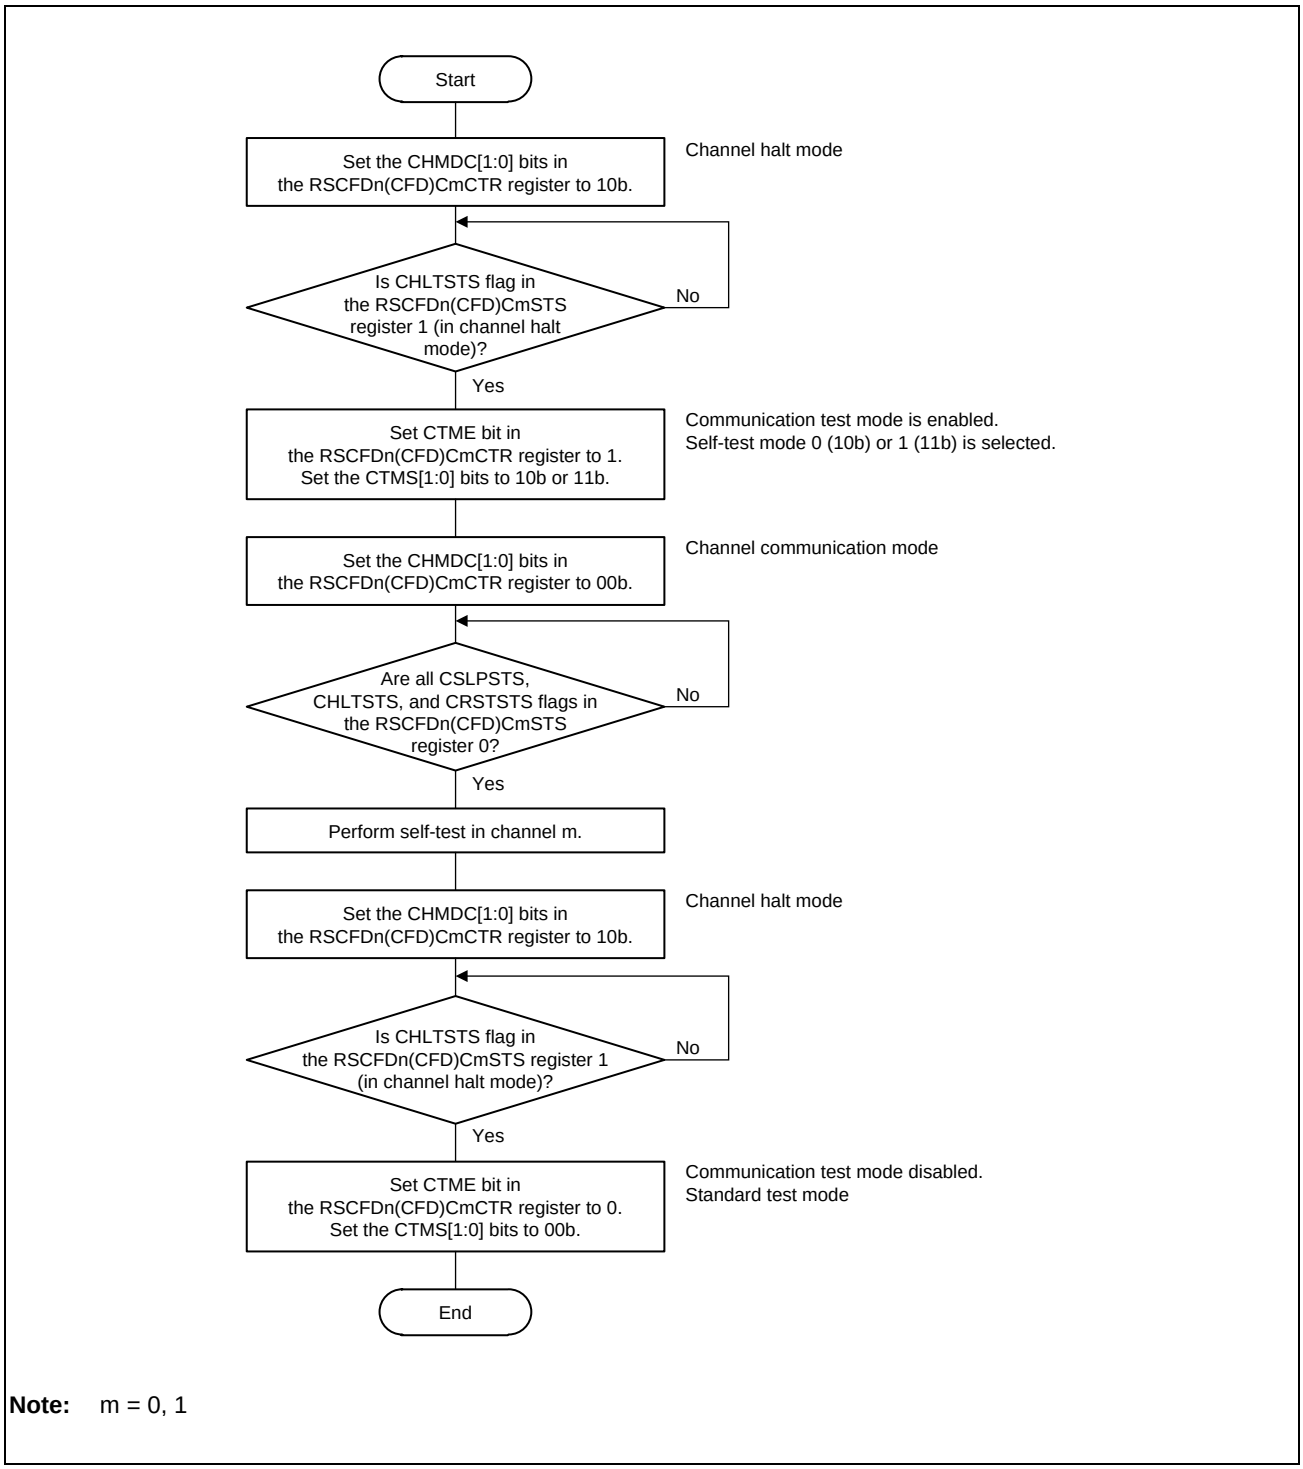
Figure 28.34 Transmit History Buffer Reading Procedure

28.11.4 Test Settings

28.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 28.35 shows the self-test mode setting procedure.



Note: m = 0, 1

Figure 28.35 Self-Test Mode Setting Procedure

28.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 28.47** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 28.47 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	H'7575	H'8A8A	RTME bit in the RSCFDn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 28.36** shows the procedure for releasing the protection.

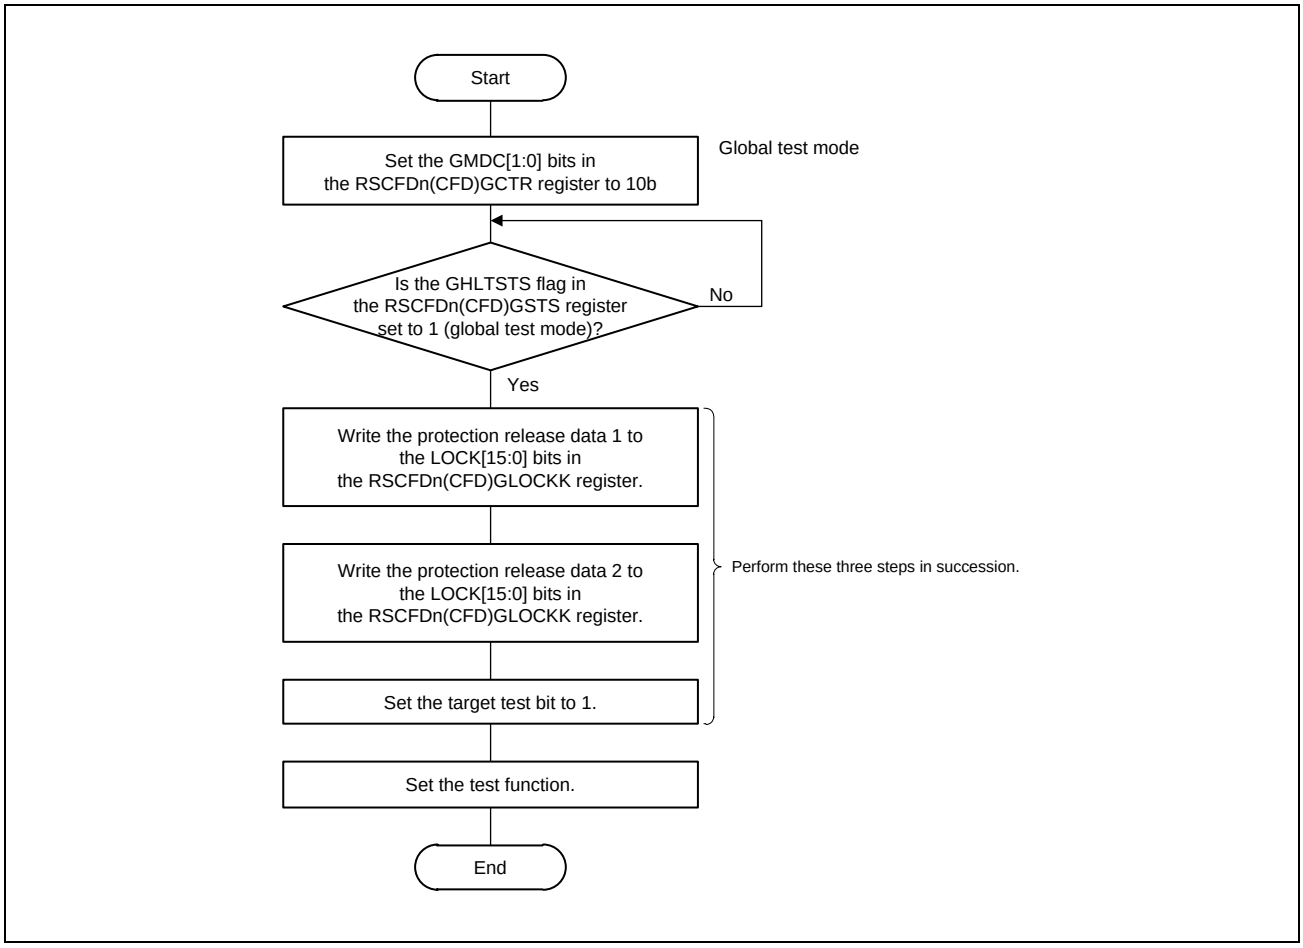


Figure 28.36 Protection Release Procedure

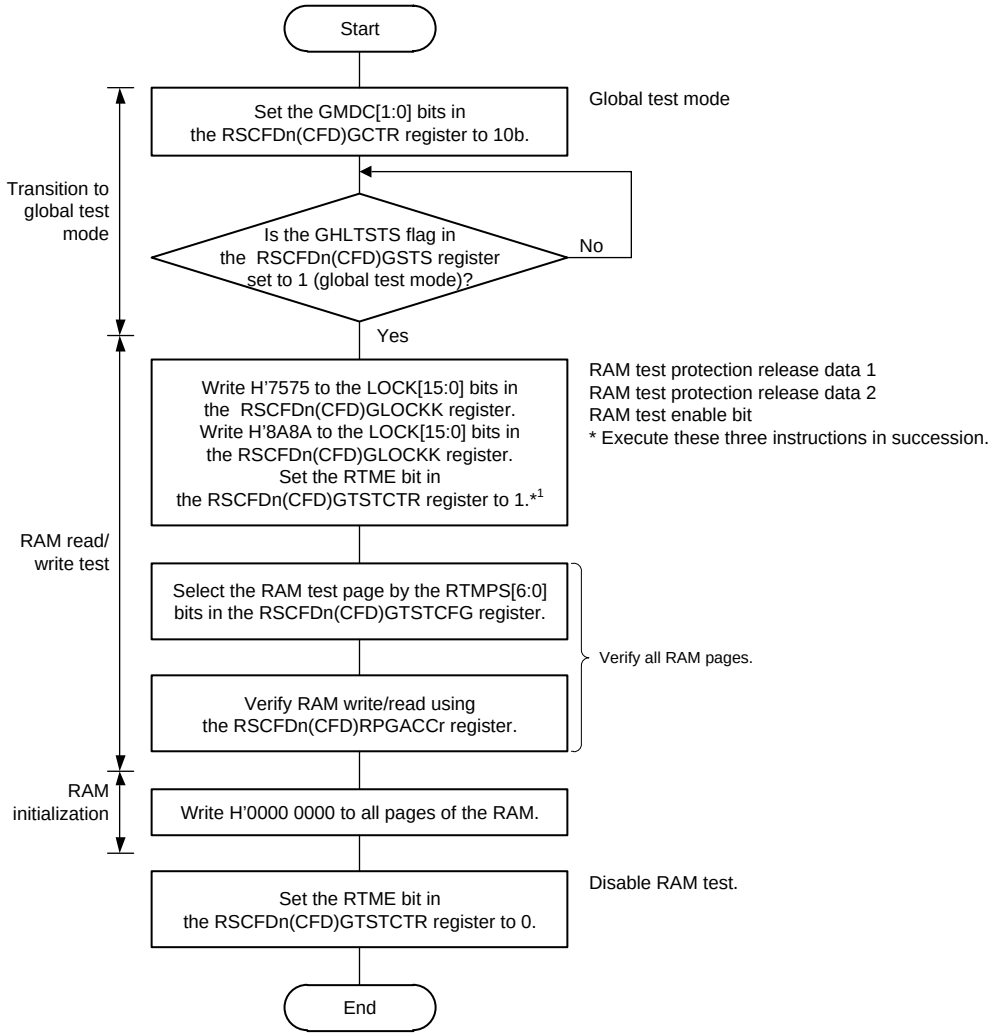
28.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write H'0000 0000 to all pages of the CAN RAM.

Figure 28.37 shows the RAM test setting procedure.



Note: r = 0 to 63

Note 1. Before transitioning to the RAM test, perform the following.
- Cancel transmission request.
- Disable of each FIFO and transmission queue
- Clear flag of receive buffer

Figure 28.37 RAM Test Setting Procedure

28.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 28.38 shows the inter-channel communication test setting procedure.

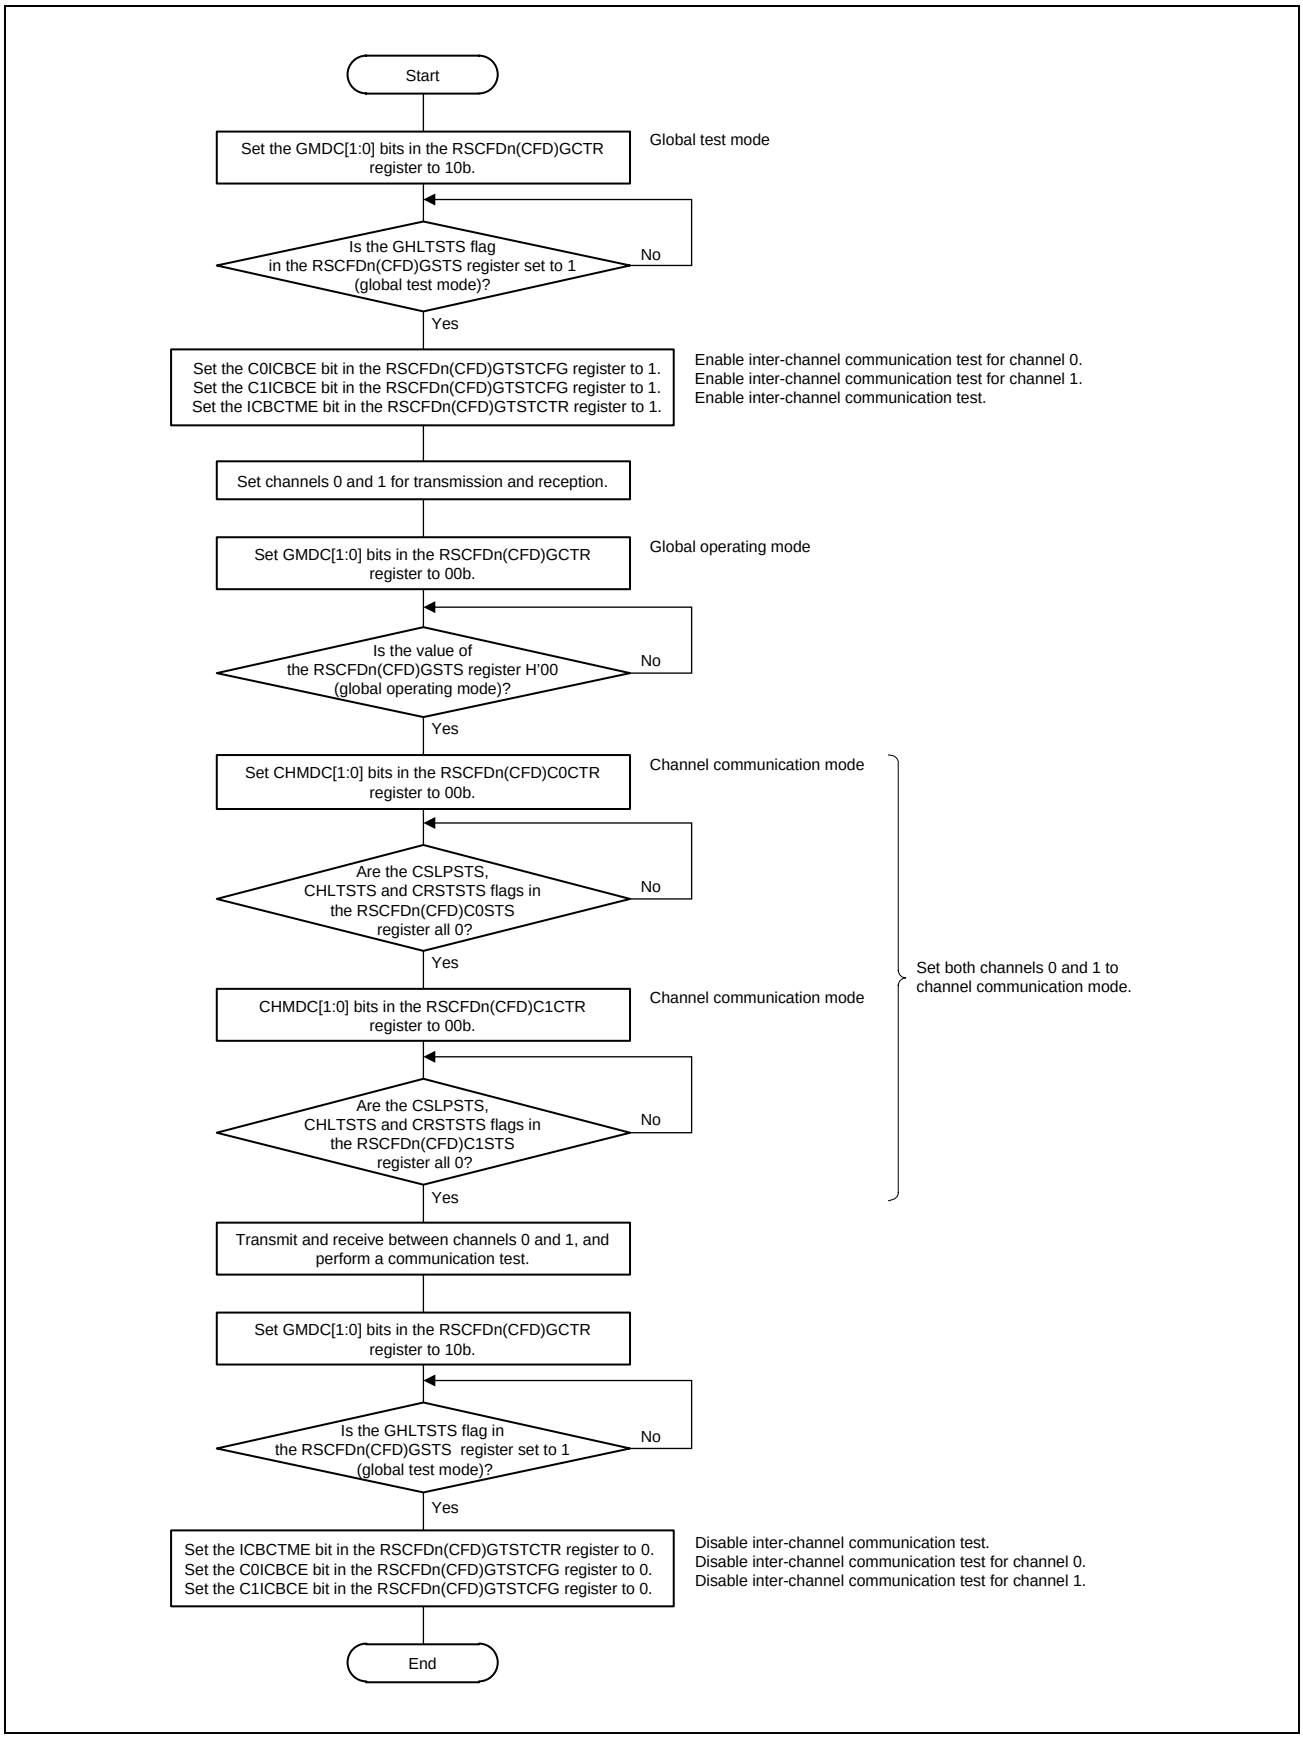


Figure 28.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

28.12 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0, 1) for transitions.
- When only classical CAN frames are used in CANFD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to H’00. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS2, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS2, RSCFDn(CFD)TMTCSTS0 to RSCFDn(CFD)TMTCSTS2, and RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CANFD mode), write H’00 to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not bet allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CANFD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/ receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in **Section 28.3, Registers (Classical CAN Mode)** and **Section 28.4, Registers (CANFD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
  - Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)

- Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
- Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
- Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
- Transmit history access register (RSCFDn(CFD)THLACCm registers)
- RAM test page access register (RSCFDn(CFD)RPGACCr registers)

- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

30. Gigabit Ethernet Interface

Gigabit Ethernet Interface includes Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard. When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

Internal TCP/IP Offload Engine (TOE) calculates Checksum by hardware and has functions filtering Ethernet Frames and automatically responding specific frames. Dedicated Direct memory access controller (DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the URAM at high speed.

30.1 Features

30.1.1 Specification

- 2 channels
- Supports transfer at 1000 Mbps and 100 Mbps, 10 Mbps
- Supports filtering of Ethernet frames
- Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface)
- Supports interface conforming to IEEE802.3 PHYMII (Media Independent Interface)

Table 30.1 lists the features of the Gigabit Ethernet Interface block.

Table 30.1 Specifications (Functions) (1/2)

IP Name	1. Function
E-MAC	(1) Transmission and reception of Ethernet (IEEE 802.3) frames (2) Supports transfer at 10, 100 and 1000 Mbps in Full-duplex Mode, 10, 100 Mbps in Half-duplex Mode (3) Flow control conforming with the IEEE 802.3x standard (4) Supports MII (Media Independent Interface) and RGMII (Reduced Gigabit Media Independent Interface) (5) Transmission/Reception Low Power Idle Code
TOE	(1) Calculation of Checksum for following part of frames – IPv4 Header – IPv4 TCP/UDP/ICMP – IPv6 TCP/UDP/ICMP (2) Filtering of Ethernet Frames The Possible Configuration of Filter Condition are followings. – Ethernet Type – IP Protocol No. – UDP destination port No. – Destination MAC address (Unicast) – Destination MAC address (Broadcast) – Destination MAC address (Multicast) – ARP Request of Local Station – Neighbor Solicitation of Local Station – Except IPv6 Next Header (Analyzable) (3) Automatically Responding to ARP Request and Neighbor Solicitation

Table 30.1 Specifications (Functions) (2/2)

IP Name	1. Function
DMAC	(1) Supports AXI for DMA (128bit data width) (2) Supports APB for register access (32bit data width) (3) Direct Memory Access between URAM and TOE/E-MAC by Descriptor Method (4) Supported Maximum Frame Size are followings. – Transmission Frame is 1.5 KByte – Reception Frame is 8 Kbyte

30.1.2 Block Diagram

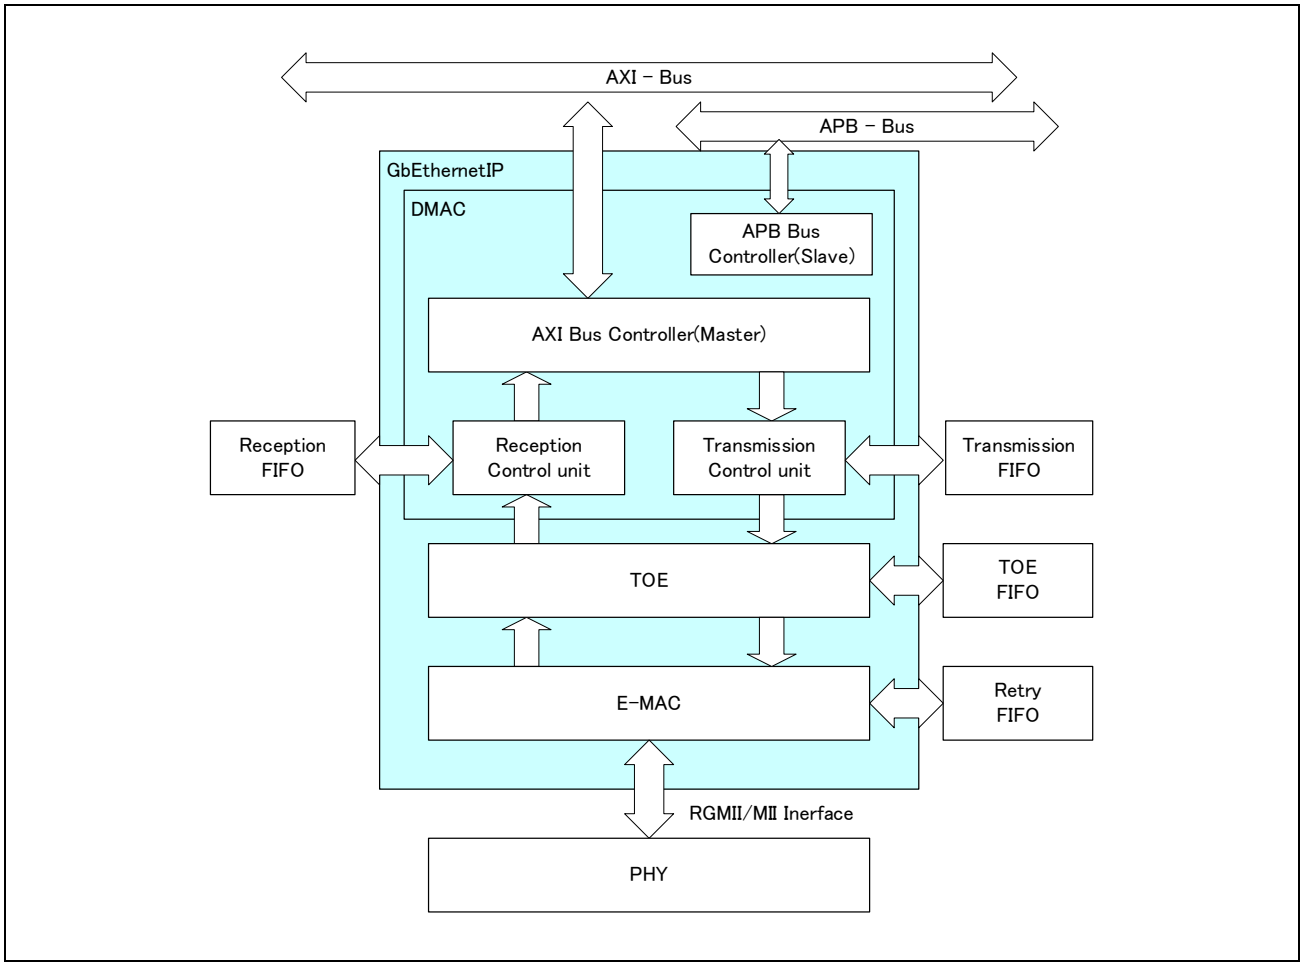

Figure 30.1 Block Diagram of Gigabit Ethernet Interface

30.2 External signal pins

Table 30.2 shows external signal pins for Gigabit Ethernet Interface.

Table 30.2 External pin Interface

Name	I/O	Description	Active Level	Initial value	Handling in not used
ET0_TXC/TX_CLK	I	Ch0 transmit clock signal	—	—	Pull-Down
ET0_TX_CTL/TX_EN	O	Ch0 Transmit control/enable signal	H	0b	Open
ET0_TXD[3-0]	O	Ch0 Transmit data signal	—	0b	Open
ET0_TX_ERR	O	Ch0 Transmit error signal	H	0b	Open
ET0_TX_COL	I	Ch0 Transmit collision signal	H	—	Pull-Down
ET0_TX_CRS	I	Ch0 Transmit carrier sense signal	H	—	Pull-Down
ET0_RXC/RX_CLK	I	Ch0 Receive clock signal	—	—	Pull-Down
ET0_RX_CTL/RX_DV	I	Ch0 Receive data Control/valid signal	H	—	Pull-Down
ET0_RXD[3-0]	I	Ch0 Receive data signal	—	—	Pull-Down
ET0_RX_ERR	I	Ch0 Receive error signal	H	—	Pull-Down
ET0_MDC	O	Ch0 Management information transfer clock signal	—	0b	Open
ET0_MDIO	I/O	Ch0 Management information transmit/receive data	—	Open	Pull-Down
ET0_LINKSTA	I	Ch0 PHY Link status signal	H	—	Pull-Down
ET1_TXC/TX_CLK	I	Ch1 transmit clock signal	—	—	Pull-Down
ET1_TX_CTL/TX_EN	O	Ch1 Transmit control/enable signal	H	0b	Open
ET1_TXD[3-0]	O	Ch1 Transmit data signal	—	0b	Open
ET1_TX_ERR	O	Ch1 Transmit error signal	H	0b	Open
ET1_TX_COL	I	Ch1 Transmit collision signal	H	—	Pull-Down
ET1_TX_CRS	I	Ch1 Transmit carrier sense signal	H	—	Pull-Down
ET1_RXC/RX_CLK	I	Ch1 Receive clock signal	—	—	Pull-Down
ET1_RX_CTL/RX_DV	I	Ch1 Receive data Control/valid signal	H	—	Pull-Down
ET1_RXD[3-0]	I	Ch1 Receive data signal	—	—	Pull-Down
ET1_RX_ERR	I	Ch1 Receive error signal	H	—	Pull-Down
ET1_MDC	O	Ch1 Management information transfer clock signal	—	0b	Open
ET1_MDIO	I/O	Ch1 Management information transmit/receive data	—	Open	Pull-Down
ET1_LINKSTA	I	Ch1 PHY Link status signal	H	—	Pull-Down

30.3 Register Configuration

30.3.1 Register Base Address

The base addresses of each channel are listed in the following table.

Table 30.3 Register Base Address

Register Name	Base Address Name	Base Address
ETH0	<ETH0_CA55_base>	H'0_11C2_0000
ETH1	<ETH1_CA55_base>	H'0_11C3_0000

30.3.2 IO Mode Registers

Refer to **Section 41, General Purpose Input Output Port (GPIO)** for Gigabit Ethernet Interface IO mode configuration.

30.3.3 DMAC Registers

Table 30.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (1/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
DMAC mode register	CCC	R/W	H'0000 0000	H'000	32
Descriptor base address table register	DBAT	R/W	H'0000 0000	H'004	32
Descriptor base address load request register	DLR	R/W	H'003F FFFF	H'008	32
DMAC status register	CSR	R	H'0000 0001	H'00C	32
Current descriptor address register q (q = 0,4)	CDARq	R	H'0000 0000	H'010 + q × 4	32
Error status register	ESR	R	H'0000 0000	H'088	32
Receive configuration register	RCR	R/W	H'6000 0000	H'090	32
Reception Truncation Configuration register	RTC	R/W	H'7FFC 7FFC	H'0B4	32
Transmit configuration register	TGC	R/W	H'0022 2200	H'300	32
Transmit configuration control register	TCCR	R/W	H'0000 0000	H'304	32
Transmit status register	TSR	R	H'0000 0000	H'308	32
MAC status FIFO Access register	MFA	R	H'0000 0000	H'30C	32
MAC status FIFO Access 2 register	MFA2	R	H'0000 0000	H'340	32
Descriptor interrupt control register	DIC	R/W	H'0000 0000	H'350	32
Descriptor interrupt status register	DIS	R/W	H'0000 0000	H'354	32
Error interrupt control register	EIC	R/W	H'0000 0000	H'358	32
Error interrupt status register	EIS	R/W	H'0000 0000	H'35C	32
Receive interrupt control register 0	RIC0	R/W	H'0000 0000	H'360	32
Receive interrupt status register 0	RIS0	R/W	H'0000 0000	H'364	32
Receive interrupt control register 1	RIC1	R/W	H'0000 0000	H'368	32
Receive interrupt status register 1	RIS1	R/W	H'0000 0000	H'36C	32
Receive interrupt control register 2	RIC2	R/W	H'0000 0000	H'370	32
Receive interrupt status register 2	RIS2	R/W	H'0000 0000	H'374	32
Transmit interrupt control register	TIC	R/W	H'0000 0000	H'378	32

Table 30.4 Configuration of DMAC-related Registers (From H'000 to H'4FF) (2/2)

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Transmit interrupt status register	TIS	R/W	H'0000 0000	H'37C	32
Interrupt summary status register	ISS	R	H'0000 0000	H'380	32
Common Interrupt Enable register	CIE	R/W	H'0000 0000	H'384	32
Receive Interrupt Control register 3	RIC3	R/W	H'0000 0000	H'388	32
Receive Interrupt Status register 3	RIS3	R/W	H'0000 0000	H'38C	32
Descriptor Interrupt Enable register	DIE	R/W	H'0000 0000	H'450	32
Descriptor Interrupt Disable register	DID	R/W	H'0000 0000	H'454	32
Error Interrupt Enable register	EIE	R/W	H'0000 0000	H'458	32
Error Interrupt Disable register	EID	R/W	H'0000 0000	H'45C	32
Receive Interrupt Enable register 0	RIE0	R/W	H'0000 0000	H'460	32
Receive Interrupt Disable register 0	RID0	R/W	H'0000 0000	H'464	32
Receive Interrupt Enable register 1	RIE1	R/W	H'0000 0000	H'468	32
Receive Interrupt Disable register 1	RID1	R/W	H'0000 0000	H'46C	32
Receive Interrupt Enable register 2	RIE2	R/W	H'0000 0000	H'470	32
Receive Interrupt Disable register 2	RID2	R/W	H'0000 0000	H'474	32
Transmit Interrupt Enable register	TIE	R/W	H'0000 0000	H'478	32
Transmit Interrupt Disable register	TID	R/W	H'0000 0000	H'47C	32
Receive Interrupt Enable register 3	RIE3	R/W	H'0000 0000	H'488	32

30.4 Register Descriptions

30.4.1 DMAC Registers

30.4.1.1 DMAC Mode Register (CCC)

The CCC register specifies the operating mode of the DMAC.

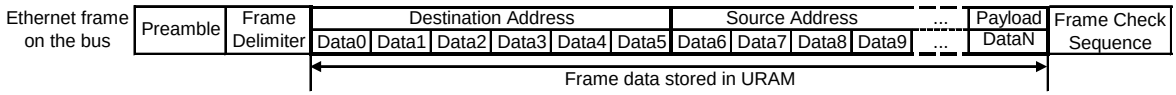
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FCE	—	—	—	—	BOC	—	ERCS	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RDFD	DTSR	—	—	—	—	—	—	OPC[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
25	FCE	0b	R/W	Flow Control Enable 0b Flow control disabled 1b Flow control enabled This bit enables the flow control support of E-MAC. When flow control is enabled, the E-MAC gets informed about the Reception FIFO level (Reception FIFO fill level reached RCR.RFCL).
24 to 21	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
20	BOC	0b	R/W	Byte Order Configuration 0b First Ethernet byte in URAM [7:0] This bit defines the byte ordering of frame data in URAM in relation to the byte order in the Ethernet frame. The CPU can only write 0b to this bit.*1
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	ERCS	0b	R/W	Enable Reference 250MHz Clock Stop function 0b Disable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function. 1b Enable reference 250 MHz clock(clk_miitx_gtx_refclk) stop function. This bit enables the stop function of reference clock of Ethernet. When this bit is '1', Gigabit Ethernet Interface asserts Output Signal “refclk_stop_en” during it does not need reference clock. *Note*: If PHY does not support stopping TXC of RGMII Interface, set “0” to this bit. Because TXC is generated from clk_miitx_gtx_refclk. [Changing condition] This bit is set to 0b when RESET mode is entered.
17 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
9	RDFD	0b	R/W	Reception Descriptor Fetch Disable 0b Reception Descriptor Fetch Enable 1b Reception Descriptor Fetch Disable This register is used to stop the fetch of reception descriptor. By fetch stops, the state of Reception Descriptor Controller of DMAC will stop at IDLE. CSR.RDFDM indicates the current fetch status of reception descriptor. The CPU should not change any configuration or mode until CSR.RDFDM is updated once the Reception Descriptor Fetch Disable request is given. The CPU should not cancel the Reception Descriptor Fetch Disable request (set this bit to 0b) before CSR.RDFDM is read as 1b.
8	DTSR	0b	R/W	Data Transfer Suspend Request 0b Normal operation 1b Request suspension of data transfer This bit requests to suspend further Gigabit Ethernet Interface accesses to URAM. A currently on-going access is completed. CSR.DTS indicates the current suspend status. The CPU should not change any configuration or mode until CSR.DTS is updated once data transfer suspend request is given. The CPU should not cancel the data transfer suspend request (set this bit to 0b) before CSR.DTS is read as 1b.
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	OPC	00b	R/W	OPeration Command 00b Enter RESET mode 01b Enter CONFIG mode 10b Enter OPERATION mode 11b Reserved These bits define the operating mode DMAC should enter. Refer to **Section 4.1** for details about the operating modes. The CPU can write to these bits in any operating mode. [Changing condition] These bits are set to 00b when RESET mode is entered.

Note 1. Following illustrates a received Ethernet frame and the part of the frame stored in URAM.

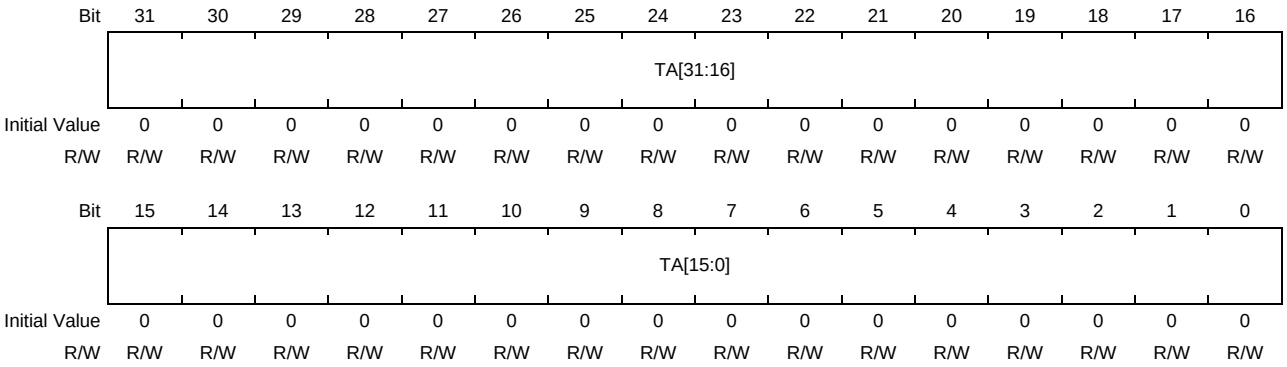


When CCC.BOC is 0b, an Ethernet frame is represented in URAM as:

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DPTR+0	Data3								Data2								Data1								Data0							
DPTR+4	Data7								Data6								Data5								Data4							
DPTR+8	Data11								Data10								Data9								Data8							

30.4.1.2 Descriptor Base Address Table Register (DBAT)

The DBAT register specifies the base address of the descriptor table in the URAM.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TA[31:0]	H'0000_0000	R/W	Table Address Address of descriptor base address table in URAM These bits define the address of the first entry of the descriptor base address table. Refer to **Section 4.2.3** about function and structure of the descriptor base address table. The CPU can only write to these bits if CSR.OPS is CONFIG and OPERATION. The CPU should only write values which are a multiple of 4 to these bits.

30.4.1.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the count descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	LBA4	—	—	—	LBA0
Initial Value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 5	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
4	LBA4	1b	R/W	Load Base Address 4(Rx0) 0b No pending load request 1b Pending load request This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8*4). By setting this bit to 1b CPU requests a load of the current descriptor address of queue q. If there is an on-going transfer for queue q, the load is processed after the whole frame has been transferred. Note: In case of a transmission queue, the load function is not influencing the transmit start request (TCCR.TSRQ); so, fetching continues at base address. To prevent this behavior, it is recommended to request the load of transmission queues only when TCCR.TSRQ is 0b. The CPU can only write to this bit if CSR.OPS is OPERATION. The CPU can only write 1b to this bit. [Changing condition] This bit is set to 1b when leaving OPERATION mode. This bit is set to 0b when there is no on-going transfer (related to old chain) for queue q. Note for verification: In Rx, if the entirety or the final part of a frame is stored into a FEMPTY_ND descriptor, then there is no actual frame transfer to URAM but still LBA reload is processed only when the transfer from RxRAM to BMI is completed for that frame.
3 to 1	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
0	LBA0	1b	R/W	Load Base Address 0(Tx0) 0b No pending load request 1b Pending load request This bit requests to set the current descriptor address of queue q (CDARq.CDA) to an entry of the descriptor base address table (DBAT.TA + 8*0). For the other description, refer to LBA4 bit of this register.

30.4.1.4 DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the DMAC is running and the individual communications states.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TDUO	RPO	—	—	—	TPO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RCSI	RDFDM	DTS	—	—	—	—	OPS[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	TDUO	0b	R	Transmission Descriptor Update On-going 0b No pending descriptor update 1b Pending descriptor update in URAM This bit indicates that there is pending descriptor update for a transmit queue. When this bit is 1b, there are descriptors of already or currently processed transmit storage elements not updated in URAM. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when all transmit queue related storage elements processed. This bit is set to 1b when descriptor related status update procedure starts (descriptor update and SFR flagging).
20	RPO	0b	R	Reception Process On-going 0b No pending reception 1b Pending received frames in Reception FIFO This bit indicates that there is pending receive data for a receive queues. When this bit is 1b, there are frames in Reception FIFO that are not completely stored in URAM. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when a frame is completely stored in URAM, the descriptor update has been completed, and there are no pending frames in Reception FIFO for storage to URAM. This bit is set to 1b when a frame received by E-MAC is completely stored in Reception FIFO.
19 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TPO	0b	R	Transmission Process On-going 0b No pending transmission 1b Pending frames for transmission This bit indicates that there is pending or on-going transmission process for transmit queue. When this bit is 1b, a frame fetch from the queue in URAM has been started or completed but this frame has not been completely transmitted by E-MAC Descriptor write back is not included in this bit.
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
10	RCSI	0b	R	Reference 250 MHz Clock is being Stopped Internally 0b Reference 250 MHz Clock is being not stopped internally 1b Reference 250 MHz Clock is being stopped internally This bit indicates that Gigabit Ethernet Interface has stopped Reference 250 MHz Clock (clk_miitx_gtx_refclk) internally or not. When this bit is 1b, Internal Gated Clock Cell for Reference 250 MHz Clock is closed. During that time, this clock is not provided to internal logics. [Changing condition] This bit is set to 0b when the condition of input signal “refclk_stop” changes to 0b. This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CCC.ERCS is 0b. This bit is set to 1b when the condition of output signal “refclk_stop_en” changes to 1b.
9	RDFDM	0b	R	Reception Descriptor Fetch Disable Monitor 0b Reception Descriptor Fetch will happen 1b Reception Descriptor Fetch is stopped This bit is for monitoring. It can be used in order to confirm a state of Reception Descriptor Controller of DMAC. If this bit is '1', it means the fetch of Reception Descriptor from URAM by DMAC is completely stopped. [Changing condition] This bit is set to 0b when CCC.RDFD is 0b. This bit is set to 0b when RESET mode is entered. This bit is set to 1b when CCC.RDFD is 1b and fetch of Reception Descriptor from URAM is completely stopped.
8	DTS	0b	R	Data Transfer Suspended 0b Access to URAM will happen 1b Access to URAM is suspended This bit indicates if DMAC is allowed to access URAM. [Changing condition] This bit is set to 0b when CCC.DTSR is 0b. This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when CCC.DTSR is 1b and there is no on-going URAM access.
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	OPS	0001b	R	OPerating mode Status 0001b RESET 0010b CONFIG 0100b OPERATION others reserved These bits represent the current operating mode of DMAC. [Changing condition] These bits are updated when an operating mode changes is processed.

30.4.1.5 Current Descriptor Address Register q (CDARq) (q = 0,4)

The CDARq register indicates the current descriptor address.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDA[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDA[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDA	All 0	R	Current Descriptor Address Current descriptor address of transmission / receive queue q These bits indicate the address of the descriptor which is currently being processed by queue q or which will be processed when queue q gets active. For q=0 the addresses refer to the transmit queues. From q=4 the addresses refer to the receive queues. *Note*: The current descriptor address cannot be used for HW/SW synchronization. CDARq.CDA may one or more descriptors ahead from information available in URAM. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to DBAT.TA + 8*q when entering OPERATION mode. These bits are set to DBAT.TA + 8*q when the load base address request of queue (DLR.LBA) has been processed. These bits are set to DESCR.DPTR when a link descriptor (LINK, LINKFIX) has been processed. These bits are incremented by the size of the descriptor control structure (8 for normal) when a frame data descriptor has been processed.

30.4.1.6 Error Status Register (ESR)

Error Status Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

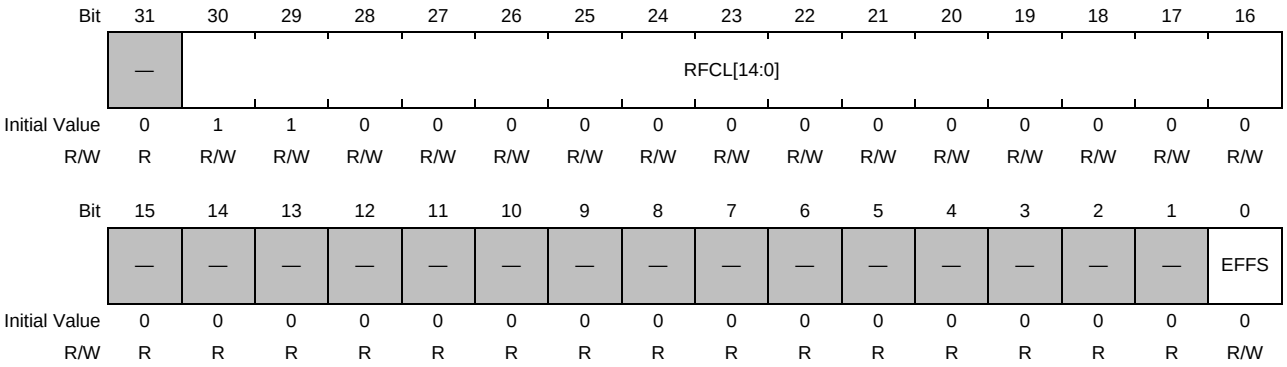
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	EIL	0b	R	Error Information Lost 0b No loss of error information 1b Lost of error information detected This bit indicates that error information detected by Gigabit Ethernet Interface is lost because the previous reported error has not been processed by CPU. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CPU writes 0b to EIS.QEF. This bit is set to 1b when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1b.
11 to 8	ET	0000b	R	Error Type 0000b (0) Read descriptor from URAM 0001b (1) Write descriptor to URAM 0010b (2) Interpret read descriptor 0011b (3) Transmission FIFO is corrupted 0100b (4) Read data from URAM 0101b (5) Write data to URAM 0110b (6) Reading data from Reception FIFO 0111b (7) Reception FIFO is corrupted 1000b (8) Frame size error during reception detected 1001b (9) Reserved 1010b (10) Transmission FIFO Data access error others reserved These bits indicate details about the transfer stage which was handled when Gigabit Ethernet Interface has detected an error. When the fault is related to the read descriptor (ESR.ET=0 or 2), CPU needs to correct the faulty descriptor before the related queue can continue processing. In this case the queue halts at the faulty descriptor and CDARq.CDA (with q=ESR.EQN) identifies faulty descriptor. All other errors are transient in nature and may be corrected by continuation of HW or SW operation; so there is no strong demand on CPU interaction. The CPU should only evaluate these bits when EIS.QEF is 1b. [Changing condition] These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	EQN	00000b	R	Number of faulty queue These bits indicate the queue number which was being handled when Gigabit Ethernet Interface has detected an error. A fault reported for ESR.EQN= 0 is related to transmit queue. From ESR.EQN=4 the fault is related to receive queue. The CPU should only evaluate these bits when EIS.QEF is 1b. The CPU should not evaluate these bits when ESR.ET is 0011b, 0111b. [Changing condition] These bits are updated when the set condition of EIS.QEF is fulfilled and EIS.QEF is 0b.

30.4.1.7 Receive Configuration Register (RCR)

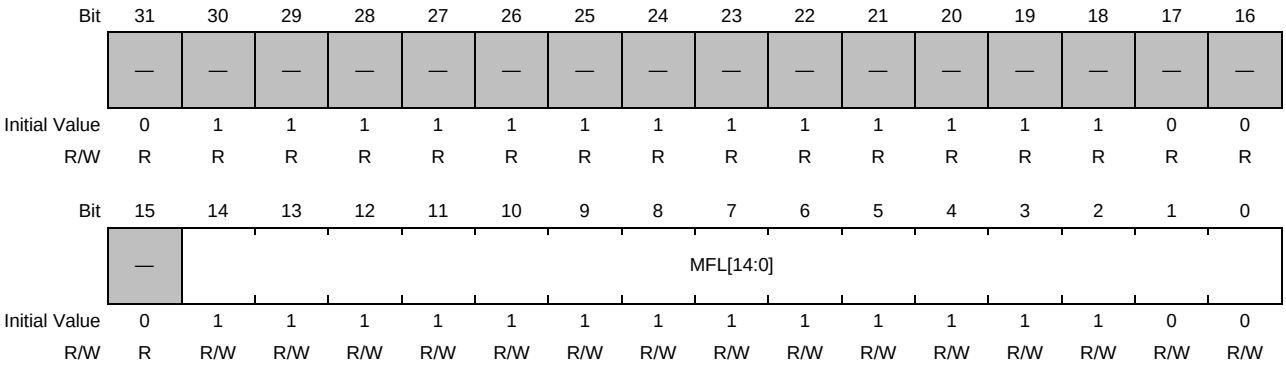
The RCR register is used to make settings related to reception for the DMAC.



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 16	RFCL[14:0]	H'6000	R/W	Reception FIFO Critical Level Number of bytes stored in Reception FIFO before critical level is reached (RFCL[1:0] are fixed to 0). These bits define a fill level of the Reception FIFO in bytes to generate FIFO critical level reached warning notification (RIS1.RFWF). The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	EFFS	0b	R/W	Enable Faulty Frame Storage 0b Storage of faulty frames disabled 1b Storage of faulty frames enabled (for debug) This bit enables the storage of received frames classified as faulty by the TOE or E-MAC. Faulty received frames will always be stored in receive queue. *Note*: DESCR.MSC informs about the reception fault detected by the TOE or E-MAC. The CPU can only write to this bit if CSR.OPS is CONFIG. *Note*: This bit is used only for debug. Do not set RCR.EFFS=1 during normal operation.

30.4.1.8 Reception Truncation Configuration Register I (RTC)

Reception Truncation Configuration register



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 18	—	All 1	R	Reserved Whenever it is read, all bits 1 are read. The written value will be ignored.
17 to 15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 0	MFL	H'7FFC	R/W	Maximum Frame Length These bits define the maximum frame length (64 to 8k bytes) stored to URAM. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is 1000b). Additionally, the DESCR.TI in the updated descriptor is set to 1b. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits.

30.4.1.9 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the DMAC.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TBD[1:0]		—	—	—	—	—	—	—	—
Initial Value	0	0	1	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
20 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
16 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	1b	R	Reserved Whenever it is read, 1 is read. The written value will be ignored.
12 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 8	TBD	10b	R/W	Transmission FIFO Depth This bit defines the depth of the Transmission FIFO used for transmit queue. Gigabit Ethernet Interface fetches up to TGC.TBD frames from URAM to Transmission FIFO for transmit queue. The CPU can only write “10b” to this bit. Frame transmission by E-MAC can start for transmission queue when at least one frame from transmit queue is available in Transmission FIFO. The CPU can only write to these bits if CSR.OPS is CONFIG.
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.10 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the DMAC and is used to make related settings.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	MFR2	MFEN2	MFR	MFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

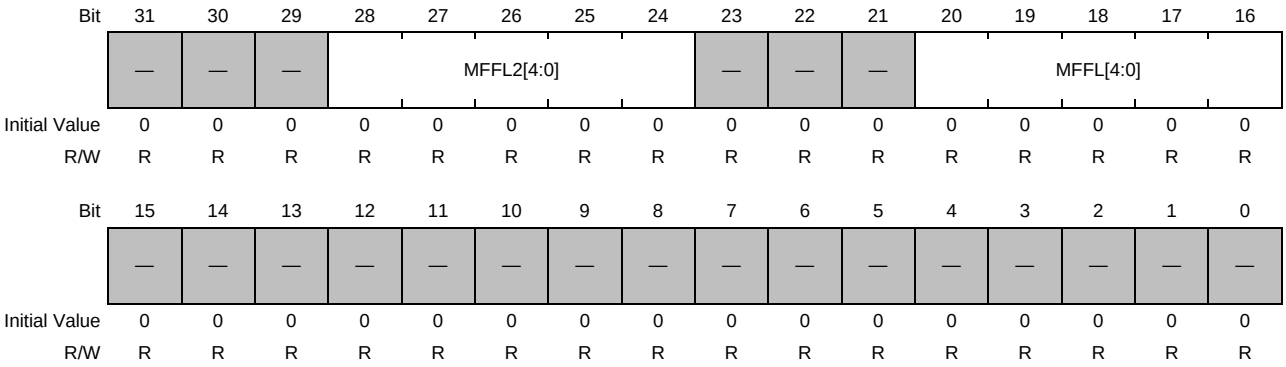
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TSRQ
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	MFR2	0b	R/W	MAC status FIFO2 Release 0b No requests to MAC status FIFO2 1b Release oldest entry of MAC status FIFO2 This bit releases the oldest entry of the MAC status FIFO2. When 1b is written to this bit, Gigabit Ethernet Interface gets informed that CPU has processed the oldest MAC status FIFO2 entry as visible in MFA2 register. The oldest entry is removed from MAC status FIFO2. This bit is always read as 0b. *Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1).
18	MFEN2	0b	R/W	MAC status FIFO2 Enable 0b Disabled 1b Enabled This bit enables the storage of transmission status information (the E-MAC flags for frame transmission) in the MAC status FIFO2. When this bit is set to 0b all pending FIFO entries are removed. *Note*: Do not use the function of this bit in the Duplex Mode (CXR20.DPM=1).
17	MFR	0b	R/W	MAC status FIFO Release 0b No request to MAC status FIFO 1b Release oldest entry of MAC status FIFO This bit releases the oldest entry of the MAC status FIFO. When 1b is written to this bit, DMAC gets informed that CPU has processed the oldest MAC status FIFO entry as visible in MFA register. The oldest entry is removed from MAC status FIFO. This bit is always read as 0b.
16	MFEN	0b	R/W	MAC status FIFO Enable 0b Disabled 1b Enabled This bit enables the storage of transmission status information (the TOE flags for frame transmission) in the MAC status FIFO. Additionally, CPU can control the status storage for each frame provided for transmission using DESCR.MSR. When this bit is set to 0b all pending FIFO entries are removed.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	TSRQ	0b	R/W	Transmission Start Request Queue 0b Transmission queue empty or stopped 1b Pending frames in queue to fetch This bit defines that frames, provided by CPU in transmit queue in URAM should be transmitted. When this bit is 1b, there are pending frames in transmit queue which have not been fetched to the Transmission FIFO. *Note*: The transmission start request cannot be used for HW/SW synchronization. TCCR.TSRQ may be cleared before frame data is completely fetched from URAM. *Note*: The frame transmission by E-MAC is decoupled from the fetching to the Transmission FIFO. Transmission scheduling for a queue depends on the transmission priority. CSR.TPO gives an indication about pending transmissions. The CPU can only write to this bit if CSR.OPS is OPERATION. The CPU can only write 1b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when CPU writes 1b to it. This bit is set to 0b when DMAC has processed an EEMPTY, FEMPTY or LEMPTY descriptor (no data available). This bit is set to 0b when DMAC has processed an EOS descriptor (end of set). This bit is set to 0b when DMAC has processed a faulty descriptor. This bit is set to 0b when CCC.OPC is 01b and there is no on-going fetch transfer for queue.

30.4.1.11 Transmit Status Register (TSR)

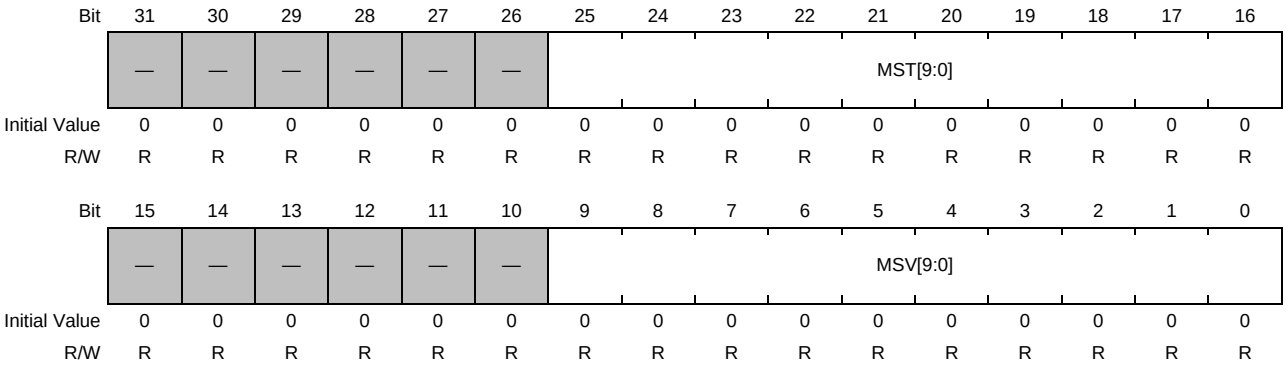
The TSR register indicates the state of transmission by the DMAC.



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
28 to 24	MFFL2	0000b	R	MAC status FIFO2 Fill Level Number of entries stored in the MAC status FIFO2 These bits indicate the number of entries available in the MAC status FIFO2. If this value is 0, the FIFO2 is empty. If this value is 16, the FIFO2 is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when TCCR.MFEN2 is 0b. This value is incremented when TCCR.MFEN2 is 1b, TSR.MFFL2 is not 16, and E-MAC detects an error during transmission of frame. This value is decremented when 1b is written to TCCR.MFR2 and TSR.MFFL2 is not 0.
23 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 16	MFFL	00000b	R	MAC status FIFO Fill Level Number of entries stored in the MAC status FIFO These bits indicate the number of entries available in the MAC status FIFO. If this value is 0, the FIFO is empty. If this value is 16, the FIFO is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when TCCR.MFEN is 0b. This value is incremented when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is not 16. This value is decremented when 1b is written to TCCR.MFR and TSR.MFFL is not 0.
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.12 MAC status FIFO Access Register (MFA)

MAC status FIFO Access register



Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25to 16	MST	H'00	R	MAC Status Tag Tag number from descriptor identifying the frame MAC status relation These bits represent the DESCR.TAG bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the TOE status available in the FIFO (MFA.MSV). The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR). These bits are updated when the FIFO is overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16). Note for verification: These bits are set to 0 when leaving OPERATION mode.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9to 0	MSV	H'00	R	MAC status value These bits represent the TOE status bits as stored in the oldest MAC status FIFO entry. MSV [9] Unsupported transmission frame MSV [8:0] Reserved The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR). These bits are updated when the FIFO overwritten (a frame with DESCR.MSR in descriptor has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16). Note for verification: These bits are set to 0 when leaving OPERATION mode.

30.4.1.13 MAC status FIFO Access 2 Register (MFA2)

MAC status FIFO Access 2 register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8 to 0	MSV2	H'00	R	MAC Status Value2 These bits represent the MAC status bits as stored in the oldest MAC status FIFO2 entry. MSV [8] abort information MSV [7:3] Reserved MSV [2] Carrier lost during frame transmission MSV [1] Delay collision MSV [0] Transmission time out The CPU should not read these bits when TSR.MFFL2 is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO2 (TSR.MFFL2 changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1b to TCCR.MFR2). These bits are updated when the FIFO2 is overwritten when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame.

30.4.1.14 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 1	DPFi	All 0	R/W	Descriptor Processed Flag i (i = 1 to 15) 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in a reception or transmit queue has been processed where DESCR.DIE is i. *Note*: When DESCR.DIE is 0000b, no descriptor interrupt is generated. *Note*: When DESCR.DIE is 0001b, in addition a queue specific descriptor interrupt is generated. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor has been processed where DESCR.DIE is i.
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.15 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 1	DPDi	All 0	R/W	Descriptor Processed interrupt Disable i (i = 1 to 15) 0b No change of DIC.DPEi 1b Set DIC.DPEi to 0b This bit supports interrupt enable. It controls set of DIC.DPEi. This bit is always read as 0b.
0	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.18 Error Interrupt Status Register (EIS)

The EIS register indicates the states of DMAC-related error interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFF2	—	MFFF	—	—	—	—	—	—	QEF	MTEF	MREF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	QFS	0b	R	Queue Full Summary 0b No interrupt pending 1b Queue full interrupt pending Summary bit to indicate that at least one queue is full. [Changing condition] This bit is set when any matching pair of RIC2.QFE enable and RIS2.QFF flag are both 1b; or when both the RIS2.RFFF flag and RIC2.RFFE enable are 1b.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFF2	0b	R/W	MAC status FIFO2 Full Flag 0b No interrupt pending 1b MAC status FIFO2 full, oldest MAC status lost MAC status FIFO2 Full Flag This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO2 is full (overwrite condition). The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when TCCR.MFEN2 is 1b, TSR.MFFL2 is 16, and E-MAC detects an error during transmission of frame.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFF	0b	R/W	MAC status FIFO Full Flag 0b No interrupt pending 1b MAC status FIFO full, oldest MAC status lost This bit indicates that a transmission MAC status is overwritten because the MAC status FIFO is full (overwrite condition). The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and TSR.MFFL is 16.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
2	QEF	0b	R/W	Queue Error Flag 0b No interrupt pending 1b Interrupt pending This bit indicates that an error has been detected while processing receive or transmit queue. Detail about the detected error is indicated by ESR. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when an error condition is detected.
1	MTEF	0b	R/W	MAC Transmission Error Flag 0b No interrupt pending 1b MAC has reported an error during transmission This bit indicates that the E-MAC has detected a fault during transmission. For detail, the E-MAC registers have to be checked. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when E-MAC detects an error during frame transmission.
0	MREF	0b	R/W	MAC Reception Error Flag 0b No interrupt pending 1b MAC has reported an error during reception This bit indicates that the E-MAC has detected a fault during reception. For detail, the E-MAC registers have to be checked. *Note*: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code is stored in the descriptor (DESCR.MSC). By evaluating this information CPU can identify corrupted frames in URAM. The CPU can only write 0b to this bit.

30.4.1.19 Error Interrupt Control Register (EIC)

The EIC register controls the DMAC-related error interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MFFE2	—	MFFE	—	—	—	—	—	—	QEE	MTEE	MREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFE2	0b	R/W	MAC status FIFO2 Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MFFF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MFFD2. This bit is set to 1b when writing 1b to EIE.MFFS2.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFE	0b	R/W	MAC status FIFO Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MFFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MFFD. This bit is set to 1b when writing 1b to EIE.MFFS.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	QEE	0b	R/W	Queue Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.QEF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.QED. This bit is set to 1b when writing 1b to EIE.QES.
1	MTEE	0b	R/W	MAC Transmission Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MTEF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MTED. This bit is set to 1b when writing 1b to EIE.MTES.

Bit	Bit Name	Initial Value	R/W	Description
0	MREE	0b	R/W	MAC Reception Error interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when EIS.MREF is 1b. [Changing condition] This bit is set to 0b when writing 1b to EID.MRED. This bit is set to 1b when writing 1b to EIE.MRES.

30.4.1.20 Error Interrupt Enable Register (EIE)

The EIE register set to 1 each bits in error interrupt control register (EIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	MFFD2	0b	R/W	MAC status FIFO2 Full interrupt Disable 0b No change of EIC.MFFE 1b Set EIC.MFFE to 0b This bit supports interrupt enable. It controls set of EIC.MFFE2. This bit is always read as 0b.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	MFFD	0b	R/W	MAC status FIFO Full interrupt Disable 0b No change of EIC.MFFE 1b Set EIC.MFFE to 0b This bit supports interrupt enable. It controls set of EIC.MFFE. This bit is always read as 0b.
8 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	QED	0b	R/W	Queue Error interrupt Disable 0b No change of EIC.QEE 1b Set EIC.QEE to 0b This bit supports interrupt enable. It controls set of EIC.QEE. This bit is always read as 0b.
1	MTED	0b	R/W	MAC Transmission Error interrupt Disable 0b No change of EIC.MTEE 1b Set EIC.MTEE to 0b This bit supports interrupt enable. It controls set of EIC.MTEE. This bit is always read as 0b.
0	MRED	0b	R/W	MAC Reception Error interrupt Disable 0b No change of EIC.MREE 1b Set EIC.MREE to 0b This bit supports interrupt enable. It controls set of EIC.MREE. This bit is always read as 0b.

30.4.1.22 Receive Interrupt Status Register 0 (RIS0)

The RIS0 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRF	0b	R/W	Frame Received Flag 0b No interrupt pending 1b New frame data is available in URAM This bit indicates that in receive queue r a frame is stored, and data is available to be processed by CPU. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame is stored in receive queue.

30.4.1.23 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRE	0b	R/W	Frame Received interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS0.FRF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID0.FRD. This bit is set to 1b when writing 1b to RIE0.FRS.

30.4.1.24 Receive Interrupt Enable Register 0 (RIE0)

The RIE0 register set to 1 each bits in receive interrupt control register (RIC0).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRS	0b	R/W	Frame Received interrupt Set r 0b No change of RIC0.FRE 1b Set RIC0.FRE to 1b This bit supports interrupt enable. It controls set of RIC0.FRE. This bit is always read as 0b.

30.4.1.25 Receive Interrupt Disable Register 0 (RID0)

The RID0 register set to 0 each bits in receive interrupt control register (RIC0).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRD	0b	R/W	Frame Received interrupt Disable 0b No change of RIC0.FRE 1b Set RIC0.FRE to 0b This bit supports interrupt enable. It controls set of RIC0.FRE. This bit is always read as 0b.

30.4.1.26 Receive Interrupt Status Register 1 (RIS1)

The RIS1 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWF	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWF	0b	R/W	Reception FIFO Warning Flag 0b No interrupt pending 1b Reception FIFO warning level reached This bit indicates that the Reception FIFO has reached the configured critical warning level. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a complete frame is received in the Reception FIFO and the fill level goes above the configured critical warning level during reception of this frame (RCR.RFCL).
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.27 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWE	0b	R/W	Reception FIFO Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS1.RFWF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID1.RFWD. This bit is set to 1b when writing 1b to RIE1.RFWS.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.28 Receive Interrupt Enable Register 1 (RIE1)

The RIE register set to 1 each bits in error receive control register (RIC1).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWS	0b	R/W	Reception FIFO Warning interrupt Set 0b No change of RIC1.RFWE 1b Set RIC1.RFWE to 1b This bit supports interrupt enable. It controls set of RIC1.RFWE. This bit is always read as 0b.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.29 Receive Interrupt Disable Register 1 (RID1)

The RID1 register set to 1 each bits in receive interrupt control register (RIC1).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFWD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RFWD	0b	R/W	Reception FIFO Warning interrupt Disable 0b No change of RIC1.RFWE 1b Set RIC1.RFWE to 0b This bit supports interrupt enable. It controls set of RIC1.RFWE. This bit is always read as 0b.
30 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

30.4.1.30 Receive Interrupt Status Register 2 (RIS2)

The RIS2 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFF	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFF	0b	R/W	Reception FIFO Full Flag 0b No interrupt pending 1b Reception FIFO full, received frame data lost This bit indicates that a frame was received by E-MAC which could not be completely stored in the Reception FIFO. The incomplete frame is lost. There is no information available which receive queue would handle this frame. Frames which are marked by E-MAC as faulty after complete reception can also trigger an overrun. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when frame data provided by E-MAC cannot be stored in the Reception FIFO.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFF	0b	R/W	Queue Full Flag 0b No interrupt pending 1b Queue full, received frame data lost This bit indicates that there was no sufficient space in receive queue to store completely a received frame. A receive queue is treated as full when no empty descriptor (read descriptor with DESCR.DT = FEMPTY or FEMPTY_ND) is available. *Note*: If there is no empty descriptor left in queue during storage of a split frame, an incomplete frame will be stored in the queue. Such incomplete frame can be identified based on a descriptor sequence error (no FEND). *Note*: Reading descriptor may be one or more storage elements ahead from actual storage in URAM. CDARq.CDA provides information where queue has been stopped. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when there is pending receive data in Reception FIFO for receive queue and there is no space left for storage. This bit is set to 1b when a SW defined stop point (EOS descriptor) reached within a split frame.

30.4.1.31 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFE	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFE	0b	R/W	Reception FIFO Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS2.RFFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID2.RFFD. This bit is set to 1b when writing 1b to RIE2.RFFS.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFE	0b	R/W	Queue Full interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS2.QFF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID2.QFD. This bit is set to 1b when writing 1b to RIE2.QFS.

30.4.1.32 Receive Interrupt Enable Register 2 (RIE2)

The RIE2 register set to 1 each bits in receive interrupt control register (RIC2).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFS	0b	R/W	Reception FIFO Full interrupt Set 0b No change of RIC2.RFFE 1b Set RIC2.RFFE to 1b This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0b.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFS	0b	R/W	Queue Full interrupt Set 0b No change of RIC2.QFE 1b Set RIC2.QFE to 1b This bit supports interrupt enable. It controls set of RIC2.QFE. This bit is always read as 0b.

30.4.1.33 Receive Interrupt Disable Register 2 (RID2)

The RID2 register set to 1 each bit in receive interrupt control register (RIC2).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RFFD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	QFD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	RFFD	0b	R/W	Reception FIFO Full interrupt Disable 0b No change of RIC2.RFFE 1b Set RIC2.RFFE to 0b This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0b.
30 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	QFD	0b	R/W	Queue Full interrupt Disable 0b No change of RIC2.QFE 1b Set RIC2.QFE to 0b This bit supports interrupt enable. It controls set of RIC2.QFE. This bit is always read as 0b.

30.4.1.34 Receive Interrupt Status Register 3 (RIS3)

The RIS3 register indicates the states of the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPF	0b	R/W	Receive Descriptor Processed Flag 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in reception queue has been processed where DESCR.DIE is 0001b. *Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in reception queue has been processed where DESCR.DIE is 1.

30.4.1.35 Receive Interrupt Control Register 3 (RIC3)

The RIC3 register controls the DMAC receive interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPE	0b	R/W	Receive Descriptor Processed interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when RIS3.RDPF is 1b. [Changing condition] This bit is set to 0b when writing 1b to RID3.RDPD. This bit is set to 1b when writing 1b to RIE3.RDPS.

30.4.1.36 Receive Interrupt Enable Register 3 (RIE3)

The RIE3 register set to 1 each bits in receive interrupt control register (RIC3).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPS	0b	R/W	Receive Descriptor Processed interrupt Set 0b No change of RIC3.RDPE 1b Set RIC3.RDPE to 1b This bit supports interrupt enable. It controls set of RIC3.RDPE. This bit is always read as 0b.

30.4.1.37 Receive Interrupt Disable Register 3 (RID3)

The RID3 register set to 0 each bits in receive interrupt control register (RIC3).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RDPD	0b	R/W	Receive Descriptor Processed interrupt Disable 0b No change of RIC3.RDPE 1b Set RIC3.RDPE to 0b This bit supports interrupt enable. It controls set of RIC3.RDPE. This bit is always read as 0b.

30.4.1.38 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the DMAC transmit interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RCSRF	MFWF2	MFUF2	MFWF	MFUF	—	—	—	—	—	—	—	—	—	FTF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPF	0b	R/W	Transmit Descriptor Processed Flag 0b No interrupt pending 1b Descriptor interrupt pending This bit indicates that a descriptor in transmit queue has been processed where DESCR.DIE is 0001b. *Note*: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a descriptor in transmit queue has been processed where DESCR.DIE is 1.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRF	0b	R/W	Reference Clock Stop Req Flag 0b No interrupt pending 1b Reference Clock Stop Request occurred This bit indicates that Gigabit Ethernet Interface expects to stop “clk_miitx_gtx_refclk”. Whenever this flag is asserted, CPU has to stop ETH_PLL (PLL to generate “clk_miitx_gtx_refclk”). To stop ETH_PLL, refer to the document of System Controller. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when CCC.ERCS is 0b. This bit is set to 1b when Gigabit Ethernet Interface has expected to stop “clk_miitx_gtx_refclk”.

Bit	Bit Name	Initial Value	R/W	Description
13	MFWF2	0b	R/W	MAC status FIFO2 Warning Flag 0b No interrupt pending 1b Tx Status FIFO2 warning level has been reached This bit indicates that the warning level of the MAC status FIFO2 (12 out of 16 entries) has been reached. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN2 is 0b. This bit is set to 0b when writing 1b to TCCR.MFR2. This bit is set to 1b when TCCR.MFEN2 is 1b, the MAC Status FIFO2 contains already 11 entries (TSR.MFFL2 is 11), and E-MAC detects an error during transmission of frame.
12	MFUF2	0b	R/W	MAC status FIFO2 Updated Flag 0b No interrupt pending 1b Tx Status FIFO2 has been updated This bit indicates that the MAC status FIFO2 has been updated when the E-MAC detects an error during transmission of frame. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN2 is 0b. This bit is set to 0b when writing 1b to TCCR.MFR2. This bit is set to 1b when TCCR.MFEN2 is 1b and E-MAC detects an error during transmission of frame.
11	MFWF	0b	R/W	MAC status FIFO Warning Flag 0b No interrupt pending 1b Tx Status FIFO warning level has been reached This bit indicates that the warning level of the MAC status FIFO (12 out of 16 entries) has been reached. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN is 0b. This bit is set to 0b when writing 1b to TCCR.MFR. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE, TCCR.MFEN is 1b and the MAC Status FIFO contains already 11 entries (TSR.MFFL is 11).
10	MFUF	0b	R/W	MAC status FIFO Updated Flag 0b No interrupt pending 1b Tx Status FIFO has been updated This bit indicates that the MAC status FIFO has been updated after the TOE has transmitted a frame. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 0b when TCCR.MFEN is 0b. This bit is set to 0b when writing 1b to TCCR.MFR. This bit is set to 1b when frame with DESCR.MSR has been transmitted to TOE and TCCR.MFEN is 1b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTF	0b	R/W	Frame Transmitted Flag 0b No interrupt pending 1b Frame transmitted by E-MAC This bit indicates that from transmit queue a frame is transmitted from DMAC. The CPU can only write 0b to this bit. [Changing condition] This bit is set to 0b when leaving OPERATION mode. This bit is set to 1b when a frame from transmit queue has been transmitted from DMAC.

30.4.1.39 Transmit Interrupt Control Register (TIC)

The TIC register controls the DMAC transmit interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	RCSRE	MFWE2	MFUE2	MFWE	MFUE	—	—	—	—	—	—	—	—	—	FTE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPE	0b	R/W	Transmit Descriptor Processed interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.TDPF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.TDPD. This bit is set to 1b when writing 1b to TIE.TDPS.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRE	0b	R/W	Reference Clock Stop Req interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.RCSRF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.RCSRD. This bit is set to 1b when writing 1b to TIE.RCSRS.
13	MFWE2	0b	R/W	MAC status FIFO2 Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFWF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFWD2. This bit is set to 1b when writing 1b to TIE.MFWS2.
12	MFUE2	0b	R/W	MAC status FIFO2 Updated interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFUF2 is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFUD2. This bit is set to 1b when writing 1b to TIE.MFUS2.

Bit	Bit Name	Initial Value	R/W	Description
11	MFWE	0b	R/W	MAC status FIFO Warning interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFWF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFWD. This bit is set to 1b when writing 1b to TIE.MFWS.
10	MFUE	0b	R/W	MAC status FIFO Updated interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.MFUF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.MFUD. This bit is set to 1b when writing 1b to TIE.MFUS.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FTE	0b	R/W	Frame Transmitted interrupt Enable 0b Disabled 1b Enabled While this bit is 1b an interrupt will be generated when TIS.FTF is 1b. [Changing condition] This bit is set to 0b when writing 1b to TID.FTD. This bit is set to 1b when writing 1b to TIE.FTS.

30.4.1.40 Transmit Interrupt Enable Register (TIE)

The TIE register set to 1 each bits in transmit interrupt control register (TIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPS	0b	R/W	Transmit Descriptor Processed interrupt Set 0b No change of TIC.TDPE 1b Set TIC.TDPE to 1b This bit supports interrupt enable. It controls set of TIC.TDPE. This bit is always read as 0b.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRS	0b	R/W	Reference Clock Stop Req interrupt Set 0b No change of TIC.RCSRE 1b Set TIC.RCSRE to 1b This bit supports interrupt enable. It controls set of TIC.RCSRE. This bit is always read as 0b.
13	MFWS2	0b	R/W	MAC status FIFO2 Warning interrupt Set 0b No change of TIC.MFWE2 1b Set TIC.MFWE2 to 1b This bit supports interrupt enable. It controls set of TIC.MFWE2. This bit is always read as 0b.
12	MFUS2	0b	R/W	MAC status FIFO2 Updated interrupt Set 0b No change of TIC.MFUE2 1b Set TIC.MFUE2 to 1b This bit supports interrupt enable. It controls set of TIC.MFUE2. This bit is always read as 0b.
11	MFWS	0b	R/W	MAC status FIFO Warning interrupt Set 0b No change of TIC.MFWE 1b Set TIC.MFWE to 1b This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0b.
10	MFUS	0b	R/W	MAC status FIFO Updated interrupt Set 0b No change of TIC.MFUE 1b Set TIC.MFUE to 1b This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTS	0b	R/W	Frame Transmitted interrupt Set 0b No change of TIC.FTE 1b Set TIC.FTE to 1b This bit supports interrupt enable. It controls set of TIC.FTE. This bit is always read as 0b.

30.4.1.41 Transmit Interrupt Disable Register (TID)

The TID register set to 0 each bits in transmit interrupt control register (TIC).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	TDPD	0b	R/W	Transmit Descriptor Processed interrupt Disable 0b No change of TIC.TDPE 1b Set TIC.TDPE to 0b This bit supports interrupt enable. It controls set of TIC.TDPE. This bit is always read as 0b.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	RCSRD	0b	R/W	Reference Clock Stop Req interrupt Disable 0b No change of TIC.RCSRE 1b Set TIC.RCSRE to 0b This bit supports interrupt enable. It controls set of TIC.RSCRE. This bit is always read as 0b.
13	MFWD2	0b	R/W	MAC status FIFO2 Warning interrupt Disable 0b No change of TIC.MFWE2 1b Set TIC.MFWE2 to 0b This bit supports interrupt enable. It controls set of TIC.MFWE2. This bit is always read as 0b.
12	MFUD2	0b	R/W	MAC status FIFO2 Updated interrupt Disable 0b No change of TIC.MFUE2 1b Set TIC.MFUE2 to 0b This bit supports interrupt enable. It controls set of TIC.MFUE2. This bit is always read as 0b.
11	MFWD	0b	R/W	MAC status FIFO Warning interrupt Disable 0b No change of TIC.MFWE 1b Set TIC.MFWE to 0b This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0b.
10	MFUD	0b	R/W	MAC status FIFO Updated interrupt Disable 0b No change of TIC.MFUE 1b Set TIC.MFUE to 0b This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0b.
9 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	FTD	0b	R/W	Frame Transmitted interrupt Disable 0b No change of TIC.FTE 1b Set TIC.FTE to 0b This bit supports interrupt enable. It controls set of TIC.FTE. This bit is always read as 0b.

30.4.1.42 Common Interrupt Enable register (CIE)

The CIE register is used to control interrupts line.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	CTIE	—	—	—	—	—	—	—	CRIE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	CTIE	0b	R/W	Common Transmit Interrupt Enable 0b Disabled 1b Enabled This bit controls transmit related interrupt outputs of Gigabit Ethernet Interface. It has no influence to internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS).
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CRIE	0b	R/W	Common Receive Interrupt Enable 0b Disabled 1b Enabled This bit controls receive related interrupt outputs of Gigabit Ethernet Interface. It has no influence to internal flagging in Gigabit Ethernet Interface SFR (e.g. ISS).

30.4.1.43 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of DMAC-related interrupts.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DPM15	DPM14	DPM13	DPM12	DPM11	DPM10	DPM9	DPM8	DPM7	DPM6	DPM5	DPM4	DPM3	DPM2	DPM1	RCSRM

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	DPMi	All 0	R	Descriptor Processed Mirror i 0b No interrupt pending 1b Descriptor interrupt pending Descriptor Processed Mirror i (i = 1 to 15) [Changing condition] This bit is set when any matching pair of DIC.DPEi enable and DIS.DPFi flag are both 1b.
16	RCSRM	0b	R	Reference Clock Stop Req Mirror 0b No interrupt pending 1b Reference Clock Stop Req interrupt pending This bit indicates that TIS.RCSRF is 1b and TIC.RCSRE is 1b. [Changing condition] This bit is updated when TIS.RCSRF or TIC.RCSRE changes.
15	MFWM2	0b	R	MAC status FIFO2 Warning Mirror 0b No interrupt pending 1b MAC status FIFO2 warning interrupt pending This bit indicates that TIS.MFWF2 is 1b and TIC.MFWE2 is 1b. [Changing condition] This bit is updated when TIS.MFWF2 or TIC.MFWE2 changes.
14	MFUM2	0b	R	MAC status FIFO2 Updated Mirror 0b No interrupt pending 1b MAC status FIFO2 updated interrupt pending This bit indicates that TIS.MFUF2 is 1b and TIC.MFUE2 is 1b. [Changing condition] This bit is updated when TIS.MFUF2 or TIC.MFUE2 changes.
13	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	RFWM	0b	R	Reception FIFO Warning Summary 0b No interrupt pending 1b Reception FIFO warning interrupt pending This bit indicates that RIS1.RFWF is 1b and RIC1.RFWE is 1b. [Changing condition] This bit is updated when RIS1.RFWF or RIC1.RFWE changes.

Bit	Bit Name	Initial Value	R/W	Description
11	MFWM	0b	R	MAC status FIFO Warning Mirror 0b No interrupt pending 1b MAC status FIFO warning interrupt pending This bit indicates that TIS.MFWF is 1b and TIC.MFWE is 1b. [Changing condition] This bit is updated when TIS.MFWF or TIC.MFWE changes.
10	MFUM	0b	R	MAC status FIFO Updated Mirror 0b No interrupt pending 1b MAC status FIFO updated interrupt pending This bit indicates that TIS.MFUF is 1b and TIC.MFUE is 1b. [Changing condition] This bit is updated when TIS.MFUF or TIC.MFUE changes.
9 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	MM	0b	R	MAC Mirror 0b No interrupt pending 1b MAC interrupt pending This bit indicates that there is a pending interrupt request issued by MAC. *Note*: The MAC is able to assert interrupt also in CONFIG mode.
6	EM	0b	R	Error Mirror 0b No interrupt pending 1b Error interrupt pending This bit indicates that at least one enabled flag in EIS is 1b or EIS.QFS is 1b. [Changing condition] This bit is updated when EIS or EIC changes.
5 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	FTM	0b	R	Frame Transmitted Mirror 0b No interrupt pending 1b Frame transmitted interrupt pending [Changing condition] This bit is set when any matching pair of TIC.FTE enable and TIS.FTF flag are both 1b. This bit is set when any matching pair of TIC.TDPE enable and TIS.TDPF flag are both 1b.
1	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FRM	0b	R	Frame Received Mirror 0b No interrupt pending 1b Frame received interrupt pending [Changing condition] This bit is set when any matching pair of RIC0.FRE enable and RIS0.FRF flag are both 1b. This bit is set when any matching pair of RIC3.RDPE enable and RIS3.RDPF flag are both 1b.

30.4.2 E-MAC Registers

30.4.2.1 E-MAC operating mode register 1 (CXR20)

CXR20 sets the E-MAC operating mode.

Rewriting the bits in this register is prohibited when the transmission function is enabled (TPE=1) and reception function is enabled (RPE=1).

Write restrictions:

Rewrite all the bits except for TPE and RPE when transmission function is disabled (TPE=0) and reception function is disabled (RPE=0).

R/W	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	TRCCM	0b	R/W	TINT/RINT Counter Clear Mode Specifies the method of clearing TINT source counter (CXR40-43) and RINT source counter (CXR50-57). 1: Clears the register to 0 when reading the register. 0: Clears the register to 0 when writing to the register. (clears any write data to 0 at write)
25	RCPT	0b	R/W	Reception CRC Pass Through 1: CRC of received frame is transferred to TOE. RCSC (auto calculation of checksum of received frame data part) function is disabled at this time. 0: CRC of received frame is not transferred to TOE.
24	TCPT	0b	R/W	Transmit CRC Pass Through 1: CRC of transmit frame is not calculated automatically (hardware calculation). It is necessary to input the data with CRC added in AT port. 0: CRC of transmit frame is calculated automatically (hardware calculation). It is necessary to input the data without CRC added in AT port.
23	RCSC	0b	R/W	Reception Check Sum Calculation 1: Checksum of received frame data part is automatically calculated (hardware calculation). RCPT must be set to 0 at this time. 0: Checksum of received frame data part is not calculated automatically (hardware calculation).
22	CXSER	0b	R/W	Carrier extension Short Error Function for debug. It should always be set to 0.

Bit	Bit Name	Initial Value	R/W	Description
21	DPAD	0b	R/W	Data Padding 1: Less than 60-byte data is transmitted without padding. 0: Less than 60-byte data is padded and transmitted as 60-byte data.
20	RZPF	0b	R/W	Reception Zero PAUSE Frame 1: Enables to receive PAUSE frame with TIME parameter value being 0. 0: Disables receiving PAUSE frame with TIME parameter value being 0.
19	TZPF	0b	R/W	Transmit Zero PAUSE Frame 1: PAUSE frame of 0 Time parameter value is transmitted at asserting “Reception FIFO Critical Level Notification” from DMAC 0: PAUSE frame of 0 Time parameter value is not transmitted at asserting “Reception FIFO Critical Level Notification” from DMAC
18	PFR	0b	R/W	PAUSE Frame Receive 1: PAUSE frame is transferred to TOE. 0: PAUSE frame is not transferred to TOE.
17	RXF	0b	R/W	Receive Flow control mode 1: Receive flow control function (PAUSE frame reception) is enabled. 0: Receive flow control function (PAUSE frame reception) is disabled.
16	TXF	0b	R/W	Transmit Flow control mode 1: Transmit flow control function (PAUSE frame transmission) is enabled. 0: Transmit flow control function (PAUSE frame transmission) is disabled.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	CER	0b	R/W	CRC Error Used for debugging. It should always be set to 0.
11 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
8 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	RPE	0b	R/W	Receive Port Enable 1: Receive function of E-MAC is enabled. 0: Receive function of E-MAC is disabled. If 1 is changed to 0 while a frame is being received, the frame is completely received.
5	TPE	0b	R/W	Transmit Port Enable 1: Transmission function of E-MAC is enabled. 0: Transmission function of E-MAC is disabled. If 1 is changed to 0 while a frame is being transmitted, the frame is completely transmitted.
4	LPM	0b	R/W	Low Power Mode 1: E-MAC operates as Low Power Mode. 0: E-MAC operates as Normal Mode. (When LPM bit is set to “1”, DPM bit should be also set to “1”)
3 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DPM	0b	R/W	Duplex Mode 1: Operates in full duplex mode. 0: Operates in half duplex mode.

Bit	Bit Name	Initial Value	R/W	Description
0	PRM	0b	R/W	Promiscuous Mode 1: All the frames except for PAUSE frame are received. Self-addressed unicast, different address unicast, multicast, and broadcast frames are all transferred to TOE. PAUSE frame reception is controlled by PFR bit. 0: Self-addressed unicast, multicast, and broadcast frames are received, then transferred to TOE.

30.4.2.2 Maximum receive frame length register (CXR2A)

CXR2A sets the maximum receive frame length.

Write restrictions:

If CXR20_bit6 is set to 1, it is not allowed to rewrite to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

17 to 0	LEN_LMT	H'000	R/W	frame LENgth upper LiMiT value Sets the maximum receive frame length (Including CRC). If the receive frame length exceeds the set value, frame length error (RINT4) is asserted. < Set value > — < Check value > H'00000 to H'005EE — 1518 Byte H'005EF — 1519 Byte H'005F0 — 1520 Byte … H'007FF — 2047 Byte H'00800 — 2048 Byte … H'01000 — 4096 Byte … H'10000 — 65536 Byte … H'20000 to H'3FFFF — 131072 Byte

30.4.2.3 Interrupt status register (CXR21)

CXR21 indicates interrupt status.

Read restrictions:

When the PHY used does not have an INT signal, consider the read value of PHYI bit (bit3) as undefined.

Write restrictions:

Writing 0 is invalid. 1 or 0 cannot be written to bit 3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PFRI	0b	R/W	PAUSE Frame Retry Interrupt Interrupt source based on the PAUSE frame transmission retry count: Indicates that the PAUSE frame transmission is retried for the number of times specified using the CXR81 register. This bit can be cleared to 0 in the following way. (1) Read the CXR82 register to clear CXR82. (2) Write 1 to this bit.
3	PHYI	Xb	R/W	PHY Interrupt PHY chip interrupt source: Indicates status of 'PHY INT' of the E-MAC input/output signals. 1: Interrupt from PHY is asserted. 0: Interrupt from PHY is negated. Signal polarity of 'PHY INT' can be set using CXR2C. *Note*: When the PHY used does not have an INT signal, the read value of this bit should be undefined.
2	LINKI	0b	R/W	LINK Interrupt Link status change interrupt source: Indicates that on/off of bit 0 (LINK) of CXR2B has changed. Write 1 to clear this bit. *Note*: Before referring to this bit, determine whether to use PHY_LINK input signal or RGMII-Inband Status LINK bit as the link using SEL_LINK (bit 0) in the CXR31 register.
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
0	FCI	0b	R/W	False Carrier Interrupt Invalid carrier detected interrupt source: Indicates that an invalid carrier was detected in the PHY chip. Write 1 to clear this bit to 0.

30.4.2.4 Enables/disables interrupts register (CXR22)

CXR22 enables/disables interrupts.

It is possible to enable/disable interrupts for each interrupt source indicated in CXR21 (bit unit).

Write restrictions:

If the PHY used does not have an INT signal, set PHYIM bit (bit 3) to 0. In the case of without using PHY_LINK signal and without using RGMII Inband Status function (case of setting ‘10’ or ‘11’ to SEL_LINK of CXR31), set PHYIM bit (bit 2) to 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	PFRIM	0b	R/W	PAUSE Frame Retry Interrupt Mask 1: Interrupt by PFRI bit in the CXR21 register is enabled. 0: Interrupt by PFRI bit in the CXR21 register is disabled.
3	PHYIM	0b	R/W	PHY Interrupt Mask 1: Interrupt by PHYI bit in the CXR21 register is enabled. 0: Interrupt by PHYI bit in the CXR21 register is disabled. *Note*: If the PHY used does not have an INT signal, set this bit to 0.
2	LINKIM	0b	R/W	LINK Interrupt Mask 1: Interrupt by LINKI bit in the CXR21 register is enabled. 0: Interrupt by LINKI bit in the CXR21 register is disabled.
1	—	0b	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
0	FCIM	0b	R/W	False Carrier Interrupt Mask 1: Interrupt by FCI bit in the CXR21 register is enabled. 0: Interrupt by FCI bit in the CXR21 register is disabled.

30.4.2.5 PHY register access register (CXR23)

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

For PHY register access using CXR23, see **Section 30.5.14.3(2), PHY Register Access Method (Using CXR23)** and IEEE Standard 802.3, 2000 Edition “22.2.4.5 Management frame structure.”

Write restrictions:

Writing bit 3 is invalid.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SOFT_LINK	SIGNAL_LINK	INBAND_LINK	LINK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	X	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	SOFT_LINK	0b	R	Software LINK Indicates the LINK ON/OFF status of software LINK setting (CXR2G) 1: Link ON (Link Up) 0: Link OFF (Link Down) This bit indicates the value of CXR2G.
2	SIGNAL_LINK	0b	R	LINK signal input Indicates the LINK ON/OFF status of the PHY_LINK input signal. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: Before referring to this bit, set the polarity of the PHY_LINK input signal using PHYLINKP (bit 1) in the CXR2C register.
1	INBAND_LINK	Xb	R	Inband Status LINK Indicates the link bit of RGMII Inband status. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: If the PHY used does not support Inband-status, the read value of this bit should be undefined.
0	LINK	0b	R	LINK status Indicates link status. 1: Link ON (Link Up) 0: Link OFF (Link Down) *Note*: Before referring to this bit, determine whether to use the PHY_LINK input signal, RGMII-Inband Status LINK bit or software LINK as the link using SEL_LINK (bit3, bit0) in the CXR31 register. In addition, to use the PHY_LINK input signal, set the polarity of PHY_LINK input using PHYLINKP (bit 1) in the CXR2C register.

30.4.2.7 Polarity set register (CXR2C)

CXR2C sets the polarity of ‘PHY_LINK’ and ‘PHY_INT’ signals.

Write restrictions:

Rewrite to this register with bits 2 and 3 in CXR22 being 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PHYLINKP	PHYIP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	PHYLINKP	0b	R/W	PHY_LINK Polarity Sets polarity of input signal ‘avb_miimg_link’. 1: High active (LINK ON [LINK UP] status with high) 0: Low active (LINK ON [LINK UP] status with low)
0	PHYIP	0b	R/W	PHY Interrupt Polarity Sets polarity of input signal ‘avb_miimg_int’. 1: High active (interrupt status with high) 0: Low active (interrupt status with low)

30.4.2.8 In-Band Status set register (CXR31)

CXR31 sets whether to apply In-Band Status function*1 of RGMII-IF to the E-MAC operating mode.

It is possible to select the configured value by software for Link status.

Note 1. In-Band Status function (optional) is a notification function from PHY to E-MAC about Link Status (Up/Down), transmission speed (10 M/100 M/1 G) and Duplex (Half/Full) via RGMII-IF.

Write restrictions:

Rewrite to this register with transmission function disabled (CXR20 TPE = 0) and reception function also disabled (CXR20 RPE = 0). If the PHY used does not support In-band Status, set ‘H’0000000’ to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	SEL_LINK[1]	SEL_SPEED	SEL_DUPLEX	SEL_LINK[0]
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3	SEL_LINK[1]	0b	R/W	Select LINK See bit0 of this register.
2	SEL_SPEED	0b	R/W	Select Speed*1, *2 ‘1’: The information from In-band Status is used for setting the E-MAC operation speed. ‘0’: CXR2D register value is used for setting the E-MAC operation speed.
1	SEL_DUPLEX	0b	R/W	Select Duplex*1, *2 ‘1’: The information from In-band Status is used for setting Full/Half Duplex. ‘0’: CXR20 DPM bit value is used for setting Full/Half Duplex.
0	SEL_LINK[0]	0b	R/W	Select LINK*1, *2 SEL_LINK [1:0] ‘11’: The information from CXR20 TPE bit value is used for setting the LINK.*3 The status of CXR20 TPE bit is set to CXR2B LINK bit. When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit. ‘10’: The information from CXR2B SOFTWR_LINK bit value is used for setting the LINK.*3 The status of CXR2G SOFT_LINK bit is set to CXR2B LINK bit. When this value is set, set ‘0’ (disable LINK interrupt) to CXR22 LINKIM bit. ‘01’: The information from In-band Status is used for setting the LINK. ‘00’: The information from the PHY_LINK input signal is used for setting the LINK.

Note 1. If the PHY does not support In-band Status is used or If MII-IF is used, do not set value using In-band Status.

Note 2. If the device driver software is developed as common for MII-IF and RGMII-IF, not using this register is recommended.

Note 3. When Low Power Mode E-MAC is used, it needs to know the status of PHY as Link Up (Link ON). But, when it does not have the information to judge the status of LINK (because MII-IF is used and PHY_LINK signal is not used), set ‘10’ or ‘11’.
In the case of SEL_LINK [1:0] = ‘10’, CXR2B SOFT_LINK is used. So, software has to check the LINK status by register of

PHY and set that information to CXR2G.
In the case of SEL_LINK [1:0] = ‘11’, CXR20 TPE is used as LINK status.

30.4.2.9 In-Band Status indicate register (CXR32)

CXR32 indicates In-Band-Status of RGMII-IF.

In-Band Status function (option) is the function that the PHY notifies the E-MAC of link status (Up/Down), transfer rate (10 M/100 M/1 G) and duplex (full or half duplex), using the RGMII interface signal.

Write restrictions:

Write disabled

3 to 2	SPEED	00b	R	Speed ‘10’: Transfer rate mode of E-MAC is 1 Gbps. ‘01’: Transfer rate mode of E-MAC is 100 Mbps. ‘00’: Transfer rate mode of E-MAC is 10 Mbps.
1	DUPLEX	0b	R	Duplex ‘1’: Duplex mode of E-MAC is Full Duplex. ‘0’: Duplex mode of E-MAC is Half Duplex.
0	LINK	0b	R	LINK ‘1’: LINK status is Link On (Link Up). ‘0’: LINK status is Link Off (Link Down).

30.4.2.11 PHY interface select register (CXR35)

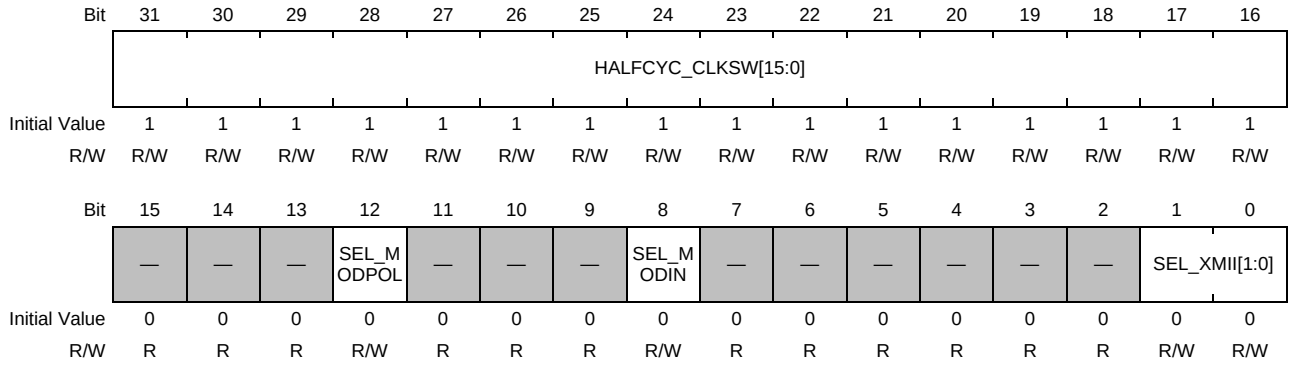
CXR35 selects RGMII or MII interface.

Write restrictions:

(1) After release reset, make write-access to this register before making write-access to other registers (except MDIOMOD). Even if not need to change the value of this register, make write-access to this register at least one time. Because RGMII/MII MODE is recognized by accessing this register.

(2) If need to re-write the value of this register after making write-access to other register, reset to E-MAC is needed.

(3) If need to re-write the value of this register without making write-access to other register, wait the quadruple time which is set at HALFCYC_CLKSW.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	HALFCYC_CLKSW	H'FFFF	R/W	A clock stop time at the clock switching The wait time (over 20 us) is needed when PHY interface is selected at initializing Gigabit Ethernet Interface. Set the number of clk_chi (APB clock) cycle to be half of wait time (over 10 us). H'0000: 1 cycle of clk_chi H'0001: 2 cycle of clk_chi H'0002: 3 cycle of clk_chi … H'03E8: 1000 cycle of clk_chi (If clk_chi is 100 MHz (10 ns), half of wait time will be 10 us) H'07D0: 2000 cycle of clk_chi (If clk_chi is 200 MHz (5 ns), half of wait time will be 10 us) … H'FFFF: 65536 cycle of clk_chi (default value)
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	SEL_MODPOL	0b	R/W	polar selection of RGMII/MII Mode input signal '0': (default value) E-MAC recognizes RGMII-IF is used. '1': E-MAC recognizes MII-IF is used.
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SEL_MODIN	0b	R/W	method for selection of RGMII/MII '0': SEL_XMII field of this register is used for RGMII/MII selection (default value) '1': Reserved
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1 to 0	SEL_XMII	00b	R/W	Selection of PHY interface to be used '00': RGMII interface is used (default value) '01': Reserved '10': MII interface is used '11': Reserved *Note*: The case of SEL_MODIN (bit8) = '0', this field is used to select PHY interface. The case of SEL_MODIN (bit8) = '1', this field is not used and Mode signals which is provided from out of E-MAC is used to select PHY interface.

Note: This register needs to write access at least one time.

[A] The case which CXR35 SEL_XMII is used for the selection of RGMII/MII in APB Clock 100 MHz.

(1) To use RGMII interface, Set 'H'03E8 0000' to this register.

(2) To use MII interface, Set 'H'03E8 0002' to this register.

30.4.2.12 PHY interface indicate register (CXR36)

CXR36 indicates the status of RGMII/MII Interface.

Write restrictions:

Write disabled

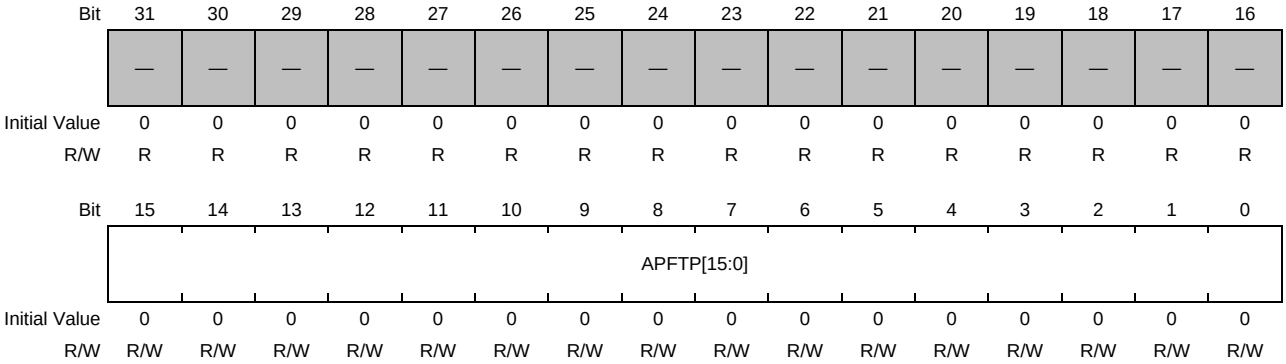
30.4.2.13 PAUSE frame register 1 (CXR71)

CXR71 sets the timer value for Auto PAUSE frame.

Write restrictions:

Set a value other than all 0 when transmission system flow control is enabled. (CXR20_bit16 = 1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	APFTP	H'0000	R/W	Auto Pause Frame Time Parameter The value set in this register is used as the Timer value for PAUSE frame during Auto PAUSE Frame transmission. *Note*: Set the value of this register to other than 0000 when transmission system flow control is enabled (CXR20_bit 16 = 1). <set value> <bit time> H'0000 — H'0001 512 × 1 bit time H'0002 512 × 2 bit time H'0003 512 × 3 bit time … H'FFFF 512 × 65535 bit time <transfer rate> <1 bit time> 1000 Mbps 1 ns 100 Mbps 10 ns 10 Mbps 100 ns

30.4.2.14 PAUSE frame register 2 (CXR72)

CXR72 starts the transmission of Manual PAUSE frames and sets the timer value for Manual PAUSE frame.

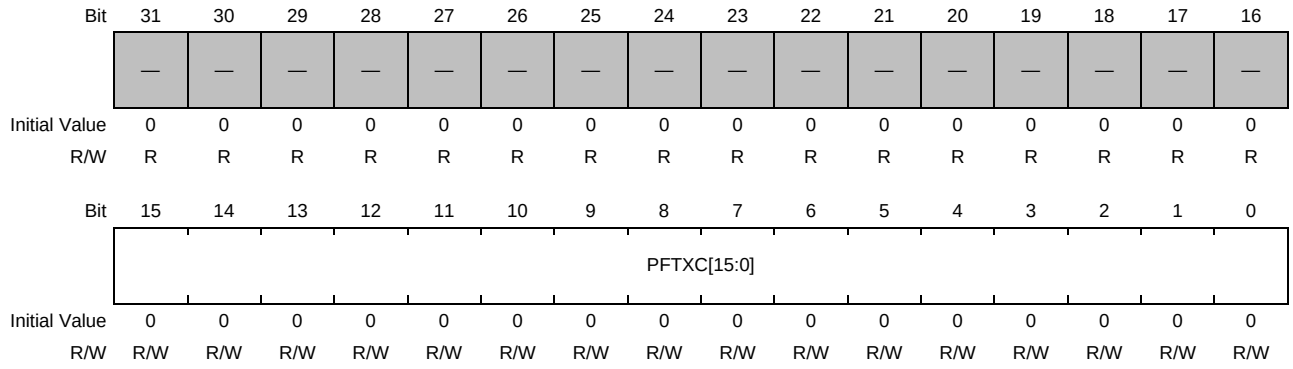
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	MPFTP	H’0000	R/W	Manual Pause Frame Time Parameter When a value is written to this register, PAUSE frame transmission is started using the value as the timer value. <set value> <bit time> H’0000 — H’0001 512 × 1 bit time H’0002 512 × 2 bit time H’0003 512 × 3 bit time … H’FFFF 512 × 65535 bit time <transfer rate> <1 bit time> 1000 Mbps 1 ns 100 Mbps 10 ns 10 Mbps 100 ns

30.4.2.15 PAUSE frame register 3 (CXR8A)

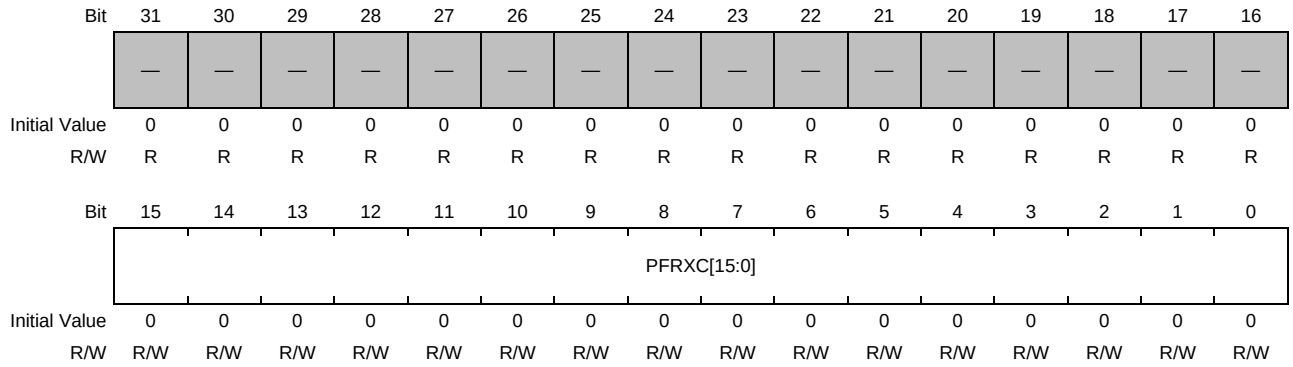
CXR8A is a transmit counter for PAUSE frame.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PFTXC	H'0000	R/W	Pause Frame TX Counter Indicates the number of times of transmission of Auto PAUSE frames and Manual PAUSE frames in total. This register is cleared to 0 when read.

30.4.2.16 PAUSE frame register 4 (CXR80)

CXR80 is a receive counter for PAUSE frame.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PFRXC	H'0000	R/W	Pause Frame RX Counter Indicates the number of PAUSE frames received when receive system flow control is enabled (CXR20_bit17 = 1). This register is cleared to 0 when read.

30.4.2.17 PAUSE frame register 5 (CXR81)

CXR81 sets the upper limit of the number of autonomous transmissions of PAUSE frame.

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PFRTC	H’FFFF	R	Pause Frame Retry Counter Indicates the number of times of Auto PAUSE frame transmission from “Reception FIFO Critical Level Notification” from DMAC assertion to negation. This register is cleared to 0 when read and at the start of “Reception FIFO Critical Level Notification” from DMAC assertion.

30.4.2.19 E-MAC operating mode register 2 (CXR2D)

CXR2D sets the operating mode of the E-MAC.

Rewriting this register bits is prohibited with transmission function enabled (CXR20<TPE> = 1) and reception function enabled (CXR20<RPE> = 1).

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
5 to 4	SPEED	00b	R/W	Transmit SPEED Set transfer rate.

SPEED[1] bit5	SPEED[0] bit4	Transmit Speed
0	0	10 Mbps
0	1	100 Mbps
1	0	1000 Mbps
1	1	Reserved

3 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

30.4.2.20 Software LINK status register (CXR2G)

CXR2G indicates the status of Software LINK.

Write restrictions:

Before setting ‘1’ to this register, set SEL_LINK of CXR31 whether using PHY_LINK input signal, using LINK bit of RGMII-Inband Status or using LINK setting by software.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	SOFT_LINK	0b	R/W	Software LINK This bit is used when the LINK status is set by software. ‘1’: Link ON (Link Up) ‘0’: Link OFF (Link Down) *Note*: Before setting ‘1’ to this bit, set SEL_LINK of CXR31 whether using PHY_LINK input signal, using LINK bit of RGMII-Inband Status or using LINK setting by software. Additionally, if PHY_LINK input signal is used, set the polar of PHY_LINK input signal by PHYLINKP of CXR2C.
2 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

30.4.2.21 Mac Address register 1 (CXR24)

CXR24 set the universal MAC address (upper 32 bits).

Write restrictions:

Rewriting this register is prohibited when 1 is set to CXR20_bit 5 or 6.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TINT3_CNT	H'0000	R/W	TINT3 Counter Indicates the number of occurrences of TINT3. TINT3: Transmission is terminated in error with TINT3 generated under the following conditions: Delay collision occurs at the end of transmit frame, the receive frame at the time of the collision continues until the start of next frame transmission, but does not continue until the end of the transmission. However, these conditions do not occur in normal operation.

30.4.2.26 RINT1 counter register (CXR50)

CXR50 indicates the number of occurrences of RINT1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT1_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT1_CNT	H'0000	R/W	RINT1 Counter Indicates the number of occurrences of RINT1. RINT1: Receive frame CRC error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.27 RINT2 counter register (CXR51)

CXR51 indicates the number of occurrences of RINT2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	RINT2_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT2_CNT	H'0000	R/W	RINT2 Counter Indicates the number of occurrences of RINT2. RINT2: Frame reception error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.28 RINT3 counter register (CXR52)

CXR52 indicates the number of occurrences of RINT3.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT3_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT3_CNT	H'0000	R/W	RINT3 Counter Indicates the number of occurrences of RINT3. RINT3: Erroneous frame length (less than 64byte frame was received.) When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.29 RINT4 counter register (CXR53)

CXR53 indicates the number of occurrences of RINT4.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT4_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT4_CNT	H'0000	R/W	RINT4 Counter Indicates the number of occurrences of RINT4. RINT4: Erroneous frame length {A frame longer than the maximum frame length was received. Maximum frame length (including CRC) can be specified using the LEN_LMT field in the CXR2A register.} When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.30 RINT5 counter register (CXR54)

CXR54 indicates the number of occurrences of RINT5.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT5_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT5_CNT	H'0000	R/W	RINT5 Counter Indicates the number of occurrences of RINT5. RINT5: Fractional bit error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data)

30.4.2.31 RINT6 counter register (CXR55)

CXR55 indicates the number of occurrences of RINT6.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT6_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT6_CNT	H'0000	R/W	RINT6 Counter Indicates the number of occurrences of RINT6. RINT6: Carrier extension lost When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.32 RINT7 counter register (CXR56)

CXR56 indicates the number of occurrences of RINT7.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT7_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT7_CNT	H'0000	R/W	RINT7 Counter Indicates the number of occurrences of RINT7. RINT7: Carrier extension error When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.33 RINT8 counter register (CXR57)

CXR57 indicates the number of occurrences of RINT8.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RINT8_CNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RINT8_CNT	H'0000	R/W	RINT8 Counter Indicates the number of occurrences of RINT8. RINT8: Multicast frame received When CXR20_bit 26 = 1, this register is cleared to 0 when read. When CXR20_bit 26 = 0, this register is cleared to 0 when written to. (Cleared to 0 when written to, irrespective of the write data.)

30.4.2.34 MDIO status register (MDIOSTS)

MDIOSTS indicates the status of PHY register access (MDIO access).

Write restrictions:

Write disabled

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BSY
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	BSY	0b	R	PHY register access Busy flag 0: Access enabled 1: Busy Do not write to MDIOCMD, MDIOADR, MDIODAT or MDIOMOD registers when this bit is1.

30.4.2.35 MDIO command register (MDIOCMD)

MDIOCMD specifies the commands for PHY register access (MDIO access).

Write restrictions:

Do not write to this register when the BSY bit in the MDIOSTS register is 1.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	OP	00b	R/W	Operation Code for PHY register access 00: Setting prohibited 01: WRITE 10: READ 11: Setting prohibited

30.4.2.36 MDIO address register (MDIOADR)

MDIOADR specifies PHY address and PHY register address.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	A[9:5]					A[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

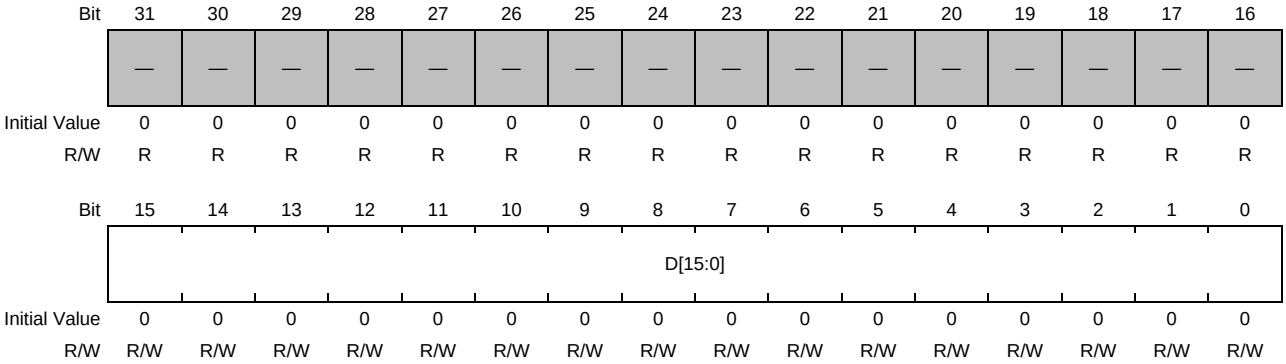
Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 5	A[9:5]	00000b	R/W	PHY address 5 bits
4 to 0	A[4:0]	00000b	R/W	PHY register address 5 bits

30.4.2.37 MDIO data register (MDIODAT)

MDIODAT specifies PHY write data and indicates read data.

Write restrictions:

Do not write to this register when the BSY bit in the MDIOSTS register is 1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	D[15:0]	H'0000	R/W	PHY register data When writing: Write data When reading: Read data

30.4.2.38 MDIO mode register (MDIOMOD)

MDIOMOD sets the operating mode of the MDIO controller.

Write restrictions:

Writing to this bit is prohibited during PHY register access.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEL_MDIO_N	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CYC_OCLK[7:0]							
Initial Value	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

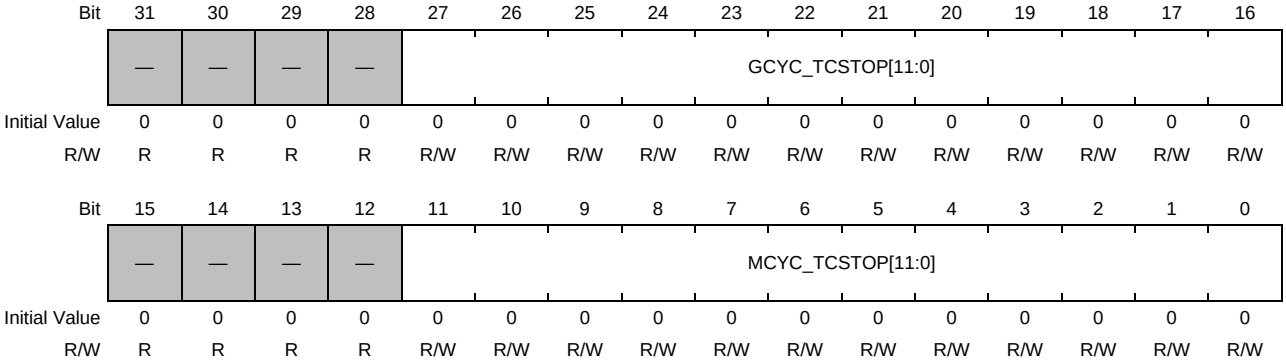
Bit	Bit Name	Initial Value	R/W	Description
31	SEL_MDIO_N	1b	R/W	Selection for PHY register access (MDIO access selection) 0: Uses MDIO controller for PHY register access. 1: Uses CXR23 register for PHY register access. (Initial value)
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	CYC_OCLK	H'FF	R/W	MDC (MDIO control clock) half cycle (number of cycles for system clock) H'00: 7 cycles H'01: 7 cycles ... H'06: 7 cycles H'07: 8 cycles H'08: 9 cycles H'09: 10 cycles ... H'FE: 255 cycles H'FF: 256 cycles (Initial value) MDC half cycle should be set to be 200 ns or more. (Calculation example) 27 cycles at a 133-MHz Clock (1 cyc=7.5 ns), 200 ns or more -> Setting value is H'1A (26d) 7.5 × 27 = 202.5 ≥ 200 (Setting example) //66.66 MHz (15 ns): Setting value ≥ H'0D (13d) (14 cyc × 15 ns = 210 ns) //133.3 MHz (7.5 ns): Setting value ≥ H'1A (26d) (27 cyc × 7.5 ns=202.5 ns) //266.6 MHz (3.75 ns): Setting value ≥ H'35 (53d) (54 cyc × 3.75 ns=202.5 ns)

30.4.2.39 Low Power Mode register 1 (LPTXMOD1)

LPTXMOD1 sets the operating mode of the Low Power Transmission.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	GCYC_TCSTOP	H’000	R/W	Number of minimum clock cycles until stopping RGMII TXC (1 Gbps) 0: 10 cycles (Initial value) 1 to 8: (Setting prohibited) 9: 9 cycles 10: 10 cycles 11: 11 cycles (skip the rest)
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	MCYC_TCSTOP	H’000	R/W	Number of minimum clock cycles until stopping RGMII TXC (100 Mbps) 0: 10 cycles (Initial value) 1 to 8: (Setting prohibited) 9: 9 cycles 10: 10 cycles 11: 11 cycles (skip the rest)

30.4.2.40 Low Power Mode register 2 (LPTXMOD2)

LPTXMOD2 sets the operating mode of the Low Power Transmission.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’ and CXR20_bit5 = ‘0’. When set ‘1’ to this register, check the configuration of Clock stoppable of PHY is ‘1’.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MAC_TLPI_TYPE	—	—	—	STP_TXC_LPI
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MAC_TLPI_TYPE	0b	R/W	Transmission LPI Operation Type of MAC ‘1’: MAC TX LPI Slave Mode E-MAC does not transmit LPI code during LPI period. But using LPI Wakeup parameters (LPTXGTH3/LPTXMTH3) to make the delay time of transmitting such as for PAUSE Frame. When making PHY control the operation of LPI (Low Power Idle), set ‘1’ to this bit. ‘0’: MAC TX LPI Master Mode E-MAC controls the operation of LPI. (Initial value)
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STP_TXC_LPI	0b	R/W	Setting of stopping LPI TXC (this bit is used only RGMII Mode) ‘1’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during output of LPI code. ‘0’: The clock for RGMII transmitting (fet_miitx_gtx_clk) is not stopped during output of LPI code. (Initial value) Set ‘1’ to this bit when TX Clock stop capable (Note1) of PHY is ‘1’ *Note 1.* See the Bit 6 Clock Stop Capable (MAC may stop clock during LPI) of PCS Status register in PHY MMD extended register (MMD address 3, REG address 1) *Note 2.* In the case of CCC.ERCS = 1 (The “clk_miitx_gtx_refclk” stop function is enable), even if this bit was set to ‘0’, the clock for RGMII transmitting (fet_miitx_gtx_clk) is stopped during the stopping period of “clk_miitx_gtx_refclk”. Because “fet_miitx_gtx_clk” is generated from “clk_miitx_gtx_refclk”.

30.4.2.41 RGMII Low Power parameter register 1 (LPTXGTH1)

LPTXGTH1 sets the change timing to Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LPTX_GSTH1[31:16]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GSTH1	H’0000_0000	R/W	Threshold value of LPI code transmission standby status (1 Gbps) (Unit is 32 ns) 0: (Initial value) When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code. 1 to 7: Setting prohibited ... 32: When MAC does not receive transmission request during 1024 ns. MAC starts transmitting LPI code. ... 31250: When MAC does not receive transmission request during 1 ms, MAC starts transmitting LPI code. ... (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF.

30.4.2.42 RGMII Low Power parameter register 2 (LPTXGTH2)

LPTXGTH2 sets the change timing to Low Power Idle Transmission Mode after enabled function of transmitting LPI code at 1Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GSTH2	H’0000_0000	R/W	Threshold value of starting LPI code transmission standby status (1 Gbps) (Unit is 32 ns) 0: (Initial value) MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. 1 to 7: Setting prohibited ... 32: MAC will be ready for transmitting LPI code after 1024 ns later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 31250000: MAC will be ready for transmitting LPI code after 1 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 31562500: MAC will be ready for transmitting LPI code after 1.01 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 100000000: MAC will be ready for transmitting LPI code after 3.2 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value In the standard, the behavior of PHY is undefined if PHY receives LPI code within 1 s after Link Up. Therefore, the recommended value was determined as 1.01 s. (1 s plus 1% margin) The following is reason why “LPM bit of CXR20 is set to ‘1’” was include to the condition. Intenal Clock (32 ns:1 Gbps, 320 ns:100 Mbps) is used to measure the time after Link Up. But Internal Clock will change during transmission rate is un-determined. So, it is difficult to measure the time after Link Up exactly. Therefore, “LPM bit of CXR20 is set to ‘1’” was include to the condition as determined point of transmission rate of Low Power Mode.

30.4.2.43 RGMII Low Power parameter register 3 (LPTXGTH3)

LPTXGTH3 sets the operation return from Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value). Do not set 262144 (H’00040000) or more to this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LPTX_GRTH[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_GRTH	H'0000_0000	R/W	Transmission Low Power resume time (1 Gbps) (Unit 32 ns) 0: (Initial value) After received transmit request, MAC transmits Normal Idle code during 17.184 us. And then MAC returns to Normal Mode from Low Power Mode. 1 to 7: Setting prohibited ... 32: After received transmit request, MAC transmits Normal Idle code during 1024 ns And then MAC returns to Normal Mode from Low Power Mode. ... 516: After received transmit request, MAC transmits Normal Idle code during 16.512 us. And then MAC returns to Normal Mode from Low Power Mode. 521: After received transmit request, MAC transmits Normal Idle code during 16.672 us. And then MAC returns to Normal Mode from Low Power Mode. 532: After received transmit request, MAC transmits Normal Idle code during 17.024 us. And then MAC returns to Normal Mode from Low Power Mode. 537: After received transmit request, MAC transmits Normal Idle code during 17.184 us. And then MAC returns to Normal Mode from Low Power Mode. ... 1000: After received transmit request, MAC transmits Normal Idle code during 17.184 us. And then MAC returns to Normal Mode from Low Power Mode. ... 262144 or more: Reserved (Setting prohibited) (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value The basic value of this field is LPI WakeUp Time (Tw_sys_tx) with 1% margin. In the case of 1000BASE-T, Tw_sys_tx is 16.5 us. But some of PHY needs 1 us for Wakeup Time. Therefore, Recommended value was determined as 17.184 us. The setting value of this field will be the overhead time return from Low Power Mode. Do not set the value will be under the 16.5 us (Minimum Wakeup Time which is defined by standard) to this field. In addition, if PHY has the LPI transmission control function, PHY also make overhead time same as Wake-Up Time.

30.4.2.44 RGMII Low Power parameter register 4 (LPTXGTH4)

LPTXGTH4 sets the minimum period for Low Power Idle Transmission Mode at 1 Gbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
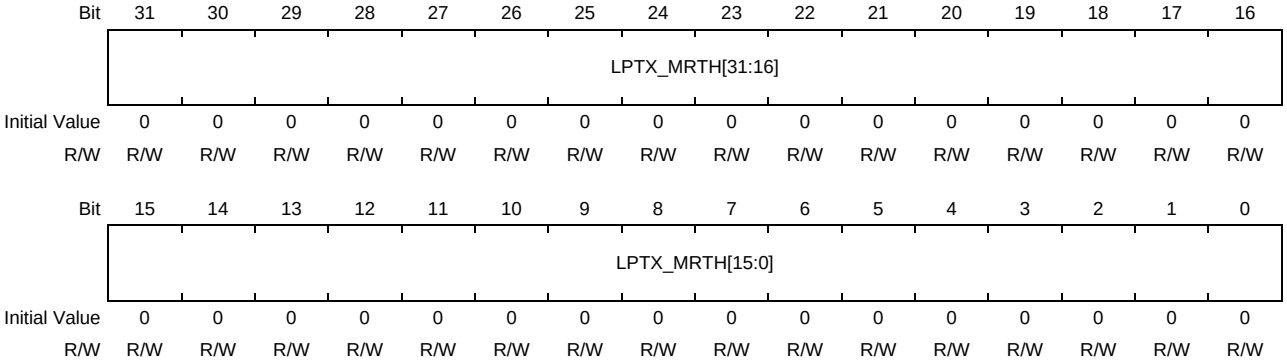
31 to 0	LPTX_MSTH2	H’0000_0000	R/W	Threshold value of starting LPI code transmission standby status (100 Mbps) (Unit is 320 ns) 0: (Initial value) MAC will be ready for transmitting LPI code after 1.01 s later from Link Up or LPM bit of CXR20 is set to ‘1’. 1 to 7: Setting prohibited ... 32: MAC will be ready for transmitting LPI code after 10240 ns later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 3125000: MAC will be ready for transmitting LPI code after 1.0 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 3156250: MAC will be ready for transmitting LPI code after 1.01 s from LinkUp/LPM bit of CXR20 is set to ‘1’. ... 10000000: MAC will be ready for transmitting LPI code after 3.2 s later from LinkUp/LPM bit of CXR20 is set to ‘1’. ... (skip the rest) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value In the standard, the behavior of PHY is undefined if PHY receives LPI code within 1 s after Link Up. Therefore, the recommended value was determined as 1.01 s. (1 s plus 1% margin) The following is reason why “LPM bit of CXR20 is set to ‘1’” was include to the condition. Internal Clock (32 ns:1 Gbps, 320 ns:100 Mbps) is used to measure the time after Link Up. But Internal Clock will change during transmission rate is un-determined. So, it is difficult to measure the time after Link Up exactly. Therefore, “LPM bit of CXR20 is set to ‘1’” was include to the condition as determined point of transmission rate of Low Power Mode.

30.4.2.47 MII Low Power parameter register 3 (LPTXMTH3)

LPTXMTH3 sets the operation return from Low Power Idle Transmission Mode at 100 Mbps.

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value). Do not set 262144 (H’00040000) or more to this register.



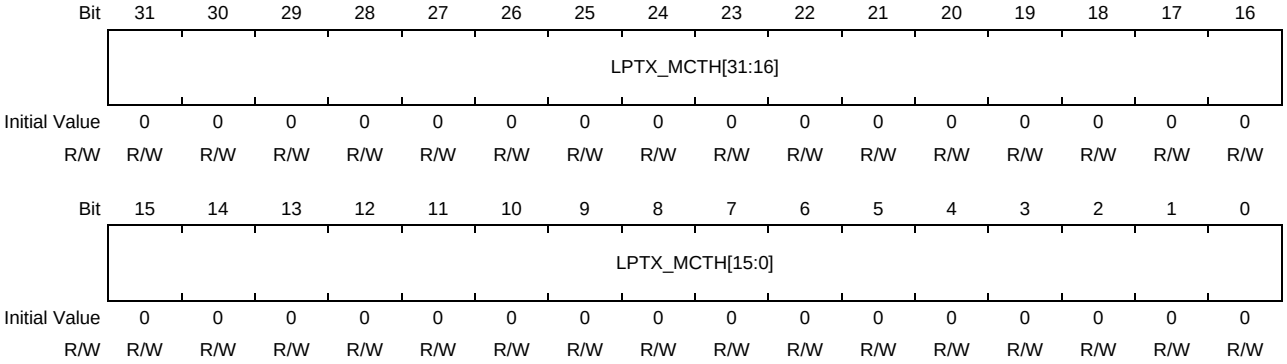
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_MRTH	H’0000_0000	R/W	Transmission Low Power resume time (100 Mbps) (Unit 320 ns) 0: (Initial value) After received transmit request, MAC transmits Normal Idle code during 30.40 us. And then MAC returns to Normal Mode from Low Power Mode. 1 to 7: Setting prohibited ... 32: After received transmit request, MAC transmits Normal Idle code during 10240 ns And then MAC returns to Normal Mode from Low Power Mode. ... 94: After received transmit request, MAC transmits Normal Idle code during 30.08 us And then MAC returns to Normal Mode from Low Power Mode. 95: After received transmit request, MAC transmits Normal Idle code during 30.40 us And then MAC returns to Normal Mode from Low Power Mode. ... 262144 or more: Reserved (Setting prohibited) *Note*: This value is used by internal logic and does not mean indicating accurate time on PHY IF. Recommended setting value The basic value of this field is LPI WakeUp Time (Tw_sys_tx) with 1% margin. In the case of 100BASE-TX, Tw_sys_tx is 30 us. Therefore, recommended value was determined as 30.4 us. The setting value of this field will be the overhead time return from Low Power Mode. Do not set the value under the 30 us (Minimum Wakeup Time which is defined by standard) to this field.

30.4.2.48 MII Low Power parameter register 4 (LPTXMTH4)

LPTXMTH4 sets the minimum period for Low Power Idle Transmission Mode at 100 Mbps

Write restrictions:

Write to this register when the CXR20_bit6 = ‘0’, CXR20_bit5 = ‘0’. Recommended value is H’00000000 (Initial value).



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LPTX_MCTH	H’0000_0000	R/W	Minimum Transmission Low Power time (100 Mbps) (Unit is 320 ns) 0: (Initial value) After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 3200 ns. 1 to 7: Setting prohibited 8: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 2560 ns. ... 10: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 3200 ns. ... 844: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 270.08 us (Sleep Time+α). ... 1000: After started to output Transmission LPI code, MAC will continue to output Transmission LPI code at least 320 us. ... (skip the rest) *Note*: This value is used by internal logic and doesn’t mean indicating accurate time on PHY IF. Recommended setting value Recommended value of this field is 3.2 us (3200 ns) for 100BASE-TX. This value based on followings: [1] his value should be sufficiency longer than 360 ns [2] This value should be sufficiency shorter than Wake Up Time (30 us). And selected the value which is close to geometric mean of [1] and [2].

30.4.3 TOE Registers

30.4.3.1 Checksum operating mode register (CSR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFOCAP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RBP	TBP	—	—	RPE	TPE	—	—	—	CCM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17 to 16	FIFOCAP	00b	R/W	FIFO CAPACITY TOE FIFO Capacity 00b: 2 Kbyte (512 Word × 32bit) 01b: 4 Kbyte (1024 Word × 32bit) 10b: 8 Kbyte (2048 Word × 32bit) 11b: 16 Kbyte (4096 Word × 32bit) Write to this field when TPE is ‘0’.
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	RBP	0b	R/W	Receive Bypass Enable Bypass Enable of TOE Rx function. 0b: Rx Function is not bypassed. 1b: Rx Function is bypassed. (for debug) *Note*: This bit is used only for debug. Do not set 1b during normal operation. When this bit is set to “1", all Rx Functions of TOE are bypassed. Therefore, TOE sends Rx frame from E-MAC to DMAC even if RPE is ‘0’. Write to this bit when RPE is ‘0’. When this bit is set to “0", set E-MAC as CRC Pass Through Mode (CXR20 RCPT = “1”). When this bit is set to “1”, set E-MAC as Non-CRC Pass Through Mode (CXR20 RCPT = “0”).
8	TBP	0b	R/W	Transmit Bypass Enable Bypass Enable of TOE Tx Function 0b: Tx Function is not bypassed. 1b: Tx Function is bypassed (for debug) *Note*: This bit is used only for debug. Do not set 1b during normal operation. When this bit is set to “1", all Tx Functions of TOE are bypassed. Therefore, TOE sends Tx frame from DMAC to E-MAC even if TPE is ‘0’. Since Tx Frame does not go through TOE FIFO, there is no latency. Write to this bit when TPE is ‘0’.
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
5	RPE	0b	R/W	Receive Port Enable Enable of Frame Output Function to DMAC. 0b: Output Function is disabled. 1b: Output Function is enabled. When value is changed from ‘1’ to ‘0’ during TOE is outputting any frames, the value of this bit will be ‘0’ after finished outputting. Therefore, ‘1’ is read as read value during TOE is outputting frames.
4	TPE	0b	R/W	Transmit Port Enable Enable of Frame Output Function to E-MAC. 0b: Output Function is disable. 1b: Output Function is enabled. Procedure of setting ‘0’ to this bit. (1) Set ‘0’ to TPE. (2) Continue to read TPE until it will be read as ‘0’. (TPE will be ‘0’ when TOE FIFO will be empty) (3) If read value is ‘0’, procedure of setting ‘0’ is finished.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CCM	0b	R/W	Counter Clear Mode This bit designates the clear method of Interrupt Status Counters (CSR20, CSR30, CSR31, CSR32) 1b: When each Counter Registers are read, they are cleared to ‘0’. 0b: When each Counter Registers are written any value, they are cleared to ‘0’. Write to this bit when TPE is ‘0’ and RPE is ‘0’.

30.4.3.2 Tx Frame Checksum Enable register (CSR1)

R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	RDHD	0b	R/W	Receive Destination Option Header Enable When the frame from E-MAC has a Destination Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
26	RAHD	0b	R/W	Receive Authentication Header Enable When the frame from E-MAC has an AH header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
25	RROUT	0b	R/W	Receive Routing Header Enable When the frame from E-MAC has a Routing header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
24	RHOP	0b	R/W	Receive Hop-by-Hop Option Header Enable When the frame from E-MAC has a Hop-by-Hop Option header, this bit configures whether TOE ascribes this frame to Supported Frame or not. 0b: Ascribes to Unsupported Frame 1b: Ascribes to Supported Frame If bits 20, 21 and 22 of this register are ‘0’, the configuration of this bit is ignored. Write to this bit when RPE is ‘0’.
23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	RICMP6	0b	R/W	Receive ICMP Checksum in IPv6 Enable Enable of IPv6 ICMP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is ‘1’, the value of bits [27:24] are valid. Write to this bit when RPE is ‘0’.

Bit	Bit Name	Initial Value	R/W	Description
21	RUDP6	0b	R/W	Receive UDP Checksum in IPv6 Enable Enable of IPv6 UDP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is '1', the value of bits [27:24] are valid. Write to this bit when RPE is '0'.
20	RTCP6	0b	R/W	Receive TCP Checksum in IPv6 Enable Enable of IPv6 TCP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable When this bit is '1', the value of bits [27:24] are valid. Write to this bit when RPE is '0'.
19 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	RICMP4	0b	R/W	Receive ICMP Checksum in IPv4 Enable Enable of IPv4 ICMP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.
5	RUDP4	0b	R/W	Receive UDP Checksum in IPv4 Enable Enable of IPv4 UDP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.
4	RTCP4	0b	R/W	Receive TCP Checksum in IPv4 Enable Enable of IPv4 TCP Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'. These bits are read as 0. The write value should be always 0.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RIP4	0b	R/W	Receive IPv4 Checksum Enable Enable of IPv4 Header Checksum Calculation in the frame from E-MAC. 0b: Disable 1b: Enable Write to this bit when RPE is '0'.

30.4.3.4 Tx Extended Header Number register (CSR3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
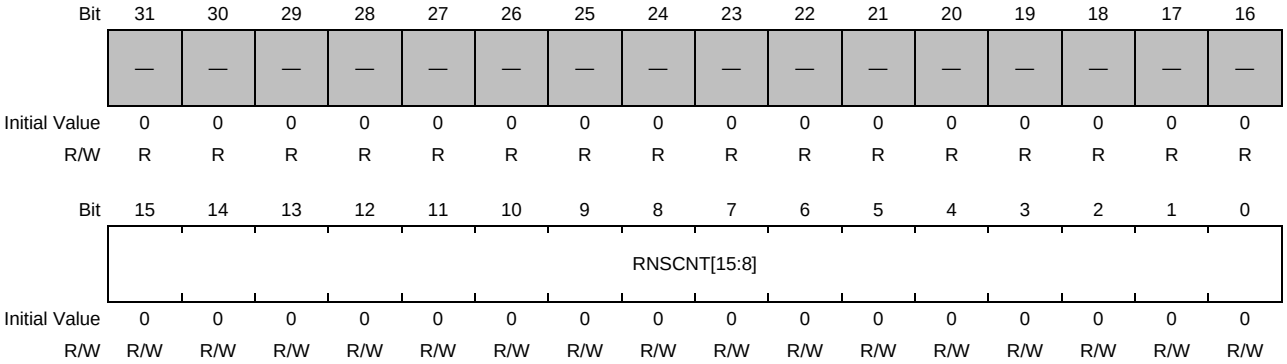
	TNSCNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	TNSCNT	H'0000	R/W	Transmit Not Support Frame Counter Counter for Transmitted Unsupported Frames When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is OR of followings. • TYPE/TPID is Unsupported • Not ("MF = 0" and "Fragment Offset = H'0000") • Protocol is Unsupported • Next Header of IPv6 frame is Unsupported • The number of Next Header in IPv6 frame is 9 or more • Checksum calculation for a particular frame is disabled by CSR1 • The Frame Length is shorter than the result of Frame Analysis by TOE.

30.4.3.7 Unsupported Rx Frame Counter register (CSR30)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RNSCNT	H'0000	R/W	Receive Not Support Frame Counter Counter for Received Unsupported Frames When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is OR of followings. • TYPE/TPID is Unsupported • Not ("MF = 0" and "Fragment Offset = H'0000") • Protocol is Unsupported • Next Header of IPv6 frame is Unsupported • The number of Next Header in IPv6 frame is 9 or more • Checksum calculation for a particular frame is disabled by CSR2 • The Frame Length is shorter than the result of Frame Analysis by TOE.

30.4.3.8 Rx IPv4 Header checksum Error Counter register (CSR31)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R4ECNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	R4ECNT	H'0000	R/W	Receive IPv4 Header Checksum Error Counter Counter for the number of IPv4 Header Checksum Error in the frames from E-MAC. When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is following. When the frame which has IPv4 Checksum Error comes, TOE counts up this register.

30.4.3.9 Rx TCP/UDP/ICMP checksum Error Counter register (CSR32)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTUECNT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	RTUECNT	H'0000	R/W	Receive TCP/UDP/ICMP Checksum Error Counter Counter for the number of TCP/UDP/ICMP Checksum Error in the frames from E-MAC. When CSR0_bit0 is '1', this register is cleared to '0' by read access. When CSR0_bit0 is '0', this register is cleared to '0' by write access of any data. The condition of counting up is following. When the frame which has TCP/UDP/ICMP Checksum Error comes, TOE counts up this register.

30.4.3.10 Filter Operation/Auto Response Enable register (CSFR00)

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	mac_adr	H'0000	R/W	MAC Address MAC Address [47:32] of Local Station Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

30.4.3.14 Lower Local MAC address register (CSFR03_L)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	mac_adr[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	mac_adr[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	mac_adr	H'0000_0000	R/W	MAC Address MAC Address [32:0] of Local Station Write to this field when CSFR00.reply_fifo_en = "0", reg_fifo_en = "0" and sby_mode = "00b".

30.4.3.15 IPv6 no_next_header Protocol Number register (CSFR04)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	no_next_header[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	0	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	no_next_header	H'3B	R/W	Protocol Number of IPv6 no_next_header Usually, do not need to change from Initial values (59). Write to this field when CSFR00.sby mode is '00b'.

30.4.3.16 Ethernet Type Condition register i (i = 0 to 3) (CSFR10_i)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	type_2*i+1[15:8]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	type_2*i[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	type_2*i+1	H'0000	R/W	Ethernet Type 2*i+1 Configuration of the Ethernet TYPE for Filter Condition and Interrupt Condition. Write to this field when CSFR10. type_2*i+1_en is "0".
15 to 0	type_2*i	H'0000	R/W	Ethernet Type 2*i Configuration of the Ethernet TYPE for Filter Condition and Interrupt Condition. Write to this field when CSFR10. type_2*i_en is "0".

30.4.3.17 Ethernet Type Condition Enable register (CSFR10)

Bit	Bit Name	Initial Value	R/W	Description
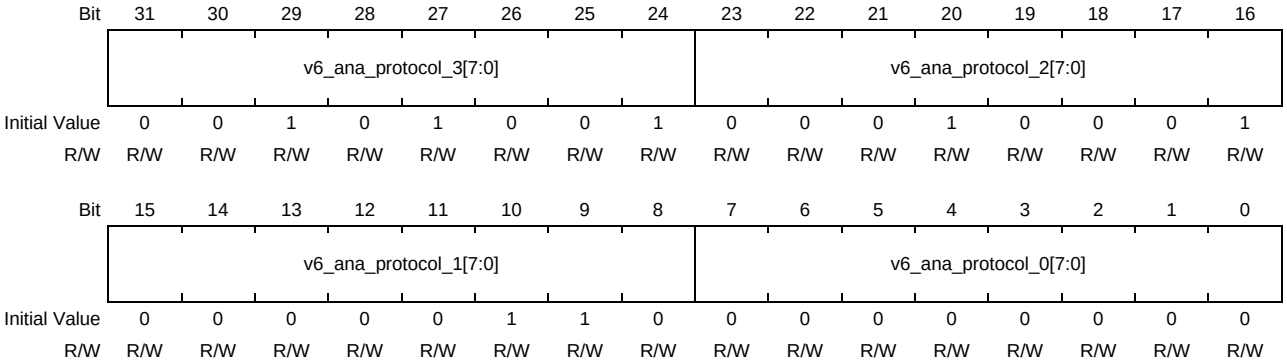
14	mac_da_mul_14_en	0b	R/W	mac_da_mul_14 enable Enable for the value of mac_da_mul_14 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
13	mac_da_mul_13_en	0b	R/W	mac_da_mul_13 enable Enable for the value of mac_da_mul_13 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
12	mac_da_mul_12_en	0b	R/W	mac_da_mul_12 enable Enable for the value of mac_da_mul_12 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
11	mac_da_mul_11_en	0b	R/W	mac_da_mul_11 enable Enable for the value of mac_da_mul_11 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
10	mac_da_mul_10_en	0b	R/W	mac_da_mul_10 enable Enable for the value of mac_da_mul_10 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
9	mac_da_mul_9_en	0b	R/W	mac_da_mul_9 enable Enable for the value of mac_da_mul_9 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
8	mac_da_mul_8_en	0b	R/W	mac_da_mul_8 enable Enable for the value of mac_da_mul_8 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
7	mac_da_mul_7_en	0b	R/W	mac_da_mul_7 enable Enable for the value of mac_da_mul_7 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
6	mac_da_mul_6_en	0b	R/W	mac_da_mul_6 enable Enable for the value of mac_da_mul_6 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
5	mac_da_mul_5_en	0b	R/W	mac_da_mul_5 enable Enable for the value of mac_da_mul_5 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
4	mac_da_mul_4_en	0b	R/W	mac_da_mul_4 enable Enable for the value of mac_da_mul_4 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
3	mac_da_mul_3_en	0b	R/W	mac_da_mul_3 enable Enable for the value of mac_da_mul_3 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
2	mac_da_mul_2_en	0b	R/W	mac_da_mul_2 enable Enable for the value of mac_da_mul_2 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable

Bit	Bit Name	Initial Value	R/W	Description
1	mac_da_mul_1_en	0b	R/W	mac_da_mul_1 enable Enable for the value of mac_da_mul_1 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable
0	mac_da_mul_0_en	0b	R/W	mac_da_mul_0 enable Enable for the value of mac_da_mul_0 which is configured in CSFR15_U/L. 0b: Disable 1b: Enable

30.4.3.29 IPv6 analysis Protocol Condition register 0 (CSFR16_0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	v6_ana_protocol_3	H'29	R/W	IPv6 Analyzable Protocol No 3 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'29 IPV6 (41). Write to this field when CSFR16. v6_ana_protocol_3_en is '0b'.
23 to 16	v6_ana_protocol_2	H'11	R/W	IPv6 Analyzable Protocol No 2 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'11 UDP (17). Write to this field when CSFR16. v6_ana_protocol_2_en is '0b'.
15 to 8	v6_ana_protocol_1	H'06	R/W	IPv6 Analyzable Protocol No 1 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'06 TCP (6). Write to this field when CSFR16. v6_ana_protocol_1_en is '0b'.
7 to 0	v6_ana_protocol_0	H'00	R/W	IPv6 Analyzable Protocol No 0 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'00 Hop-by-Hop (0). Write to this field when CSFR16. v6_ana_protocol_0_en is '0b'.

30.4.3.30 IPv6 analysis Protocol Condition register 1 (CSFR16_1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	v6_ana_protocol_7[7:0]								v6_ana_protocol_6[7:0]							
Initial Value	0	0	1	1	1	0	1	0	0	0	1	1	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	v6_ana_protocol_5[7:0]								v6_ana_protocol_4[7:0]							
Initial Value	0	0	1	0	1	1	0	0	0	0	1	0	1	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	v6_ana_protocol_7	H'3A	R/W	IPv6 Analyzable Protocol No.7 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'3A ICMPv6 (58). Write to this field when CSFR16. v6_ana_protocol_7_en is '0b'.
23 to 16	v6_ana_protocol_6	H'33	R/W	IPv6 Analyzable Protocol No.6 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'33 Authentication (51). Write to this field when CSFR16. v6_ana_protocol_6_en is '0b'.
15 to 8	v6_ana_protocol_5	H'2C	R/W	IPv6 Analyzable Protocol No.5 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'2C Flag (44). Write to this field when CSFR16. v6_ana_protocol_5_en is '0b'.
7 to 0	v6_ana_protocol_4	H'2B	R/W	IPv6 Analyzable Protocol No.4 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'2B Routing (43). Write to this field when CSFR16. v6_ana_protocol_4_en is '0b'.

30.4.3.31 IPv6 analysis Protocol Condition register 2 (CSFR16_2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	v6_ana_protocol_8[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	v6_ana_protocol_8	H'3C	R/W	IPv6 Analyzable Protocol No 8 IPv6 protocol No to continue analysis in the Frame analysis procedure of Filter and Interrupt. Initial value is H'3C Destination Options (60). Write to this field when CSFR16. v6 ana protocol 8 en is '0b'.

30.4.3.32 IPv6 analysis Protocol Condition Enable register (CSFR16)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	v6_ana_protocol_8_en	v6_ana_protocol_7_en	v6_ana_protocol_6_en	v6_ana_protocol_5_en	v6_ana_protocol_4_en	v6_ana_protocol_3_en	v6_ana_protocol_2_en	v6_ana_protocol_1_en	v6_ana_protocol_0_en
Initial Value	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	v6_ana_protocol_8_en	1b	R/W	v6_ana_protocol_8 enable Enable for the value of v6_ana_protocol_8 which is configured in CSFR16_i. 0b: Disable 1b: Enable
7	v6_ana_protocol_7_en	1b	R/W	v6_ana_protocol_7 enable Enable for the value of v6_ana_protocol_7 which is configured in CSFR16_i. 0b: Disable 1b: Enable
6	v6_ana_protocol_6_en	1b	R/W	v6_ana_protocol_6 enable Enable for the value of v6_ana_protocol_6 which is configured in CSFR16_i. 0b: Disable 1b: Enable
5	v6_ana_protocol_5_en	1b	R/W	v6_ana_protocol_5 enable Enable for the value of v6_ana_protocol_5 which is configured in CSFR16_i. 0b: Disable 1b: Enable
4	v6_ana_protocol_4_en	1b	R/W	v6_ana_protocol_4 enable Enable for the value of v6_ana_protocol_4 which is configured in CSFR16_i. 0b: Disable 1b: Enable
3	v6_ana_protocol_3_en	1b	R/W	v6_ana_protocol_3 enable Enable for the value of v6_ana_protocol_3 which is configured in CSFR16_i. 0b: Disable 1b: Enable
2	v6_ana_protocol_2_en	1b	R/W	v6_ana_protocol_2 enable Enable for the value of v6_ana_protocol_2 which is configured in CSFR16_i. 0b: Disable 1b: Enable
1	v6_ana_protocol_1_en	1b	R/W	v6_ana_protocol_1 enable Enable for the value of v6_ana_protocol_1 which is configured in CSFR16_i. 0b: Disable 1b: Enable
0	v6_ana_protocol_0_en	1b	R/W	v6_ana_protocol_0 enable Enable for the value of v6_ana_protocol_0 which is configured in CSFR16_i. 0b: Disable 1b: Enable

30.4.3.33 Wake Up Interrupt Status register (CSFR20)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	trs_dmac	—	—	—	—	—	—	—	ieee_len	ns_dis	ns_dup	ns_uni_nopt	ns_uni

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	trs_dmac	0b	R/W	Transmit to DMAC Wake Up Interrupt which occurs by transmitting Frame from TOE to DMAC without discarding of filtering ‘1’ Write: Clear ‘0’ Write: Invalid
27 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	ieee_len	0b	R/W	IEEE Length filter Wake Up Interrupt which occurs by reception of IEEE802.3 Length Frame ‘1’ Write: Clear ‘0’ Write: Invalid
19	ns_dis	0b	R/W	Neighbor Solicitation discarded filter Wake Up Interrupt which occurs by reception of Invalid Neighbor Solicitations ‘1’ Write: Clear ‘0’ Write: Invalid
18	ns_dup	0b	R/W	Neighbor Solicitation Duplicate filter Wake Up Interrupt which occurs by reception of IP Duplicate Detection Neighbor Solicitations. ‘1’ Write: Clear ‘0’ Write: Invalid
17	ns_uni_nopt	0b	R/W	Neighbor Solicitation Unicast no option filter Wake Up Interrupt which occurs by reception of unicast Neighbor Solicitations (Except “Option Type=1” or No “Option Type”). ‘1’ Write: Clear ‘0’ Write: Invalid
16	ns_uni	0b	R/W	Neighbor Solicitation Unicast filter Wake Up Interrupt which occurs by reception of unicast Neighbor Solicitations (“Option Type=1”). ‘1’ Write: Clear ‘0’ Write: Invalid
15	ns_mul	0b	R/W	Neighbor Solicitation Multicast filter Wake Up Interrupt which occurs by reception of multicast Neighbor Solicitations. ‘1’ Write: Clear ‘0’ Write: Invalid

Bit	Bit Name	Initial Value	R/W	Description
14	ana_stp	0b	R/W	Analysis stop filter Wake Up Interrupt which occurs by reception of Un-analyzable Frames. ‘1’ Write: Clear ‘0’ Write: Invalid
13	v6_ana_protocol	0b	R/W	IPv6 Analysis protocol filter Wake Up Interrupt which occurs by reception of Un-analyzable IPv6 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
12	arp_noreq	0b	R/W	ARP no request filer Wake Up Interrupt which occurs by reception of ARP (Except ARP REQ). ‘1’ Write: Clear ‘0’ Write: Invalid
11	garp_self	0b	R/W	GARP self filter Wake Up Interrupt which occurs by reception of GARP REQ for Local Station. ‘1’ Write: Clear ‘0’ Write: Invalid
10	garp_other	0b	R/W	GARP other filter Wake Up Interrupt which occurs by reception of GARP REQ for Other Station. ‘1’ Write: Clear ‘0’ Write: Invalid
9	arp_self	0b	R/W	ARP self filter Wake Up Interrupt which occurs by reception of ARP REQ for Local Station. ‘1’ Write: Clear ‘0’ Write: Invalid
8	arp_other	0b	R/W	ARP other filter Wake Up Interrupt which occurs by reception of ARP REQ for Other Station. ‘1’ Write: Clear ‘0’ Write: Invalid
7	v6_udp_pt	0b	R/W	IPv6 UDP port filter Wake Up Interrupt which occurs by match of IPv6 UDP Port No. ‘1’ Write: Clear ‘0’ Write: Invalid
6	v4_udp_pt	0b	R/W	IPv4 UDP port filter Wake Up Interrupt which occurs by match of IPv4 UDP Port No. ‘1’ Write: Clear ‘0’ Write: Invalid
5	v6_protocol	0b	R/W	IPv6 protocol filter Wake Up Interrupt which occurs by match of IPv6 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
4	v4_protocol	0b	R/W	IPv4 protocol filter Wake Up Interrupt which occurs by match of IPv4 Protocol No. ‘1’ Write: Clear ‘0’ Write: Invalid
3	type	0b	R/W	Type filter Wake Up Interrupt which occurs by match of Ether Type. ‘1’ Write: Clear ‘0’ Write: Invalid
2	mac_da_mul	0b	R/W	MAC DA multicast filter Wake Up Interrupt which occurs by match of Multicast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid

Bit	Bit Name	Initial Value	R/W	Description
1	mac_da_bro	0b	R/W	MAC DA broadcast filter Wake Up Interrupt which occurs by match of Broadcast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid
0	mac_da_uni	0b	R/W	MAC DA unicast filter Wake Up Interrupt which occurs by match of Unicast MAC DA. ‘1’ Write: Clear ‘0’ Write: Invalid

NOTE

- From b[0] to b[20] are set to “1” when TOE received the Rx Frame which matches to Filter Conditions even if that frame has any error (such as CRC error, short length error or etc.). Therefore, use these bits only for Debug.
- b [28] is set to “1” only when TOE sent a normal Rx Frame to DMAC.

30.4.3.34 Wake Up Interrupt Mask register (CSFR21)

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	reply_fifo_full_m	0b	R/W	Reply FIFO full Mask Mask Configuration for ARPREQ/Neighbor Solicitations Receive Interrupt which occurs by reply_fifo_full. 0b: Non-Mask (Interrupt is asserted) 1b: Mask (Interrupt is not asserted)
1	reg_fifo_full_m	0b	R/W	Reg FIFO full Mask Mask Configuration for ARPREQ/Neighbor Solicitations Receive Interrupt which occurs by reg_fifo_full. 0b: Non-Mask (Interrupt is asserted) 1b: Mask (Interrupt is not asserted)
0	arp_ns_m	0b	R/W	ARP Neighbor Solicitation Mask Mask Configuration for ARPREQ/Neighbor Solicitations Receive Interrupt which occurs by arp_ns. 0b: Non-Mask (Interrupt is asserted) 1b: Mask (Interrupt is not asserted)

30.4.3.39 Rx ARPREQ/Neighbor Solicitation Upper MAC SA register (CSFR42_U)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ns_option_type[7:0]								—	—	—	—	—	—	arp_ns_spec	rx_arp_ns
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	arp_sa_mac[47:32]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	ns_option_type	H'00	R	Neighbor Solicitations option type This field indicates Received Neighbor Solicitations Option Type. "H'00" means that Received Frame did not have Option. When rx_arp_ns = 0 (ARPREQ), this field is invalid.
23 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	arp_ns_spec	0b	R	ARP Neighbor Solicitations spec This field indicates Received ARPREQ/Neighbor Solicitations Frame Type. The Case of ARPREQ (rx_arp_ns = 0) 0b: ARPREQ 1b: GARPREQ The Case of Neighbor Solicitations (rx_arp_ns = 1) 0b: Multicast Neighbor Solicitations 1b: Unicast Neighbor Solicitations
16	rx_arp_ns	0b	R	ARP Neighbor Solicitations This field indicates which frame did TOE receive ARPREQ or Neighbor Solicitations. 0b: ARPREQ 1b: Neighbor Solicitations
15 to 0	arp_sa_mac	H'0000	R	ARP source Address MAC This field indicates the Source MAC Address [47:32] of Received ARPREQ/Neighbor Solicitation. When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

30.4.3.40 Rx ARPREQ/Neighbor Solicitation Lower MAC SA register (CSFR42_L)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	arp_sa_mac[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	arp_sa_mac[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

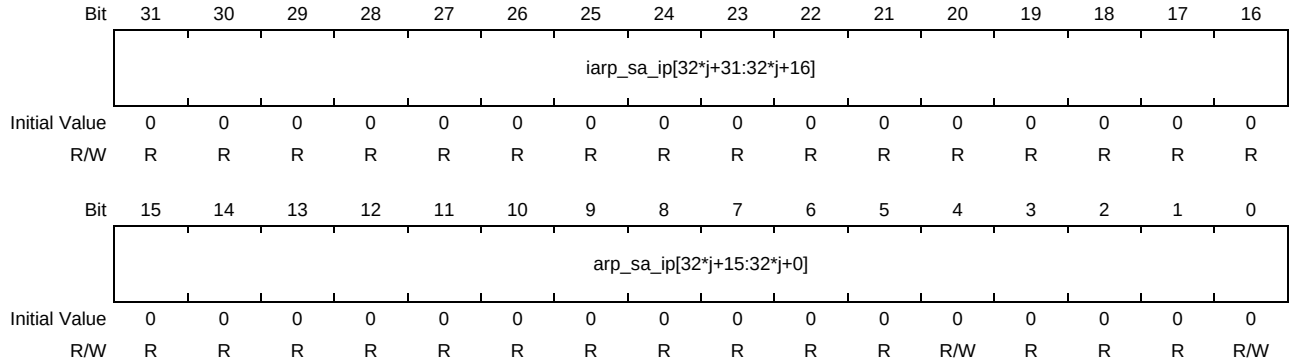
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	arp_sa_mac	H'0000_0000	R	ARP source Address MAC This field indicates the Source MAC Address [31:0] of Received ARPREQ/Neighbor Solicitation. When rx_arp_ns = 1 and ns_option_type = H'00, this field is invalid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by "Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO" is cleared by CSFR40.arp_ns.

30.4.3.41 Rx ARPREQ/Neighbor Solicitation IP SA register i (i = 0 to 3) (CSFR43_i)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	arp_sa_ip	All 0	R	ARP source Address IP This field indicates the Source IP Address[32*j+31:32*j] of Received ARPREQ/Neighbor Solicitations. The relationship between ‘i’ and ‘j’ is the following. i = 0 -> j = 3 i = 1 -> j = 2 i = 2 -> j = 1 i = 3 -> j = 0 When rx_arp_ns = 0 (ARPREQ), Only Lower 32bit (CSFR43_3) is valid.

[Update timing of this register]

This register is updated when REG FIFO is empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is asserted.

This register is updated when REG FIFO is not empty and the interrupt of int_arp_ns_n caused by “Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO” is cleared by CSFR40.arp_ns.

30.5 Operation

The Gigabit Ethernet Interface consists of the following functional units:

- DMA transfer controller (DMAC):
  Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO
- TCP/IP Offload Engine (TOE):
  Calculates Checksum by hardware. And also filters Ethernet Frames and responds specific frames automatically.
- MAC controller (E-MAC):
  Handles reception/transmission transfer from/to the RGMII or MII.

Using its direct memory access (DMA) function, the DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO for reception and transmission. Data cannot be directly read from or written to the FIFO.

To handle DMA transfer, the DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

TOE calculates checksum of received frames from E-MAC. And then it outputted to DMAC. TOE also calculates checksum of transmission frames from DMAC. And then it outputted to E-MAC. When TOE received any frames from E-MAC, it analyzes them. By the configuration of registers, TOE filters received frames. If received frame does not correspond to the configured filter conditions by registers, it will be discarded. By using this analysis function, TOE is also able to respond to ARP Request and Neighbor Solicitation automatically.

The E-MAC supports a RGMII and MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC transmits frames from TOE to the RGMII or MII. It also transmits frames from the RGMII or MII to TOE.

30.5.1 DMAC Operating Modes

Figure 30.2 illustrates the operating modes of the DMAC.

Transitions of DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the DMAC mode register

The operating mode can be confirmed by reading the operating mode status bits in the DMAC status register (CSR.OPS).

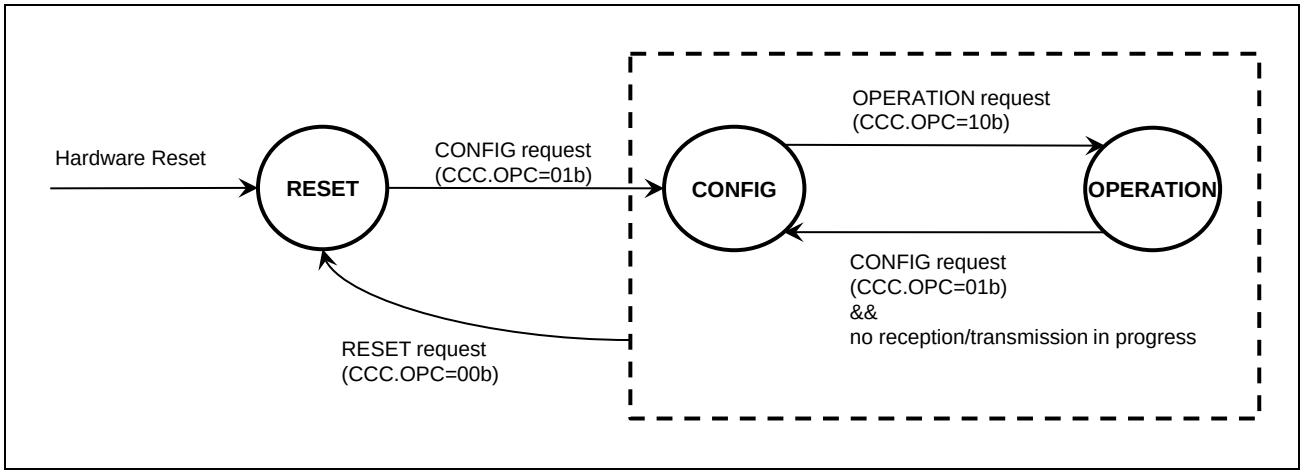


Figure 30.2 Operating Mode of DMAC

30.5.1.1 Operating Modes

(1) RESET mode

After a hardware reset, the DMAC enters RESET mode.

In RESET mode, only the DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) CONFIG mode

In CONFIG mode, various settings for the DMAC can be made.

The operation of most functions is stopped, and all status registers are initialized to their reset values.

(3) OPERATION mode

In OPERATION mode, all functions of the DMAC can operate. Ethernet communications can only proceed in this mode.

30.5.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the operating mode can be checked by reading the operating mode status bits in the DMAC status register (CSR.OPS).

Transitions other than leaving from OPERATION mode are made after the value is written to the operating mode configuration bits (CCC.OPC).

For transitions leaving from OPERATION mode, it is not executed immediately because any transmission and reception in progress will be executed before leaving from OPERATION mode. To prevent any trouble, follow the “Stop Procedure” of **Section 30.5.13.4**.

30.5.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the DMAC operating mode.

(1) Hardware reset

Resetting of the LSI chip leads to resetting of the entire Gigabit Ethernet Interface. The operating mode shifts to RESET mode.

30.5.2 Descriptors

30.5.2.1 Data Representation in URAM

The DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the DMAC.

Figure 30.3 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor processed interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.

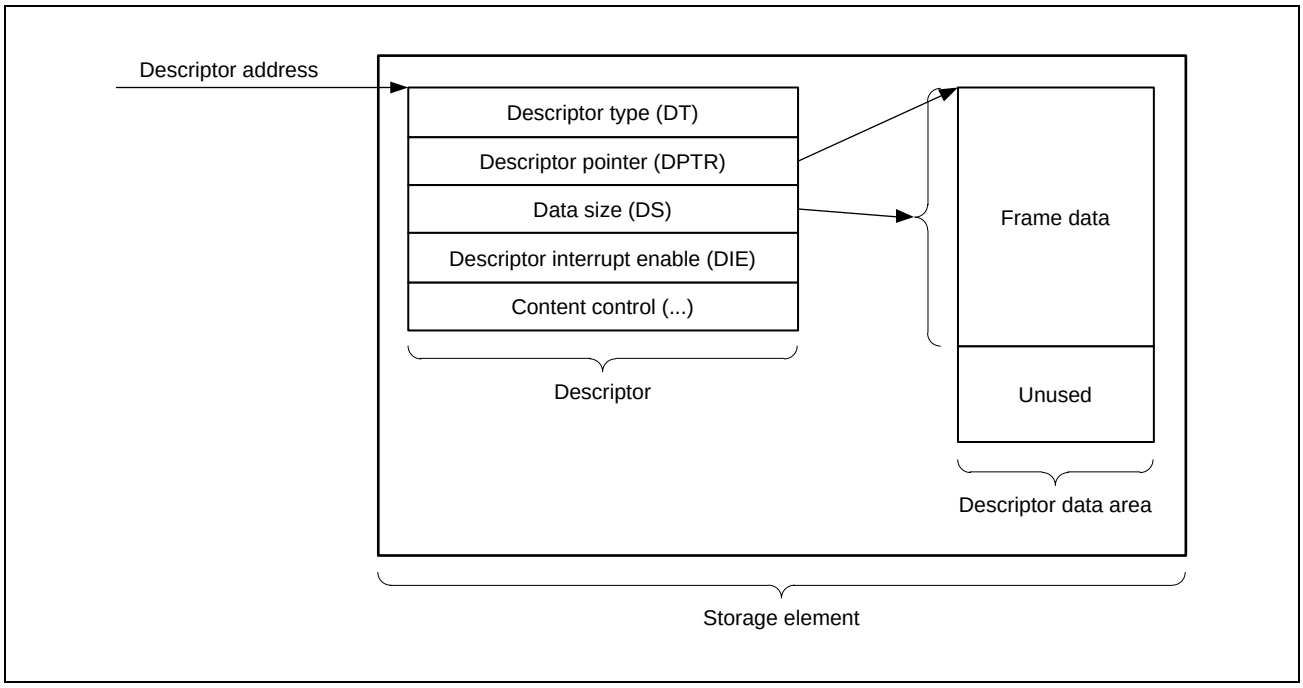

Figure 30.3 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are configured of 64 bits.

The frame data must also be aligned with a 32-bit boundary in the URAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

30.5.2.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. The queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see **Section 30.5.2.6, Descriptor Type**.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 30.4 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).

- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

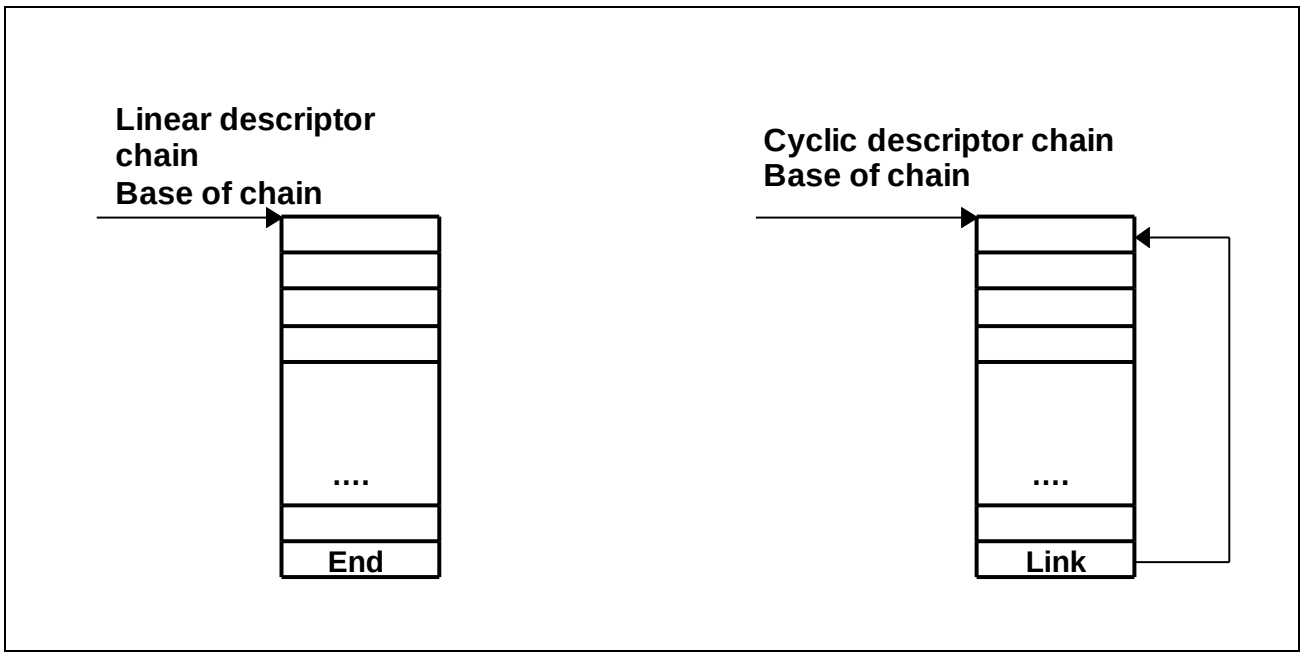

Figure 30.4 Outline of the Basic Descriptor Chains

The relationship between queue and descriptor chain is defined by the base addresses of chain. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in OPERATION mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure should be used or which topology is suitable depend on the application. A description of how to design descriptor chains to suit various applications is given in **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.

30.5.2.3 Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entry 0 is used to access transmission queues. Entry 4 is used to access reception queue.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 30.5 shows an example of a base address table for controlling transmission and reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

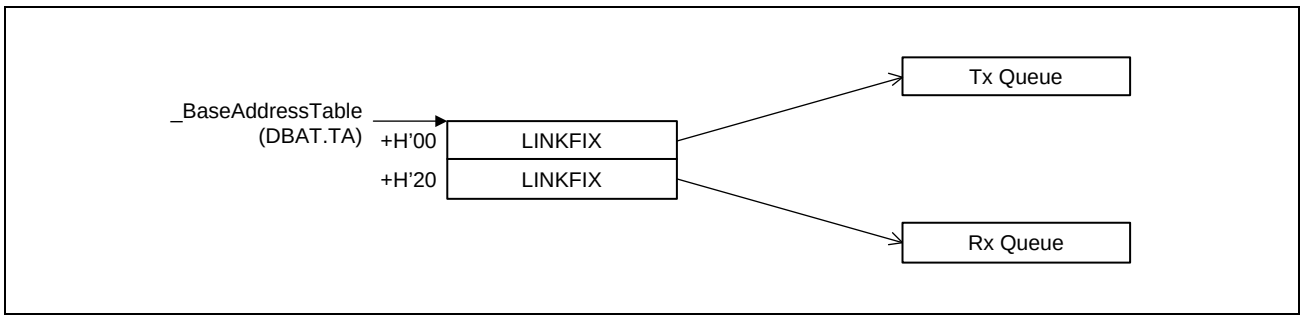

Figure 30.5 Example of a Base Address Table for Reception and Transmission Queues

30.5.2.4 Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to OPERATION mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue. The DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

30.5.2.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enables bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 30.6 illustrates the way in which the DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

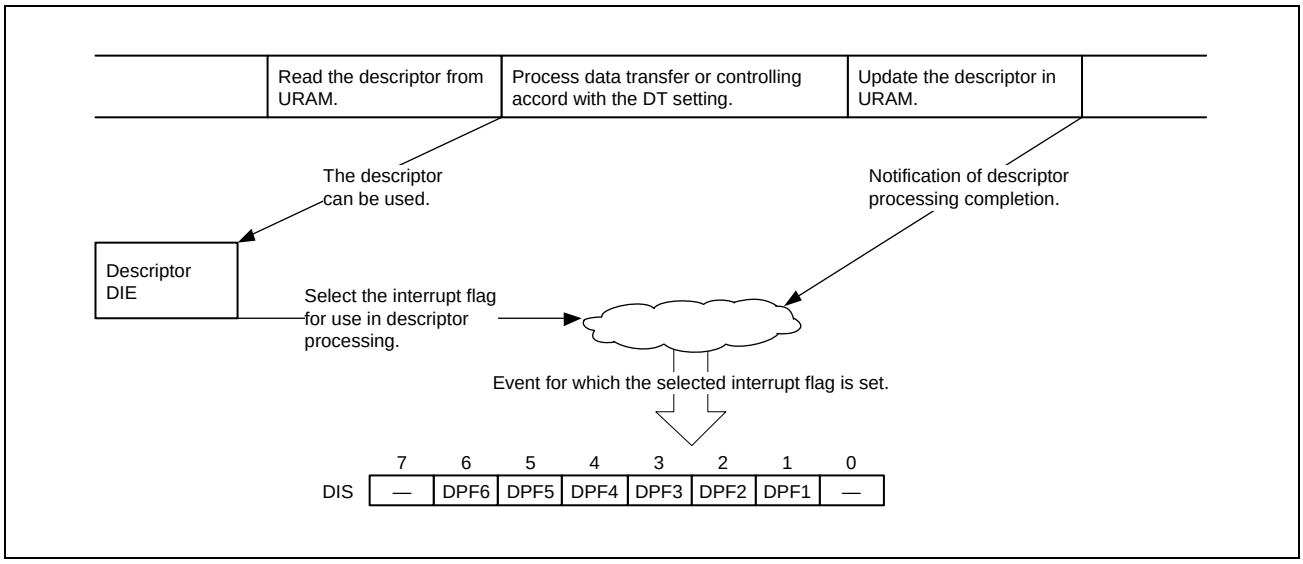

Figure 30.6 Method of Descriptor Interrupt Generation

30.5.2.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 30.7 is a summary of the descriptor types available for the DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (DMAC).

Definition of HW:

- The descriptor is processed by hardware (DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

- This descriptor type is not used in transfer in the given direction (transmission or reception).
- Do not write to this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

- Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 30.7 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the next descriptor in the chain.	HW	HW
LINKFIX	9	Fixed Link Same as LINK, but not changed by DMAC after processing.	SW	SW
EOS	10	End Of Set Control element to split a descriptor chain. The chain stops and waits for user interaction.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
DT13	13	Reserved	Invalid	Invalid
DT14	14	Reserved	Invalid	Invalid
FEMPTY_ND	15	Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame. The descriptor is processed in the same way as FEMPTY, but data are not stored in the URAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

30.5.2.7 Layout of General Descriptors in the URAM

The DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(1) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.
usable in both reception and transmission

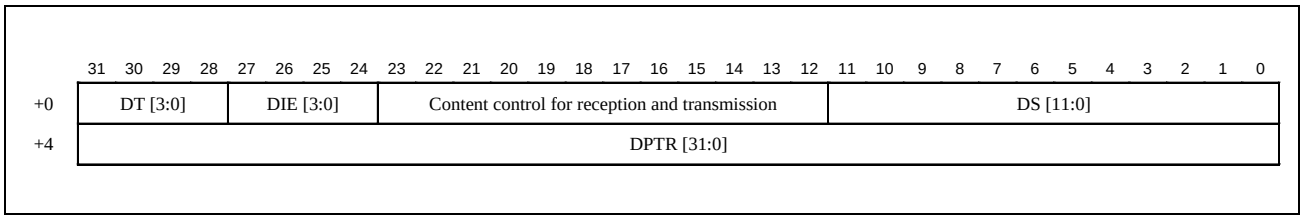

Figure 30.7 The allocation of bits in the frame data descriptors

Table 30.8 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(2) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

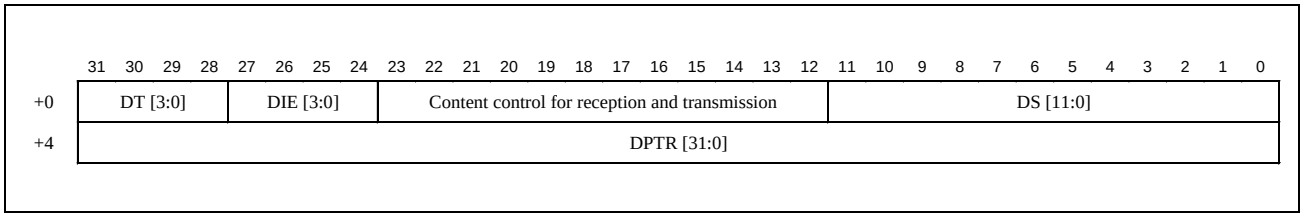

Figure 30.8 The allocation of bits in the arbitration descriptors

Table 30.9 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 15: FEMPTY_ND For details, see **Table 30.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see **Section 30.5.3.2, Setting Up Reception Descriptors**, and **Section 30.5.4.1, Setting Up Transmission Descriptors**.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(3) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

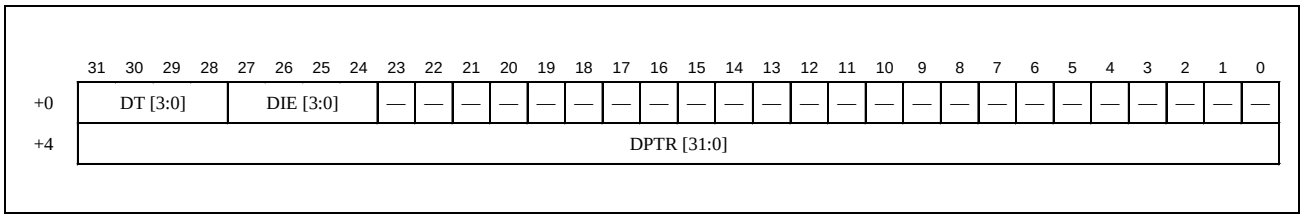

Figure 30.9 The allocation of bits in the link descriptors

Table 30.10 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see **Table 30.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(4) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

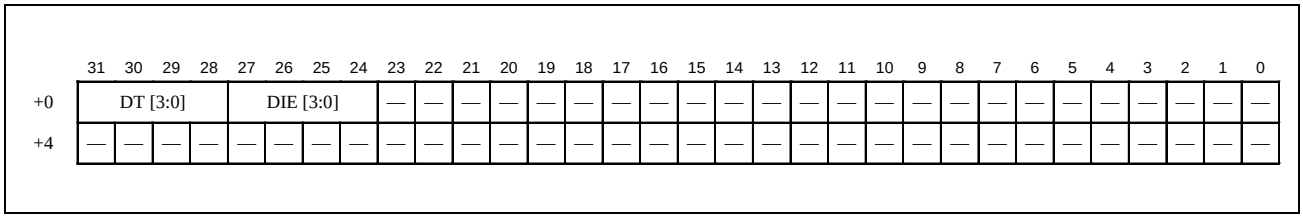

Figure 30.10 The allocation of bits in the other descriptors

Table 30.11 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see **Table 30.7, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable 0000b: Descriptor interrupt is disabled. 0001b to 1111b: The corresponding descriptor interrupt is generated (DIS.DPFi).

30.5.2.8 How to Use Frame Data Descriptors

In general, Ethernet frames are not of uniform length. The DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

Figure 30.11 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

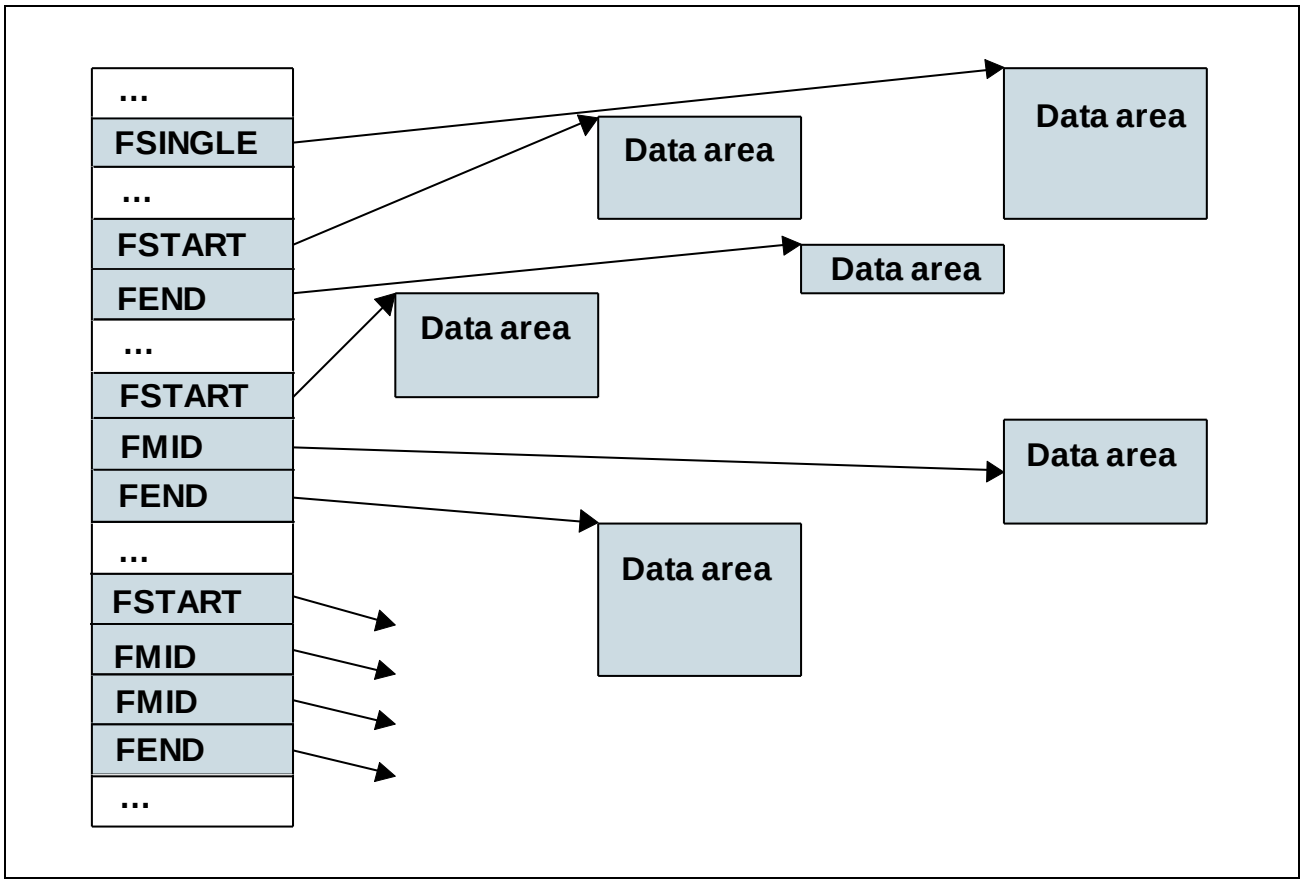

Figure 30.11 Mapping of Frame Data

For reception, the DMAC will store received frame data in the given area. If a received frame has more data than the descriptor data size (DESCR.DS), the DMAC will divide the data up.

For transmission, set the descriptor data size (DESCR.DS) to the actual data size. The DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

30.5.2.9 How to Use Chain Control Descriptors

(1) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see **Section 30.5.2.2, Using Descriptor Chains in Queues**)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(2) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFF), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

30.5.2.10 How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(1) FEMPTY and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

(2) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(3) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

30.5.2.11 Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of Gigabit Ethernet Interface can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see **Table 30.7, Summary of Descriptor Types**).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

30.5.2.12 Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment.
- While in OPERATION mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H’xxx00 and H’xxx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

30.5.3 Reception Control

The point of the DMAC is to transfer data between the TOE/E-MAC and URAM without intervention by the CPU.

DMAC needs descriptors that define the amounts of frame data to be stored and the locations. When the E-MAC received a frame, it is transferred to TOE and the conditions of reception is also transferred to DMAC as the E-MAC state. The checksum of received frame is calculated by TOE, the received frame is stored to Reception FIFO temporary. If TOE detects any errors from received frame (such as it was unsupported frame or checksum error), the error information is notified to DMAC. After that, the received frame is transferred to URAM by DMAC. At the time, MAC-Status and Error Information of TOE are written to Reception Descriptor by Write Back. For a description of how to set up descriptors for use in reception, see **Section 30.5.3.2, Setting Up Reception Descriptors**.

Figure 30.12 shows the reception data bus.

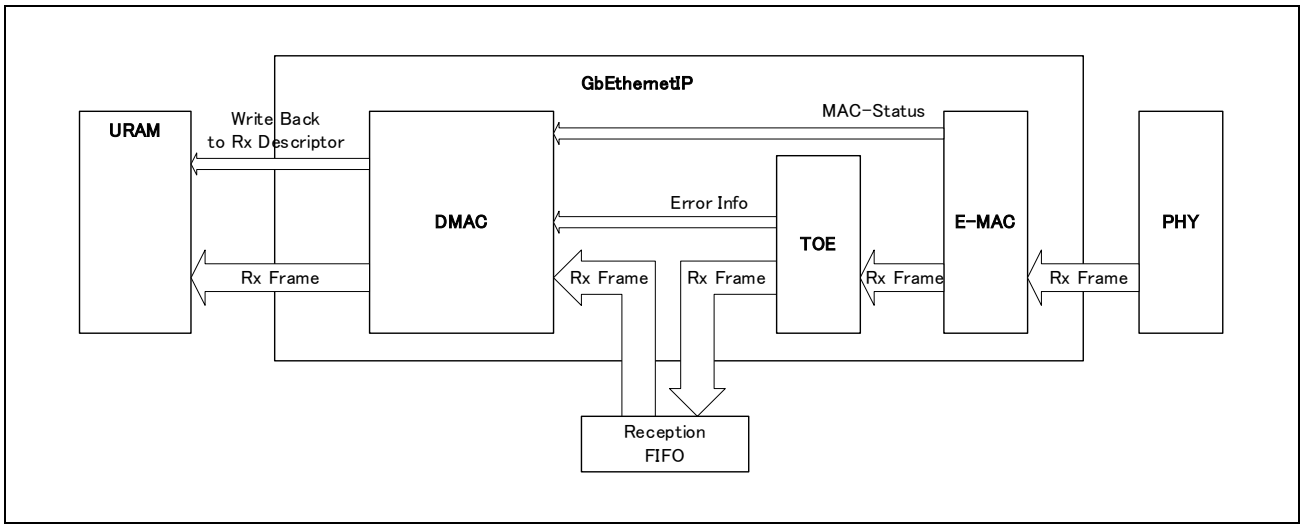

Figure 30.12 Mechanism of General Reception

30.5.3.1 Reception Queues

The DMAC stores all received frames in the URAM.

There is a condition for the DMAC to discard a received frame.

- Detection of an error during reception by the TOE and E-MAC
  - Whether error frames are discarded or stored in reception queue depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1*[1]), they are always stored in queue. In this case, characteristics specific to the queue (e.g. truncation) will vary.

Note 1. RCR.EFFS = 1 is only for debug. Do not set this condition during normal operation.

The flowchart in **Figure 30.13** shows how the DMAC selects the reception queue in accord with the frame type. The result is storage of the frame in the proper queue or the frame being discarded.

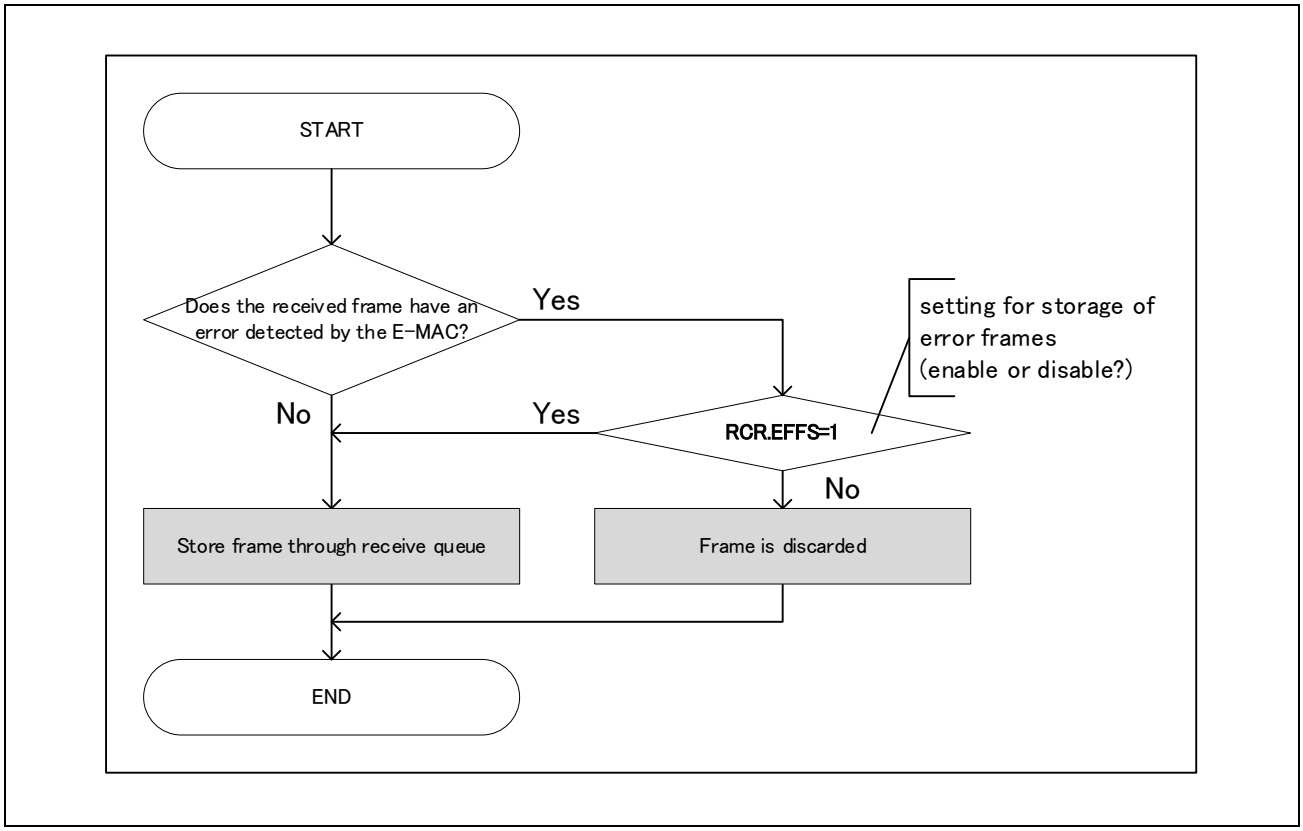

Figure 30.13 Mechanism of Reception Queue Selection

30.5.3.2 Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in **Section 30.5.2, Descriptors**.

This section describes memory operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 30.12 shows the descriptor types used in reception.

Table 30.12 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	Condition for data not being stored in a reception queue: The RIS2.QFF bit indicates that queue r is full, and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	A stop point defined by software has been reached. A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFF indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see **Section 30.5.3.3(1), Storing Frame Data in the Descriptor Data Area**.	FSTART, FMID, FEND, or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the Reception FIFO but not stored. After processing, DESCR.DS is written back as 0.	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

(2) Configuration of Reception Frame Data Descriptors

Figure 30.14 shows the configuration of descriptors for use with reception queues. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TI) are described in **Table 30.8**.

For the other fields and the descriptor types, see **Section 30.5.2.6, Descriptor Type**.

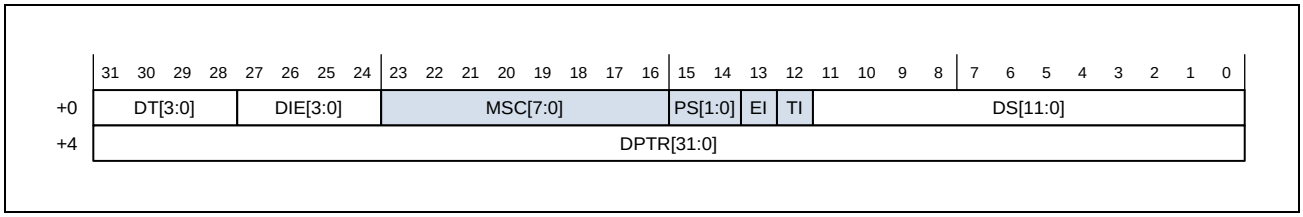

Figure 30.14 Configuration of Descriptor for a Received Frame

Table 30.13 Configuration of a Received Descriptor

Bit Name	Function
MSC	E-MAC/TOE Status Code These bits indicate errors in reception detected by the E-MAC and TOE. In the case of a divided frame, the bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows. MSC [7]: Received frame has a multicast address. (E-MAC) MSC [6]: Check-sum error (TOE) MSC [5]: Received Unsupported frame (TOE) MSC [4]: Received frame has alignment error. (E-MAC) MSC [3]: Received frame is too long. (E-MAC) MSC [2]: Received frame is too short (E-MAC) MSC [1]: Error in frame reception (E-MAC) MSC [0]: Received frame has a CRC error. (E-MAC)
PS	Padding Selection 00b: Padding is not to be inserted.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted. 0: No error 1: Error is detected
TI	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored. The bits are set to the same value within all frame data descriptors for a divided frame. 0: Data have not been truncated.

Note: The RCR.EFFS bit specifies whether frames with errors detected by the TOE or E-MAC are to be stored in the URAM or not. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

30.5.3.3 Reception Processing

After initialization, the DMAC can store received frames in the data area in the URAM as indicated by the descriptor. The DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

If the Reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor) are discarded from the Reception FIFO.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

The CPU can write FEMPTY (or FEMPTY_ND) directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTY (or FEMPTY_ND) is written to DESCR.DT.

(1) Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY_ND descriptor after processing.

(2) Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI is only valid in the last descriptor of the sequence for a divided frame.

NOTE

If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the Reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

(3) No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(2) Flow of Reception Descriptor Processing

Constructing a descriptor chain requires software (see **Figure 30.15**).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after OPERATION mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

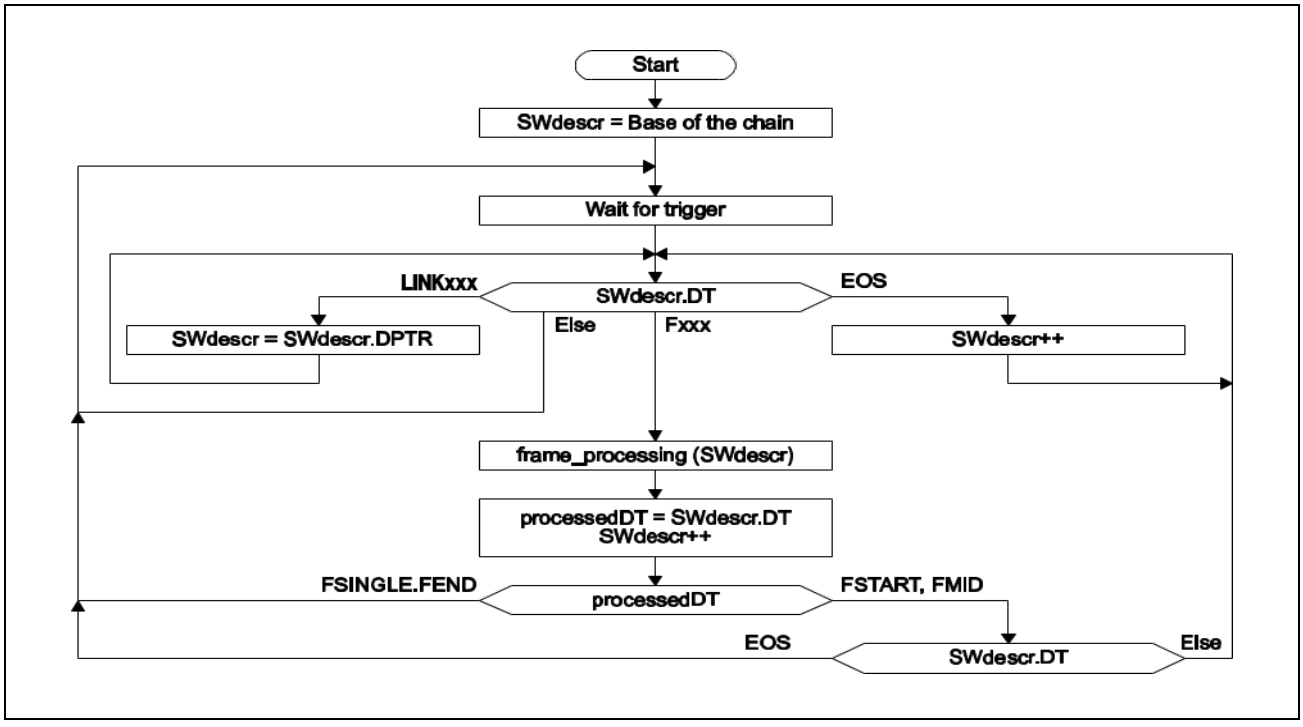

Figure 30.15 Flow of Reception Descriptor Processing

30.5.4 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see **Section 30.5.2, Descriptors**).

The DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status for the software and the DMAC. The status information for transmitted frames remains accessible after their transmission is completed.

When DMAC started to transfer a frame, it reaches to TOE via Transmission FIFO and TOE FIFO. And after the calculation of transmission frame checksum by TOE, it is transferred to PHY by E-MAC. If any error information is detected by TOE or E-MAC, they are notified to DMAC and stored to MAC Status FIFO/MAC Status FIFO2. The oldest information in them is indicated to MFA/MFA2 of DMAC register.

Figure 30.16 shows the transmission data bus

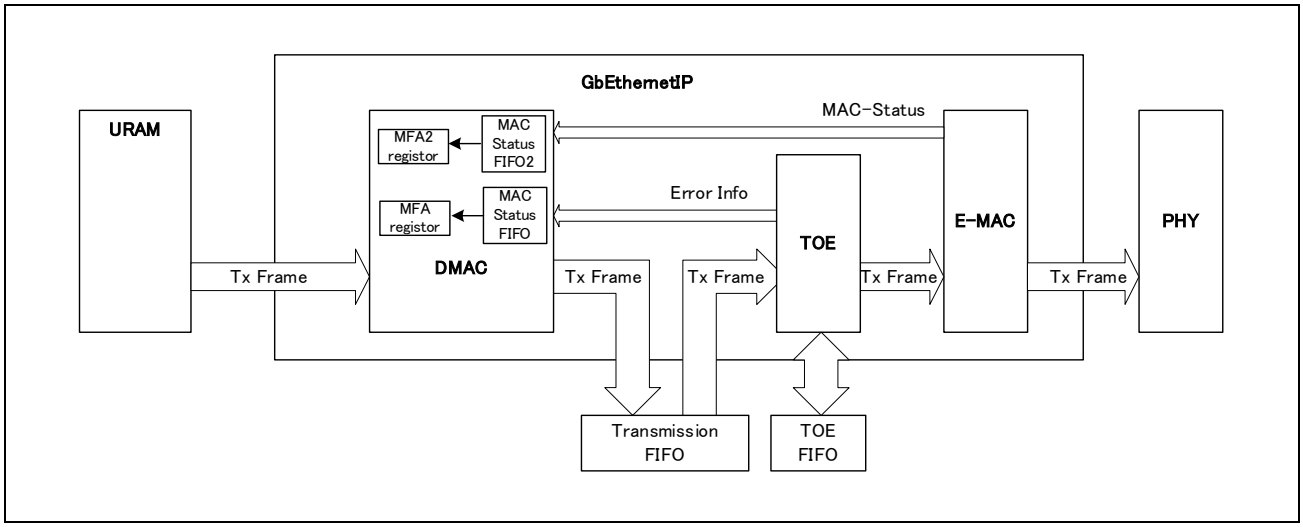

Figure 30.16 Mechanism of General Transmission

30.5.4.1 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 30.14 shows the descriptor types used in transmission.

Table 30.14 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame Middle (FMID)	The DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor.	FEMPTY
Frame End (FEND)	The DMAC fetches the last of the data for the divided frame. The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The DMAC fetches the frame of data. The frame of data that has been fetched to the Transmission FIFO is ready for transmission by the E-MAC, and then the DMAC proceeds to processing of the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission. When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQ), which stops transmission. When the TCCR.TSRQ is again set to 1 (a new transmission start request is issued), processing starts at this descriptor.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 30.17 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR, and DESCR.TAG) are described in **Table 30.15**.

For the other fields and the descriptor types, see **Section 30.5.2.6, Descriptor Type**.

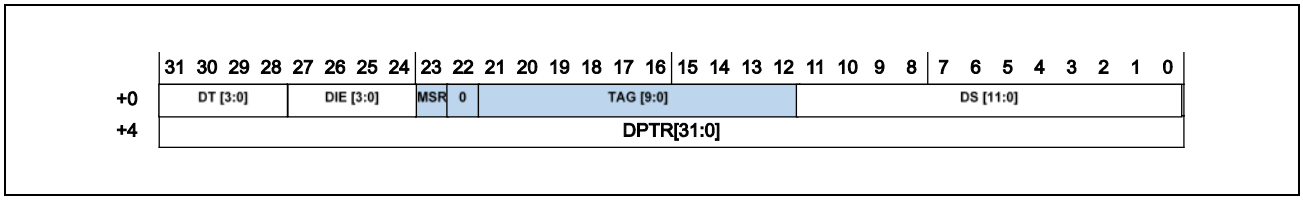

Figure 30.17 Configuration of Descriptor for a Transmitted Frame

Table 30.15 Configuration of a Transmission Descriptor

Bit Name	Function
MSR	MAC Status storage Request This bit configures if MAC transmission status of the frame is stored in MAC status FIFO. 0b: No status information is stored 1b: Status information is to be kept for this frame in MAC status FIFO This bit is considered only if DESCR.DT = FEND or FSINGLE. *Note*: If there is error during transmission of frame then status is always stored.
TAG	Frame Tag This TAG field is used to associate each frame data. Frame TAG is not required but is recommended. This bit is available while the current DESCR.DT is FEND or FSINGLE.

30.5.4.2 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue (with q = 0) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in **Section 30.5.2, Descriptors**).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 30.18 shows descriptor processing during transmission.

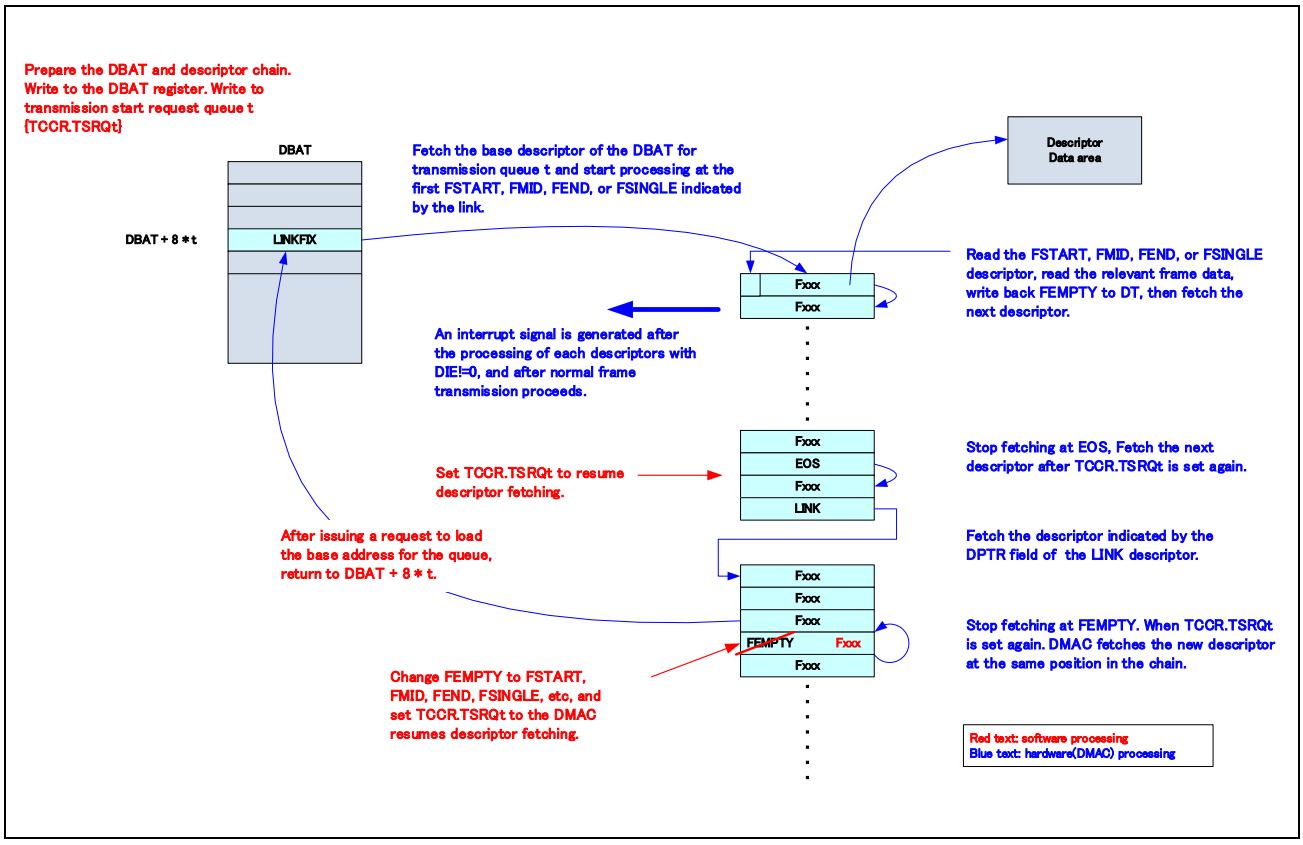

Figure 30.18 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(1) Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMTPY descriptors at the stop points.

Figure 30.19 shows the flow for software implementing this pattern. SW should read back written descriptor between changing FEMPTY descriptor before writing to TCCR.TSRQ.

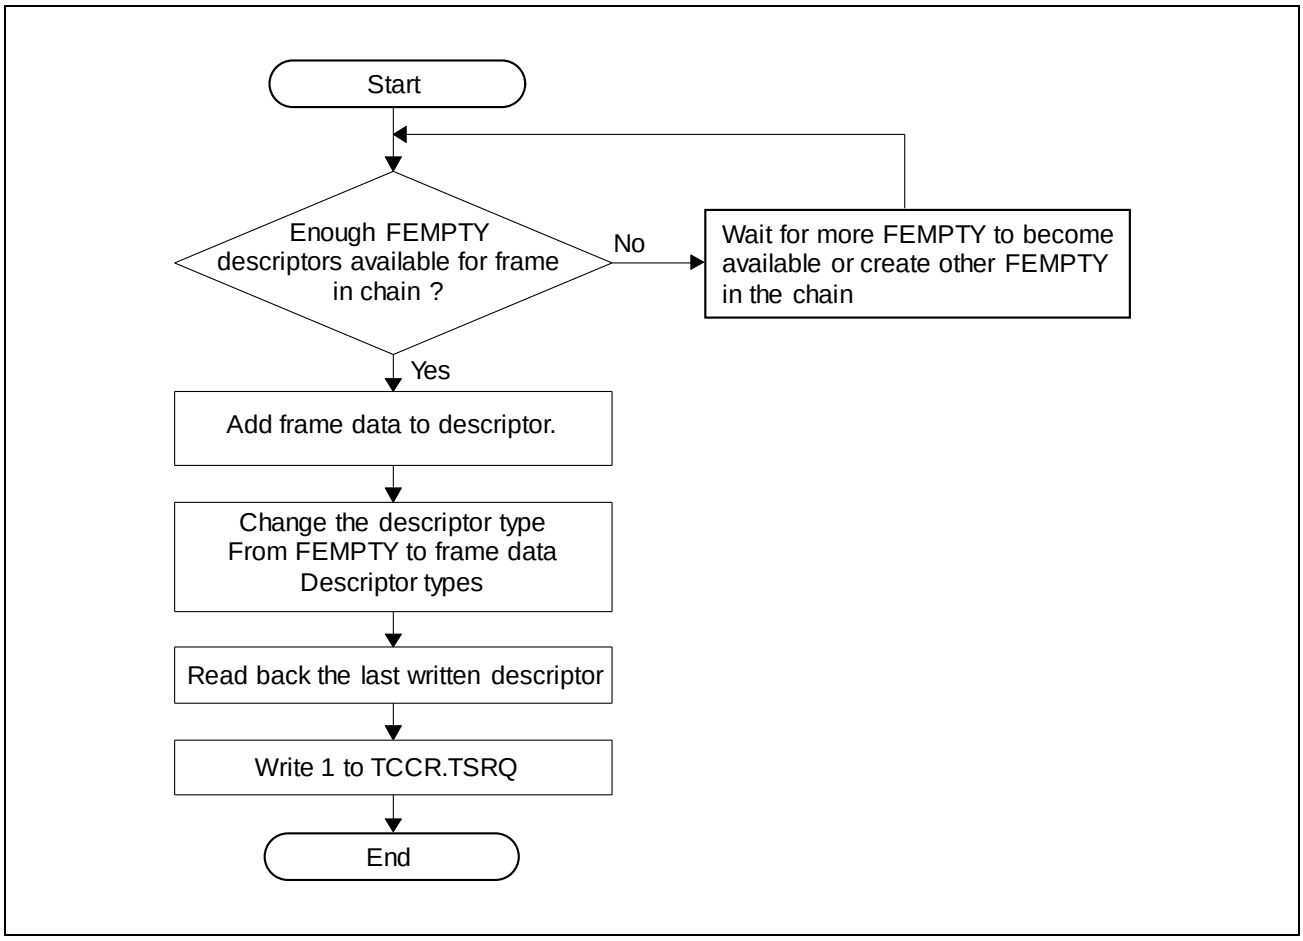

Figure 30.19 Software Flow for Immediate Frame Transmission

Figure 30.20 shows software and DMAC operations for immediate frame transmission.

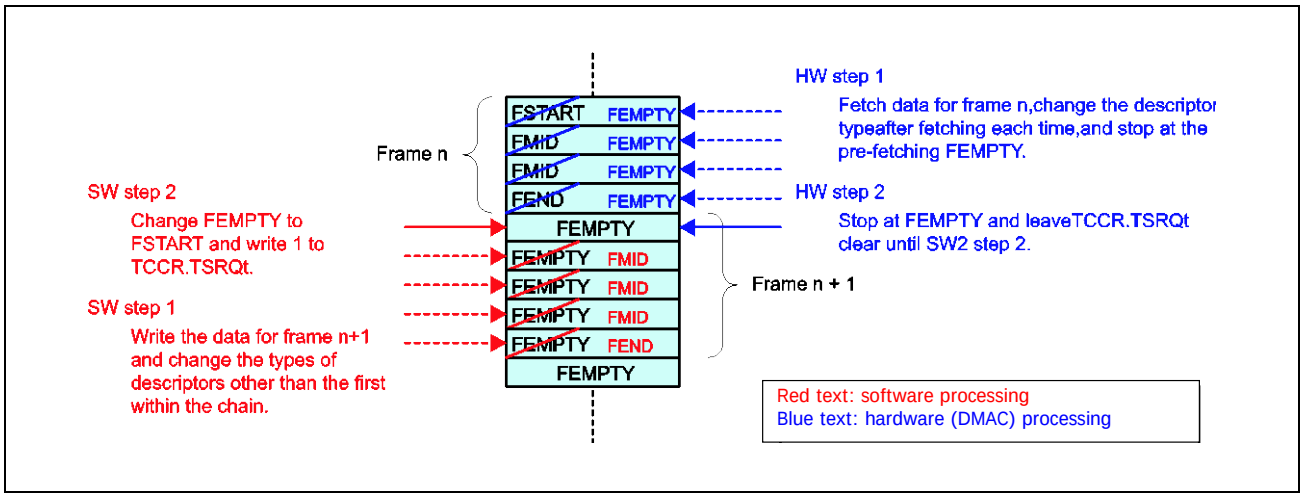

Figure 30.20 Software and DMAC Operations for Immediate Frame Transmission

(2) Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 30.21 shows the software flow in this pattern.

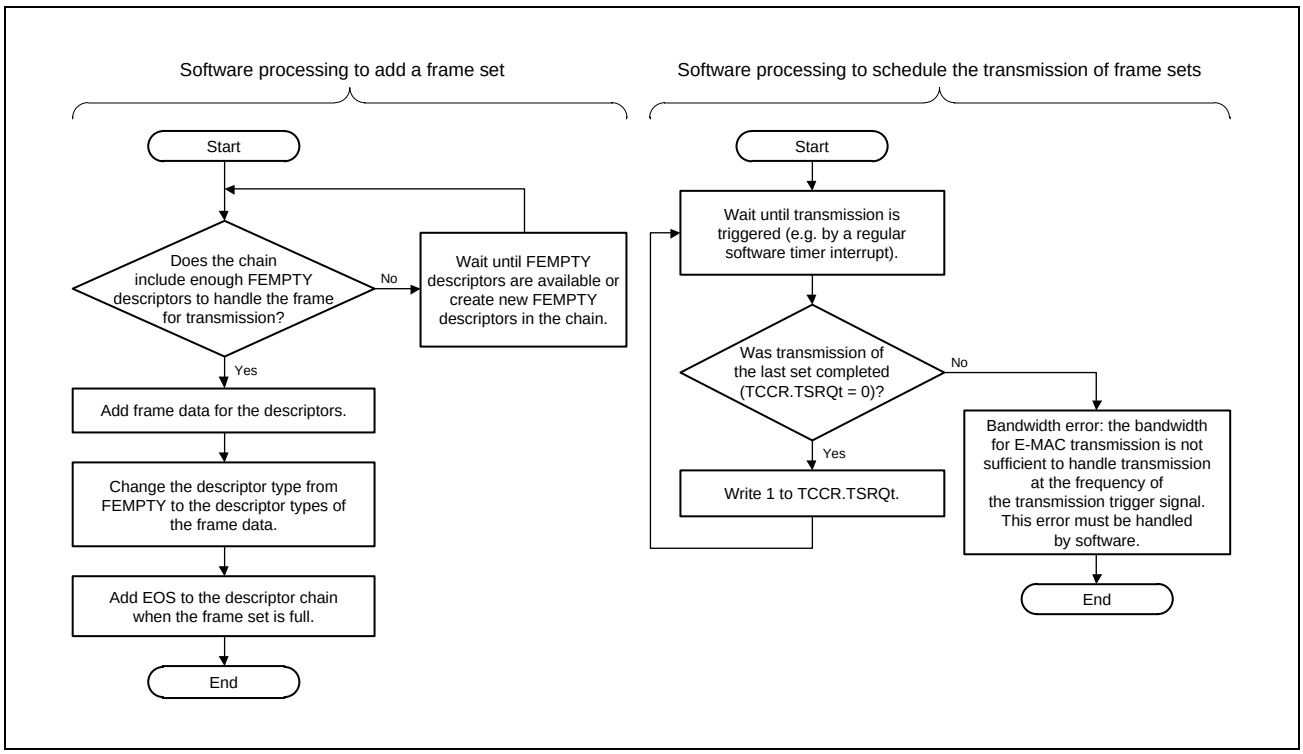

Figure 30.21 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 30.22 shows software and DMAC operations for frame set transmission.

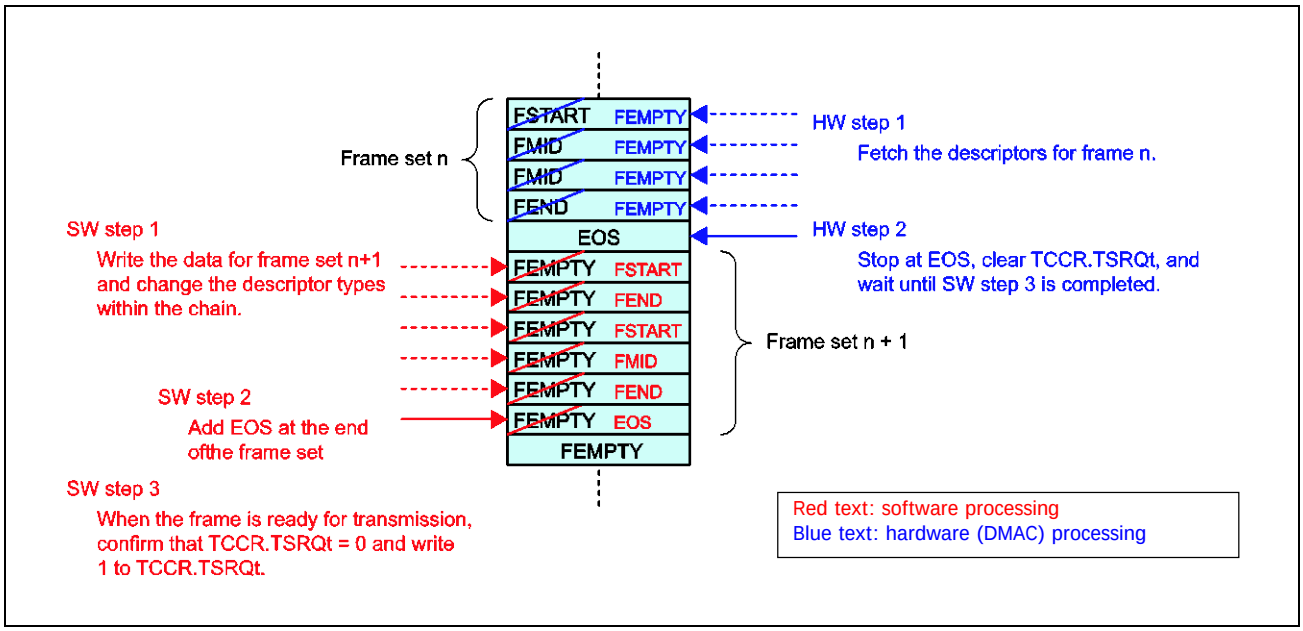

Figure 30.22 SW and DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

(3) Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 30.23 shows the flow for software implementing this pattern.

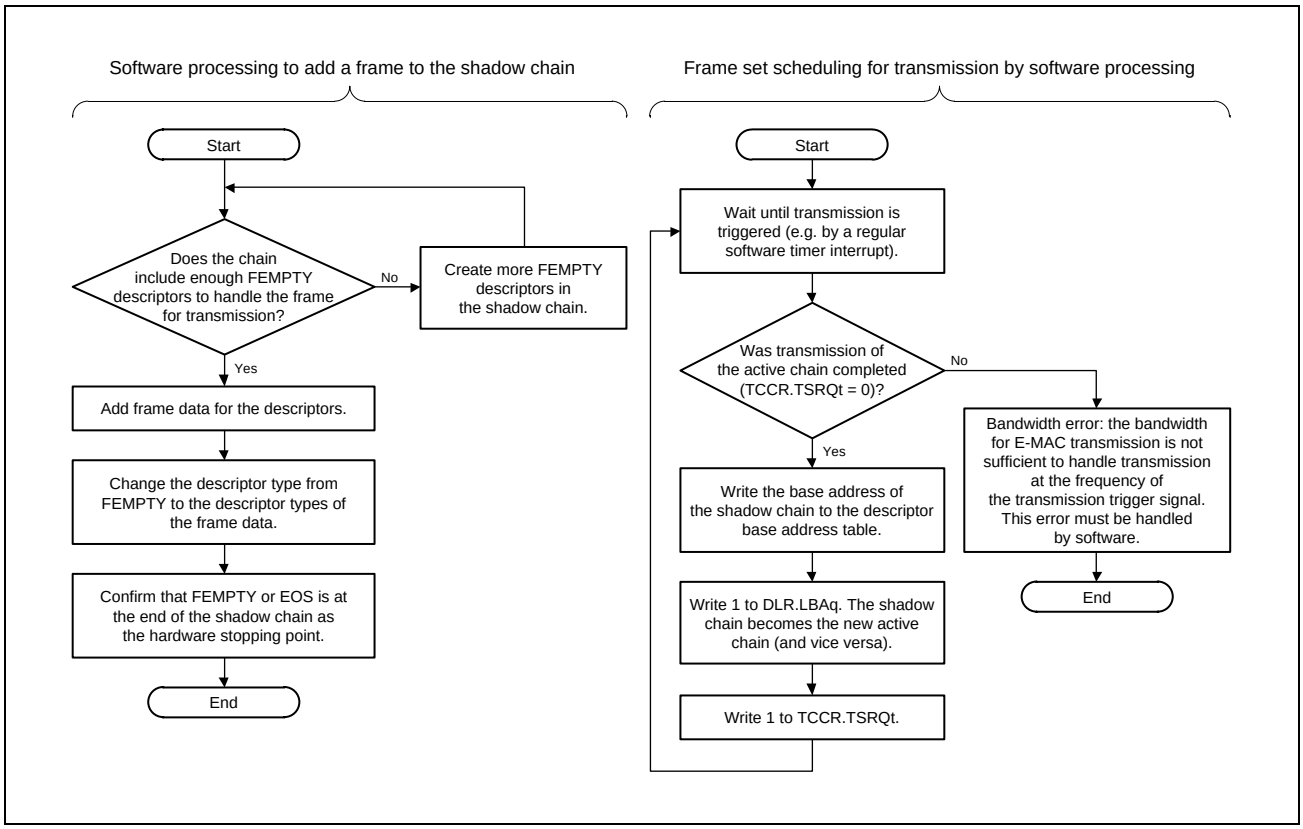

Figure 30.23 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 30.24 shows software and DMAC operations for frame set transmission.

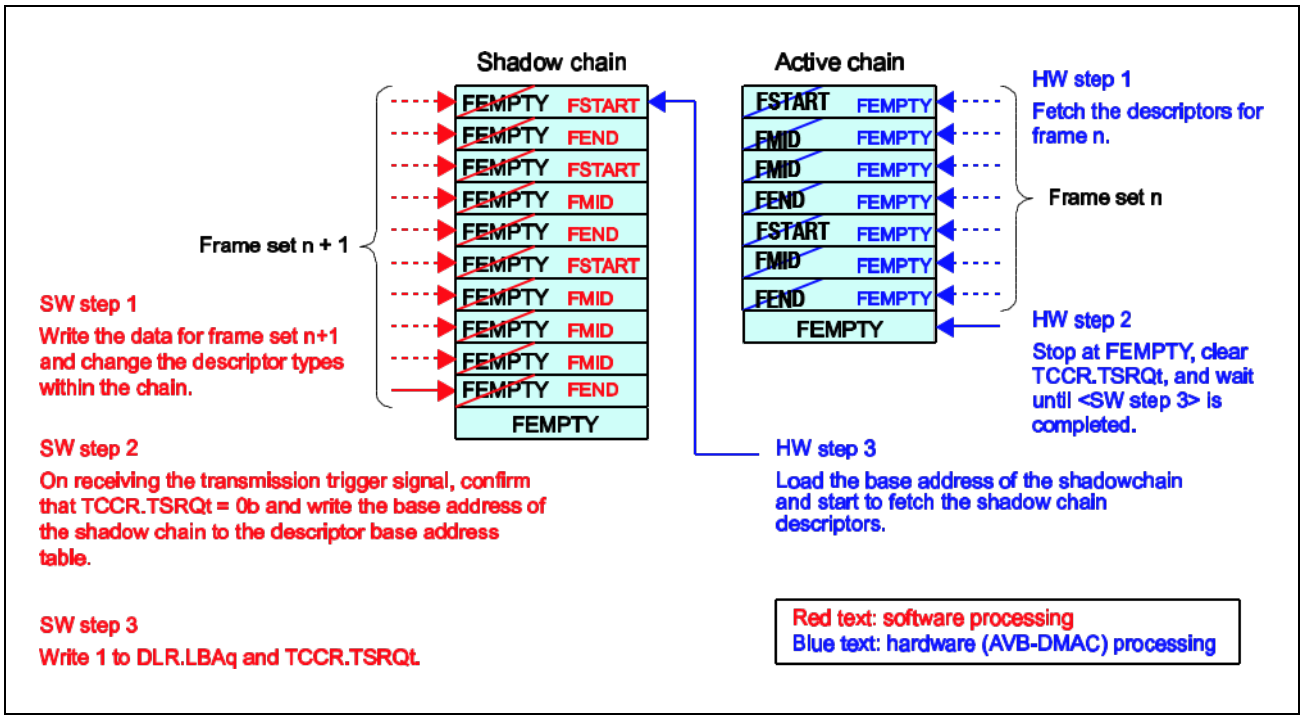

Figure 30.24 SW and DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

30.5.5 Integrity Checking

The DMAC can detect and identify errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

30.5.5.1 Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

30.5.5.2 Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

30.5.5.3 Monitoring in Both Reception and Transmission

(1) Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus.

(2) Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.

If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.
- The frame will be lost from the Transmission FIFO.

(3) Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQ) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

30.5.5.4 Monitoring in Reception

(1) Errors in access to the URAM for writing of data

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.

(2) Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the Reception FIFO RAM faults, DMAC detects the fault as error of the Reception FIFO.

30.5.5.5 Monitoring in Transmission

(1) Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the Transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:z
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  The current descriptor address (CDARq.CDA) is not updated.
  The transmit start bit in the transmit configuration control register (TCCR.TSRQ) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

(2) Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQ) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(3) Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.
- The information of MAC Status FIFO and MAC Status FIFO2 will be inconsistent.

If damaged data in the Transmission FIFO is an error due to the Transmission FIFO, this is detected by the DMAC.

30.5.6 Checksum Calculation

TOE calculates Checksum of received frames from E-MAC. And then it is outputted to DMAC. TOE also calculates Checksum of transmission frames from DMAC. And then it is outputted to E-MAC.

To use this function, configure E-MAC as CRC Pass Through Mode (CXR20.RCPT = 1).

TOE supports Checksum Calculation for following part of frames. See **Section 30.5.6.4** for about the details of Supported Frames.

- IPv4 Header
- IPv4 TCP/UDP/ICMP
- IPv6 TCP/UDP/ICMP

30.5.6.1 Checksum Calculation handling

(1) Reception Handling

The result of Checksum Calculation is attached to last 4 byte of Ethernet Frames like **Figure 30.25**. And then the handled frames are transferred to memory by DMAC. If the frame does not have checksum error at the part of IPv4 Header or TCP/UDP/ICMP, the value of “H’0000” is attached to each part as the result of Checksum Calculation. The case of Unsupported Frame, the value of “H’FFFF” is attached. For example, if the part of IP Header is unsupported, “H’FFFF” is set to both field of IPv4 Header and TCP/UDP/ICMP. The case of IPv6, IPv4 Header field is always set to “H’FFFF”. And the set value of TCP/UDP/ICMP field is depend on configuration for support conditions.

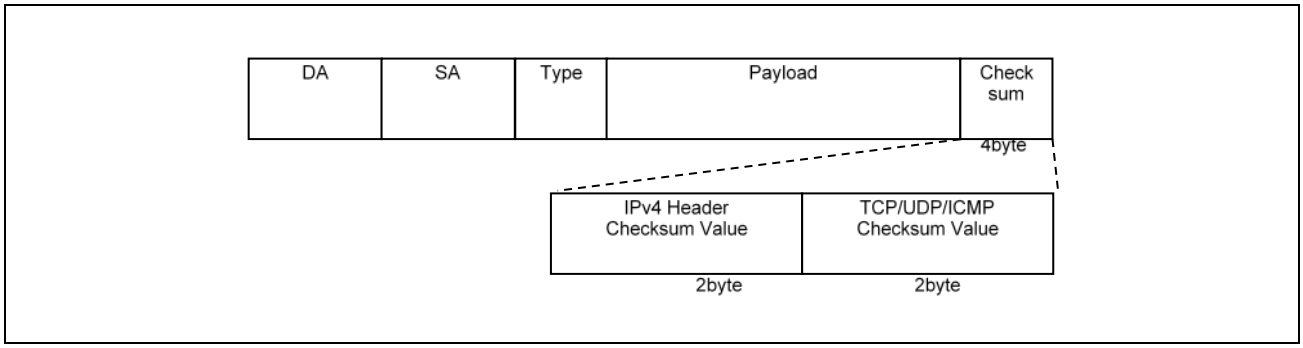

Figure 30.25 The field of checksum attaching field (Ex. Ethernet Frame of DIX)

(2) Transmission Handling

The result of Checksum Calculation is set to the Checksum field of each IPv4 Header/TCP/UDP/ICPM. For the Unsupported Frames, those fields are not changed. If a transmission frame is an UDP frame of IPv4 and its Checksum value in the UDP Header field is “H’0000”, TOE does not calculate Checksum for UDP part of this frame. Because Checksum for IPv4 UDP frame is defined as optional function in standards. If a transmission IPv4 UDP frame does not need to Checksum Value, set “H’0000” to the Checksum field in the UDP Header.

30.5.6.2 Error Notification

When TOE detects any errors by Checksum Calculation, the error information is notified to DMAC. The errors are detected by TOE are followings:

- Unsupported Transmission Frame Error (This error information is indicated to “MFA” register)
- Unsupported Reception Frame Error (This error information is stored to Descriptor by Write Back)
- Reception Frame has Checksum Error (This error information is stored to Descriptor by Write Back)

30.5.6.3 Individually Configuration by the frame type

The Enable/Disable setting of Checksum Calculation is configurable by CSR1 and CSR2 register. And CSR1 and CSR2 register are able to configure Enable/Disable setting individually for frame type. For example, it is possible to disable the checksum calculation for only UDP part of IPv4 frame.

The relationship between the Frame Type and Error Notification to DMAC are indicated at **Table 30.16** and **Table 30.17**. **Table 30.16** is for Transmission Frames. **Table 30.17** is for Reception Frames. The condition of both tables is that the checksum calculation for all frame type is enabled by CSR1 and CSR2 register.

If the checksum calculation of each Frame Type is configured as Disable individually by CSR1 and CSR2 register, the operation is followings. (Following descriptions are for the normal frames)

(1) Disabled Transmission Checksum Calculation

TOE notifies an Unsupported Transmission Frame Error to DMAC. And the Checksum Values which Type is configured as “Disable” are not changed.

(2) Disabled Reception Checksum Calculation

The frames which have Disabled configuration Types are handled as Unsupported Frame. So, the error notification to DAMC is same as the case of Unsupported Frames.

If the other checksum field which is configured as Enable has Checksum Error, Received Checksum Error is notified to DMAC. Received Unsupported Error also is notified. The value of “H’FFFF” is set to the checksum field which is configured as Disable.

Table 30.16 Relationship between Transmission Frame Type and Error Notification to DMAC

Transmission Frame Type						Checksum Operation		
VLAN-tag		IP		Transport protocol		Error Notification to DMAC	Checksum Value	
Number of tags	TPID	Protocol	Condition	Protocol	Condition	Unsupported Frame Error	IPv4 Header	TCP/UDP/ICMP
0 or 1	Nothing or H'8100	IPv4	Not Fragmented Packet	TCP/ICMP	—	Non-Asserted	Calculated Value	Calculated Value
				UDP	Checksum Field is not H'0000	Non-Asserted	Calculated Value	Calculated Value

Illegal Frames*2						—	Non-Asserted	Asserted	H'FFFF	H'FFFF

Note 1. See the **Section 30.5.6.4** for about the Supported Extended Headers.

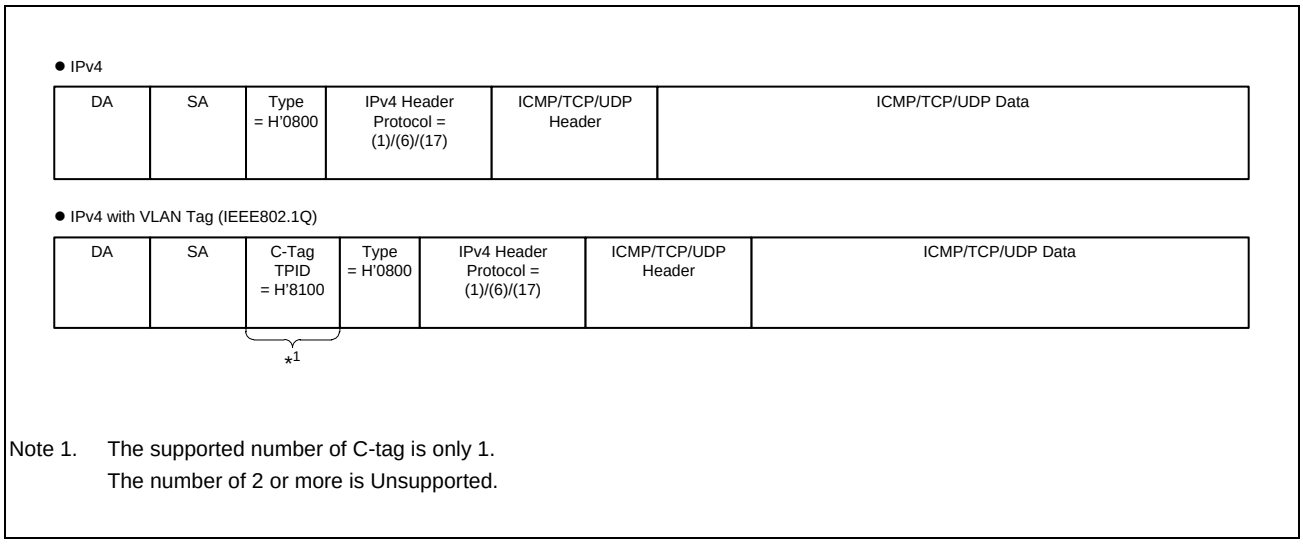
Note 2. The Frame Length is shorter than the result of Frame Analysis by TOE. Or the case of E-MAC detected Errors.

30.5.6.4 Supported Frame for Checksum Calculation

Following Frames are example of Supported/Unsupported Frame Formats for Checksum Calculation.

(1) For IPv4 Checksum Calculation

Figure 30.26 is Supported Frame Format for the Checksum Calculation of IPv4 Header and IPv4 TCP/UDP/ICMP.

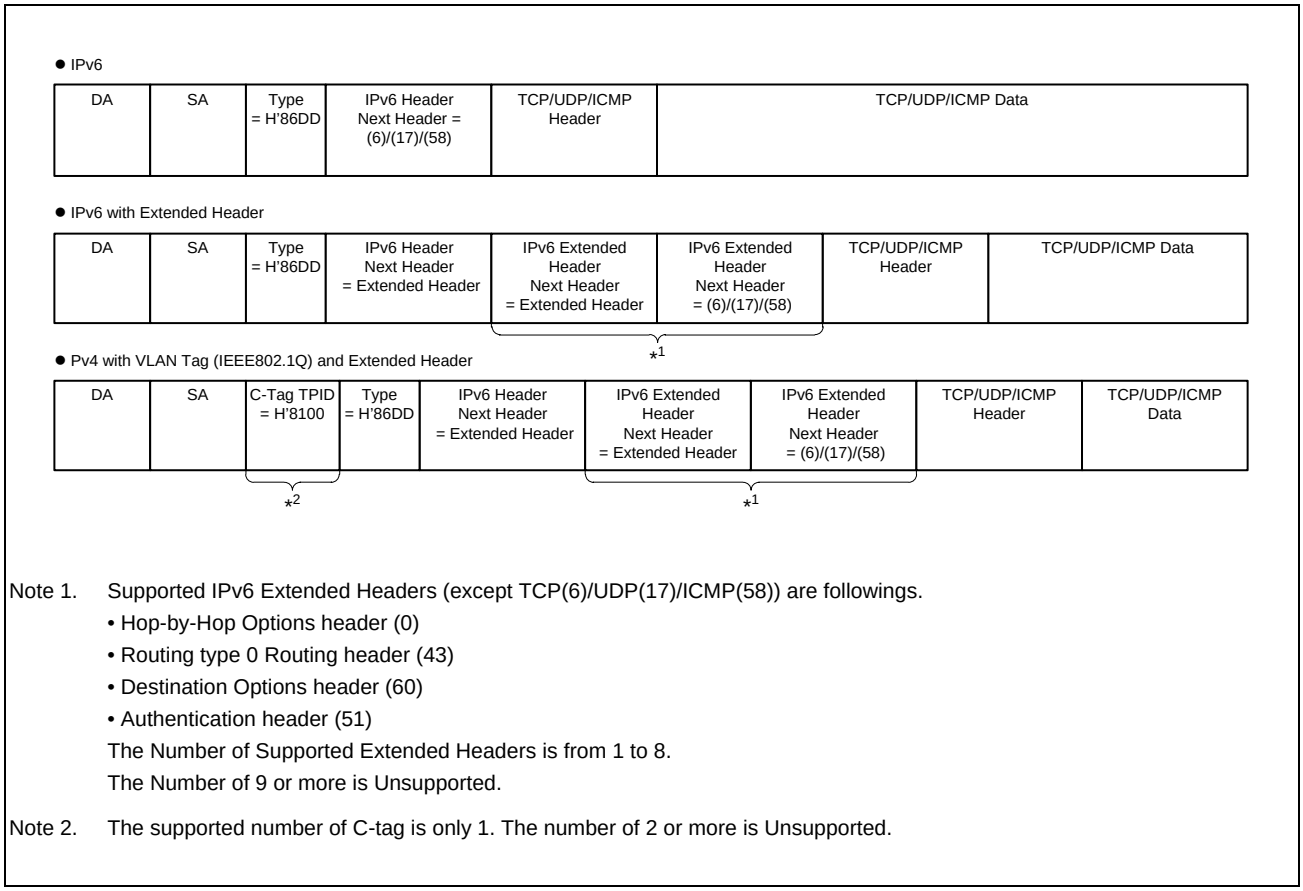


Note 1. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.26 Supported Frame Format for IPv4 Checksum Calculation

(2) For IPv6 Checksum Calculation

Figure 30.27 is Supported Frame Format for the Checksum Calculation of IPv6 TCP/UDP/ICMP.



Note 1. Supported IPv6 Extended Headers (except TCP(6)/UDP(17)/ICMP(58)) are followings.
- Hop-by-Hop Options header (0)
- Routing type 0 Routing header (43)
- Destination Options header (60)
- Authentication header (51)

The Number of Supported Extended Headers is from 1 to 8.
The Number of 9 or more is Unsupported.

Note 2. The supported number of C-tag is only 1. The number of 2 or more is Unsupported.

Figure 30.27 Supported Frame format for IPv6 Checksum Calculation

(3) Unsupported Frame Format (example)

Figure 30.28 is an Example Unsupported Frame Format.

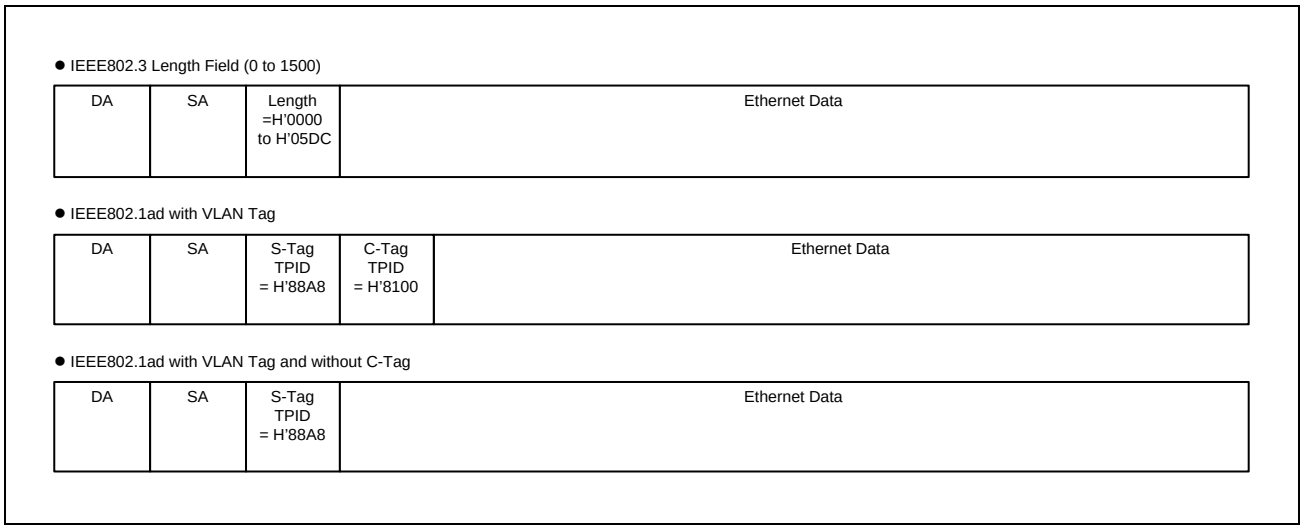


Figure 30.28 Unsupported Frame Format (example)

30.5.6.5 Checksum Calculation Flow

Figure 30.29 and **Figure 30.30** are Flows for Checksum Calculation by TOE.

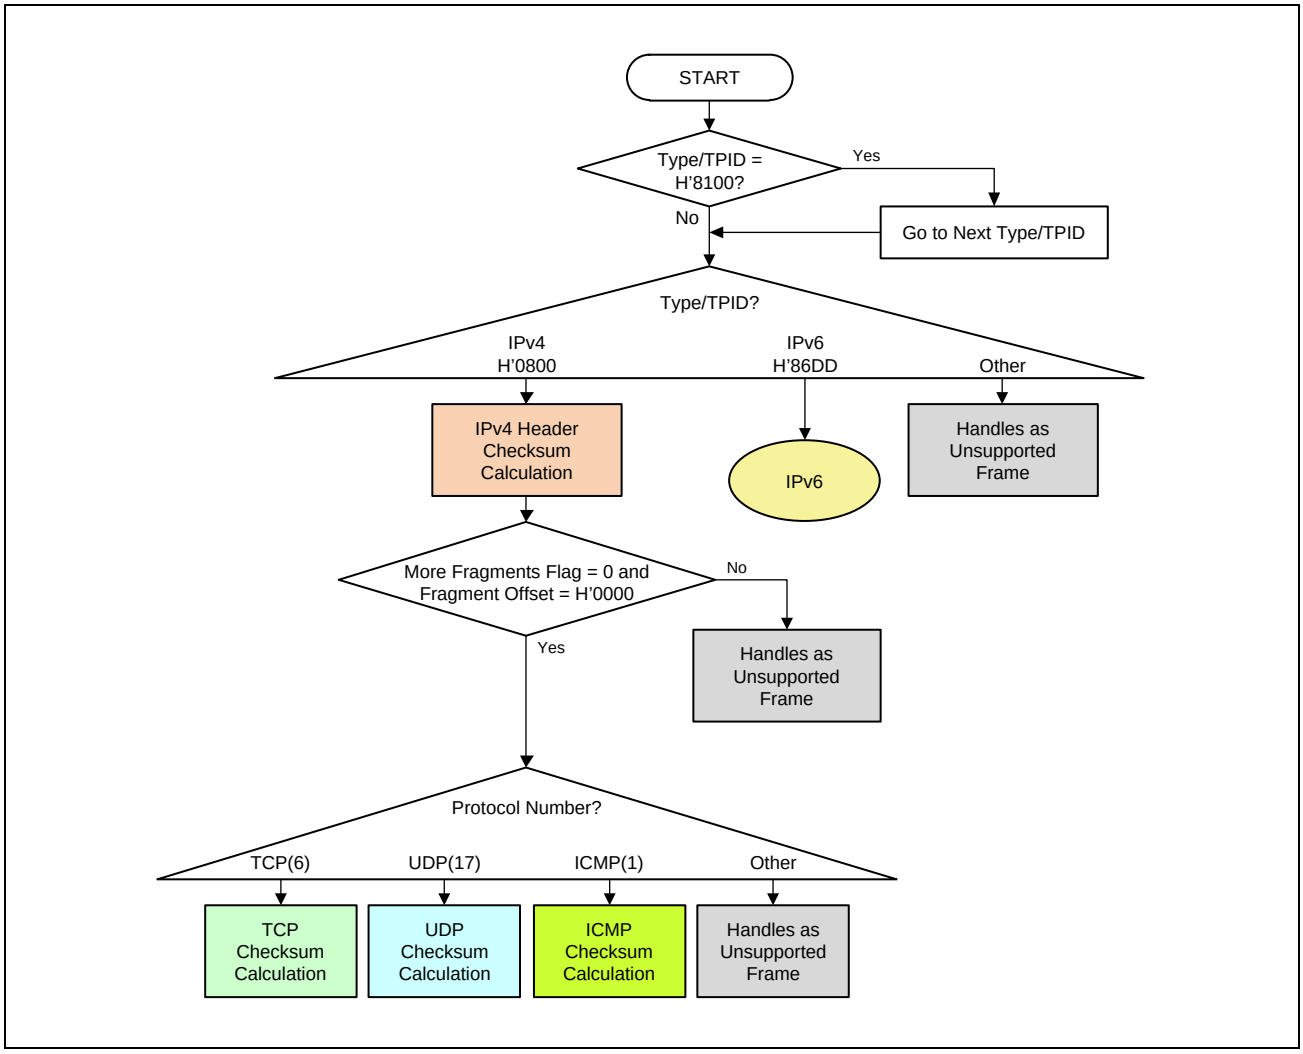

Figure 30.29 Checksum Calculation Flow (Part1)

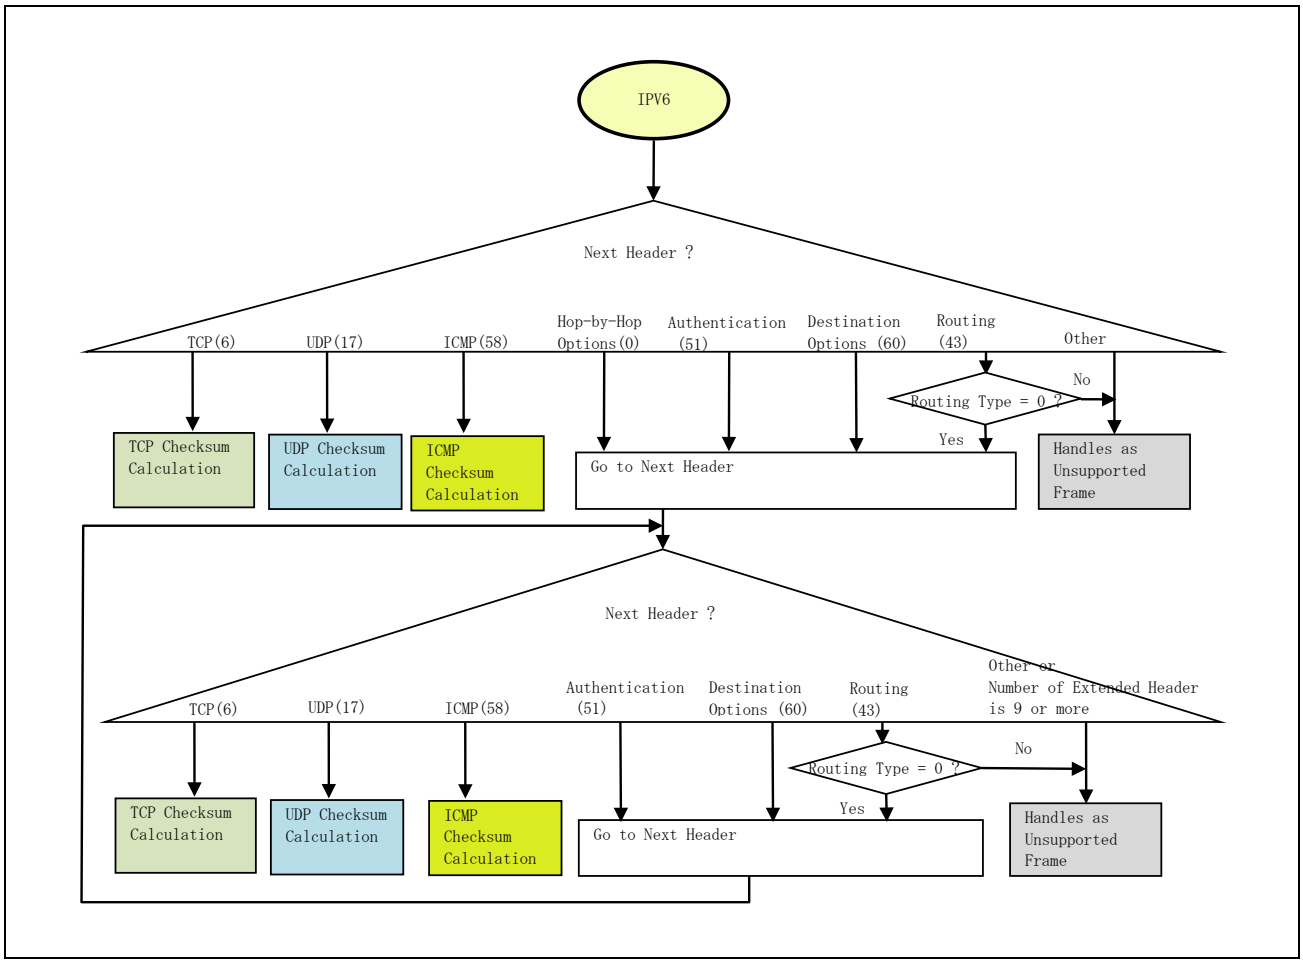

Figure 30.30 Checksum Calculation Flow (Part2)

30.5.7 Received Frame Filter

TOE has Received Frame Filters. When TOE received the frame which is not match to filters, TOE discards (abort) that frame. TOE is also able to assert an interrupt if TOE received the frame which is match to filters.

The Possible Configuration of Filter Condition are followings.

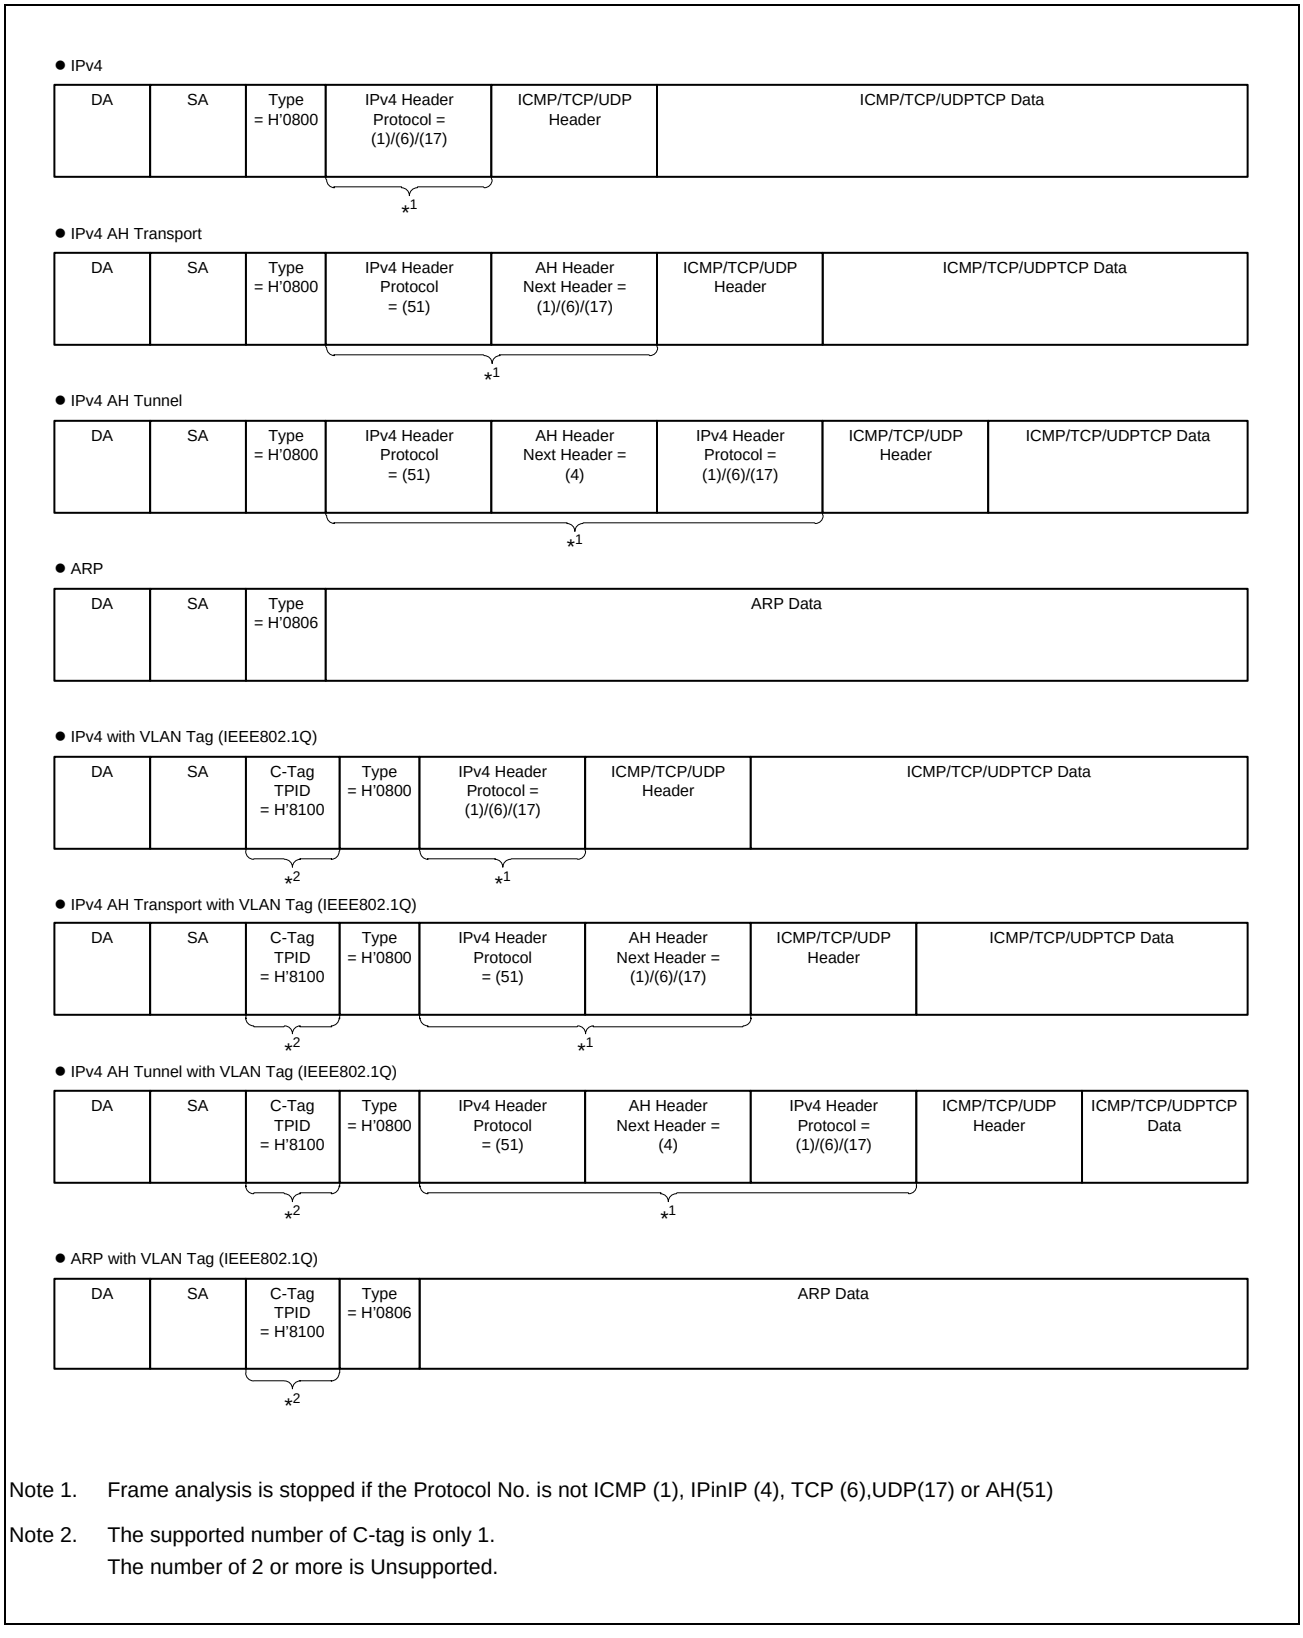
- Ethernet Type
- IP Protocol No.
- UDP destination port No.
- Destination MAC address (Unicast)
- Destination MAC address (Broadcast)
- Destination MAC address (Multicast)
- ARP Request of Local Station
- Neighbor Solicitation of Local Station
- Except IPv6 Next Header (Analyzable)

30.5.7.1 Supported Frame for Received Frame Filter

Followings are Supported /Unsupported Frame Formats by Received Frame Filter.

(1) For IPv4 Frame Filter

Figure 30.31 is Supported Frame format of IPv4.



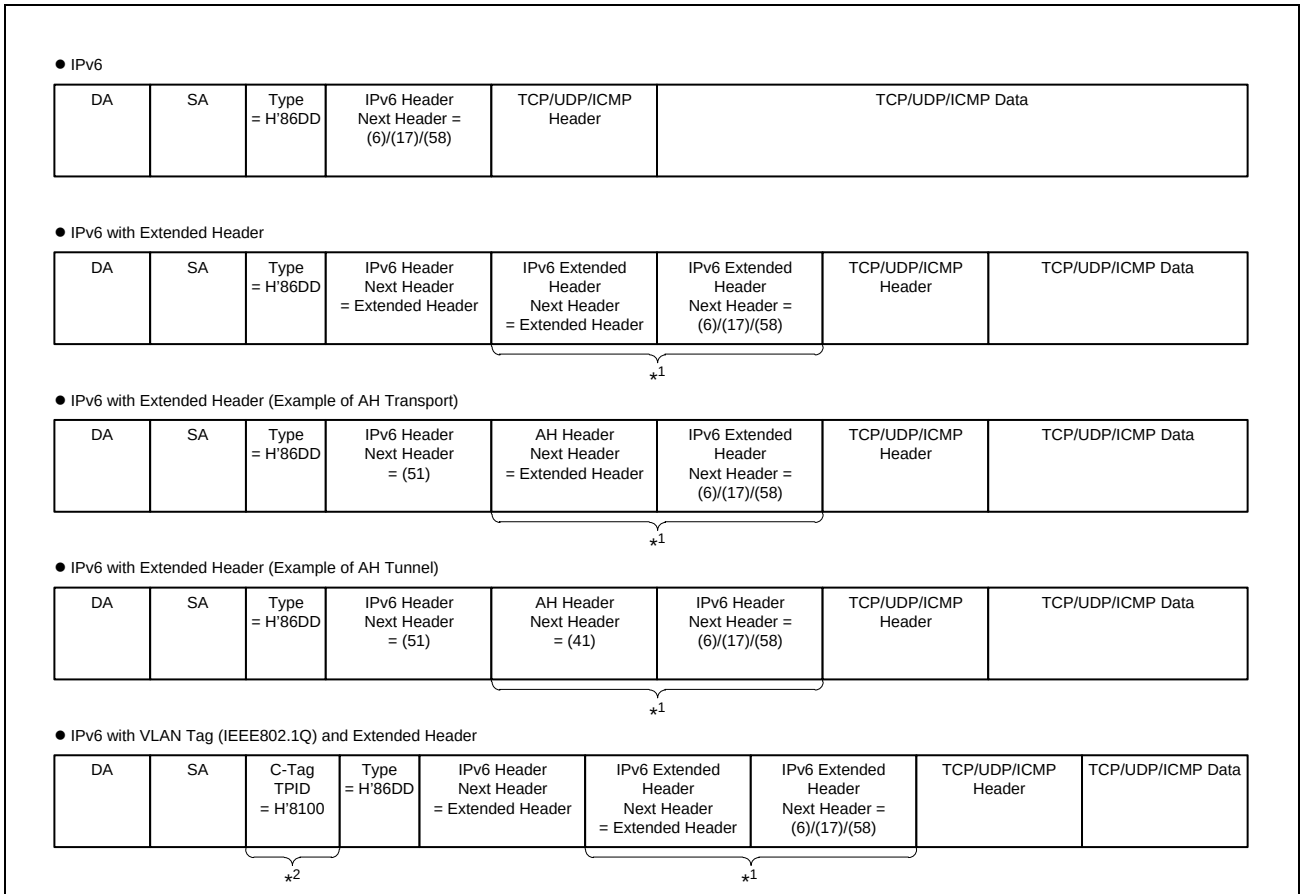
Note 1. Frame analysis is stopped if the Protocol No. is not ICMP (1), IPinIP (4), TCP (6),UDP(17) or AH(51)

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.31 Supported Frame of IPv4

(2) For IPv6 Frame Filter

Figure 30.32 is Supported Frame format of IPv6.



Note 1. Supported Extended Header (except TCP(6),UDP(17) and ICMP(58) are followings.
- Hop-by-Hop Options header (0)
- IPv6(41)
- Routing type 0 Routing header (43)
- Flag (44)
- Authentication header (51)
- Destination Options header (60)

Others are Unsupported and Frame analysis is stopped.

Note 2. The supported number of C-tag is only 1.
The number of 2 or more is Unsupported.

Figure 30.32 Supported Frame Format of IPv6

(3) Unsupported Frame Format (Example)

Figure 30.33 is Example Unsupported Frame Format.

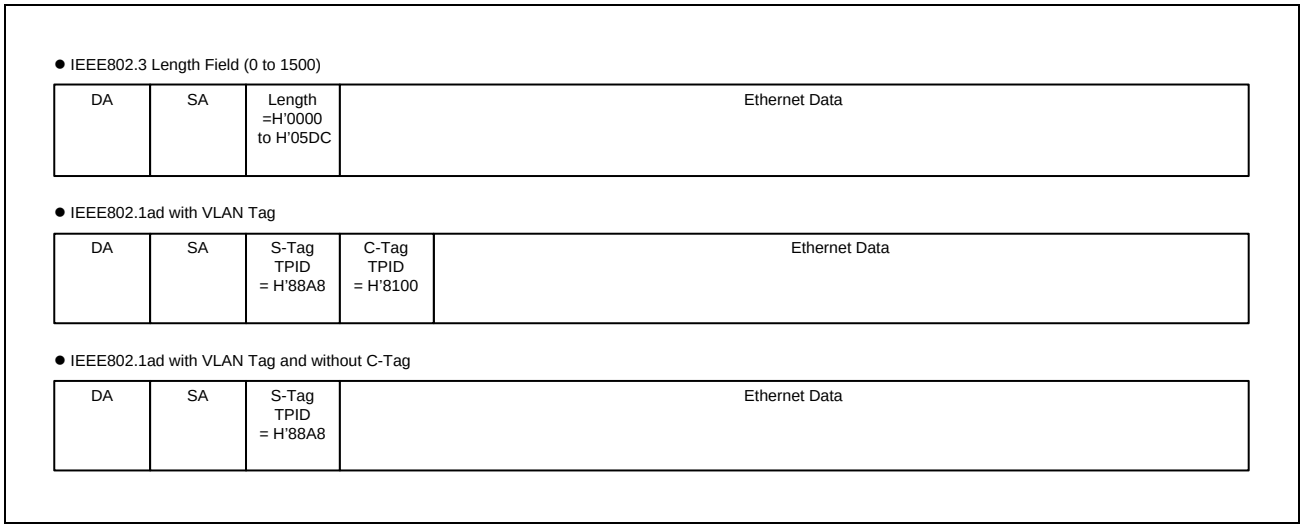


Figure 30.33 Example Unsupported Frame Format

30.5.7.2 Received Frame Filtering Flow

Figure 30.34 to **Figure 30.40** are Received Frame Filtering Flows.

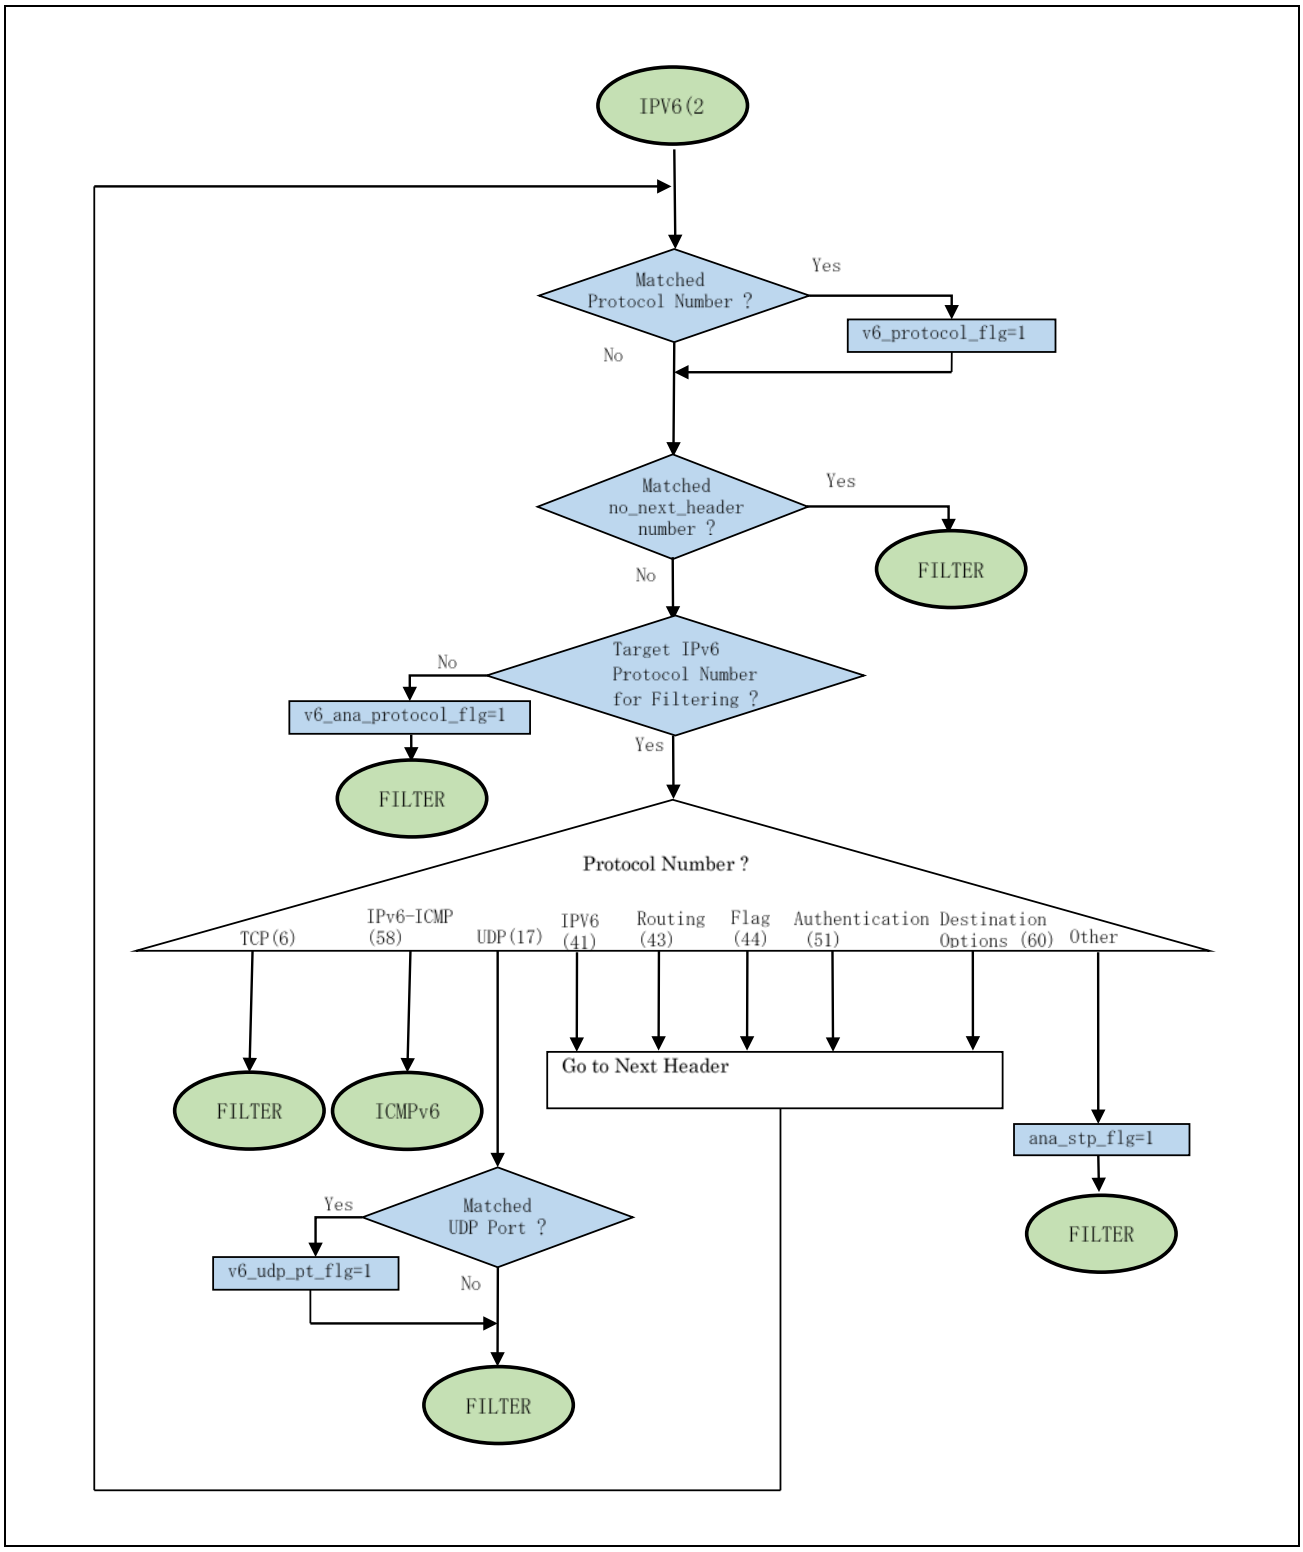

Figure 30.37 Received Frame Filtering Flow (Part4)

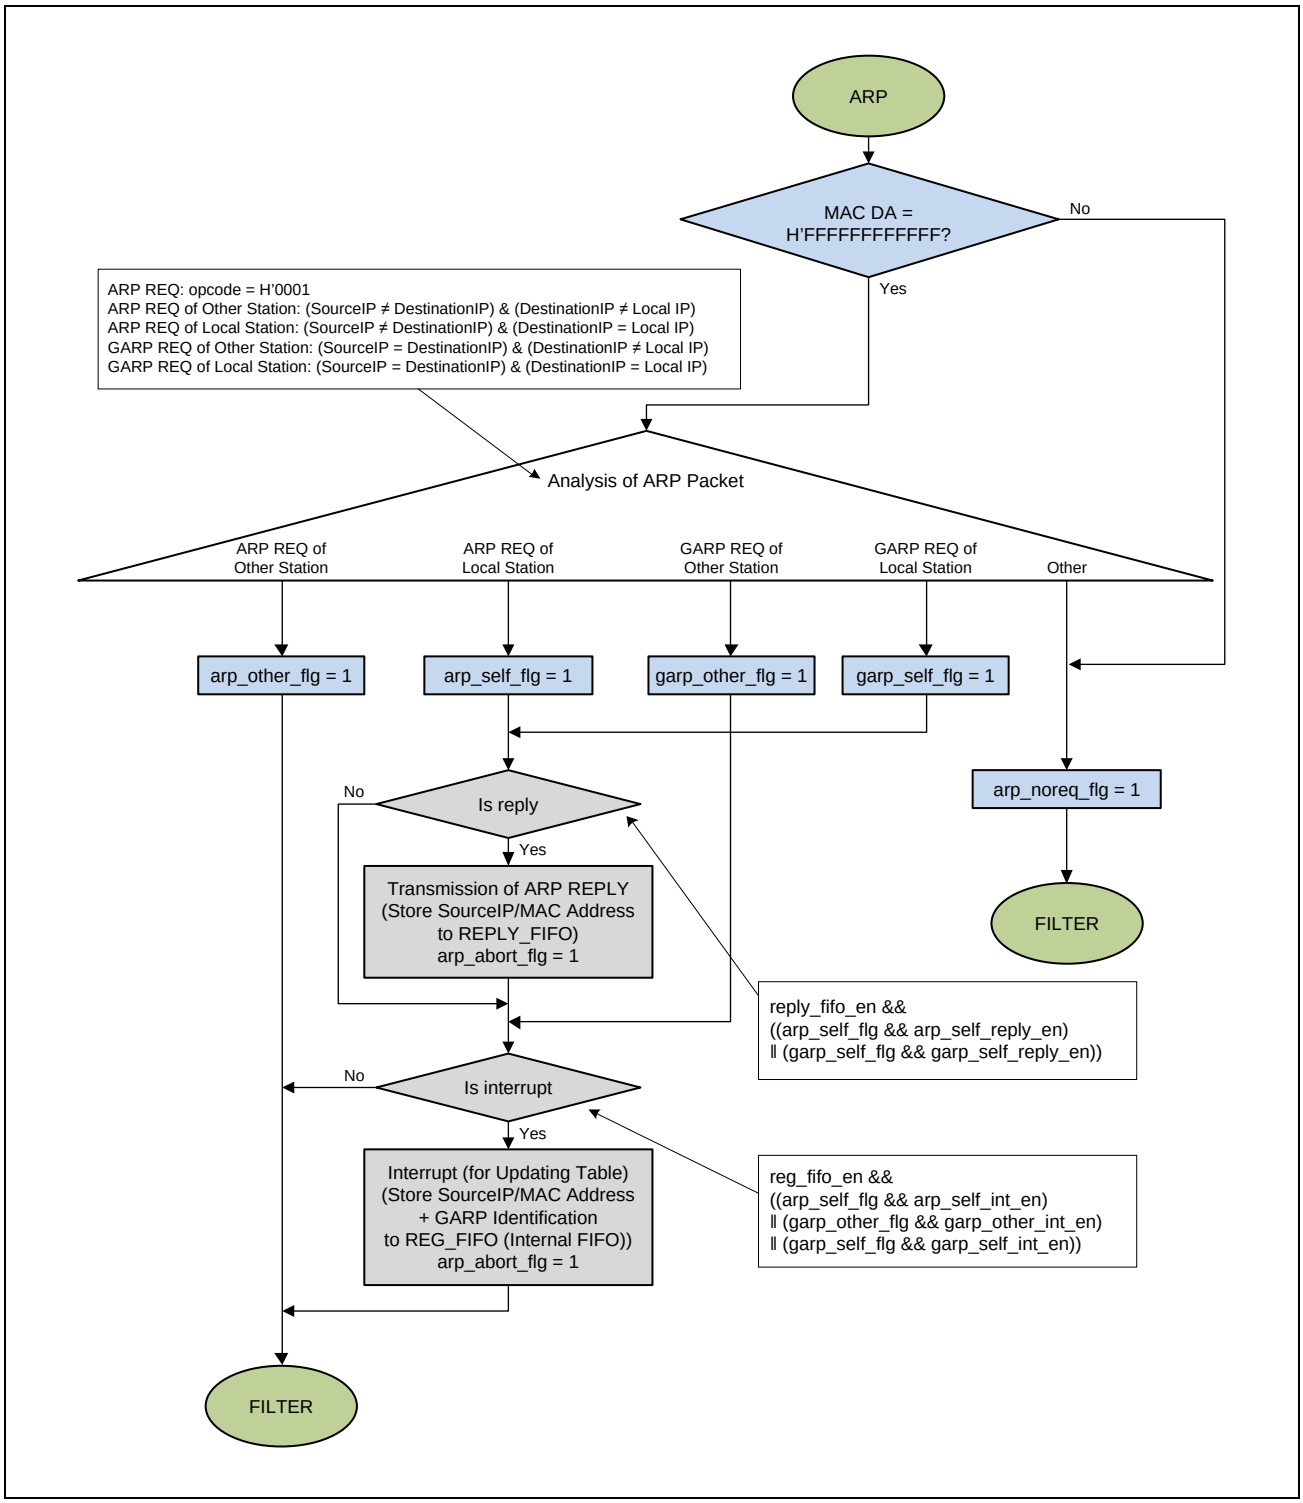

Figure 30.38 Received Frame Filtering Flow (Part5)

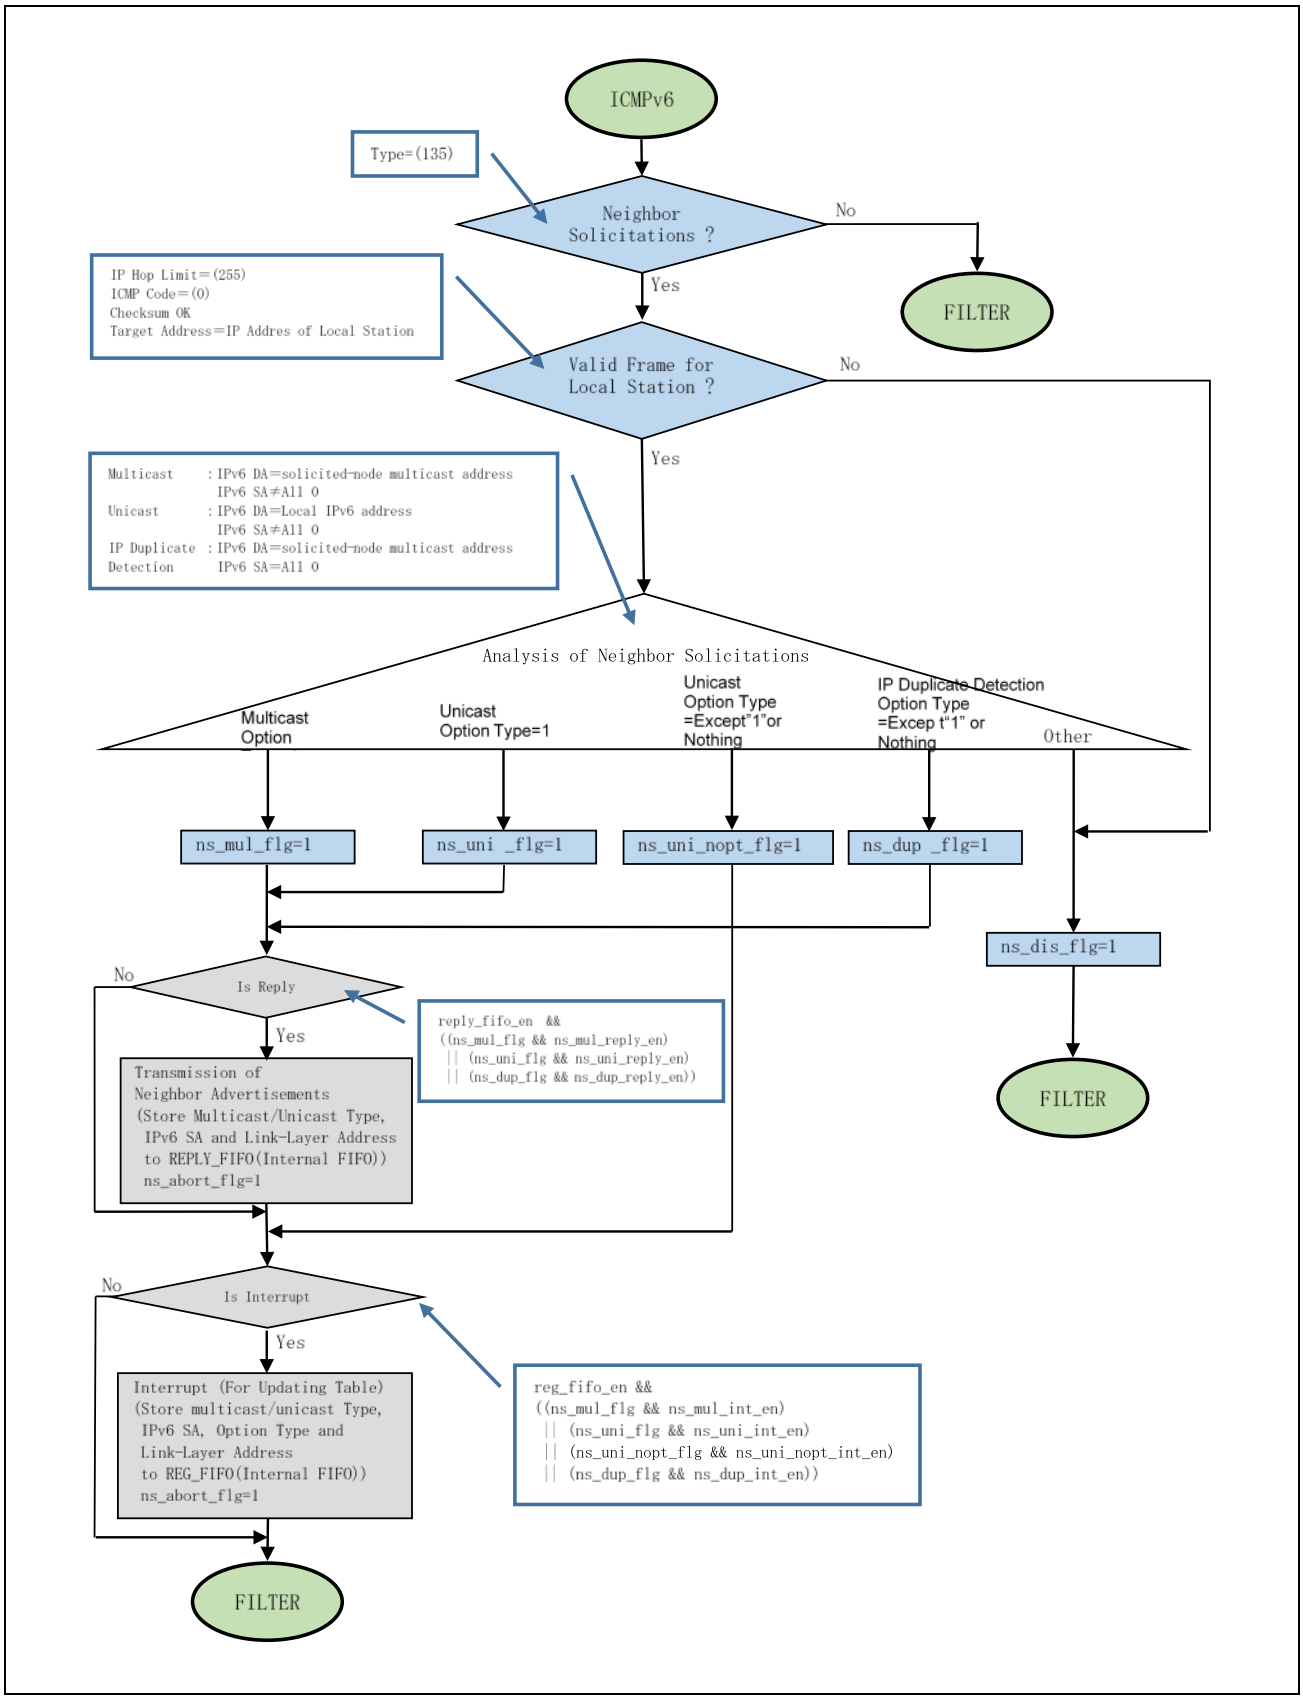

Figure 30.39 Received Frame Filtering Flow (Part6)

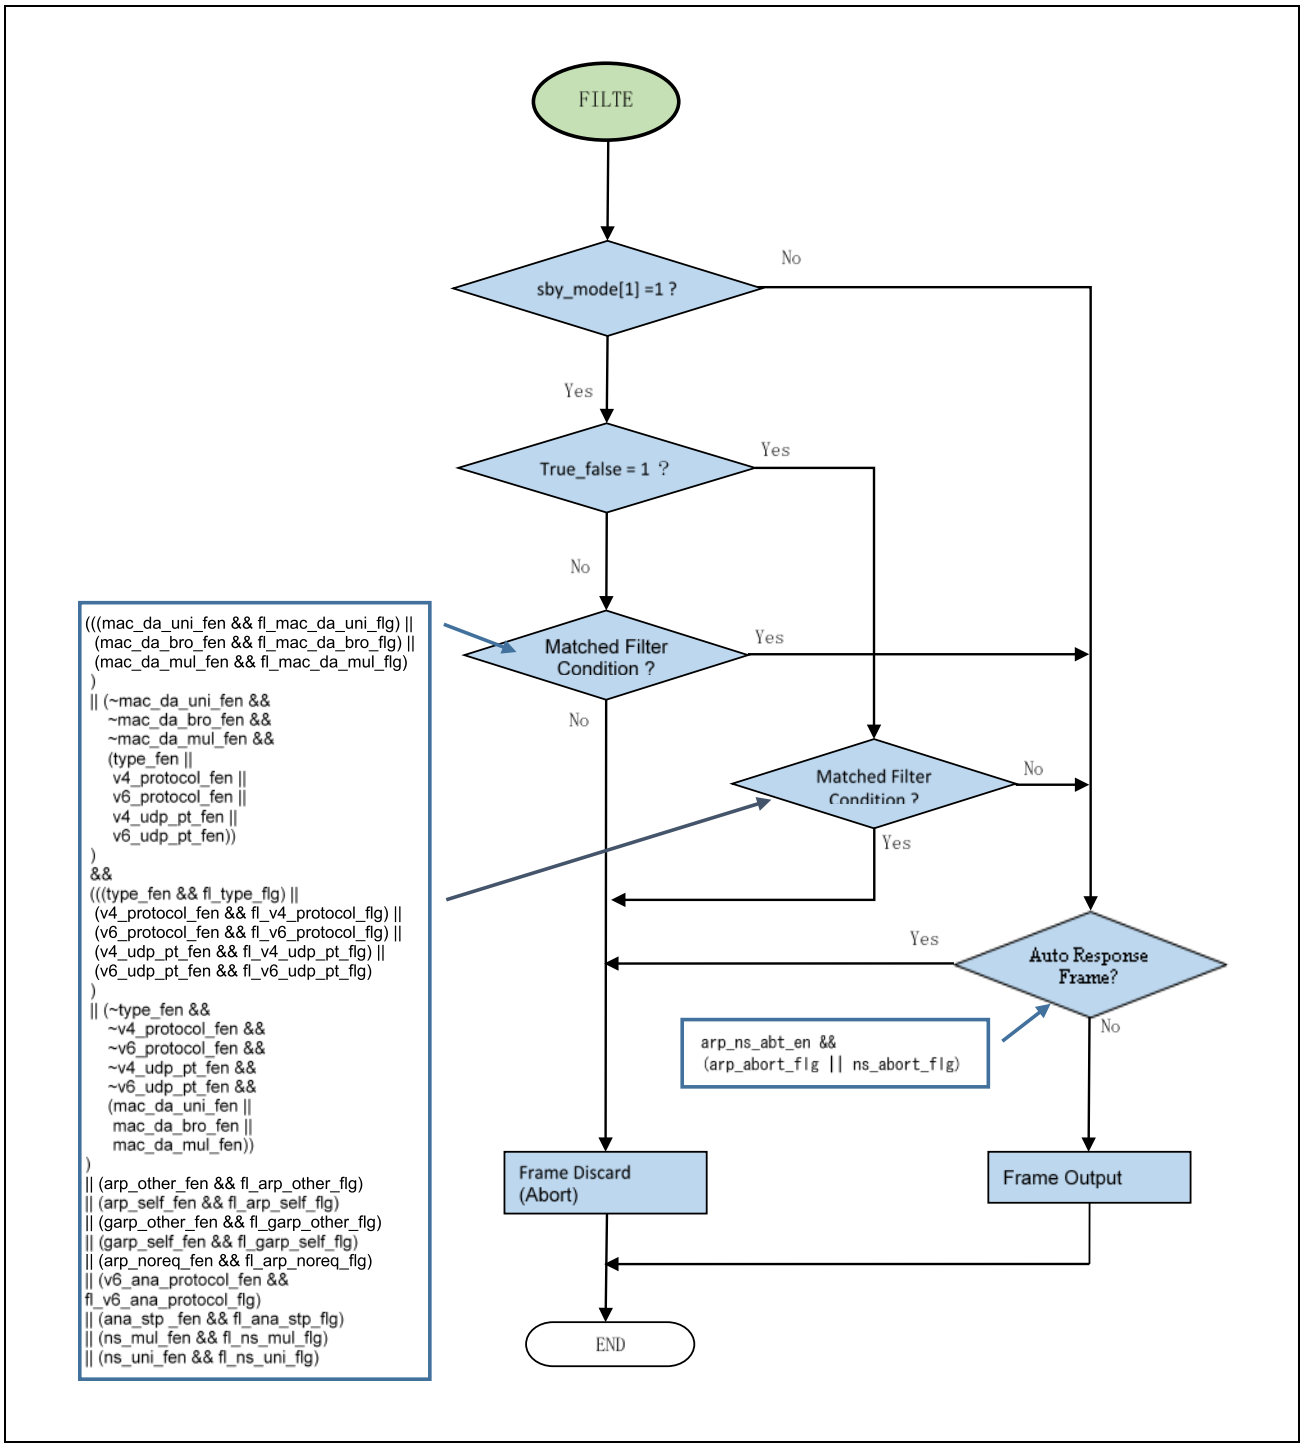

Figure 30.40 Received Frame Filtering Flow (Part7)

30.5.7.3 Filtering and Interrupts

Figure 30.41 is an overview for the function of Filtering and Interrupt.

TOE has flags for each filter conditions. When they match filter configurations of CSFR1*, each flag is set.

CSFR00 controls the action (discard or transmit) for the frames which are configured that Filtering is Enable. The filter condition relationship between “Match/Unmatch” and “Discard/Transmit” is configured by CSFR00.true_false.

The Enable/Disable configuration for discarding frame is controllable in a lump by CSFR00.sby_mode [1:0].

The flag status of each filter’s conditions is indicated to CSFR20 and outputted as interrupt. And the mask control for each interrupt is configured by CSFR21.

TOE has flags of each filter’s conditions for Filtering and Interrupt. The set condition of flags for each function is same. But clear condition is different. (The flags for Filtering are cleared at the top of frame. The flags for Interrupt are cleared by write access to the interrupt status registers.) And TOE also has Interrupt Flag which indicates the Received Frame was transmitted from TOE to DMAC without discarding by filtering conditions.

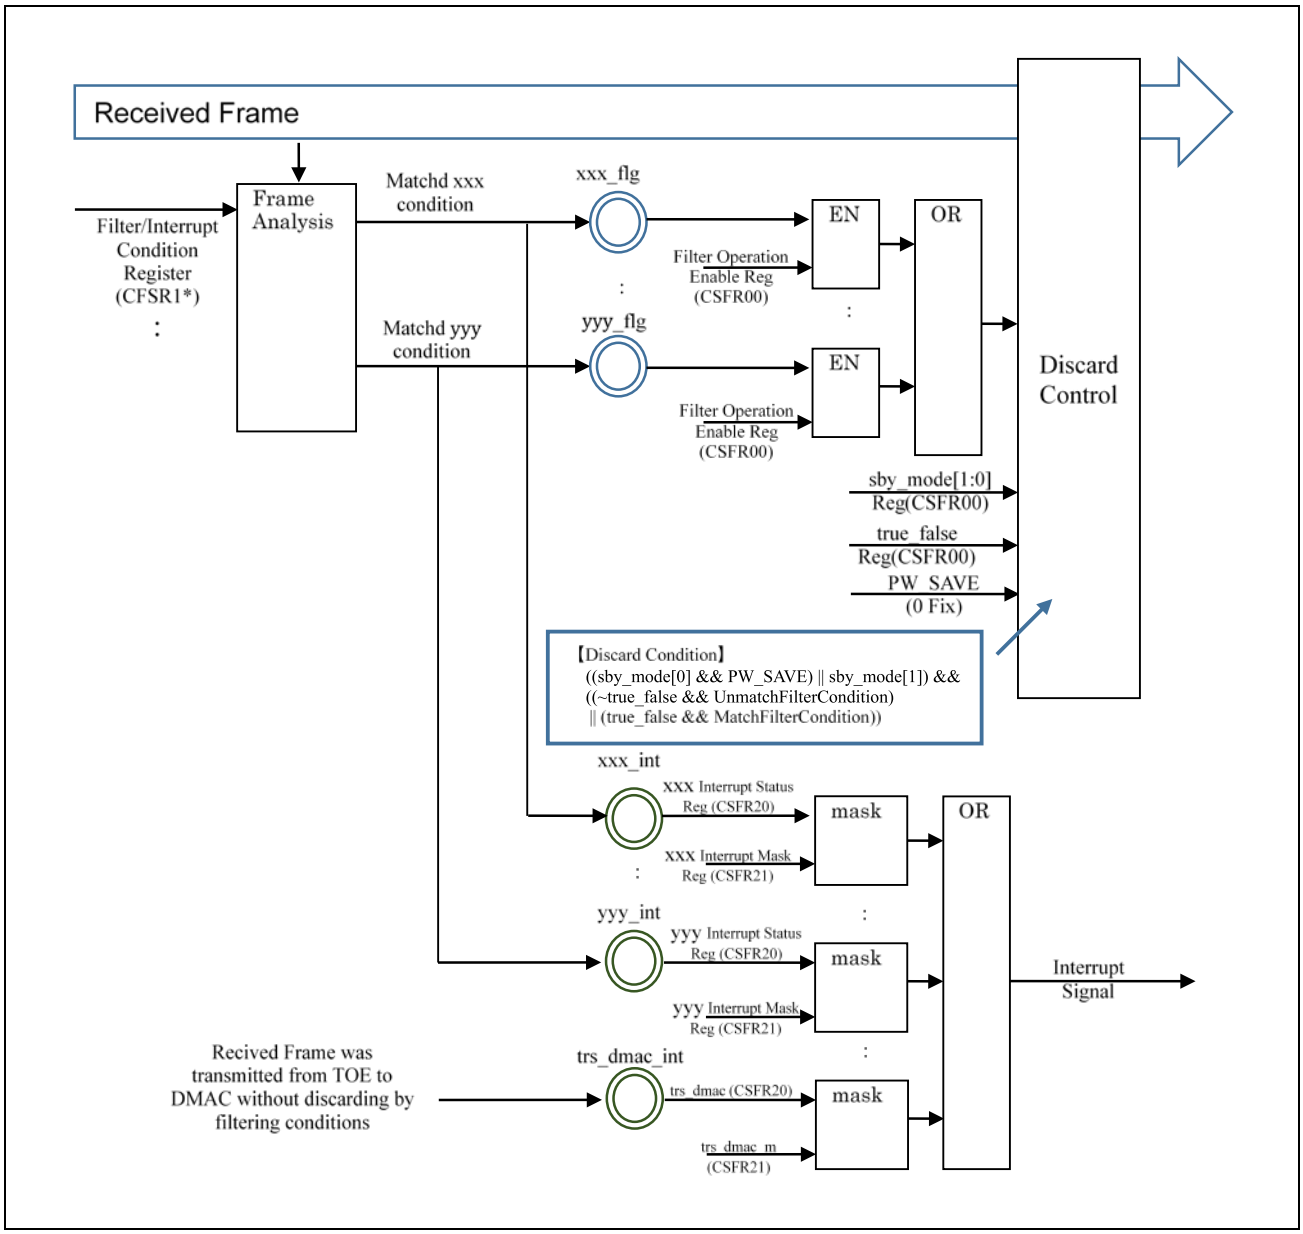

Figure 30.41 Overview of Filtering and Interrupt

30.5.8 Auto Response

TOE has following automatic responding functions.

- When TOE received ARP request for Local Station, it transmits ARP reply automatically.
- When TOE received Neighbor Solicitation for Local Station, it transmits Neighbor Advertisement automatically.

TOE also has following interrupt functions for updating ARP Table/Cache or responding function by software.

- When TOE received ARP request for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)
- When TOE received Neighbor Solicitation for Local Station, it asserts interrupt and indicates packet's information to registers. (CSFR4*)

30.5.8.1 Auto Response Function for ARP REQ

Table 30.18 is operations for ARP request. See **Figure 30.38** for about the Frame Analysis Flow of ARP REQ.

Table 30.18 Operation after Received ARP REQ

	General Operation		TOE Operation		
ARP REQ	Transmit ARP REPLY	Update Table	REPLY FIFO	REG FIFO	Remarks Column
ARP for Other Station (SourceIP ≠ DestinationIP)	×	×	×	×	ARP REQ for Other Station
ARP for Local Station (SourceIP ≠ DestinationIP)	✓	✓	✓	✓	Operation of ARP for Local Station
GARP for Other Station (SourceIP = DestinationIP)	×	✓	×	✓	Request of updating ARP Table
GARP for Local Station (SourceIP = DestinationIP)	✓	×	✓	×	Response for IP Duplicate Detection

GARP:

REQ which Source IP Address and Destination IP Address are same.

REPLY FIFO:

It stores SourceIP/MAC Address to FIFO and transmits ARP REPLY by Hardware.
The information in this FIFO is cleared after TOE sends ARP REPLY.

REG FIFO:

It stores SourceIP/MAC Address + GARP identification to FIFO and asserts interrupt.
Software is expected to check registers (CSFR4*) and update ARP Table.
The information in this FIFO is cleared by writing "1" to CSRF40.arp_ns. At that time if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en
.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.arp_self_reply_en
.garp_self_reply_en
.arp_self_int_en
.garp_other_int_en
.garp_self_int_en

When CSFR00.arp_ns_abt_en = “1”, the ARP frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for Neighbor Solicitation” which is indicated in the chapter of 4.8.2. And the FIFO capacity is for 8 frames.

If TOE received ARP REQ when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives ARP REQ which is stored to both FIFO, its information is not stored to both FIFO.

Table 30.19 Operation after Received Neighbor Solicitation

	General Operation		TOE Operation		
Neighbor Solicitations	Transmit Neighbor Advertisements	Update Cache	REPLY FIFO	REG FIFO	Remarks Column
Multicast for Local Station Option Type = 1 (SourceIP ≠ All 0)	✓	✓	✓	✓	—
Unicast for Local Station Option Type = 1 (SourceIP ≠ All 0)	✓	✓	✓	✓	—
Unicast for Local Station Option Type ≠ 1 or Nothing (SourceIP ≠ All 0)	✓	×	×	✓	Transmission of Neighbor Advertisements is executed by software via REG_FIFO.
IP Duplicate Detection for Local Station Option Type ≠ 1 or Nothing (SourceIP = All 0)	✓	×	✓	×	Response for IP Duplicate Detection
Other	×	×	×	×	Invalid

REPLY FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification to FIFO and transmits Neighbor Advertisements by Hardware.

The information in this FIFO is cleared after TOE sends Neighbor Advertisements.

REG FIFO:

It stores SourceIP/MAC Address + multicast/unicast identification + OptionType to FIFO and asserts interrupt to CPU. Software is expected handling followings by interrupt status (CSFR4*).

- Updating cache.
- In the case of Unicast for Local Station(Option Type ≠ 1 or Nothing), transmits Neighbor Advertisements after checking Source MAC Address by referencing cache or Neighbor search.

The information in this FIFO is cleared by writing “1” to CSRF40.arp_ns. At that time, if this FIFO has next information, CSRF40.arp_ns is asserted again and CSFR4* are updated to next information.

TOE does not support anycast address. If anycast address is set to CSFR02_i register, TOE behaves same action the case of received unicast address. But the Random Delay Function for responding Neighbor Advertisement which is be defined in RFC2461 is not supported.

Storing to REPLY FIFO and REG FIFO is controlled by followings.

Use followings for Enable/Disable Configuration in a lump.

CSFR00.reply_fifo_en

.reg_fifo_en

Use followings for Enable/Disable Configuration of individually

CSFR30.ns_mul_reply_en

.ns_uni_reply_en

.ns_dup_reply_en

.ns_mul_int_en

.ns_uni_int_en

.ns_uni_nopt_int_en

.ns_dup_int_en

When CSFR00.arp_ns_abt_en = “1”, the Neighbor Solicitation frame which was stored to REPLY FIFO or REG FIFO is not transferred to DMAC. It is discarded (aborted).

REPLY FIFO and REG FIFO is used as shared FIFO for the function of “Auto Response for ARP REQ” which is indicated in the chapter of 4.8.1. And the FIFO capacity is for 8 frames.

If TOE received Neighbor Solicitation when FIFO was full, its information is not stored to FIFO and the interrupt is asserted to notify the status of by reg_fifo_full or reply_fifo_full. If one-FIFO is already full and TOE receives Neighbor Solicitations which is stored to both FIFO, its information is not stored to both FIFO.

30.5.9 Flow Control

Flow control conforming to the IEEE802.3x is possible during full-duplex operation. There are two methods of transmitting PAUSE frames that are used in flow control as given below.

To use this function, configure CCC.FCE and RCR.RFCL of DMAC.

(1) Auto transmission of PAUSE frame (See bit 16 in CXR20)

A PAUSE frame is automatically transmitted by E-MAC when DMAC notifies that the condition of Reception FIFO reached at Critical Level. The value set in the CXR71 parameter settings register is used as the timer value included in the PAUSE frame. After transmitting a PAUSE frame, if the “Reception FIFO Critical Level Notification” from DMAC is not negated by the time that is indicated in the Timer value, the PAUSE frame is sent again. The number of times of transmitting a PAUSE frame can be set from 1 to 65535 in the CXR81 register, and once the upper limit of the transmission count is reached (value set in CXR81), the PAUSE frame is not transmitted thereafter.

However, if the “Reception FIFO Critical Level Notification” from DMAC is negated, the transmission count counter is reset when the next “Reception FIFO Critical Level Notification” from DMAC is asserted and PAUSE frame transmission begins. It is also possible to not define the transmission count upper limit (transmitting for infinite times).

(2) Manual transmission of PAUSE frame (See CXR72)

The PAUSE frame can be transmitted by software instruction. PAUSE frame transmission is started by setting the Timer value in the CXR72 register. In this case, PAUSE frame is transmitted once only (one frame).

(3) PAUSE Timer value (See bits 19 and 20 in CXR20)

Control can be enabled or disabled for the PAUSE frames having PAUSE Timer value 0

a) Operation during transmission
If control is enabled and the “Reception FIFO Critical Level Notification” from DMAC is negated within the time indicated by the Timer value, the PAUSE frame with Timer value 0 is transmitted.
If control is disabled, the PAUSE frame with Timer value 0 is not transmitted.

b) Operation during reception
If control is enabled, a PAUSE frame with Timer value 0 is received and frame transmission waiting is cancelled.
If control is disabled, a PAUSE frame with Timer value 0 is received and the PAUSE frame is discarded.

(4) PAUSE frame reception (See the bit 17 in CXR20)

When a PAUSE frame is received, the next frame transmission is in wait mode till the time which is considered Timer value of PAUSE frame elapses. The transmission of the frame that is being transmitted continues. In addition, the PAUSE frame reception count is counted (See CXR80).

30.5.10 Low Power Idle (LPI)

E-MAC supports the function of Low Power Idle for 1 Gbps/100 Mbps transfer rate. Since LPI function for 10Mbps is not defined in standard*1, E-MAC also does not support.

Note 1. Specifically, Standard of 10 BASE-Te whose voltage is lower than 10 BASE-T was defined. But a basic specification except about voltage (such as the rule of Code or Media Access Control Operation) is same as 10 BASE-T. (10 BASE-Te is supported by the cable of Cat5 or more)

(1) Output function of Low Power Idle Code (LPI Code)

When E-MAC does not receive any transmission request during over certain period, E-MAC outputs transmission LPI Code to PHY for notifying request to change into Low Power Mode. If E-MAC receives a transmission request (not includes the request for PAUSE frame) while outputting transmission LPI Code, E-MAC changes output Code from transmission LPI Code to Normal Idle Code. Then E-MAC resumes to transmit Frames after waiting certain period (WakeUp time of PHY).

The following time is configurable by register.
- The time from E-MAC does not receive any transmission request to E-MAC starts outputting transmission LPI Code.
- The time from E-MAC received transmission request to E-MAC starts outputting Normal Idle Code.

(2) Receive function of Low Power Idle Code (LPI Code)

When PHY receives a changing request into Low Power Mode from Link Partner, PHY starts outputting reception LPI Code to E-MAC. If E-MAC receives reception LPI Code, E-MAC does not send this Code to TOE. E-MAC outputs Normal Status to TOE same as receiving Normal Idle Code.

(3) Stop function of transmission clock (Only RGMII Mode)

When RGMII interface is used, E-MAC can stop the RGMII transmission clock (TXC) during outputting transmission LPI Code. This function is configurable by register. But the case of MII interface is used, to stop MII transmission clock (TX_CLK) which PHY outputs is prohibited.

(4) Handling function for stopping reception clock (Both RGMII and MII Mode)

E-MAC can accept to stop RGMII and MII reception clock (RXC/RX_CLK) while receiving reception LPI Code. To stop RGMII and MII reception clock (RXC/RX_CLK) is configurable by register of PHY. (See the datasheet of PHY)

[Simplified Full Duplex Mode]

E-MAC supports Simplified Full Duplex Mode which is used for Low Power Idle Function.

In the Full Duplex Mode, when E-MAC receives transmission request from Upper Module (such as DMAC), E-MAC starts transmitting frames without care of PHY status.

But in the Simplified Full Duplex Mode, E-MAC cares the PHY status and does not transmit any frames to PHY during both PHY status is Low Power Idle and PHY is changing status from Low Power Idle to Normal.

To use E-MAC as Simplified Full Duplex Mode, set ‘1’ to DMP bit and LPM bit of CXR20 register after checking Link Partner supports Low Power Idle Mode by Auto Negotiation*2.

Note 2. Check PHY and Link Partner support Low Power Idle Mode before setting E-MAC as Low Power Idle Mode. And for the function of Low Power Idle Mode, registers area of PHY was expanded. Therefore, to use Low Power Idle Mode, software has to be changed for the function of accessing PHY registers, PHY Auto Negotiation and initial setting of E-MAC.

30.5.11 Control of Reference Clock for Ethernet

Gigabit Ethernet Interface IP has a function to notify the status that whether Gigabit Ethernet Interface needs Reference Clock for Ethernet “clk_miitx_gtx_refclk” or not by “ref_clk_stop_en”. And this condition also is notified to CPU by interrupt signal “pif_int_n” (Case of interrupt is indicated on TIS.RCSRF and ISS.RCSRM).

This function is only enabled when the configurations of Gigabit Ethernet Interface are matched following all conditions.

- RGMII is selected as PHY IF.
- This function is enabled by register configuration. (CCC.ERCS = 1)
- E-MAC is configured as LowPowerMode. (CXR20.LPM = 1), Duplex = Full and TransmitSpeed = 1000 M/100 Mbps.

Figure 30.42 is a block diagram of this function.

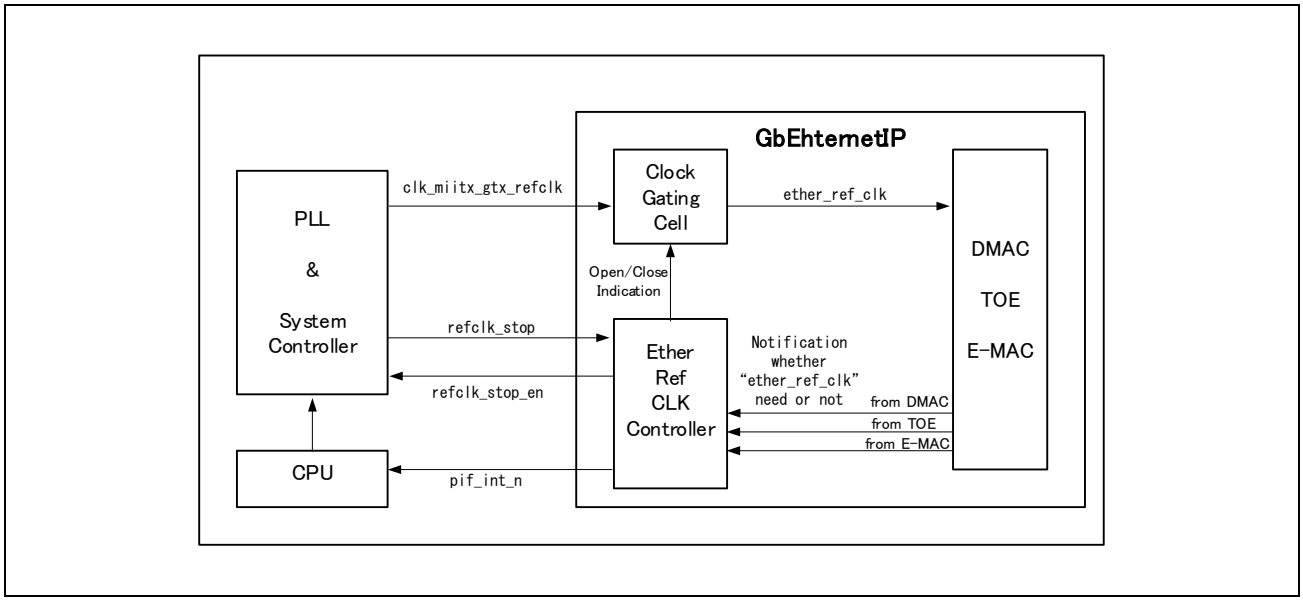

Figure 30.42 Block Diagram

As showing **Figure 30.42**, Gigabit Ethernet Interface has an “Ether Ref CLK Controller” which controls “ref_clk_stop_en”, “pif_int_n” and Open/Close Operation of Internal Clock Gating Cell for “clk_miitx_gtx_refclk”.

The state of Open/Close Operation of Internal Clock Gating Cell is indicated on CSR.RCSI.

NOTE

Whenever “pif_int_n” is asserted by this function, CPU has to instruct PLL & System Controller to stop “clk_miitx_gtx_refclk”.

30.5.11.1 Stop Procedure of Reference Clock for Ethernet

Stop procedure of “clk_miitx_gtx_refclk” is executed by following steps.

1. When DMAC and TOE do not have any Transmission Frames, they do not need “clk_miitx_gtx_refclk” anymore. So, they notify that status to Ether Ref CLK Controller.
2. After outputting Transmission LPI Code during configured time at LPTXG(M)TH4, E-MAC does not need “clk_miitx_gtx_refclk” anymore, So, it notifies that status to Ether Ref CLK Controller.
3. When Ether Ref CLK Controller is received the status that all of DMAC/TOE/E-MAC don’t need “clk_miitx_gtx_refclk” any more, it asserts “ref_clk_stop_en” to notify about this condition to ETH_PLL & System Controller. Then Gigabit Ethernet Interface closes an internal Clock Gating Cell for “clk_miitx_gtx_refclk” and asserts “pif_int_n” to indicate this condition to CPU.
4. CPU instructs ETH_PLL & System Controller to stop “clk_miitx_gtx_refclk” and writes “0” to TIS.RCSRF to clears “pif_int_n”.
5. After PLL is stopped completely, ETH_PLL & System Controller asserts “ref_clk_stop” notifying PLL status to Ether Ref CLK Controller.

Figure 30.43 is a sequence of stopping “clk_miitx_gtx_refclk”.

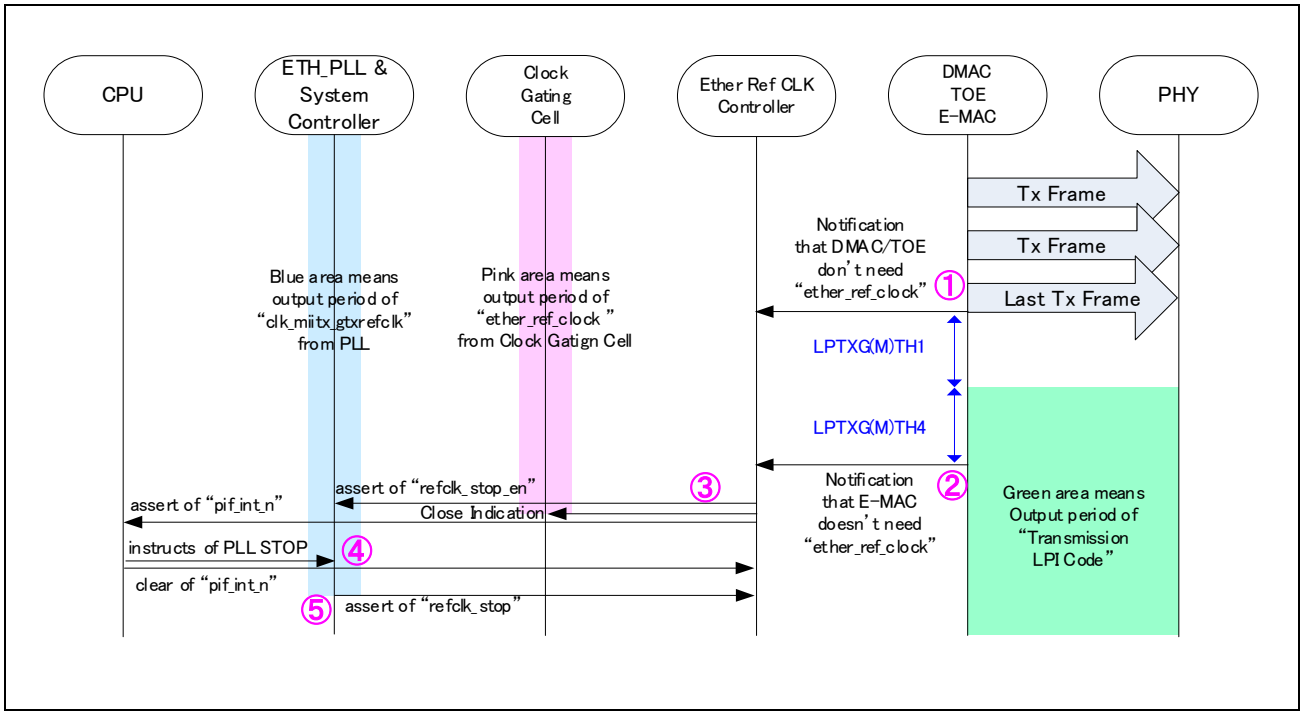

Figure 30.43 Sequence of stopping “clk_miitx_gtx_refclk”

30.5.11.2 Resume Procedure of Reference Clock for Ethernet

Resume procedure of “clk_miitx_gtx_refclk” is executed by following steps.

Case1: Gigabit Ethernet Interface receives indication from CPU restarting transmission operation.

1. CPU indicates restarting transmitting operation to DMAC.
2. DMAC fetches a new transmission descriptor and gets a Transmission Frame from external Memory. Then, it notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from DMAC that DMAC needs “clk_miitx_gtx_refclk”, it de-asserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs a Transmission Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

Figure 30.44 is a sequence of resuming “clk_miitx_gtx_refclk” of Case1.

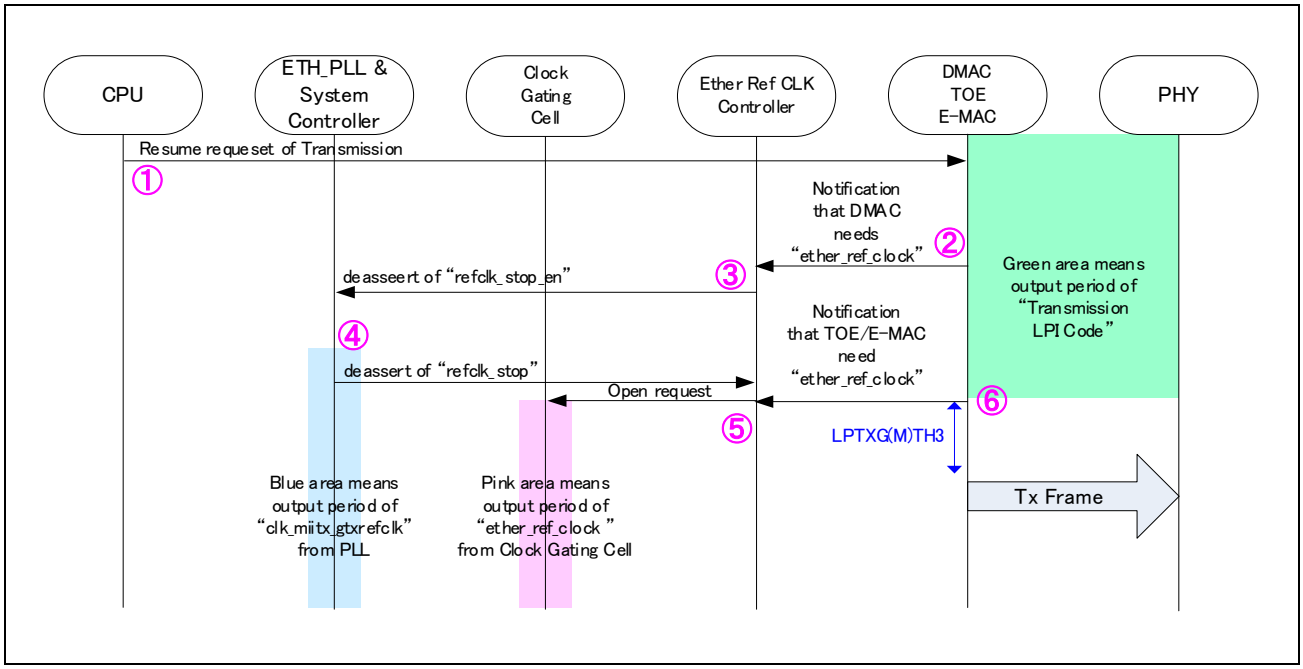

Figure 30.44 Sequence of resuming “clk_miitx_gtx_refclk” of Case1

Case2: Gigabit Ethernet Interface receives a frame which needs to Automatic Response by H/W.

For about the function of Automatic Response by H/W, see 4.8.

1. Received a frame which needs to Automatic Response by H/W from PHY.
2. After received the frame, TOE notifies to Ether Ref CLK Controller that it needs “clk_miitx_gtx_refclk” for transmitting operation.
3. After Ether Ref CLK Controller is notified from TOE that TOE needs “clk_miitx_gtx_refclk”, it deasserts “ref_clk_stop_en” to notify ETH_PLL & System Controller that Gigabit Ethernet Interface needs restart of PLL.
4. ETH_PLL & System Controller tries to restart PLL. After “clk_miitx_gtx_refclk” is resumed completely, it de-asserts “ref_clk_stop” to notify Ether Ref CLK Controller about PLL status.
5. By the change of “ref_clk_stop” from assert to de-assert, Ether Ref CLK Controller opens the internal Clock Gating Cell for ”clk_miitx_gtx_refclk”.
6. Since providing clock is resumed, Transmitting Function of DMAC/TOE/E-MAC is also resumed. Then, E-MAC outputs an Automatic Response Frame to PHY after outputting IDLE Code during the time which is configured at LPTXG(M)TH3 register.

Figure 30.45 is a sequence of resuming “clk_miitx_gtx_refclk” of Case2.

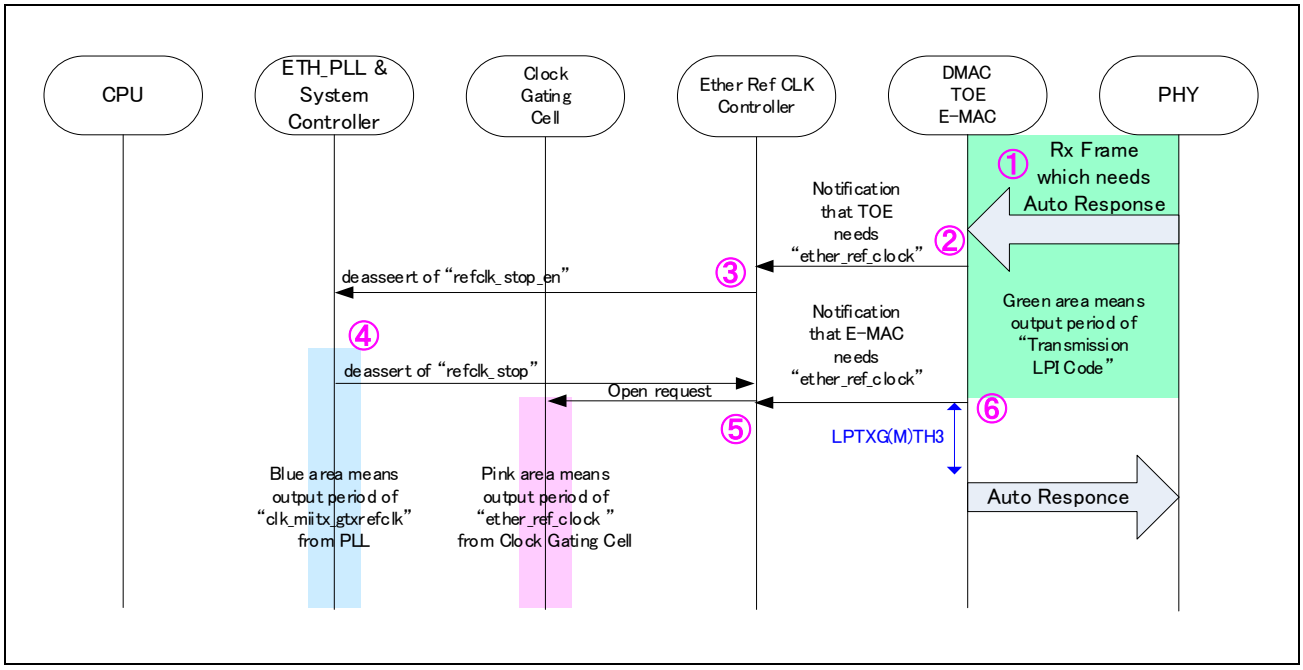

Figure 30.45 Sequence of resuming “clk_miitx_gtx_refclk” of Case2

30.5.12 Interrupts

The DMAC related interrupts include descriptor interrupts, error interrupts, reception interrupts and transmission interrupts. The states of a DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can only be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt summary bit in the error interrupt status register (EIS.QFS). This reduces the load on the CPU.

30.5.12.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupts in the receive interrupt status register 0 (RIS0.FRF)
- Descriptor processed interrupts in the receive interrupt status register 3 (RIS3.RDPF)
- Frame transmitted interrupts in the transmit interrupt status register (TIS.FTF)
- Descriptor processed interrupts in the transmit interrupt status register (TIS.TDPF)
- Descriptor processed interrupts in the descriptor interrupt status register (DIS.DPFi)

The general error interrupt state can be checked by reading the descriptor interrupt flag bits in the interrupt summary status register (ISS.DPMi) or the Reception FIFO warning interrupt summary bit (ISS.RFWM).

30.5.12.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Queue error interrupt in the error interrupt status register (EIS.QEF)
- E-MAC and TOE transmission/reception error interrupts in the error interrupt status register (EIS.MTEF, EIS.MREF, EIS.MFFF, EIS.MFFF2)
- Reception FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupts in the receive interrupt status register 2 (RIS2.QFF0)

The general error interrupt state can be checked by reading the error interrupt summary bit in the interrupt summary status register (ISS.EM, ISS.MFWM2, ISS.MFUM2).

30.5.12.3 Other Management Interrupts

The other management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

- Reception FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

- MAC Status FIFO/FIFO2 Warning Flag (TIS.MFWF/TIS.MFWF2)
- MAC status FIFO/FIFO2 Updated Flag (TIS.MFUF/TIS.MFUF2)
- Reference Clock Stop Req Flag (TIS.RCSRF)

The general error interrupt state can be checked by reading the Reception FIFO warning error interrupt status bit in the interrupt summary status register (ISS.RFWM).

30.5.12.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

- PAUSE Frame Retry Interrupt in the E-MAC status register (CXR21.PFRI)
- PHY Interrupt in the E-MAC status register (CXR21.PHYI)
- LINK Interrupt in the E-MAC status register (CXR21.LINKI)
- False Carrier Interrupt in the E-MAC status register (CXR21.FCI)

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MM).

30.5.12.5 TOE Interrupt

The TOE interrupt is issued when the TOE interrupt source is generated.

- Wake Up interrupt in the TOE register (CSFR20)
- ARPREQ/Neighbor Solicitation Receive interrupt in the TOE register (CSFR40, CSFR42_*, CSFR43_*)

30.5.12.6 Interrupt

Table 30.20, **Table 30.21**, and **Table 30.22** shows interrupt for each interrupt status bit. Interrupts of DMAC and E-MAC are merged into the “pif_int_n” of output port. TOE has two independent output ports “int_fil_n” and “int_arp_ns_n”.

Table 30.20 Interrupt of DMAC

Interrupt trigger	Interrupt flag bit	Interrupt enable bit	Interrupt (Output port)
The descriptor in a reception or transmit queue has been processed where DESCR.DIE is i	DIS.DPFi (i = 1 to 15)	DIC.DPEi = 1	pif_int_n
In receive queue a frame is stored, and data is available to be processed by CPU.	RIS0.FRF	RIC0.FRE = 1	
The descriptor in reception queue has been processed where DESCR.DIE is 0001b.	RIS3.RDPF	RIC3.RDPE = 1 & CIE.CRIE = 1	
The descriptor in transmit queue has been processed where DESCR.DIE is 0001b.	TIS.TDPF	TIC.TDPE = 1 & CIE.CTIE = 1	
A frame is transmitted from transmit queue.	TIS.FTF	TIC.FTE = 1	
An error has been detected while processing receive or transmit queue.	EIS.QEF	EIC.QEE = 1	
The E-MAC has detected a fault during transmission.	EIS.MTEF	EIC.MTEE = 1	
The E-MAC has detected a fault during reception.	EIS.MREF	EIC.MREE = 1	
The MAC status FIFO2 is full.	EIS.MFFF2	EIC.MFFE2 = 1	
The MAC status FIFO is full.	EIS.MFFF	EIC.MFFE = 1	
A received frame was not be completely stored in the Reception FIFO.	RIS2.RFFF	RIC2.RFFE = 1	
No sufficient space in receive queue to store completely a received frame.	RIS2.QFF0	RIC2.QFE = 1	
The Reception FIFO has reached warning level.	RIS1.RFWF	RIC1.RFWE = 1	
The MAC status FIFO has been reached warning level.	TIS.MFWF	TIC.MFWE = 1	
The MAC status FIFO has been updated.	TIS.MFUF	TIC.MFUE = 1	
The MAC status FIFO2 has been reached warning level.	TIS.MFWF2	TIC.MFWE2 = 1	
The MAC status FIFO2 has been updated.	TIS.MFUF2	TIC.MFUE2 = 1	
Reference Clock Stop Request has been notified	TIS.RCSRF	TIC.RCSRE = 1	

Table 30.21 Interrupt of E-MAC

Interrupt trigger	Interrupt flag bit	Interrupt enable bit	Interrupt (Output port)
PAUSE Frame Retry reached to threshold.	CXR21.PFRI	CXR22.PFRIM	pif_int_n
PHY Interrupt is detected.	CXR21.PHYI	CXR22.PHYIM	
LINK status change is detected.	CXR21.LINKI	CXR22.LINKIM	
False Carrier is detected.	CXR21.FCI	CXR22.FCIM	

Table 30.22 Interrupt of TOE

Interrupt trigger	Interrupt flag bit	Interrupt mask bit	Interrupt main enable bit	Interrupt (Output port)
Transmit Rx Frame to DMAC	CSFR20.trs_dmac	CSFR21. trs_dmac_m	—	int_fil_n
Reception of IEEE Length Frames.	CSFR20.ieee_len	CSFR21. ieee_len_m	—	
Reception of Invalid Neighbor Solicitations.	CSFR20.ns_dis	CSFR21.ns_dis_m	—	
Reception of IP Duplicate Detection Neighbor Solicitations.	CSFR20.ns_dup	CSFR21.ns_dup_m	—	
Reception of unicast Neighbor Solicitations. (Except “Option Type=1” or No “Option Type”)	CSFR20.ns_uni_nopt	CSFR21.ns_uni_nopt_m	—	
Reception of unicast Neighbor Solicitations. (“Option Type=1”)	CSFR20.ns_uni	CSFR21.ns_uni_m	—	
Reception of multicast Neighbor Solicitations.	CSFR20.ns_mul	CSFR21.ns_mul_m	—	
Reception of Un-analyzable Frames.	CSFR20.ana_stp	CSFR21.ana_stp_m	—	
Reception of Un-analyzable IPv6 Protocol No.	CSFR20.v6_ana_protocol	CSFR21.v6_ana_protocol_m	—	
Reception of ARP (Except ARP REQ).	CSFR20.arp_noreq	CSFR21.arp_noreq_m	—	
Reception of GARP REQ for Local Station.	CSFR20.garp_self	CSFR21.garp_self_m	—	
Reception of GARP REQ for Other Station.	CSFR20.garp_other	CSFR21.garp_other_m	—	
Reception of ARP REQ for Local Station.	CSFR20.arp_self	CSFR21.arp_self_m	—	
Reception of ARP REQ for Other Station.	CSFR20.arp_other	CSFR21.arp_other_m	—	
Match of IPv6 UDP Port No.	CSFR20.v6_udp_pt	CSFR21.v6_udp_pt_m	—	
Match of IPv4 UDP Port No.	CSFR20.v4_udp_pt	CSFR21.v4_udp_pt_m	—	
Match of IPv6 Protocol No.	CSFR20.v6_protocol	CSFR21.v6_protocol_m	—	
Match of IPv4 Protocol No.	CSFR20.v4_protocol	CSFR21.v4_protocol_m	—	
Match of Ether Type.	CSFR20.type	CSFR21.type_m	—	
Match of Multicast MAC DA.	CSFR20.mac_da_mul	CSFR21.mac_da_mul_m	—	
Match of Broadcast MAC DA.	CSFR20.mac_da_bro	CSFR21.mac_da_bro_m	—	
Match of Unicast MAC DA.	CSFR20.mac_da_uni	CSFR21.mac_da_uni_m	—	
REPLY_FIFO is full.	CSFR40.reply_fifo_full	CSFR41.reply_fifo_full_m	CSFR00.reply_fifo enable & at least one CSFR30.xx_reply_en	int_arp_ns_n
REG_FIFO is full.	CSFR40.reg_fifo_full	CSFR41.reg_fifo_full_m	CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en	
Reception of ARPREQ or Neighbor Solicitations and Stored to REG FIFO.	CSFR40.arp_ns	CSFR41.arp_ns_m	CSFR00.reg_fifo_en & at least one CSFR30.xx_int_en	

30.5.13 Configuration Procedure

The following are Configuration Procedures. The meaning of “X” in Write Value, set the appropriate value to each bit for your system.

30.5.13.1 Set Up Procedure

Check the Configuration of Other Station by using Auto Negotiation Function of PHY before setting Transfer Rate (1 Gbps/100 Mbps/10 Mbps), Duplex Mode (Half or Full), Low Power Mode and Flow Control to E-MAC registers.

Action		Address	Write Value	Description
Hardware Reset				
↓				
DMAC.CSR	Read	H’00C	—	Check the read value is same as “H’00000001” (Reset Mode).
↓				
DMAC.CCC	Write	H’000	H’00000001	Set “Config Mode”
↓				
DMAC.CSR	Read	H’00C	—	Check the read value is same as “H’00000002” (Config Mode).
↓				
E-MAC Initial Configuration (Not necessary to change other E-MAC registers)				
E-MAC.CXR35	Write	H’540	H’XXXXXXXX	Set the appropriate value for your system. And wait the double of your configuration value to this registor.
E-MAC.CXR31	Write	H’530	H’0000000X	Set the appropriate value for your system. (Only if In-Band Status of RGMII will be used)
E-MAC.CXR2C	Write	H’52C	H’0000000X	Set the appropriate value for your system.
E-MAC.CXR2A	Write	H’508	H’00002000	Set Max Frame size as 8KB.
E-MAC.CXR71	Write	H’554	H’0000XXXX	Set the appropriate value for your system. (Only if Flow Control Function will be used)
E-MAC.CXR24	Write	H’5C0	H’XXXXXXXX	Set the appropriate value for your system.
E-MAC.CXR25	Write	H’5C8	H’0000XXXX	Set the appropriate value for your system.
E-MAC.CXR21	Write	H’510	H’0000001F	Clear all Interrupt.
E-MAC.CXR22	Write	H’518	H’0000000X	Set the appropriate value for your system.
E-MAC.CXR2D	Write	H’5B0	H’000000X0	Set the appropriate value for your system. (Only if In-Band Status of RGMII will not be used)
E-MAC.CXR2G	Write	H’5BC	H’0000000X	Set the appropriate value for your system. (Only if Software LINK will not be used)
↓				
TOE Initial Configuration (Not necessary to change other TOE registers).				
TOE.CSR1	Write	H’804	H’0XX000XX	Set the appropriate value for your system.
TOE.CSR2	Write	H’808	H’0XX000XX	Set the appropriate value for your system.
TOE.CSFR01	Write	H’844	H’XXXXXXXX	Set the appropriate value for your system.
TOE.CSFR02_i	Write	H’848+4*i	H’XXXXXXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR03_U	Write	H’858	H’0000XXXX	Set the appropriate value for your system.
TOE.CSFR03_L	Write	H’85C	H’XXXXXXXX	Set the appropriate value for your system.
TOE.CSFR10_i	Write	H’870+4*i	H’XXXXXXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR10	Write	H’880	H’000000XX	Set the appropriate value for your system.
TOE.CSFR11_i	Write	H’884+4*i	H’XXXXXXXX	Set the appropriate value for your system. (i = 0 to 3)
TOE.CSFR11	Write	H’894	H’00000XXXX	Set the appropriate value for your system.
TOE.CSFR12_i	Write	H’898+4*i	H’XXXXXXXX	Set the appropriate value for your system. (i = 0 to 11)
TOE.CSFR12	Write	H’8C8	H’00XXXXXX	Set the appropriate value for your system.
TOE.CSFR13_U	Write	H’8CC	H’0000XXXX	Set the appropriate value for your system.
TOE.CSFR13_L	Write	H’8D0	H’XXXXXXXX	Set the appropriate value for your system.
TOE.CSFR14_U	Write	H’8D4	H’0000XXXX	Set the appropriate value for your system.
TOE.CSFR14_L	Write	H’8D8	H’XXXXXXXX	Set the appropriate value for your system.
TOE.CSFR15_U_i	Write	H’8DC+8*i	H’0000XXXX	Set the appropriate value for your system. (i = 0 to 19)
TOE.CSFR15_L_i	Write	H’8E0+8*i	H’XXXXXXXX	Set the appropriate value for your system. (i = 0 to 19)
TOE.CSFR15	Write	H’97C	H’XX0XXXXX	Set the appropriate value for your system.
TOE.CSFR20	Write	H’9A0	H’000FFFFF	Clear all Interrupt.
TOE.CSFR21	Write	H’9A4	H’000XXXXX	Set the appropriate value for your system.

Action		Address	Write Value	Description
TOE.CSFR30	Write	H'9B0	H'000XXXXX	Set the appropriate value for your system.
TOE.CSFR31	Write	H'9B4	H'XX0XXXXX	Set the appropriate value for your system.
TOE.CSFR00	Write	H'840	H'10XXXXXX	Enable the appropriate Filter Function for your system. Disable of Auto Response Function.
↓				
DMAC Initial Configuration (Not necessary to change other DMAC registers).				
DMAC.DBAT	Write	H'004	H'XXXXXXXX	Set the appropriate value for your system.
DMAC.RCR	Write	H'090	H'XXXX000X	Set the appropriate value for your system.
DMAC.RTC	Write	H'0B4	H'00002000	Set Max Reception Frame size as 8 KB.
DMAC.CIE	Write	H'384	H'00000X0X	Set the appropriate value for your system.
DMAC.DIE	Write	H'450	H'0000XXXX	Set the appropriate value for your system.
DMAC.EIE	Write	H'458	H'00000X0X	Set the appropriate value for your system.
DMAC.RIE0	Write	H'460	H'0000000X	Set the appropriate value for your system.
DMAC.RIE1	Write	H'468	H'X0000000	Set the appropriate value for your system.
DMAC.RIE2	Write	H'470	H'X000000X	Set the appropriate value for your system.
DMAC.TIE	Write	H'478	H'000XXX0X	Set the appropriate value for your system.
DMAC.RIE3	Write	H'488	H'0000000X	Set the appropriate value for your system.
↓				
DMAC.CCC	Write	H'000	H'0X0X0002	Set bit [1:0] = "10b" (Operation Mode) and bit25 (FCE)/bit18 (ERCS) = "the appropriate value for your system".
↓				
TOE.CSR0	Write	H'800	H'00000030	Set TPE and RPE = "1" and TOE FIFO=2 KB.
↓				
E-MAC.CXR20	Write	H'500	H'0XXXXXXX	Set the appropriate value for your system. (The following are example)
			H'02030061	Rx CRC PassThrough, PAUSE, TPE and RPE = '1', Half Duplex (for 100 Mbps/10 Mbps), Promiscuous.
			H'02030063	Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Full Duplex (for 10 Mbps), Promiscuous.
			H'02030073	Rx CRC PassThrough, PAUSE, TPE/RPE = '1', Simplified Full Duplex (for 1 Gbps/100 Mbps), Promiscuous.
↓				
DMAC.TCCR	Write	H'304	H'000X0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

30.5.13.2 System Mode Change Procedure (Normal -> Network Standby)

Action		Address	Write Value	Description
DMAC.TCCR	Read	H'304	—	Wait until bit0 (TSRQ) will be "0".
↓				
DMAC.CSR	Read	H'00C	—	Wait until bit16 (TPO) and bit20 (RPO) will be "0".
↓				
DMAC.CCC	Write	H'000	H'0X0X0202	Set bit9 (RDFD) = "1" to stop fetch of Rx Descriptor. Not necessary to change other bits.
↓				
DMAC.CSR	Read	H'00C		Wait until bit9 (RDFDM) will be "1" and re-check bit20 (RPO) is "0".*1
↓				
TOE Configuration to enable Auto Response Function (Not necessary to change other registers)				
TOE.CSFR40	Write	H'9C0	H'00000007	Clear all Interrupt.
TOE.CSFR41	Write	H'9C4	H'0000000X	Set the appropriate value for your system.
TOE.CSFR00	Write	H'840	H'1XXXXXXX	Enable of the appropriate Auto Response Function for your system. Not necessary to change Filter Function.
↓				
Change System Mode from "Normal" to "Network Standby".				
↓				
Set Tx Descriptor and Tx Frame at Internal SRAM				
↓				
DMAC.DBAT	Write	H'004	H'XXXXXXXX	Set the appropriate value for your system.
↓				
DMAC.DLR	Write	H'008	H'003FFFFF	Set bit0 and bit4 = "1" loading DBAT to Tx and Rx queue.
↓				

Action		Address	Write Value	Description
DMAC.TCCR	Write	H'304	H'000X0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

Note 1. If bit9 (RDFDM) is "0" and bit20 (RPO) is "0", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "0", the DMA transfer and fetch of Rx Descriptor have stopped.
So go to next step.
If bit9 (RDFDM) is "0" and bit20 (RPO) is "1", wait bit9 (RDFDM) will be "1" without accessing other registers.
If bit9 (RDFDM) is "1" and bit20 (RPO) is "1", the Reception Frame was stored to Reception FIFO.
So software has to cancel changing System mode. Set DMAC.CCC. bit9 (RDFD) = "0" immediately to resume fetch of Rx Descriptor.

30.5.13.3 System Mode Change Procedure (Network Standby -> Normal)

Action		Address	Write Value	Description
TOE.CSFR00	Write	H'840	H'10XXXXXX	Disable of the Auto Response Function. Not necessary to change Filter Function.
↓				
DMAC.TCCR	Read	H'304	—	Wait until bit0 (TSRQ) will be "0".
↓				
DMAC.CSR	Read	H'00C	—	Wait until bit16 (TPO) will be "0".
↓				
Change System Mode from "Network Standby" to "Normal".				
↓				
Set Rx/Tx Descriptor and Tx Frame at External SDRAM.				
↓				
DMAC.DBAT	Write	H'004	H'XXXXXXXX	Set the appropriate value for your system.
↓				
DMAC.DLR	Write	H'008	H'003FFFFF	load DBAT to Tx and Rx queue.
↓				
DMAC.CCC	Write	H'000	H'0X0X0002	Set "bit9 (RDFD) = 0" to start Rx DMA Transfer for Rx Frame. Not necessary to change other bits.
↓				
DMAC.TCCR	Write	H'304	H'000X0001	Set bit0 (TSRQ) = "1" and bit18 (MFEN2), bit16 (MFEN) = "the appropriate value to for your system".

30.5.13.4 Stop Procedure

Action		Address	Write Value	Description
Make “EOS” in the Tx Descriptor chain and wait until it is used. (Wait the interrupt of DIS.DPFi of this EOS Descriptor.)				
↓				
E-MAC.CXR20	Write	H’500	H’0XXXXXXX	Set bit6 (RPE) = “0” to stop Rx Function of E-MAC. Not necessary to change other bits.
↓				
Wait following time depending on the Transfer speed mode. (Waiting time that the last Rx Frame is stored to Reception FIFO and the ast Tx Frame is transmitted to PHY) • 1 Gbps : Wait 70 µs • 100 Mbps : Wait 700 µs • 10 Mbps : Wait 7 ms				
↓				
DMAC.CSR	Read	H’00C	—	Wait until bit20 (RPO) will be “0” (Wait Reception FIFO will be empty)
↓				
DMAC.CCC	Write	H’000	H’0X0X0102	Set bit8 (DTSR) = “1” to stop URAM access. Not necessary to change other bits.
↓				
DMAC.CSR	Read	H’00C	—	Wait until bit8 (DTS) will be “1” (URAM access is stopping)
↓				
TOE.CSR0	Write	H’800	H’00000000	Set bit5 (RPE) = “0” and bit4 (TPE) = “0” to stop Rx and Tx Function of TOE. Not necessary to change other bits.
↓				
TOE.CSR0	Read	H’800	—	Wait until bit5 (RPE) and bit4 (TPE) will be “0”
↓				
E-MAC.CXR20	Write	H’500	H’0XXXXXXX	Set bit5 (TPE) = “0” to stop Tx Function of E-MAC. Not necessary to change other bits.
↓				
E-MAC.CXR20	Read	H’500	—	Wait until bit6 (RPE) and bit5 (TPE) will be “0”
↓				
DMAC.CCC	Write	H’000	H’0X0X0001	Set bit [1:0] = “01b” (Config Mode) and bit8 (DTSR) = “0”

Note: If the system needs software reset, set DMAC.CCC bit [1:0] = “00b” to be RESET Mode after “Stop Procedure” and retry “Set up Procedure”.

30.5.14 Connection to PHY-LSI

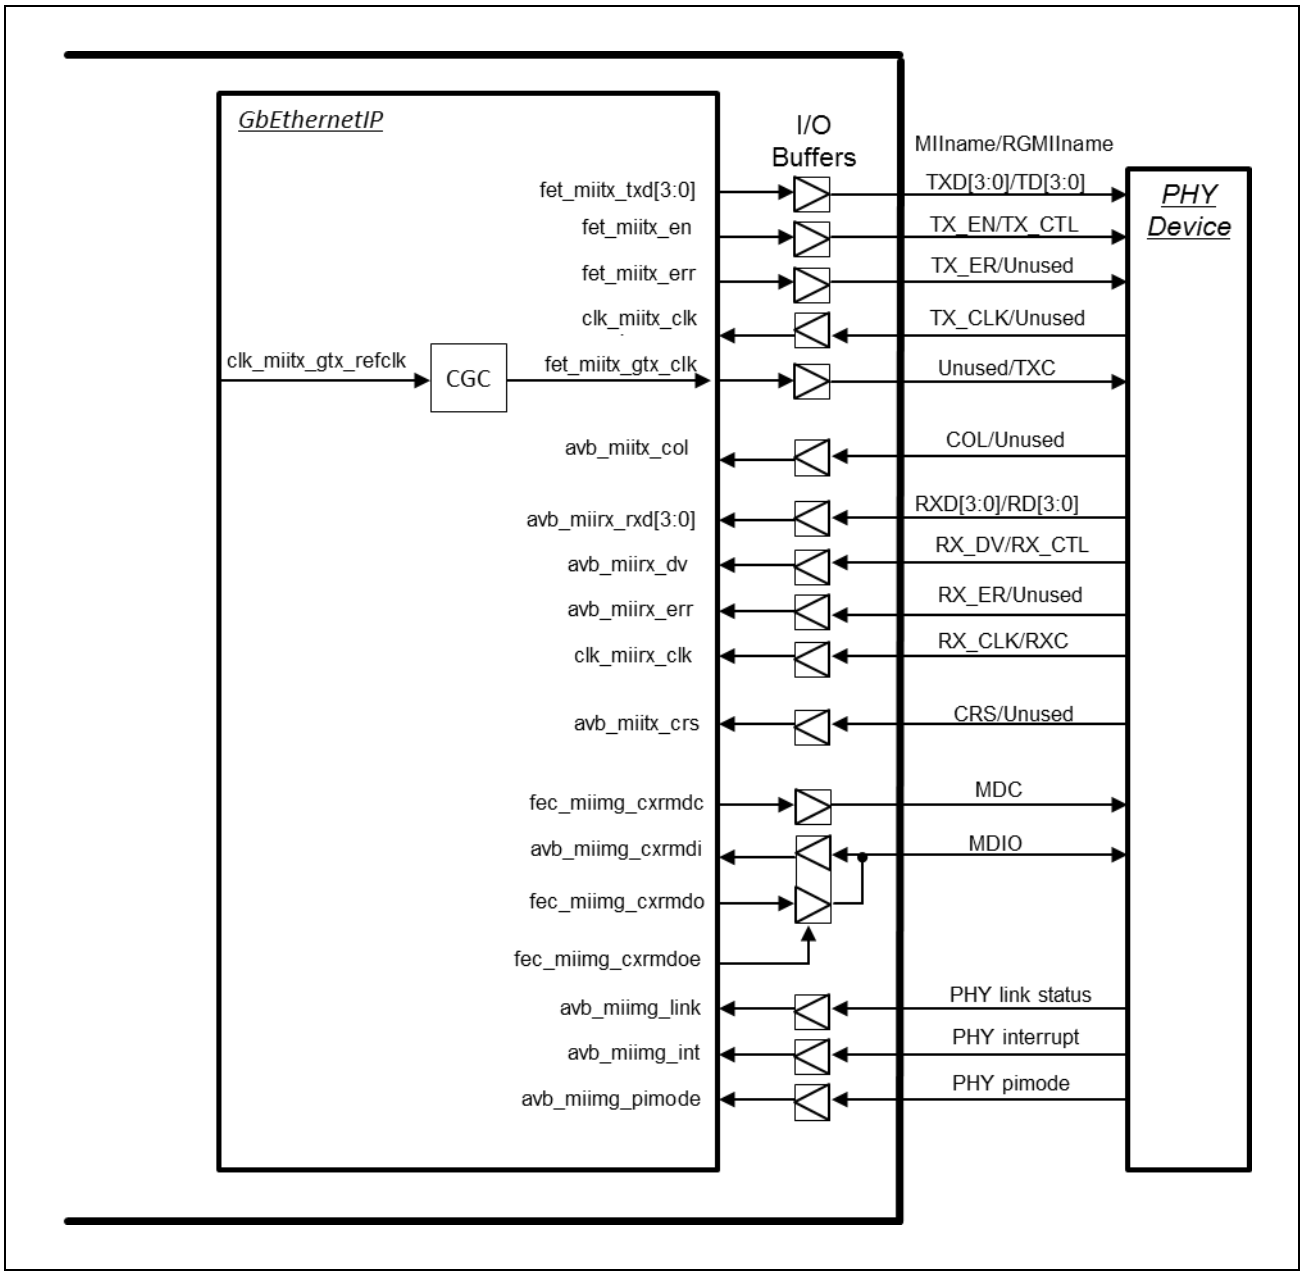

Figure 30.46 Connection to PHY-LSI

30.5.14.1 RGMII Frame Transmission/Reception Timing

Each RGMII frame transmission/reception timing is shown in **Figure 30.47** and **Figure 30.48**.

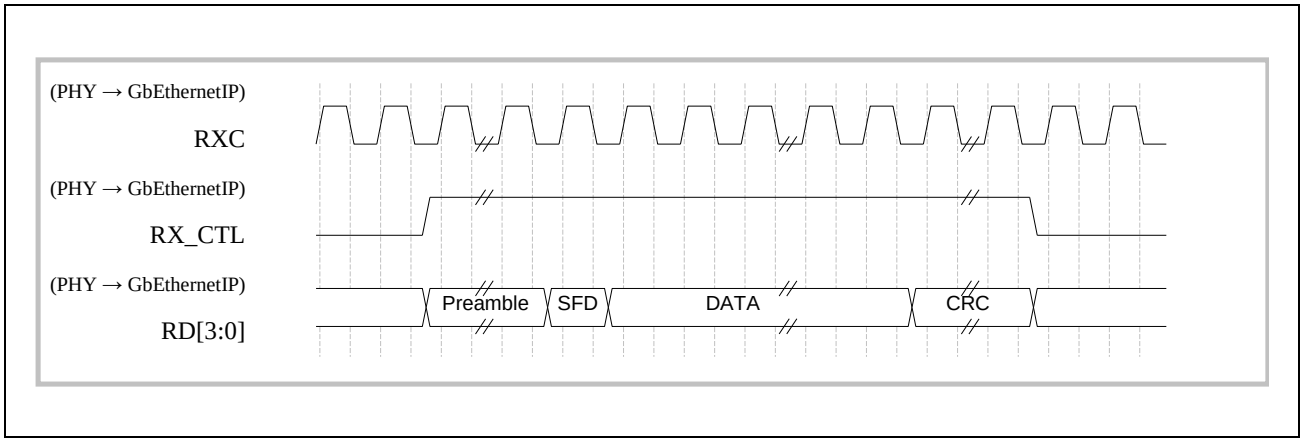

Figure 30.47 Normal Frame Reception Time Chart (RGMII)

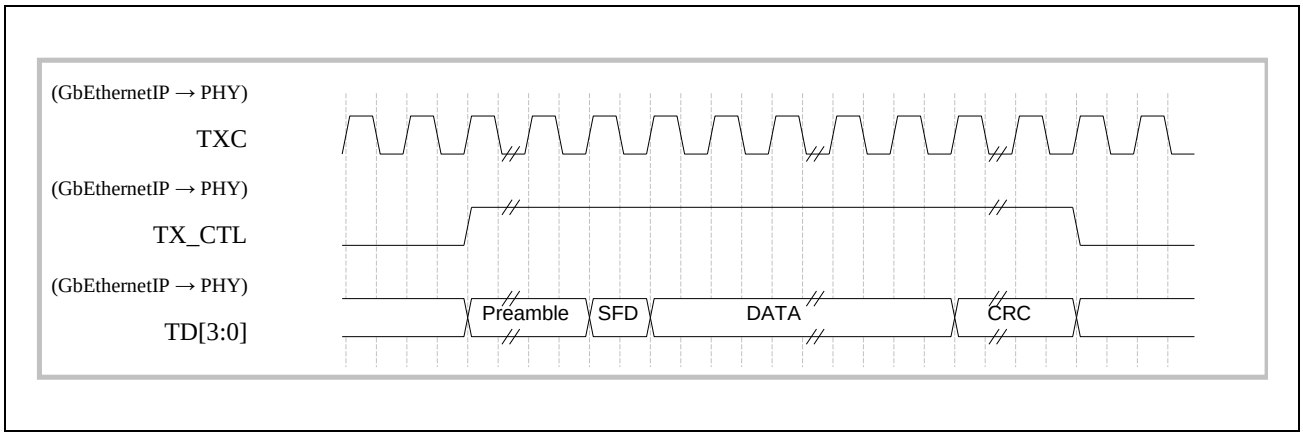

Figure 30.48 Normal Frame Transmission Time Chart (RGMII)

30.5.14.2 MII Frame Reception Timing

Each MII frame transmission/reception timing is shown in **Figure 30.49** and **Figure 30.50**.

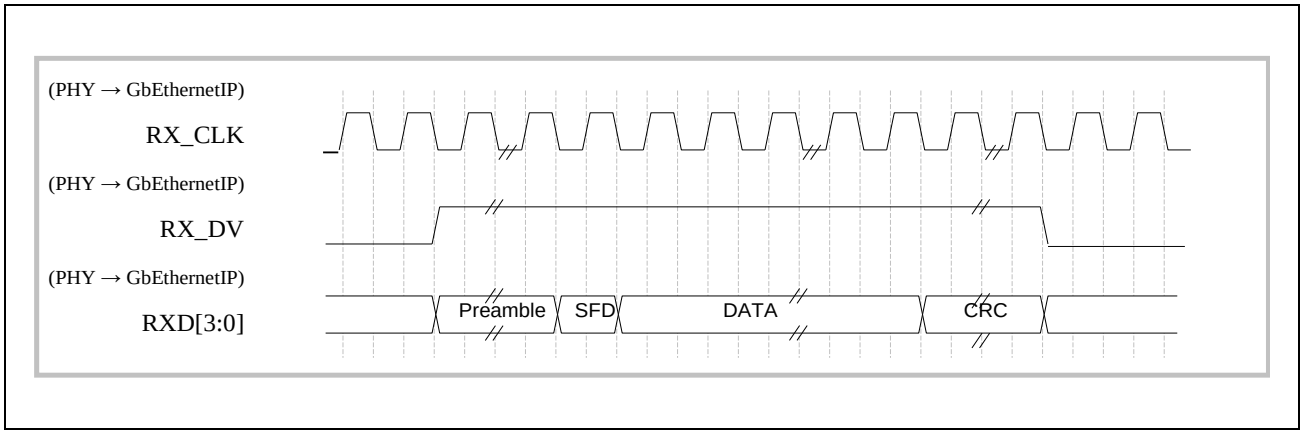

Figure 30.49 Normal Frame Reception Time Chart (MII)

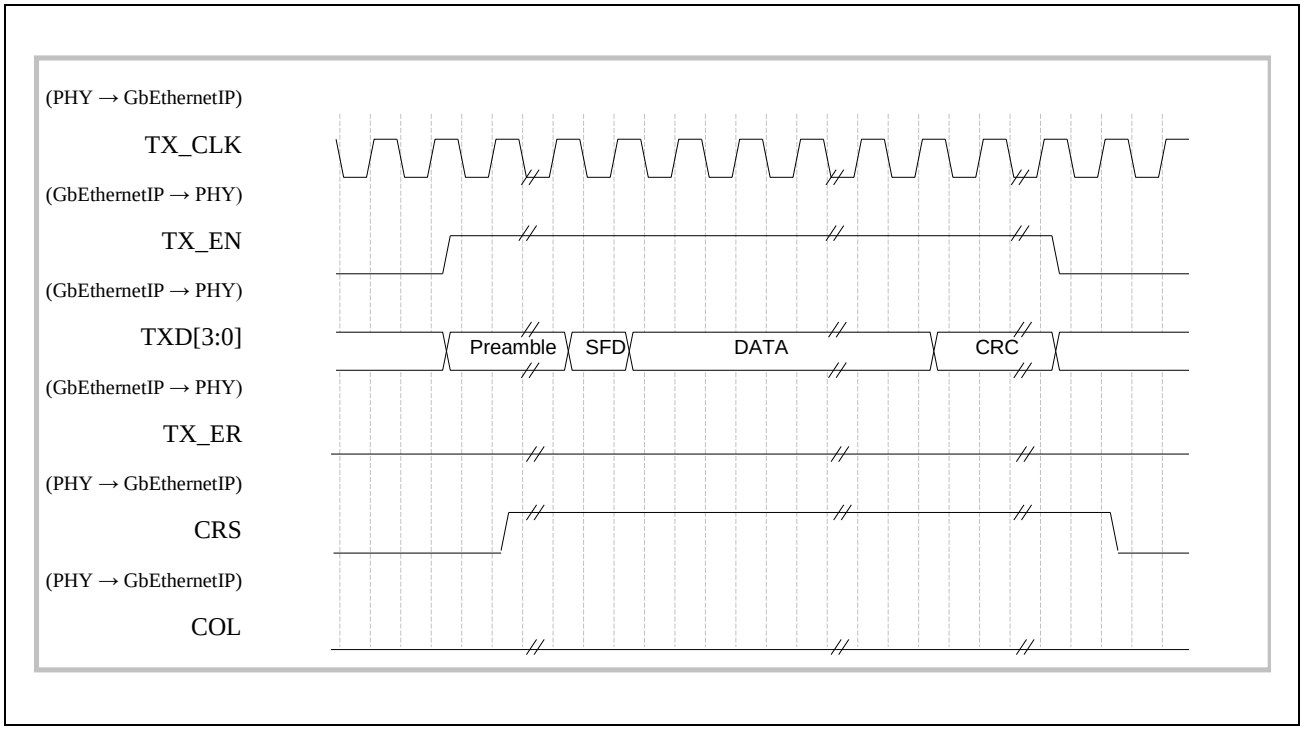

Figure 30.50 Normal Frame Transmission Time Chart (MII)

30.5.14.3 Accessing PHY Registers

There are two methods to access the PHY register: using the E-MAC-MDIOC block and using the CXR23 register.

Which access method to be used can be set using the MDIOMOD register.

(1) PHY Register Access Method (using MDIOC)

To access the PHY register from MDIOC, the SEL_MDIO bit in MDIOMOD register must be set to 0.

The following commands can be used for indirect access using MDIOC.

Table 30.23 List of MDIOC Commands

Command	OP code	Address	Data	Description
WRITE	“01”	A [9:0]	D [15:0]	Write PHY register
READ	“10”	A [9:0]	D [15:0]	Read PHY register

PHY Register Write Access Procedure (Using MDIOC)

The write access procedure for PHY register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set write data in MDIODAT register.

(4) Set OP field of MDIOCMD register to “01”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(5) Read MDIOSTS register and wait till BSY bit = 0. After BSY becomes 0, write access is complete.
{After write access to PHY register completes, the BSY bit in MDIOSTS register is cleared to 0 by hardware.}

PHY Register Read Access Procedure (Using MDIOC)

The read access procedure for PHY Register is given below.

(1) Read MDIOSTS register and confirm that BSY bit = 0.

(2) Set PHY address as (A [9:5]) and register address as (A [4:0]) in MDIOADR register.

(3) Set OP field of MDIOCMD register to “10”.
{Here, the hardware sets BSY bit in MDIOSTS register to 1.}

(4) Read MDIOSTS register and wait till BSY bit = 0.
{After read access from PHY register completes and read data becomes available in MDIODAT register, hardware clears BSY bit in MDIOSTS register is cleared to 0 by hardware.}

(5) When the BSY bit in MDIOSTS register is cleared to 0, read data is acquired from MDIODAT register and access is complete.

(2) PHY Register Access Method (Using CXR23)

To access PHY register using CXR23 register, SEL_MDIO bit of MDIOMOD register must be set to 1. (The initial value can be used as is.)

PHY access using CXR23 is done by controlling High and Low of MDC and MDIO signals for every cycle. The relationship between CXR23 register access and MDC and MDIO signals is shown below.

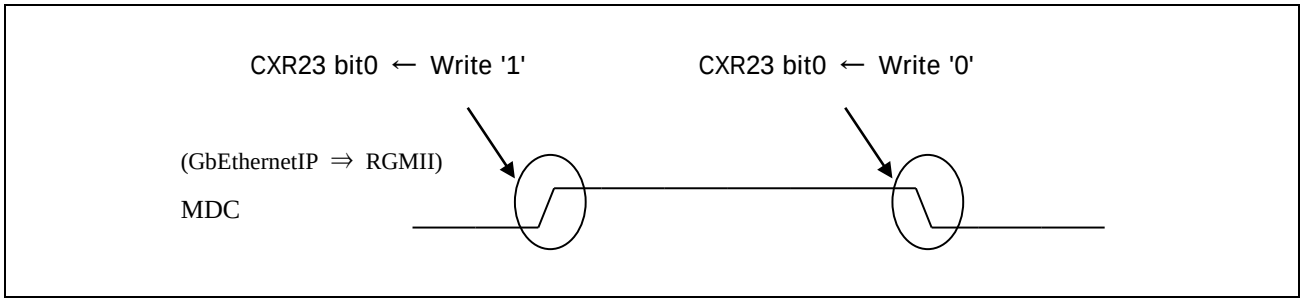

Figure 30.51 Relationship between CXR23 Write and MDC signal

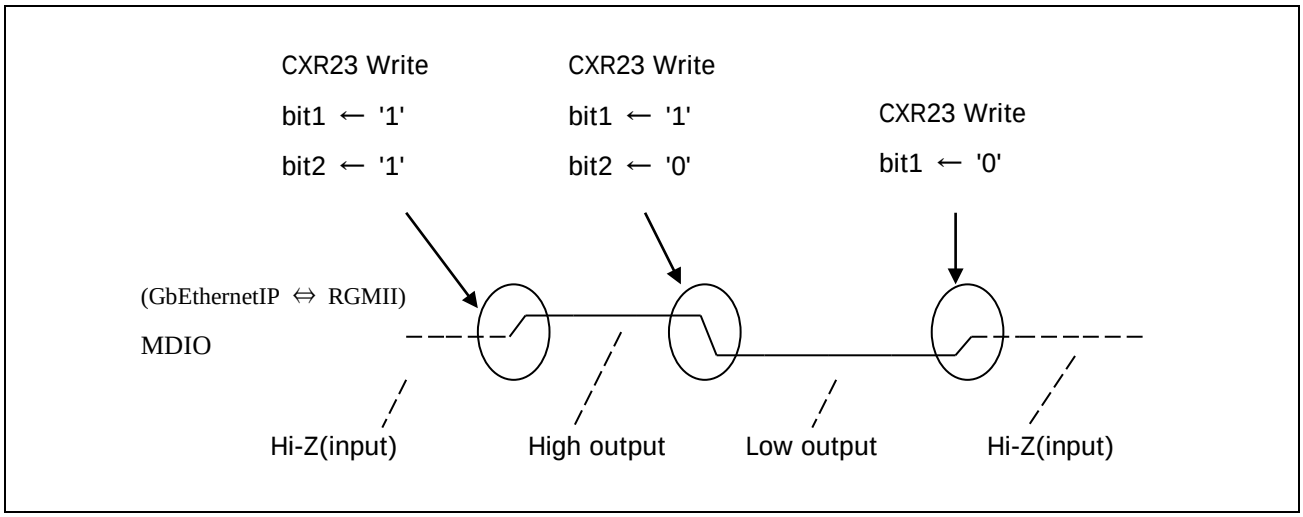

Figure 30.52 Relationship between CXR23 Write and MDIO (output) signal

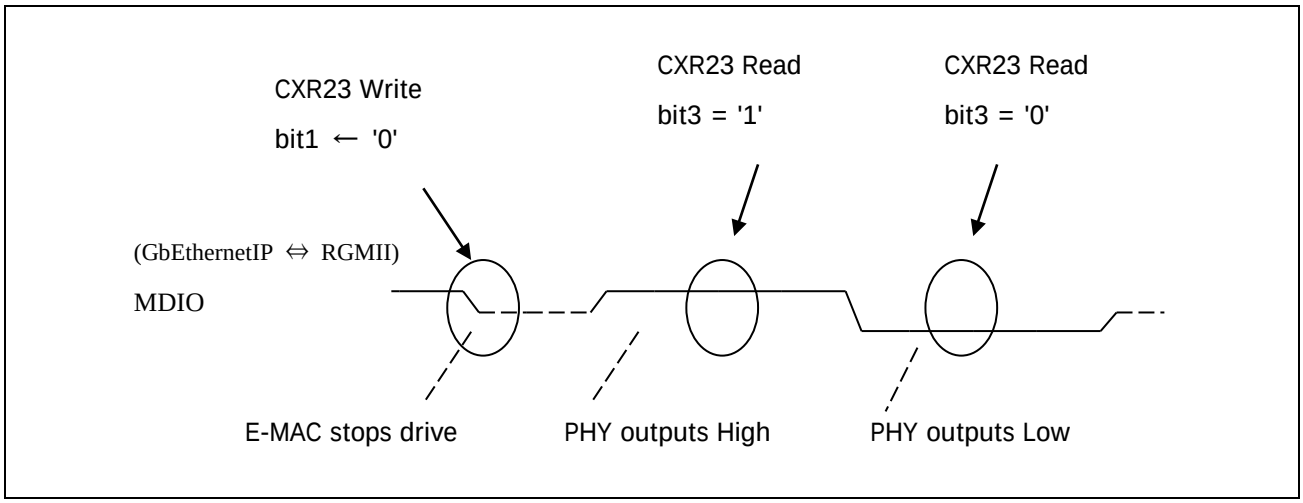

Figure 30.53 Relationship between MDIO input and CXR23 Read Values

PHY Register Write Access Procedure (Using CXR23)

To write PHY chip register, control MDC and MDIO signals based on the format given below.

(1) PHY Write Access Format

Table 30.24 PHY Write Access Format

#	Field name	I/O	Details	Remarks
1	Preamble	O	1 = 32 bits	Preamble
2	ST	O	“01”	Start
3	Op Code (Write)	O	“01”	Operation code for write
4	PHY Address	O	5 bit	PHY address (See data sheet of PHY LSI)
5	Reg Address	O	5 bit	Register address (See data sheet of PHY LSI)
6	Turn Around	O	“10”	Turnaround
7	Data (Write)	O	16 bit	Write data
8	IDLE	—	—	Idle status

(2) PHY Register Write Access Time chart

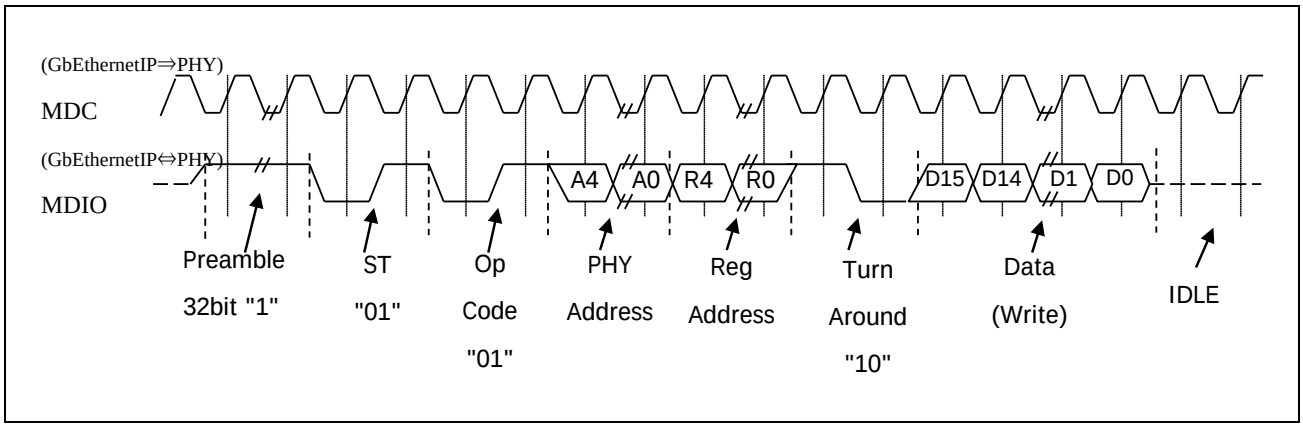

Figure 30.54 PHY Register Write Access Time Chart

(3) PHY Register Write Access Procedure

Table 30.25 PHY Register Write Access Procedure (1/2)

#	CXR23 bit 3	CXR23 bit 2	CXR23 bit 1	CXR23 bit 0	CXR23 access	Description
0	0	0	0	0	Initial state	IDLE

31. A/D Converter

31.1 Features

This LSI has a successive approximation A/D converter with a 12-bit accuracy. Up to eight analog input channels can be selected.

■ Resolution

12 bits

■ Eight input channels

■ Input voltage range

0 V to 1.8 V

■ Minimum conversion time

1.0 µs per channel (when A/D conversion clock ADIVCLK is 20 MHz)

■ Eight data registers

The A/D conversion result is stored in a 32-bit data register corresponding to each channel.

■ Sample-and-hold function

■ Trigger mode

- Software trigger mode and hardware trigger mode are available.
- Software trigger mode to start A/D conversion by software
- Hardware trigger mode to start A/D conversion by an asynchronous trigger or synchronous trigger
  - Asynchronous trigger using an external pin (ADC_TRG) as the activation source
  - Synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) or general-purpose

■ Operating mode

- Select mode and scan mode are available.
- Select mode to convert the specified single analog input channel
  - 1-buffer mode or 4-buffer mode can be specified for storing the A/D conversion result.
  - In 4-buffer mode, A/D conversion proceeds four times for the selected analog input and the A/D conversion results are stored in four registers.
- Scan mode to convert the analog inputs of arbitrarily selected channels in ascending order of channel number
  - 1-buffer mode can be specified for storing the A/D conversion result.

■ Conversion mode

- Single mode and repeat mode are available.
- Single mode to proceed A/D conversion only once
- Repeat mode to repeatedly proceed A/D conversion

■ A single interrupt source

- An A/D conversion end interrupt (INTAD) can be generated on completion of A/D conversion.
  - In the select mode with 1-buffer mode selected, an A/D conversion end interrupt is generated on completion of a single conversion.
  - In the select mode with 4-buffer mode selected, an A/D conversion end interrupt is generated on completion of four rounds of conversion.
  - In scan mode, an A/D conversion end interrupt is generated on completion of scanning of all the selected channels.

Table 31.1 shows the outline of the functions of the A/D converter.

Table 31.1 Functions of A/D Converter

Item				Source
Analog Input Channel				ADC_CH0, ADC_CH1
Conditions for starting A/D conversion	Software	Software trigger		(Enabled by software)
	Asynchronous trigger	External trigger*1	Trigger input pin	ADC_TRG
	Synchronous trigger	Trigger from MTU3a	Compare match with or input capture to MTU0.TGRA	TRGA0N
			Compare match with or input capture to MTU1.TGRA	TRGA1N
			Compare match with or input capture to MTU2.TGRA	TRGA2N
			Compare match with or input capture to MTU3.TGRA	TRGA3N
			Compare match with or input capture to MTU4.TGRA or underflow of MTU4.TCNT in complementary PWM mode	TRGA4N
			Compare match with or input capture to MTU6.TGRA	TRGA6N
			Compare match with or input capture to MTU7.TGRA or underflow of MTU7.TCNT in complementary PWM mode	TRGA7N
			Compare match with MTU0.TGRE	TRG0N
			Compare match between MTU4.TADCORA and MTU4.TCNT	TRG4AN
			Compare match between MTU4.TADCORB and MTU4.TCNT	TRG4BN
			Compare match between MTU4.TADCORA and MTU4.TCNT or compare match between MTU4.TADCORB and MTU4.TCNT	TRG4AN or TRG4BN
			Compare match between MTU4.TADCORA and MTU4.TCNT and compare match between MTU4.TADCORB and MTU4.TCNT (when interrupt skipping function 2 is used)	TRG4ABN
			Compare match between MTU7.TADCORA and MTU7.TCNT	TRG7AN
			Compare match between MTU7.TADCORB and MTU7.TCNT	TRG7BN
			Compare match between MTU7.TADCORA and MTU7.TCNT or compare match between MTU7.TADCORB and MTU7.TCNT compare match	TRG7AN or TRG7BN
			Compare match between MTU7.TADCORA and MTU7.TCNT and compare match between MTU7.TADCORB and MTU7.TCNT (when interrupt skipping function 2 is used)	TRG7ABN
Interrupt				INTAD

Note 1. To set ADC_TRG as the trigger for starting A/D conversion, set the general-purpose I/O function. For details, see **Section 41, General Purpose Input Output Port**.

Table 31.2 lists the I/O pins used in the A/D converter.

Table 31.2 I/O Pins of A/D Converter

Pin Name	I/O	Name	Function
ADC_CH0, ADC_CH1	Input	Analog input pins	Analog input pins
ADC_TRG	Input	A/D conversion trigger input	External trigger input pin for starting A/D conversion
ADC_AVDD18	Input	Analog power supply voltage	A/D converter power supply pin
VSS	Input	Analog ground	A/D converter ground pin

31.2 List of Registers

Table 31.3 shows the register list of this module.

The base address is as follows.

Base address: H'0_1005_9000 (Cortex-A55 Address Space)

Table 31.3 List of Registers of A/D Converter

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D converter mode register 0	ADM0	R/W	H'0000	H'0	32
A/D converter mode register 1	ADM1	R/W	H'0000	H'4	32
A/D converter mode register 2	ADM2	R/W	H'0000	H'8	32
A/D converter mode register 3	ADM3	R/W	H'0000	H'C	32
Reserved	—	R	H'0000	H'10 – 1F	32
A/D converter interrupt control register	ADINT	R/W	H'0000	H'20	32
A/D converter status register	ADSTS	R/W	H'0000	H'24	32
A/D converter clock division setting register	ADIVC	R/W	H'0000	H'28	32
A/D converter external trigger pin filter control register	ADFIL	R/W	H'0000	H'2C	32
A/D conversion result register 0	ADCR0	R	H'0000	H'30	32
A/D conversion result register 1	ADCR1	R	H'0000	H'34	32
A/D conversion result register 2	ADCR2	R	H'0000	H'38	32
A/D conversion result register 3	ADCR3	R	H'0000	H'3C	32
Reserved	—	R	H'0000	H'40 – 6C	32
Renesas reserved area*1	—	R/W	Undefined	H'70 – 7F	32

Note: When writing successively to the same register, the notes in **Section 31.5.2, Timing Restrictions**, need to be observed.

Note 1. Writing to a Renesas reserved area is prohibited.

31.3 Register Descriptions

31.3.1 A/D Converter Mode Register 0 (ADM0)

The ADM0 is a 32-bit register that controls A/D conversion and the power-saving mode of the A/D converter, and also executes a software reset. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRESB	—	—	—	—	—	—	—	—	—	—	—	—	PWDWNB	ADBSY	ADCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
15	SRESB	0	R/W	Issues a software reset to the A/D converter. Circuits (e.g. registers) other than those of the A/D converter will not be reset. To release the A/D converter from the reset state, write 1 to this bit. 0: A/D converter is reset. 1: A/D converter is released from the reset state. The A/D converter enters the power-saving mode when this bit is used to execute a reset.
14 to 3	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
2	PWDWNB	0	R/W	Specifies the A/D converter to enter or exit the power-saving mode. 0: Power-saving mode 1: Normal mode
1	ADBSY	0	R	Indicates the status of the A/D converter. This bit is read-only. Writing to this bit is ignored. 0: A/D converter is stopped. 1: A/D converter is busy. For operation of the ADBSY bit, see **Figure 31.1**.
0	ADCE	0	R/W	Stops or enables the A/D converter. 0: A/D converter is stopped. 1: A/D converter is enabled. When 0 is written to the ADCE bit, the A/D converter stops operating. For operation of the ADCE bit at reading, see **Figure 31.1**.

Note: Notes regarding the ADM0 register are given on the next page.

NOTES

1. To enable A/D conversion operation using the ADCE bit, first switch from PWDWNB = 0 (power-saving mode) to PWDWNB = 1 (normal mode) and then wait for a period equal to or longer than the stabilization wait time before setting the ADCE bit to 1. The stabilization wait time is 1 µs.
2. To make a transition to the power-saving mode using the PWDWNB bit, first stop operation of the A/D converter (ADCE = 0) and then confirm that A/D conversion is completed (ADBSY = 0) before setting the PWDWNB bit to 0.

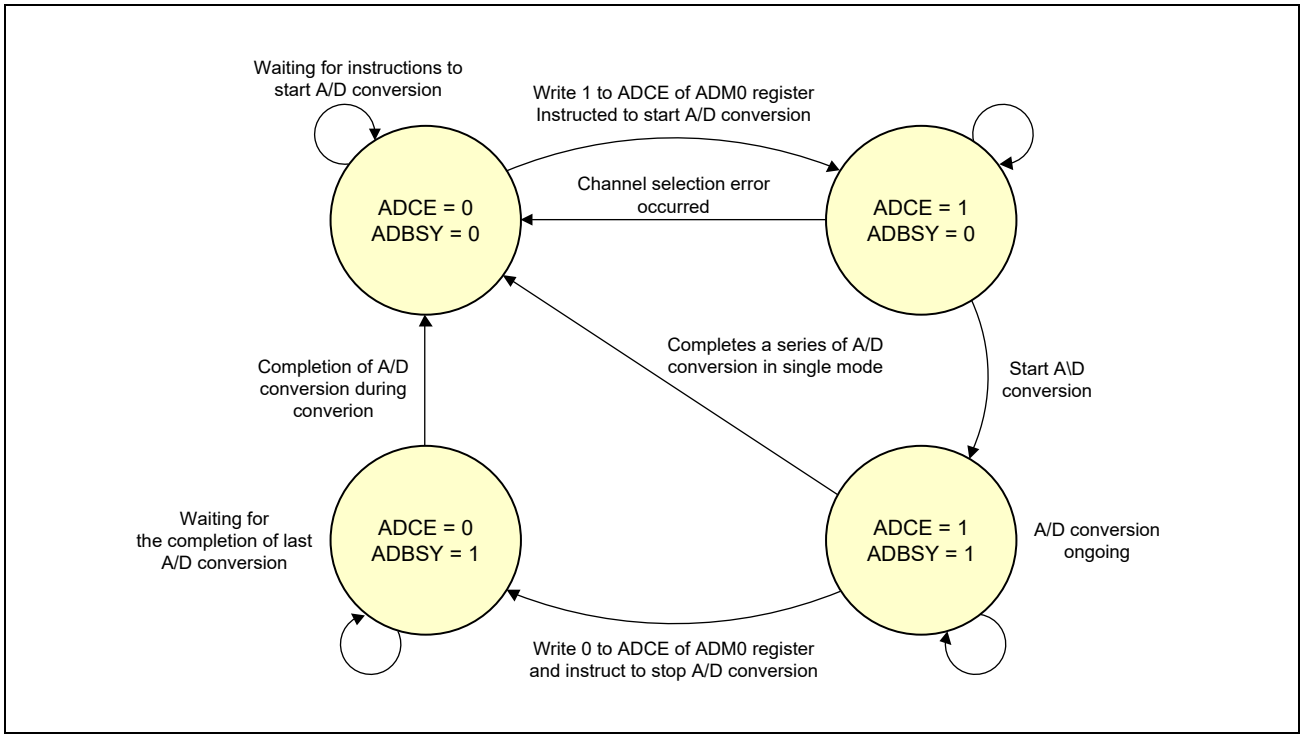

Figure 31.1 State Transitions of ADCE Bit and ADBSY Bit

31.3.2 A/D Converter Mode Register 1 (ADM1)

The ADM1 is a 32-bit register that controls A/D conversion and sets the mode for a hardware trigger. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TRGEN5	TRGEN4	TRGEN3	TRGEN2	TRGEN1	TRGEN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	EGA1	EGA0	—	—	—	—	—	—	—	BS	RPS	MS	TRGIN	TRG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
21 to 16	TRGEN[5:0]	All 0	R/W	These bits select the hardware trigger pin. For details, see **Table 31.4**.
15, 14	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
13, 12	EGA[1:0]	00	R/W	These bits select the valid edge of the trigger pin.

EGA1	EGA0	Valid Edge
0	0	Hardware trigger is invalid
0	1	Falling edge
1	0	Rising edge
1	1	Both edges

Note: When the EGA[1:0] bits are set to 00 in hardware trigger mode, a trigger from the trigger pin will be ignored. When a trigger pin of the MTU3a is used, the falling edge is always valid and the setting of the EGA[1:0] bits (01b, 10b, or 11b) will be ignored. When the external trigger pin (ADC_TRG) is used, the valid edge is set by the EGA[1:0] bits.

11 to 5	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
4	BS	0	R/W	Selects the buffer mode (valid in select mode). 0: 1-buffer mode 1: 4-buffer mode 4-buffer mode is prohibited in scan mode.
3	RPS	0	R/W	Selects the repeat number. 0: Single 1: Repeat
2	MS	0	R/W	Selects the operating mode. 0: Scan mode 1: Select mode
1	TRGIN	0	R/W	Selects the trigger input mode. 0: Auto mode 1: Step mode

Bit	Bit Name	Initial Value	R/W	Description
0	TRG	0	R/W	Sets the trigger mode. 0: Software trigger mode*1 1: Hardware trigger mode

Note 1. Set the EGA[1:0] bits to 00 when using software trigger mode.

Table 31.4 TRGEN[5:0] Bits and Trigger Source

Module	Source	Description	TRGEN[5:0] Bits					
			5	4	3	2	1	0
External pin	ADC_TRG	External trigger input	0	0	0	0	0	0
MTU	TRGA0N	Compare match with or input capture to MTU0.TGRA	0	0	0	0	0	1
	TRGA1N	Compare match with or input capture to MTU1.TGRA	0	0	0	0	1	0
	TRGA2N	Compare match with or input capture to MTU2.TGRA	0	0	0	0	1	1
	TRGA3N	Compare match with or input capture to MTU3.TGRA	0	0	0	1	0	0
	TRGA4N	Compare match with or input capture to MTU4.TGRA or underflow (trough) of MTU4.TCNT in complementary PWM mode	0	0	0	1	0	1
	TRGA6N	Compare match with or input capture to MTU6.TGRA	0	0	0	1	1	0
	TRGA7N	Compare match with or input capture to MTU7.TGRA or underflow (trough) of MTU7.TCNT in complementary PWM mode	0	0	0	1	1	1
	TRG0N	Compare match with MTU0.TGRE	0	0	1	0	0	0
	TRG4AN	Compare match between MTU4.TADCORA and MTU4.TCNT	0	0	1	0	0	1
	TRG4BN	Compare match between MTU4.TADCORB and MTU4.TCNT	0	0	1	0	1	0
	TRG4AN or TRG4BN	Compare match between MTU4.TADCORA and MTU4.TCNT or compare match between MTU4.TADCORB and MTU4.TCNT	0	0	1	0	1	1
	TRG4ABN	Compare match between MTU4.TADCORA and MTU4.TCNT and compare match between MTU4.TADCORB and MTU4.TCNT (when interrupt skipping function 2 is used)	0	0	1	1	0	0
	TRG7AN	Compare match between MTU7.TADCORA and MTU7.TCNT	0	0	1	1	0	1
	TRG7BN	Compare match between MTU7.TADCORB and MTU7.TCNT	0	0	1	1	1	0
	TRG7AN or TRG7BN	Compare match between MTU7.TADCORA and MTU7.TCNT or compare match between MTU7.TADCORB and MTU7.TCNT	0	0	1	1	1	1
	TRG7ABN	Compare match between MTU7.TADCORA and MTU7.TCNT and compare match between MTU7.TADCORB and MTU7.TCNT (when interrupt skipping function 2 is used)	0	1	0	0	0	0

31.3.3 A/D Converter Mode Register 2 (ADM2)

The ADM2 is a 32-bit register that specifies the analog input channels to be used in A/D conversion. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CHSEL 1	CHSEL 0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 2	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
1, 0	CHSEL[1:0]	All 0	R/W	These bits select the A/D analog input channel n (n = 0, 1). 0: Analog input channel n is not subjected to conversion. 1: Analog input channel n is subjected to conversion.

Note 1. Select only one channel in select mode.

Note 2. If more than one channel is selected in select mode, a channel select error occurs.

31.3.4 A/D Converter Mode Register 3 (ADM3)

The ADM3 is a 32-bit register that sets the sampling period of the A/D converter. Be sure to set this register before starting the A/D converter. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADIL7	ADIL6	ADIL5	ADIL4	ADIL3	ADIL2	ADIL1	ADIL0	ADCMP7	ADCMP6	ADCMP5	ADCMP4	ADCMP3	ADCMP2	ADCMP1	ADCMP0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ADIL[7:0]	All 0	R/W	These bits should be set to H'00.
23 to 16	ADCMP[7:0]	All 0	R/W	These bits should be set to H'0E.
15 to 0	ADSMP[15:0]	All 0	R/W	These bits set the sampling period (unit: ADIVCLK cycle). A value from H'06 (6 T) to H'AF0 (2800 T) can be set. T stands for the cycle of ADIVCLK (20 MHz).

Note: The ADIL[7:0] bits should be set to H'00 and the ADCMP[7:0] bits should be set to H'0E. If they are set to other values, normal operation cannot be guaranteed.

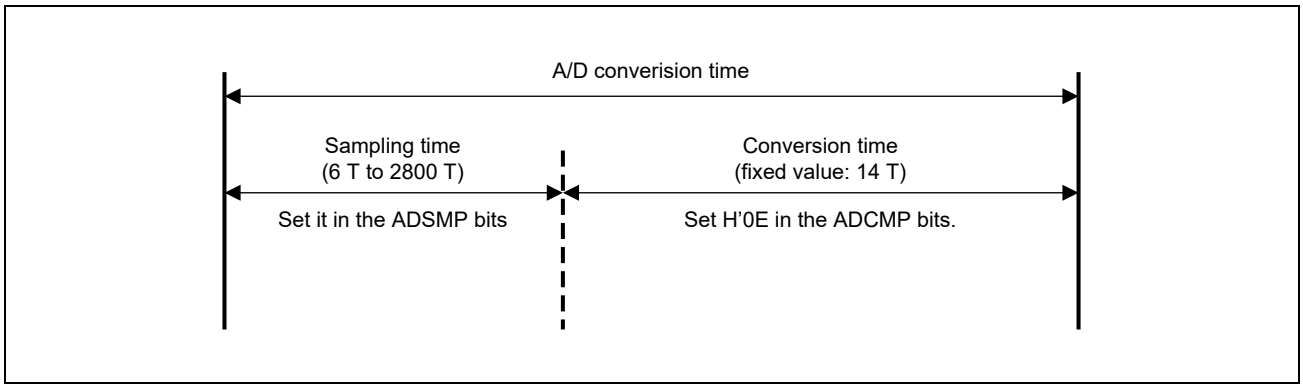

Figure 31.2 Correspondence between ADM3 Register and A/D Conversion Time

NOTE

ADIVCLK is a clock obtained by dividing the frequency of ADC_ADCLK(TSUϕ) with the ADIVC register setting.

31.3.5 A/D Converter Interrupt Control Register (ADINT)

The ADINT is a 32-bit register that controls interrupts. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSEEN

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	INTEN3	INTEN2	INTEN1	INTEN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	INTS	0	R/W	Selects the attribute of the interrupt (INTAD) signal. 0: Pulse signal 1: Reserved This bit should be set to 0.
30 to 17	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
16	CSEEN	0	R/W	Enables or disables the A/D conversion channel select error interrupt. 0: Interrupt output is disabled. 1: Interrupt output is enabled.
15 to 8	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
7 to 4	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3 to 0	INTEN[3:0]	All 0	R/W	These bits enable or disable the conversion end interrupt of channel n (n = 0 to 3). 0: Interrupt output is disabled. 1: Interrupt output is enabled. INTEN3-2 is used only in 4-buffer mode.

The interrupt signal is specified as a pulse and that pulse is output at any of the following timing:

1. An A/D conversion request is detected while the ADM2 register has caused an A/D conversion channel select error
2. Completion of conversion on the channel for which interrupt output has been enabled in the ADINT register
3. An A/D conversion request is detected while 4-buffer mode has been specified in scan mode

31.3.6 A/D Converter Status Register (ADSTS)

The ADSTS is a 32-bit register that controls the state of the A/D converter. This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TRGS	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSEST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	INTST3	INTST2	INTST1	INTST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TRGS	0	R/W	• When reading 0: Nothing detected 1: A trigger was detected during the A/D conversion time in **Figure 31.2**. • When writing 0: No effect 1: The state is cleared.
30 to 17	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
16	CSEST	0	R/W	Indicates the status of the A/D conversion channel select error interrupt. It is the status of the interrupt for an error that occurs when A/D conversion is started with no channel being specified in the CHSEL[1:0] bits in the ADM2 register as a channel on which A/D conversion proceeds. • When reading 0: No A/D conversion channel select error occurred. 1: An A/D conversion channel select error occurred. • When writing 0: No effect 1: The status is cleared.
15 to 4	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
3 to 0	INTST[3:0]	All 0	R/W	Indicates the state of the conversion end interrupt of channel n (n = 0 to 3). • When reading 0: Conversion has not finished. 1: Conversion has finished. • When writing 0: No effect 1: The state is cleared.*1

Note 1. When an interrupt source is generated simultaneously with clearing of the interrupt source, clearing is ignored and the respective bit remains set to 1.

31.3.7 A/D Converter Clock Division Setting Register (ADIVC)

The ADIVC is a 32-bit register that sets the frequency division ratio for dividing the frequency of ADC_ADCLK(TSUϕ) and supplying a clock to the A/D converter. ADIVCLK is a clock obtained by dividing the frequency of ADC_ADCLK(TSUϕ).

This register can be read from and written to in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
5, 4	FILNUM[1:0]	00	R/W	These bits select the number of stages of the AD external trigger pin filter. The signal to be filtered is ADC_ADCLK(TSUϕ) (80 MHz). 00: 12.5 ns (80 MHz) × 4 stages 01: 12.5 ns (80 MHz) × 8 stages 10: 12.5 ns (80 MHz) × 12 stages 11: 12.5 ns (80 MHz) × 16 stages
3 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	FILONOFF	0	R/W	Enables or disables the AD external trigger pin filter 0: Filter is disabled. 1: Filter is enabled.

31.3.9 A/D Conversion Result Registers 3 to 0 (ADCR3 to ADCR0)

The ADCR3 to ADCR0 are 32-bit registers that hold the A/D conversion results. The A/D converter has eight 32-bit registers. These registers are read from in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
11 to 0	AD[11:0]	All 0	R	These bits hold the A/D conversion results.

Analog Input Channel	ADCR3 to ADCR0 Registers	
	Select Mode with 1-Buffer Mode Selected or Scan Mode	Select Mode with 4-Buffer Mode Selected
0	ADCR0	ADCR3 to ADCR0
1	ADCR1	
2	—	
3	—	

The following formula indicates the relationship between the analog input voltage that is input to analog input pins (ADC_CH1, ADC_CH0) and the A/D conversion results (A/D conversion result registers (ADCR3 to ADCR0)).

$$\mathrm{ADCR} = \mathrm{INT}\left[\frac{\mathrm{Vin}}{\mathrm{ADC_AVREF}} \times 2^{\mathrm{d}} \times 0.5\right]$$

or

$$(\mathrm{ADCR} - 0.5) \times \frac{\mathrm{ADC_AVREF}}{2^{\mathrm{d}}} \leq \mathrm{Vin} < (\mathrm{ADCR} + 0.5) \times \frac{\mathrm{ADC_AVREF}}{2^{\mathrm{d}}}$$

INT[ ]:	Function that returns the integer portion of the value enclosed in [ ]
Vin:	Analog input voltage
ADC_AVREF:	Voltage of power supply pin(ADC_AVDD18) for the analog unit
ADCR:	Value of A/D conversion result registers (ADCR3 to ADCR0)
d:	Resolution of A/D converter (d = 12 in this LSI)

The relationship between the analog input voltage and A/D conversion result is shown in the figure below.

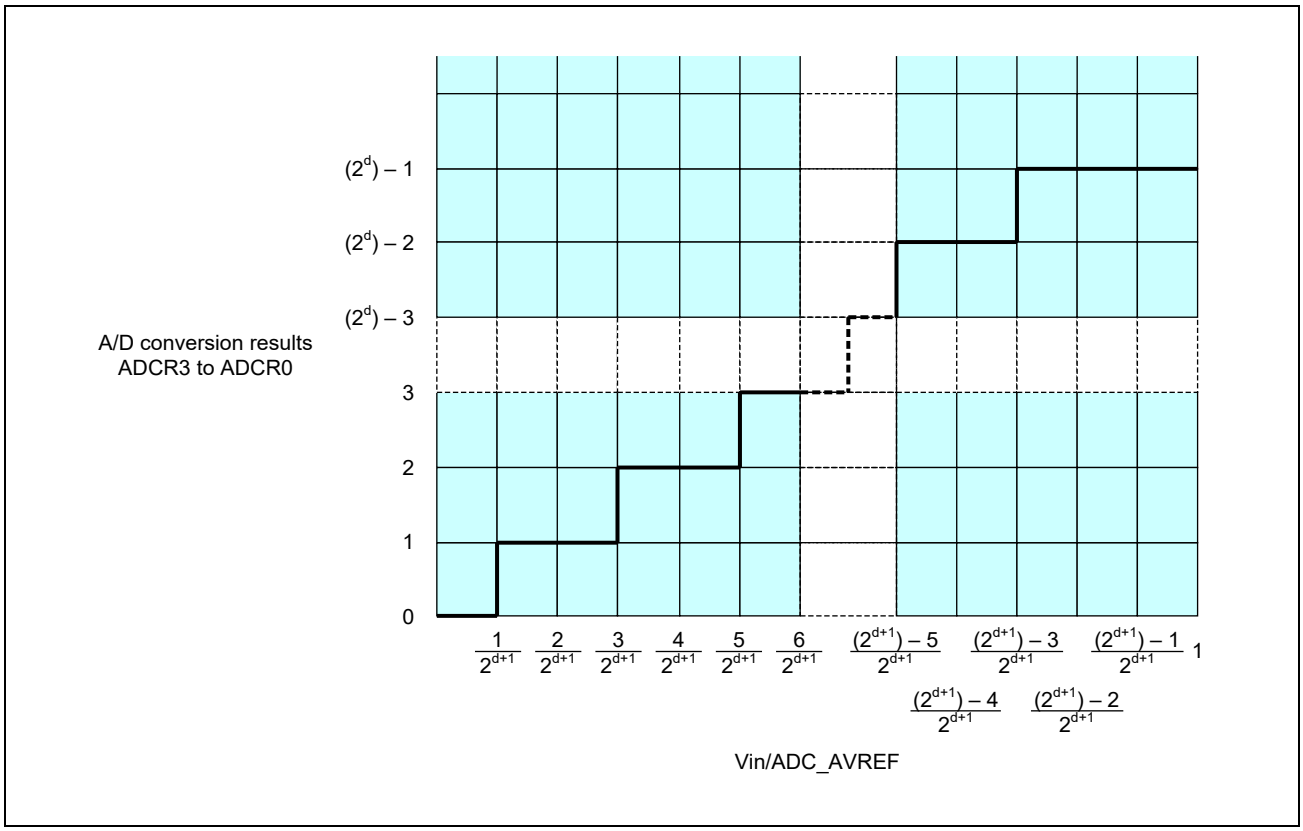

Figure 31.3 Relationship between Analog Input Voltage and A/D Conversion Result

31.4 Operation

31.4.1 Types of A/D Conversion Modes

The following A/D conversion modes can be specified. A/D conversion modes can be set in the ADM1 register.

Table 31.5 A/D Conversion Modes

Trigger Mode	Trigger Input Mode	Operating Mode	Conversion Count	Buffer Count	Operation	Example of A/D Conversion for Reference
Software trigger	—	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	**Section 31.4.4.1, Example of A/D Conversion in Select Mode with Single Mode Selected**
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	**Section 31.4.4.2, Example of A/D Conversion in Select Mode with Repeat Mode Selected**
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	**Section 31.4.4.3, Example of A/D Conversion in 4-Buffer Mode**
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 31.4.4.4, Example of A/D Conversion in Scan Mode with Single Mode Selected**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	**Section 31.4.4.5, Example of A/D Conversion in Scan Mode with Repeat Mode Selected**
				4 buffers	(Setting prohibited)	
Hardware trigger	Auto (started with a single trigger input)	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	—
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	—
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	—
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 31.4.4.6, Example of A/D Conversion in Auto Mode**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	—
				4 buffers	(Setting prohibited)	
	Step (conversion proceeds at every trigger input)	Select	Single	1 buffer	Selected 1 channel × 1-time conversion	—
				4 buffers	Selected 1 channel × 4-time conversion	—
			Repeat	1 buffer	(Selected 1 channel × 1-time conversion) × repeated	—
				4 buffers	(Selected 1 channel × 4-time conversion) × repeated	—
		Scan	Single	1 buffer	All selected channels × 1-time conversion	**Section 31.4.4.7, Example of A/D Conversion in Step Mode**
				4 buffers	(Setting prohibited)	
			Repeat	1 buffer	(All selected channels × 1-time conversion) × repeated	—
				4 buffers	(Setting prohibited)	

Note: When 4-buffer mode is set in scan mode, a channel select error occurs.

31.4.1.1 Trigger Modes

Software trigger mode and hardware trigger mode are the two types of trigger modes in which the trigger is the timing for starting the A/D conversion processing. These trigger modes can be set by the TRG bit in the ADM1 register.

(1) Software Trigger Mode

In software trigger mode, A/D conversion is started for the input of the ADC_CH1, ADC_CH0 pins by setting the ADCE bit in the ADM0 register to 1. The ADBSY bit in the ADM0 register is 1 while the converter is operating.

The hardware trigger is invalid when software trigger mode is set. Set the EGA[1:0] bits in the ADM1 register to 00 when using software trigger mode. When a hardware trigger is input, A/D conversion is not started and the TRGS bit in the ADSTS register retains 0.

(2) Hardware Trigger Mode

There are two triggers in hardware trigger mode: asynchronous trigger using the ADC_TRG pin as the activation source and synchronous trigger using the multi-function timer pulse unit 3 (MTU3a) as the activation source.

The valid edge of the selected hardware trigger can be set by the EGA[1:0] bits in the ADM1 register.

When the ADCE bit in the ADM0 register is set to 1, the A/D converter enters a standby state for a hardware trigger after 250 ns as passed and will start conversion operation upon detection of a valid edge. The ADBSY bit in the ADM0 register remains to be 1 during conversion operation.

The status of the TRGS bit in the ADSTS register can be cleared by writing 1 to the TRGS bit.

In hardware trigger mode, the available trigger input modes are auto mode and step mode. The trigger input mode can be set in the TRGIN bit in the ADM1 register.

(a) Auto mode

When a hardware trigger is input once, A/D conversion is repeated automatically for the conversion count in accordance with the specified conversion settings.

(b) Step mode

A/D conversion proceeds every time a hardware trigger is input. For example, if select mode, single mode, and 4-buffer mode are selected, conversion finishes when a hardware trigger has been input four times.

31.4.1.2 Operating mode

There are two operating modes: select mode and scan mode. The select mode has 1-buffer mode and 4-buffer mode as sub-modes. These modes can be set in the BS and MS bits in the ADM1 register.

(1) Select Mode

A/D conversion proceeds for the analog input specified in the CHSEL[1:0] bits in the ADM2 register. The A/D conversion results are stored in the ADCR3 to ADCR0 registers corresponding to the ADC_CH1, ADC_CH0 pins. In select mode, 1-buffer mode or 4-buffer mode can be used as the method for storing the A/D conversion results.

Only one channel is selectable for A/D conversion in select mode.

If more than one analog input channel is selected in select mode, a channel select error occurs.

(a) 1-buffer mode

A/D conversion proceeds only once for the analog input specified in the ADM2 register and the conversion result is stored in the ADCR3 to ADCR0 registers corresponding to the ADC_CH1, ADC_CH0 pins.

The ADC_CH1, ADC_CH0 pins correspond with the ADCR3 to ADCR0 registers on a one-on-one basis. If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs on completion of a single conversion.

This mode is usable for reading the result of a single conversion.

(b) 4-buffer mode

A/D conversion proceeds four times for the analog input specified in the ADM2 register and the conversion results are stored ADCR3 to ADCR0 registers. See **Table 31.7** for the correspondence between the analog inputs and A/D conversion result registers.

If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels corresponding to the ADCR3 to ADCR0 registers where the A/D conversion result is to be stored in 1-buffer mode, an A/D conversion end interrupt (INTAD) occurs when the A/D conversion result is stored in the ADCR3 to ADCR0 registers. For example, to generate an interrupt on the fourth A/D conversion when ADC_CH0 is selected, set the INTEN3 bit in the ADINT register to 1.

See **Table 31.6** for the relationship between the setting of the ADINT register and the output of an A/D conversion end interrupt in 4-buffer mode.

This mode is usable for obtaining the average of the A/D conversion results.

Table 31.6 ADINT Setting and Generation of A/D Conversion End Interrupt in 4-Buffer Mode

Channel for A/D Conversion	ADINT Register Setting		A/D Conversion End Interrupt
1 channel is selected from ADC_CH1, ADC_CH0	INTEN[0]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 0.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 0.
	INTEN[1]	1: Interrupt is enabled	An interrupt is output on completion of A/D conversion on channel 1.
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion on channel 1.
	INTEN[2]	1: Interrupt is enabled	An interrupt is output on completion of third A/D conversion (used only in 4-buffer mode).
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion.
	INTEN[3]	1: Interrupt is enabled	An interrupt is output on completion of fourth A/D conversion (used only in 4-buffer mode).
		0: Interrupt is disabled	No interrupt is output on completion of A/D conversion.

Table 31.7 Correspondence between Analog Inputs and A/D Conversion Result Registers in 4-Buffer Mode

Analog Input	A/D Conversion Result Register
1 channel is selected from ADC_CH1, ADC_CH0	ADCR0 (first time)
	ADCR1 (second time)
	ADCR2 (third time)
	ADCR3 (fourth time)

(2) Scan Mode

A/D conversion proceeds for the analog inputs of channels selected in the ADM2 register, in ascending order of channel number. The A/D conversion results are stored in the ADCR3 to ADCR0 registers corresponding to the analog inputs. If interrupt output is enabled in the INTEN[3:0] bits in the ADINT register for the channels on which A/D conversion proceeds, an A/D conversion end interrupt (INTAD) occurs when A/D conversion on the relevant channel finishes.

This mode is usable for constantly monitoring multiple analog signals.

In scan mode, only 1-buffer mode can be specified. If 4-buffer mode is specified in scan mode, a channel select error occurs.

31.4.1.3 Conversion Mode

Single mode and repeat mode are available. Use the RPS bit in the ADM1 register to set the conversion mode.

(1) Single Mode

When A/D conversion for the number of times of the conversion count finishes, the ADCE bit in the ADM0 register is automatically cleared to 0. For the number of times of conversion, see the description of operation in **Table 31.5**.

(2) Repeat Mode

When 1 is written to the ADCE bit in the ADM0 register, A/D conversion repeatedly proceeds in the A/D conversion mode specified in the ADM1 register. Immediately after 0 is written to the ADCE bit in the ADM0 register, A/D conversion is finished.

For the number of times of conversion, see the description of operation in **Table 31.5**.

31.4.2 Interrupt Functions

Table 31.8 lists the interrupt sources of the A/D converter and the conditions for generating them and the methods for confirming and clearing the interrupt sources.

The INTS bit in the ADINT register is used to set the operation for outputting an interrupt request of the INTAD.

Table 31.8 List of Interrupt Functions

Interrupt Source	Condition for Generation	Enabling Interrupt ADINT Register	Confirming Interrupt Source ADSTS Register*1	Method for Clearing Interrupt Source ADSTS Register
A/D conversion end	When A/D conversion on the specified channel is completed	INTEN[3:0]*2	INTST[3:0]	Write 1 to the bits that were 1 when the register was read.
A/D conversion channel select error	• When all of the CHSEL[1:0] bits in the ADM2 register were 0 at the start of A/D conversion*3 • When multiple analog input channels are selected in select mode*3 • When 4-buffer mode is specified in scan mode*3	CSEEN	CSEST	Write 1 to the CSEST bit.

Note 1. If an interrupt source is generated regardless of the settings of the INTEN[3:0] and CSEEN bits in the ADINT register, the bit corresponding to the interrupt source is set to 1 in the ADSTS register.

Note 2. The A/D conversion end interrupt can be enabled or disabled individually for each channel.

Note 3. When an A/D conversion channel select error occurs, the ADCE bit in the ADM0 register becomes 0 and A/D conversion operation is stopped.

31.4.3 Procedures of A/D Conversion

Follow the procedures given below for A/D conversion.

(1) Procedure for starting A/D conversion

After the A/D converter is released from the software reset state, use the ADM3 to ADM0 registers*1 to select the analog input channels on which A/D conversion proceeds and specify the trigger mode (software trigger or hardware trigger), operating mode (select or scan), etc.

Setting the ADCE bit in the ADM0 register to 1 will start A/D conversion in software trigger mode, whereas the A/D converter will enter a standby state for a trigger*2 in hardware trigger mode.

Note 1. Set the ADM3 to ADM0 registers when conversion by the A/D converter is stopped (ADBSY bit in the ADM0 register is 0).

Note 2. If the ADCE bit in the ADM0 register is set to 1 in hardware trigger mode, a transition is made to a trigger standby state. A/D conversion is started (ADBSY bit in ADM0 register is 1) by a hardware trigger signal and the A/D converter returns to the trigger standby state (ADBSY bit in ADM0 register is 0) on completion of A/D conversion.

A/D conversion operation is enabled.

After the A/D converter makes a transition from power-saving mode to normal mode, a period as long as the stabilization wait time is required. The stabilization wait time is 1 µs.

After the stabilization wait time has passed, set the ADCE bit in the ADM0 register to 1.

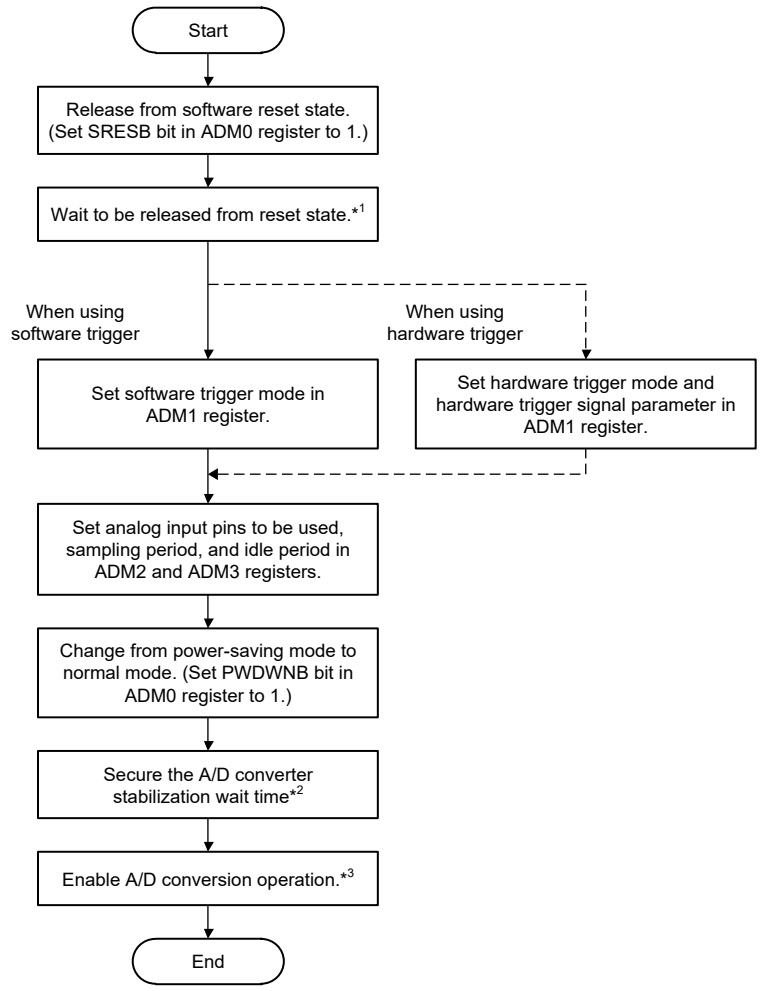
In software trigger mode, setting the ADCE bit to 1 starts A/D conversion.

In hardware trigger mode, setting the ADCE bit to 1 makes the A/D converter enter a standby state for a hardware trigger after 250 ns has passed, and conversion operation is started upon detection of a valid edge.

(2) When A/D conversion is finished, the A/D conversion results are stored in the ADCR3 to ADCR0 registers. Also, an A/D conversion end interrupt (INTAD) occurs on completion of A/D conversion on the channels specified in the INTEN[3:0] bits in the ADINT register.

31.4.3.1 Procedure for Starting A/D Conversion

Use the following flowchart to start A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

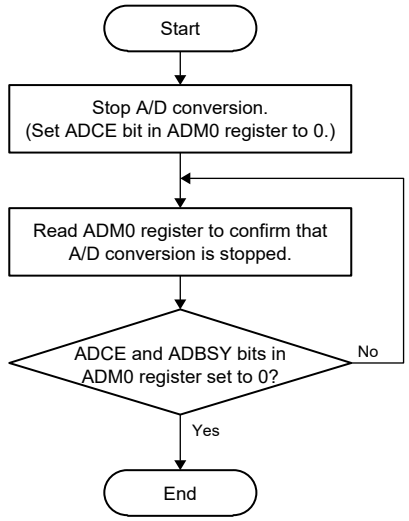
Note 2. The stabilization wait time is 1 µs.

Note 3. In software trigger mode, A/D conversion is started by setting the ADCE bit to 1.
In hardware trigger mode, after the ADCE bit is set to 1, A/D conversion is started upon detection of a valid edge.

Figure 31.4 Procedure for Starting A/D Conversion

31.4.3.2 Procedure for Stopping A/D Conversion

Use the following flowchart to stop A/D conversion.

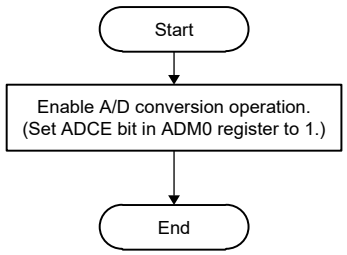


Note: For details on the operation for stopping conversion by writing 0 to the ADCE bit, see **Table 31.10**.

Figure 31.5 Procedure for Stopping A/D Conversion

31.4.3.3 Procedure for Stopping and Restarting A/D Conversion

Use the following flowchart to restart A/D conversion after it has been stopped with the procedure for stopping A/D conversion.



Note: For details on the operation for restarting conversion, see **Table 31.10**.

Figure 31.6 Procedure for Stopping and Restarting A/D Conversion

31.4.3.4 Procedure for Entering Power-saving Mode

Use the following flowchart to make a transition to the power-saving mode.

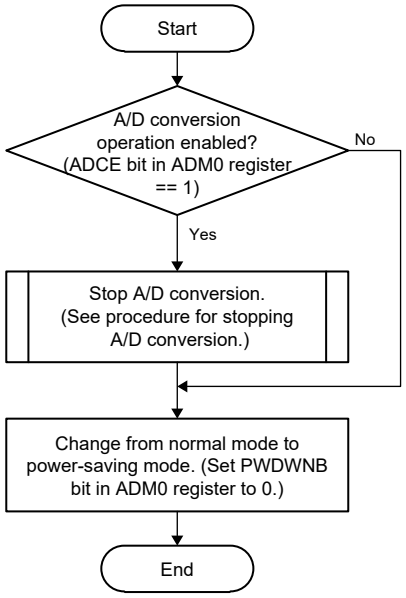


Figure 31.7 Procedure for Entering Power-Saving Mode

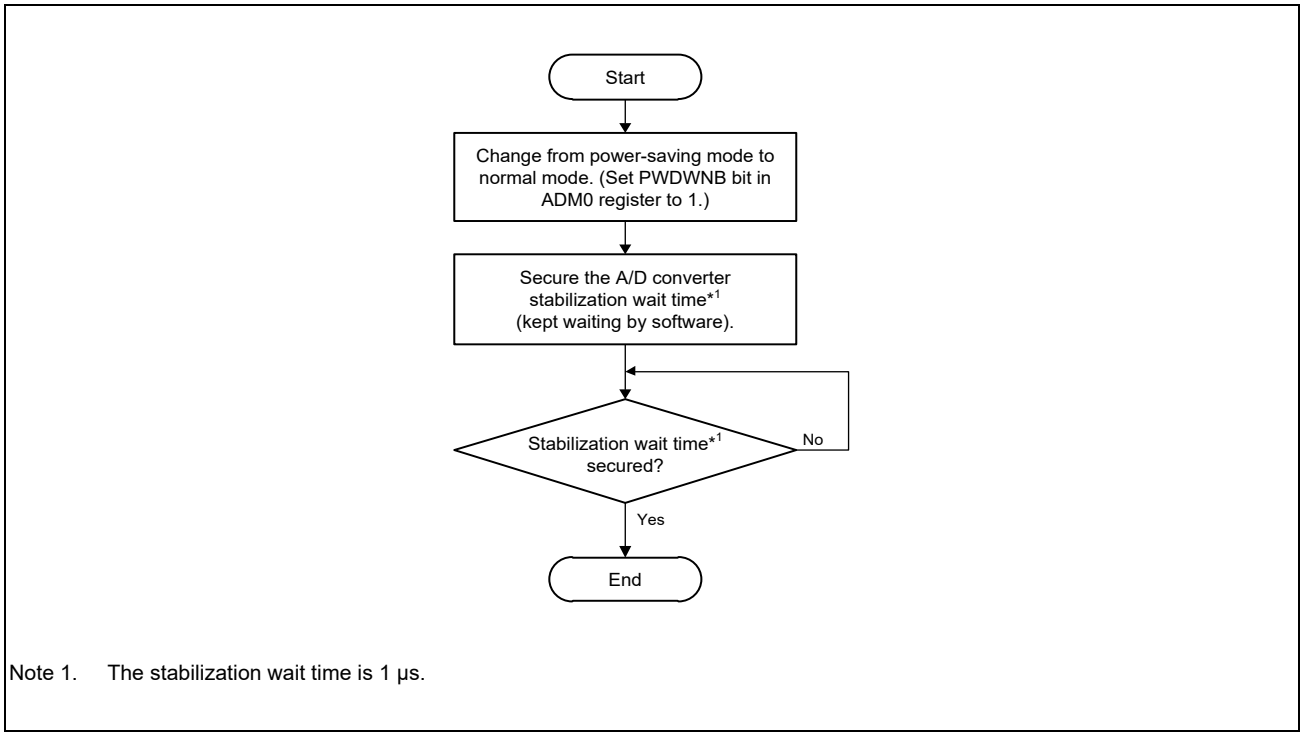
31.4.3.5 Procedure for Releasing from Power-saving Mode

Use the following flowchart to release the A/D converter from the power-saving mode.



Note 1. The stabilization wait time is 1 µs.

Figure 31.8 Procedure for Releasing from Power-Saving Mode

31.4.3.6 Procedure for a Software Reset

Use the following flowchart to execute a software reset.

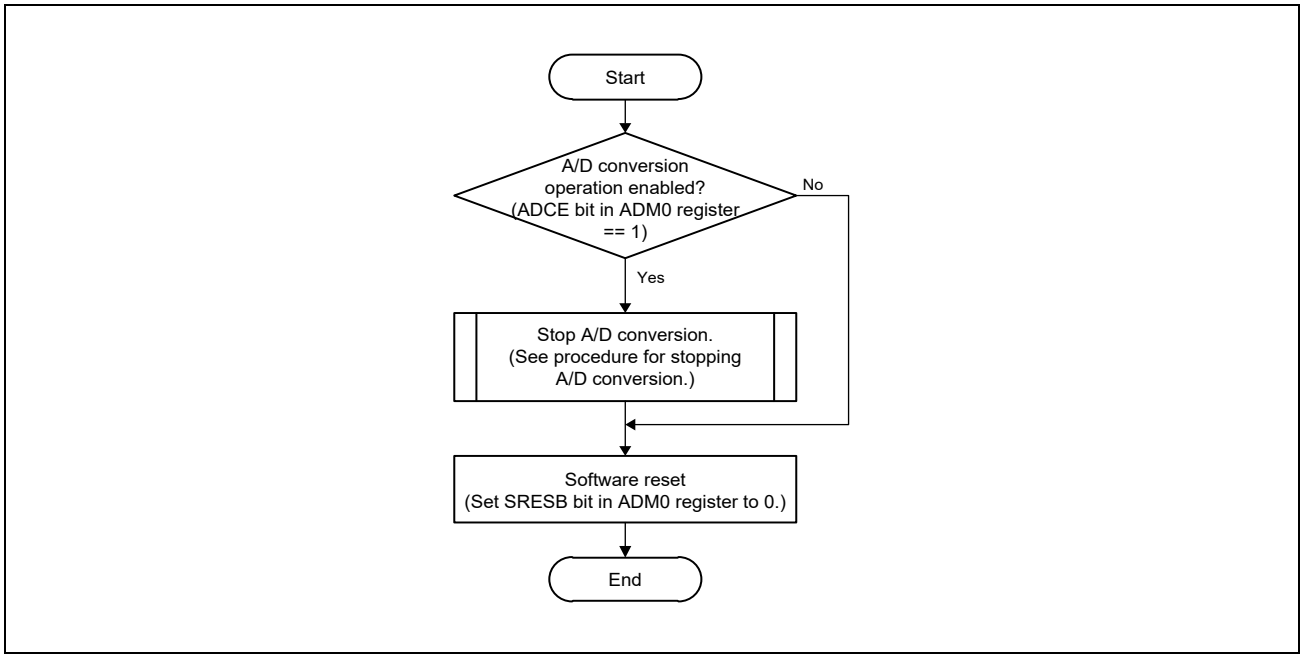


Figure 31.9 Procedure for a Software Reset

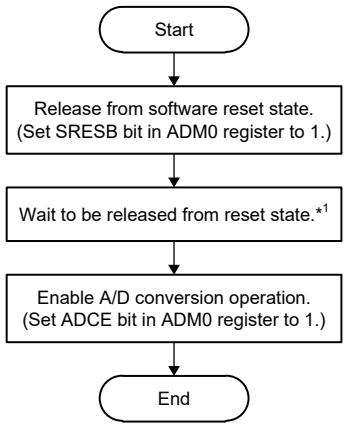
31.4.3.7 Procedure for Restarting A/D Conversion after a Software Reset

Use the following flowchart to start A/D conversion, then execute a software reset with the procedure for a software reset, and finally restart A/D conversion.



Note 1. The time waiting for the A/D converter to be released from the reset state is 2 × ADC_ADCLK(TSUϕ).

Figure 31.10 Procedure for Restarting A/D Conversion after a Software Reset

31.4.3.8 Procedure for Interrupt Processing

Use the flowchart in **Figure 31.11** to process an interrupt request that was output by the A/D converter.

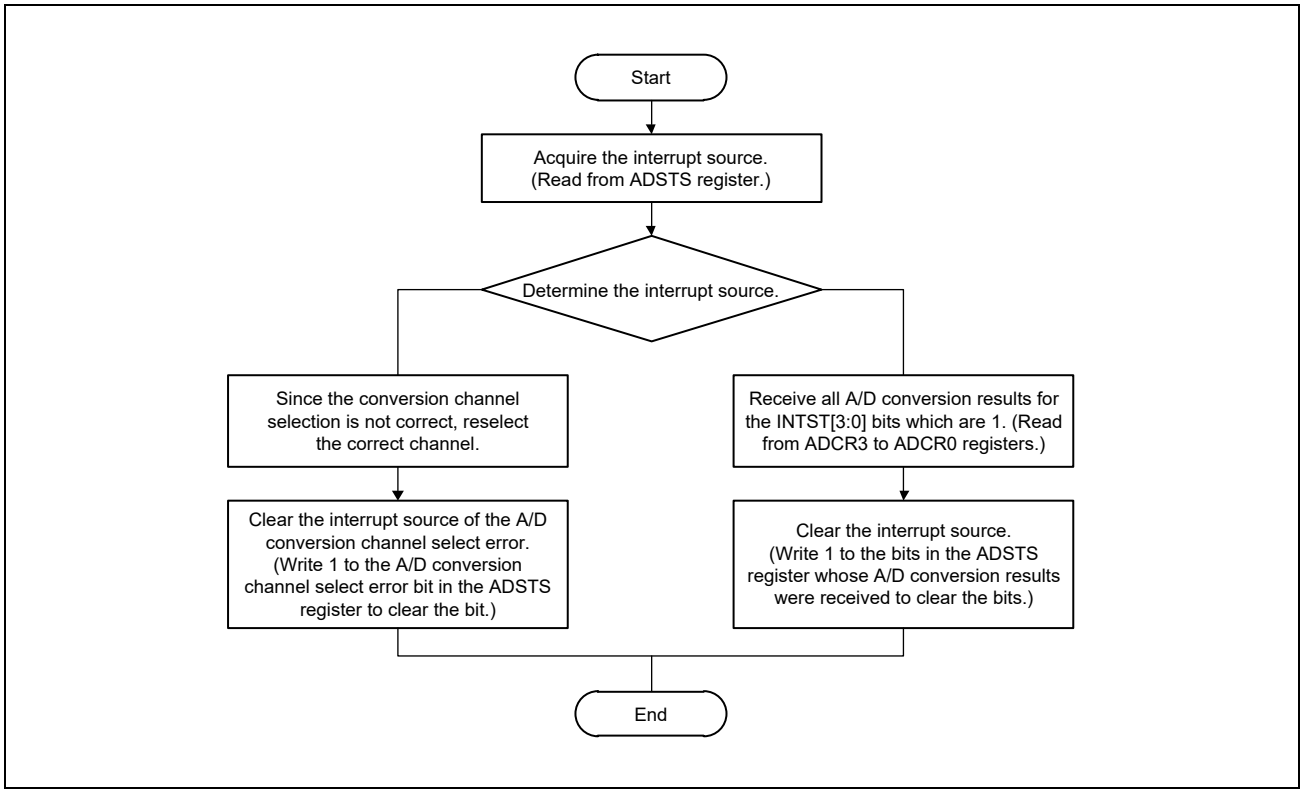


Figure 31.11 Procedure for Interrupt Processing

31.4.4 Examples of A/D Conversion

This section gives examples of A/D conversion.

1) Example of A/D conversion in select mode with single mode selected
2) Example of A/D conversion in select mode with repeat mode selected
3) Example of A/D conversion in 4-buffer mode
4) Example of A/D conversion in scan mode with single mode selected
5) Example of A/D conversion in scan mode with repeat mode selected
6) Example of A/D conversion in auto mode
7) Example of A/D conversion in step mode

Note to confirm the differences between modes shown below because not all possible combinations are included in this manual.

- For the differences between 1-buffer mode and 4-buffer mode, refer to 1) and 3).
- For the differences between single mode and repeat mode, refer to 1) and 2).
- For the differences between select mode and scan mode, refer to 1) and 4) or 2) and 5)
- For the differences between auto mode and step mode, refer to 6) and 7)
- For the differences between software trigger mode and hardware trigger mode, refer to 4) and 6).

31.4.4.1 Example of A/D Conversion in Select Mode with Single Mode Selected

Figure 31.12 shows an example of A/D conversion with software trigger mode, select mode, single mode and 1-buffer mode are selected. In the example in **Figure 31.12**, conversion proceeds with the analog input changed from ADC_CH0, ADC_CH1.

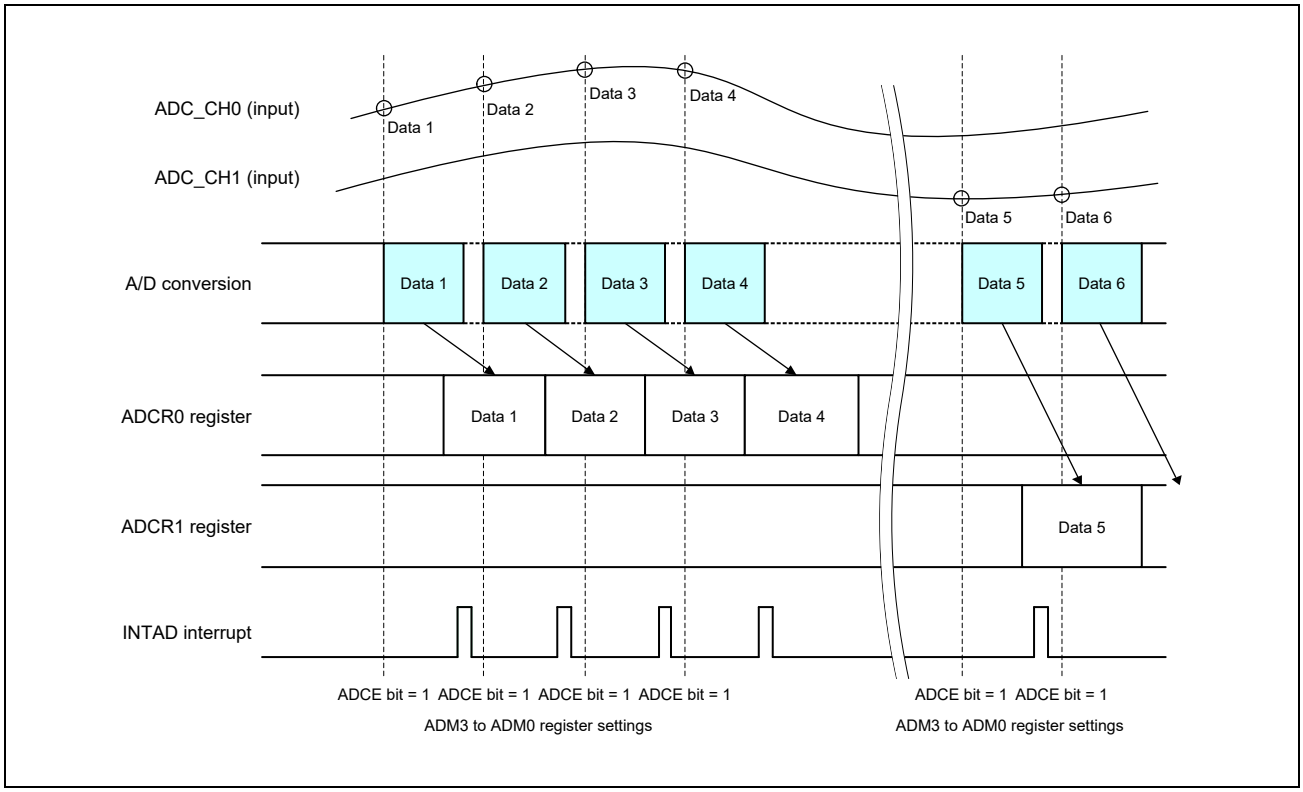

Figure 31.12 Example of A/D Conversion in Select Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 0 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result is stored in the ADCR0 register).
9. An INTAD interrupt occurs.
10. Steps 7 to 9 above are repeated.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.
12. In the ADM3 to ADM0 registers, software trigger mode, select mode, single mode, and 1-buffer mode are selected, and analog input pin ADC_CH1 is set.

13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
15. An INTAD interrupt occurs.
16. Steps 13 to 15 above are repeated.

Note 1. The stabilization wait time is 1 μs.

31.4.4.2 Example of A/D Conversion in Select Mode with Repeat Mode Selected

Figure 31.13 shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 1-buffer mode are selected. In the example in **Figure 31.13**, conversion proceeds with the analog input changed from ADC_CH0, ADC_CH1.

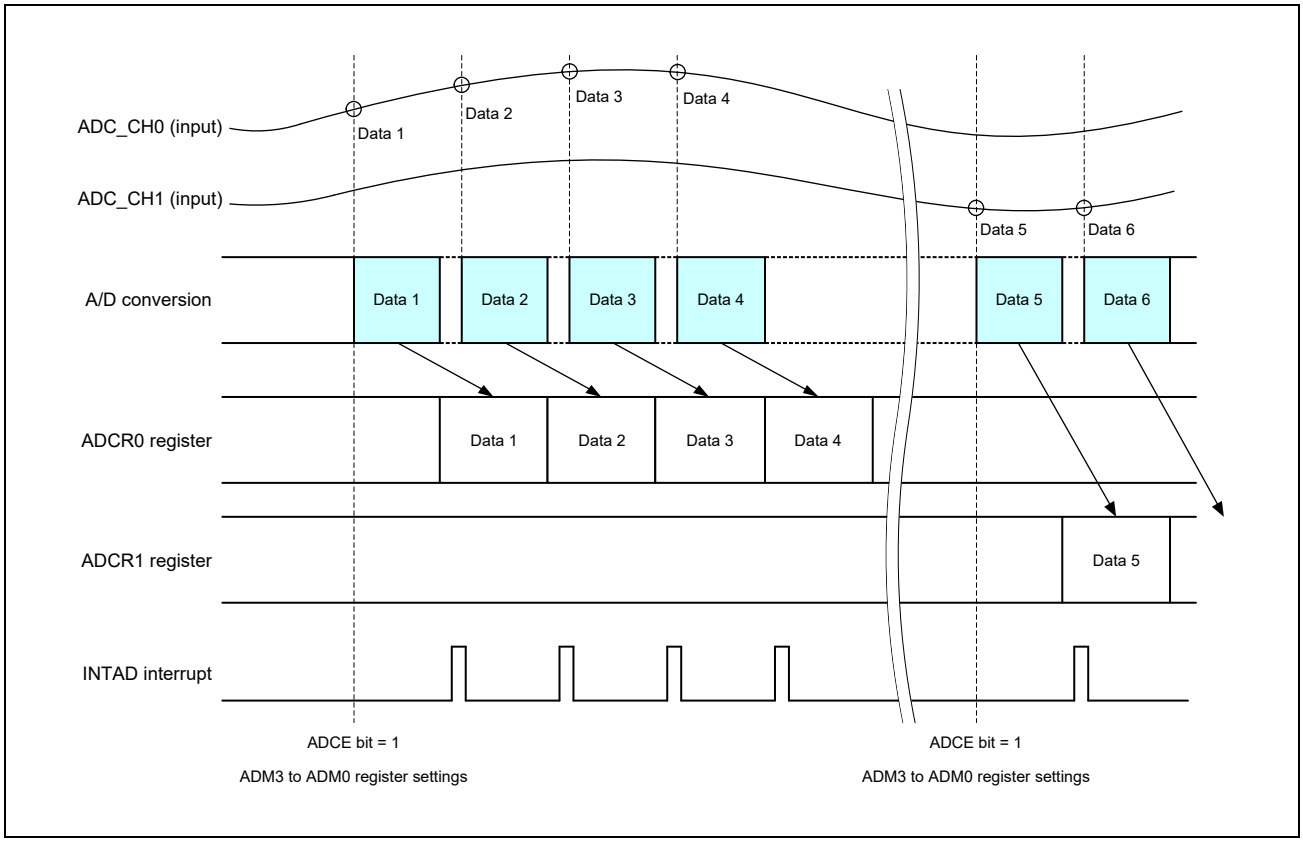

Figure 31.13 Example of A/D Conversion in Select Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 1-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 0 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result is stored in the ADCR0 register).
9. An INTAD interrupt occurs.
10. Steps 8 and 9 above are repeated automatically.
11. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.

12. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, 1-buffer mode are selected, and analog input pin ADC_CH1 is set.
13. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
14. A/D conversion proceeds on ADC_CH1 (A/D conversion result is stored in the ADCR1 register).
15. An INTAD interrupt occurs.
16. Steps 14 and 15 above are repeated.

Note 1. The stabilization wait time is 1 μs.

31.4.4.3 Example of A/D Conversion in 4-Buffer Mode

Figure 31.14 shows an example of A/D conversion with software trigger mode, select mode, repeat mode, and 4-buffer mode are selected. In the example in **Figure 31.14**, conversion proceeds with ADC_CH0 selected.

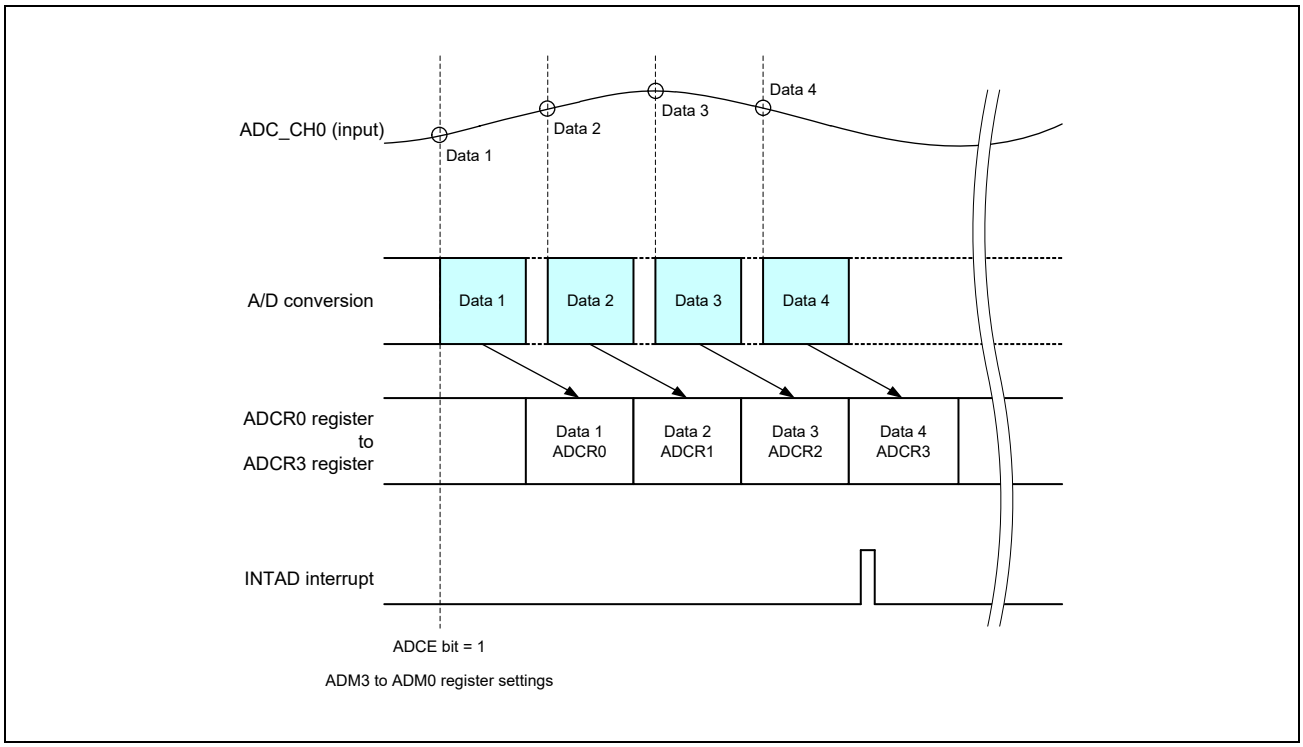

Figure 31.14 Example of A/D Conversion in 4-Buffer Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, select mode, repeat mode, and 4-buffer mode are selected, and analog input pin ADC_CH0 is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 3 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 3) is stored in the ADCR2 register).
11. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 4) is stored in the ADCR3 register).
12. An INTAD interrupt occurs.
13. Steps 8 to 12 above are repeated automatically.

14. A/D conversion operation is stopped by setting the ADCE bit in the ADM0 register to 0.

Note 1. The stabilization wait time is 1 μs.

31.4.4.4 Example of A/D Conversion in Scan Mode with Single Mode Selected

Figure 31.15 shows an example of A/D conversion with software trigger mode, scan mode, and single mode are selected. In the example in **Figure 31.15**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

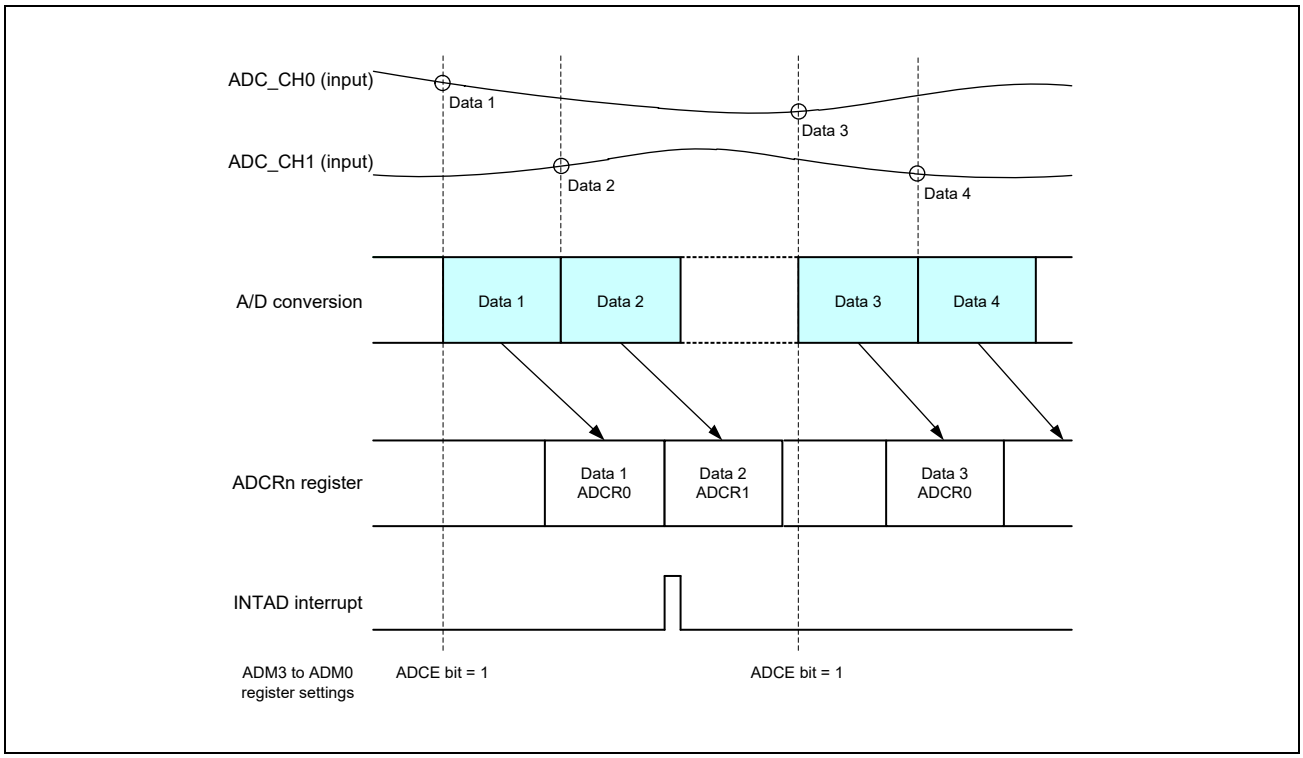

Figure 31.15 Example of A/D Conversion in Scan Mode with Single Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and single mode are selected, and analog input pins ADC_CH1, ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. An INTAD interrupt occurs.
11. Steps 7 to 10 above are repeated.

Note 1. The stabilization wait time is 1 µs.

31.4.4.5 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

Figure 31.16 shows an example of A/D conversion with software trigger mode, scan mode, and repeat mode are selected. In the example in **Figure 31.16**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

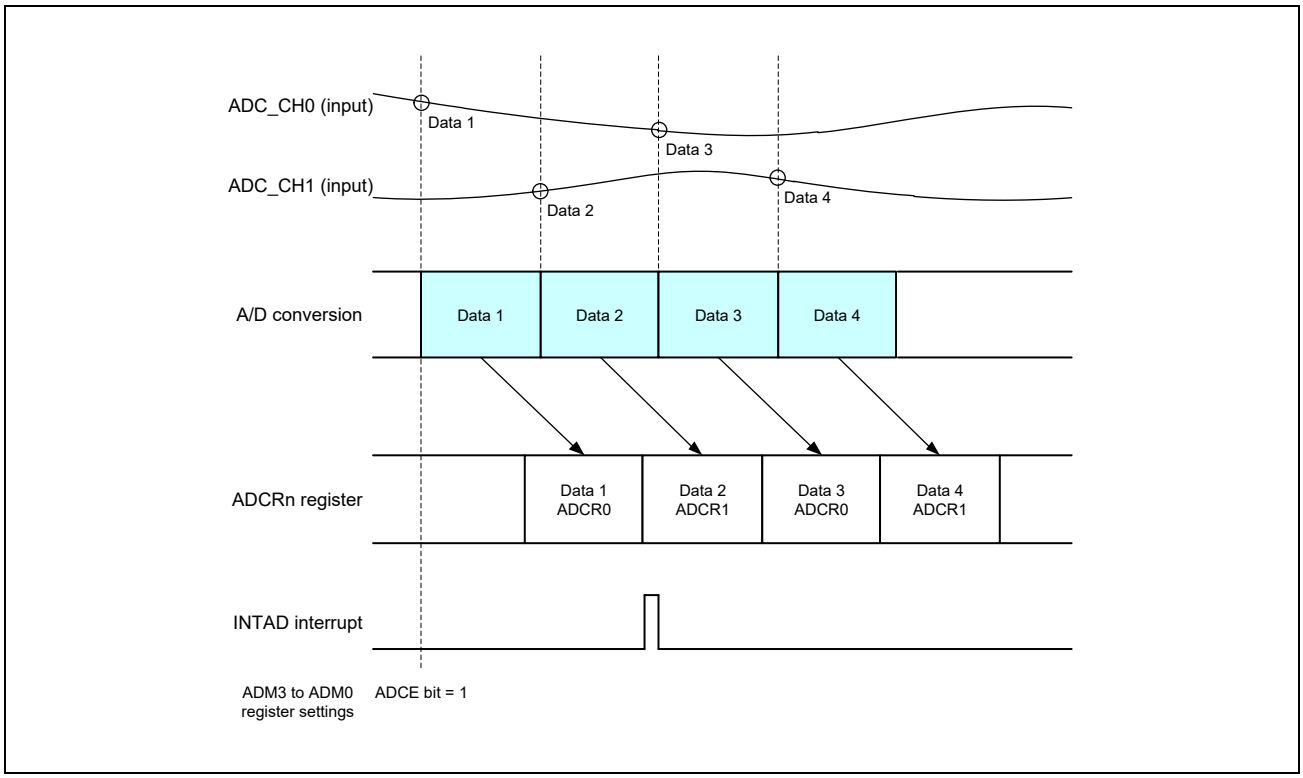

Figure 31.16 Example of A/D Conversion in Scan Mode with Repeat Mode Selected

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, software trigger mode, scan mode, and repeat mode are selected and analog input pins ADC_CH1, ADC_CH0 are set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
9. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
10. An INTAD interrupt occurs.
11. Steps 8 to 10 above are repeated automatically.

Note 1. The stabilization wait time is 1 µs.

31.4.4.6 Example of A/D Conversion in Auto Mode

Figure 31.17 shows an example of A/D conversion with hardware trigger mode, auto mode, scan mode, and single mode are selected. In the example in **Figure 31.17**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

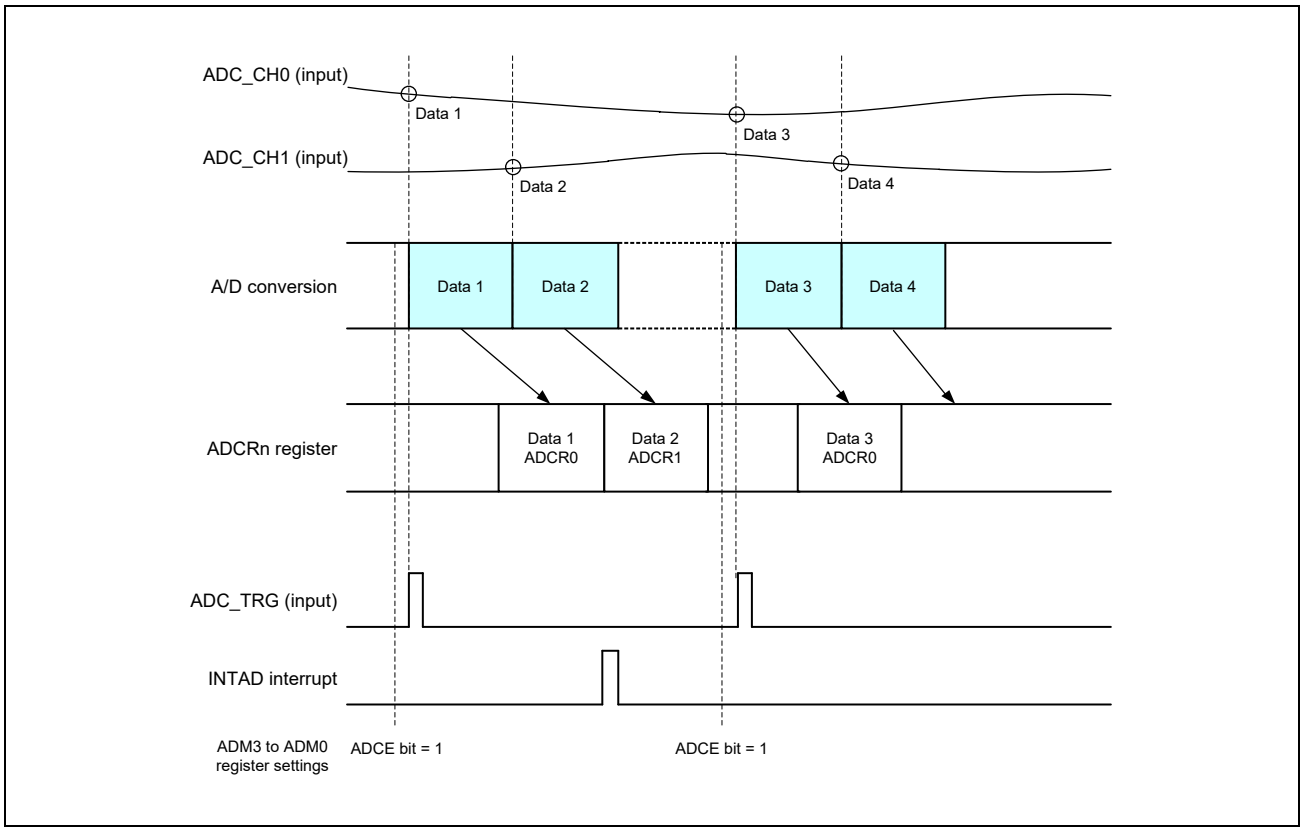

Figure 31.17 Example of A/D Conversion in Auto Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, auto mode, scan mode, and single mode are selected, and analog input pins ADC_CH1, ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1 (A/D conversion is started).
8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
11. An INTAD interrupt occurs.

12. Steps 7 to 11 above are repeated.

Note 1. The stabilization wait time is 1 µs.

31.4.4.7 Example of A/D Conversion in Step Mode

Figure 31.18 shows an example of A/D conversion with hardware trigger mode, step mode, scan mode, and single mode are selected. In the example in **Figure 31.18**, conversion proceeds with ADC_CH1, ADC_CH0 selected.

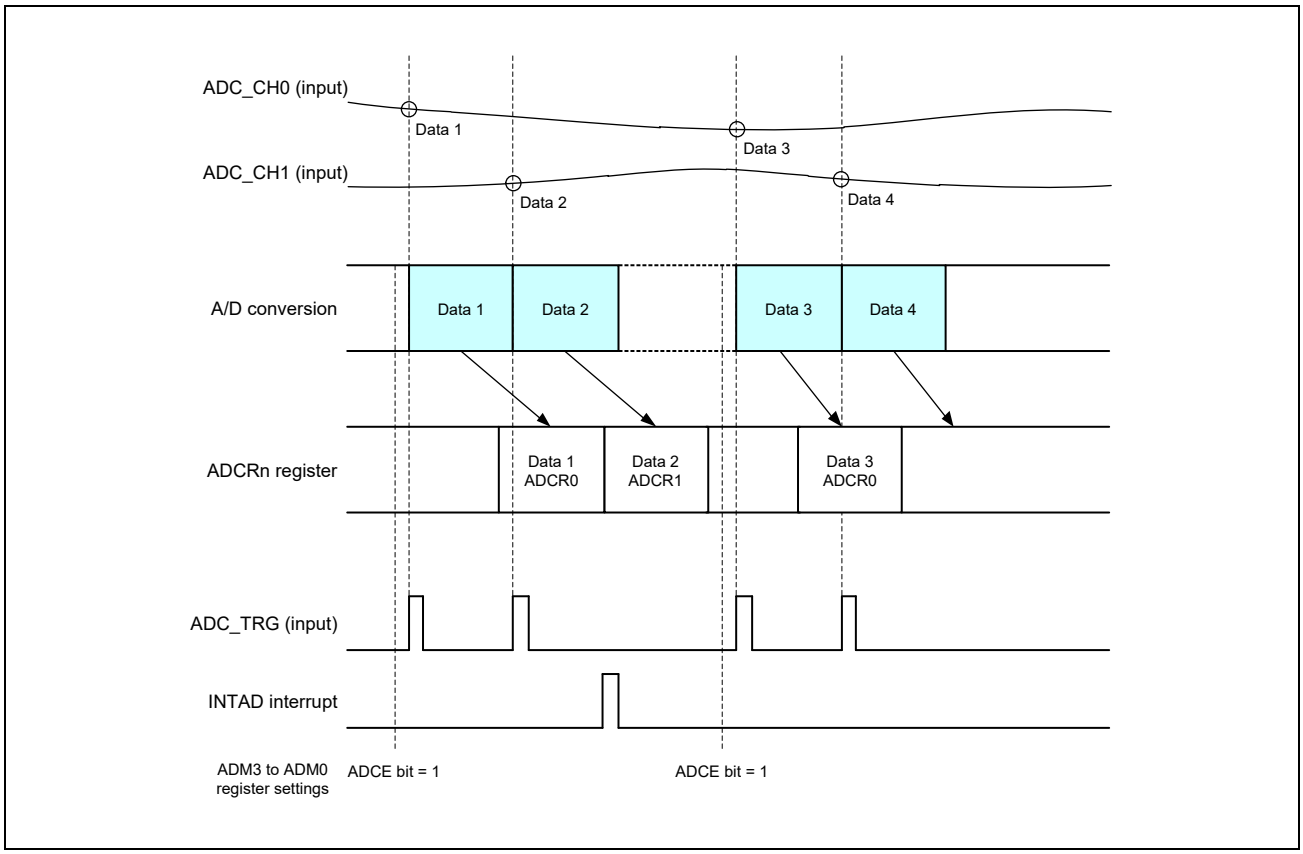

Figure 31.18 Example of A/D Conversion in Step Mode

1. The SRESB bit in the ADM0 register is set to 1 to release the A/D converter from the software reset state.
2. The A/D converter waits to be released from the reset state (wait time is 2 × ADC_ADCLK(TSUϕ)).
3. In the ADM3 to ADM0 registers, hardware trigger mode, step mode, scan mode, and single mode are selected, analog input pins ADC_CH1, ADC_CH0 are set, the trigger of the ADC_TRG pin is enabled, and rising-edge detection of the hardware trigger is set.
4. In the ADINT and ADSTS registers, the interrupt signal is set as a pulse and interrupt output of channel 1 is enabled.
5. Normal mode is selected by setting the PWDWNB bit in the ADM0 register to 1.
6. The A/D converter is kept waiting for a period equal to or longer than the stabilization wait time*1 by software.
7. A/D conversion operation is enabled by setting the ADCE bit in the ADM0 register to 1.
8. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).
9. A/D conversion proceeds on ADC_CH0 (A/D conversion result (data 1) is stored in the ADCR0 register).
10. After 250 ns that is the period it takes for accepting a trigger, a rising edge of the pulse is input to the ADC_TRG pin (A/D conversion is started).

11. A/D conversion proceeds on ADC_CH1 (A/D conversion result (data 2) is stored in the ADCR1 register).
12. An INTAD interrupt occurs.
13. Steps 7 to 12 above are repeated.

Note 1. The stabilization wait time is 1 µs.

31.5 Notes

31.5.1 Interval of Hardware Trigger

The interval (interval of input time) of a trigger in hardware trigger mode must be longer than the A/D conversion time. For the A/D conversion time, see **Section 31.3.4, A/D Converter Mode Register 3 (ADM3)**.

31.5.2 Timing Restrictions

This A/D converter has restrictions on the timing interval, which are caused by the asynchronism countermeasure circuit. The restrictions shown in **Table 31.9** need to be met. If an access is made in a period shorter than this interval, the register values on the ADC_PCLK(P0ϕ) side are not reflected in the registers on the ADC_ADCLK(TSUϕ) side because the notification of register update does not reach the ADC_ADCLK(TSUϕ) side.

Table 31.9 Restrictions on Timing Interval

Condition	Restriction
Writing to the same register successively	(Interval of write access) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ))
Interval of A/D conversion	(A/D conversion time) ≥ (6 × ADC_PCLK(P0ϕ) + 6 × ADC_ADCLK(TSUϕ))

Note: For the A/D conversion time, see **Figure 31.2**.

31.5.3 Restrictions on ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) Cycles

The ADC_PCLK(P0ϕ) and ADC_ADCLK(TSUϕ) cycles need to satisfy the relation in the following formula.

$$\frac{\text{ADC_ADCLK(TSU}\phi\text{)} \leq \text{(A/D conversion time)}}{6 - \text{ADC_PCLK(P0}\phi\text{)}}$$

Note: For the A/D conversion time, see **Figure 31.2**.

31.5.4 Operation when Stopping or Restarting A/D Conversion

When 0 is written to the ADCE bit in the ADM0 register, the A/D converter stops A/D conversion. A/D conversion is restarted by writing 0 to the ADCE bit in the ADM0 register once and then writing 1 to the same bit. Even though there was an instruction to stop A/D conversion, A/D conversion may not stop immediately. **Table 31.10** shows the operation for stopping conversion and also the operation for restarting conversion after it has been stopped.

Table 31.10 Operation when Stopping or Restarting A/D Conversion with the ADCE Bit

A/D Conversion Modes					Timing for Stopping Conversion when Stop is Instructed with ADCE = 0	Operation for Restarting Conversion
Trigger		Operating Mode	Conversion Count	Buffer Count		
Mode	Input					
Software	—	Select	Single	1	Stopped on completion of 1-time conversion.	Conversion proceeds on the channel selected in the ADM2 register.
				4	Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion.	Same as above
			Repeat	1	Stopped on completion of 1-time conversion.	Same as above
				4	Stopped on completion of conversion in which there was an instruction to stop in the middle of 4-time conversion.	Same as above
		Scan	Single	1	Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning.	Conversion proceeds from the smallest channel number selected in the ADM2 register.
				4	(Setting prohibited)	(Setting prohibited)
			Repeat	1	Stopped on completion of conversion in which there was an instruction to stop in the middle of scanning.	Conversion proceeds from the smallest channel number selected in the ADM2 register.
				4	(Setting prohibited)	(Setting prohibited)
Hardware	Auto mode	Select	Single	1	Same as software trigger mode	Same as software trigger mode
				4	Same as above	Same as above

32. USB2.0

This LSI includes 1 channel USB2.0 OTG/DRD(Host/Function) interface and 1 channel USB2.0 Host interface.

This section describes the overview of USB2.0 and USB2.0 PHY control.

The detail function of USB2.0 Host controller and the common function both Host module and Function module are described in **Section 32A, USB 2.0 Host Module**.

The detail function of USB2.0 Function controller is described in **Section 32B, USB 2.0 Function Module**.

32.1 Features

This interface complies the following specifications.

- Universal Serial Bus Specification Revision 2.0
- On-The-Go and Embedded Host Supplement to the USB Revision 2.0 Specification Revision 2.0 plus errata and ecn*1
- Enhanced Host Controller Interface (EHCI) Specification for Universal Serial Bus Revision 1.0
- EHCI v1.1 Addendum*2
- Open Host Controller Interface (OHCI) Specification for USB Release 1.0a
- Battery Charging Specification Revision 1.2*3

Note 1. Session Request Protocol(SRP) and Host Negotiation Protocol(HNP) are not supported.
Note 2. Some EHCI v1.1 feature are not supported. (Refer to **Section 32A, USB 2.0 Host Module** for detail)
Note 3. DCP (Dedicated Charging Port) is not supported as downstream port.

32.1.1 Ch0: USB2.0 OTG/DRD(Host/Function) interface

The following table shows features of this interface.

Table 32.1 Ch0: USB2.0 OTG/DRD(Host/Function) interface features

Function	Description
Host mode	• Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps)/Low-Speed(1.5Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Function mode	• Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps) • Isochronous/Interrupt/Control/Bulk transfer • Up to 10 ch PIPE (includes default control PIPE)
Other functions	• OTG function (Rev2.0) • Battery Charging function • DRD(Dual-Role-Device) function (Static switch between Host and Function)

32.1.2 Ch1: USB2.0 HOST interface

The following table shows features of this interface.

Table 32.2 Ch1: USB2.0 Host interface function features

Features	Description
Host mode	• Support mode: High-Speed(480Mbps)/Full-Speed(12Mbps)/Low-Speed(1.5Mbps) • Support Isochronous/Interrupt/Control/Bulk transfer modes • Support Isochroous/Interrupt high bandwidth transfer
Other function	• Battery Charging function

32.1.3 Block Diagram

The block diagram of USB interface is as follows.

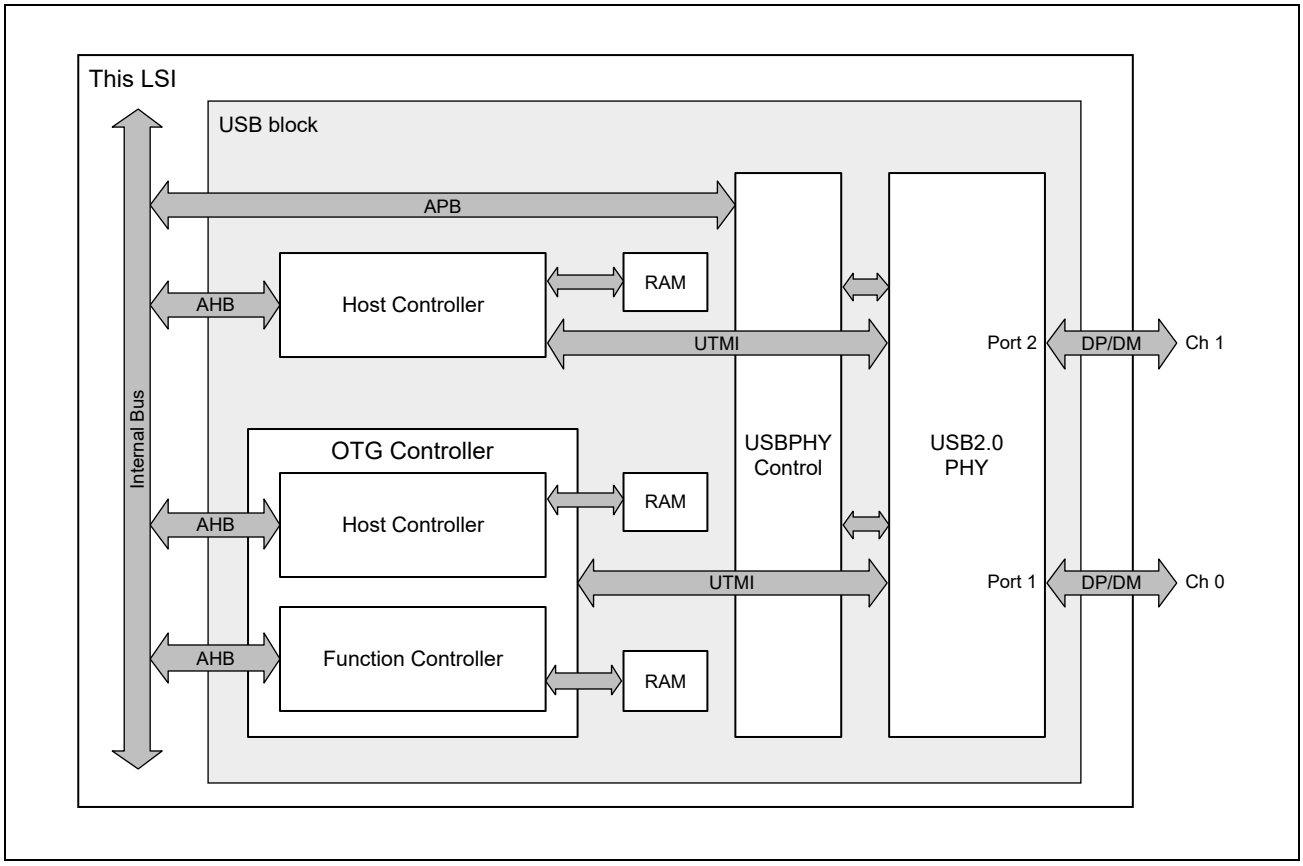

Figure 32.1 USB interface block diagram

32.1.4 External signal pins

The following table shows external signal pins for USB block.

Table 32.3 External signal pins

Name	I/O	Description	Active Level	Initial value	Handling in not used
USB0_DP	—	USB data pin Data+ (Ch0)	—	—	Open*1
USB0_DM	—	USB data pin Data- (Ch0)	—	—	Open*1
USB0_OVRCUR	I	Over current detection input (Ch0)	L	—	Pull-Up
USB0_VBUSEN	O	VBUS output enable (Ch0)	H	0b	Open
USB0_VBUSIN	I	Peripheral VBUS input (Ch0)	H	—	Pull-Down
USB0_OTG_EXICEN	O	External power IC control (Ch0)	H	0b	Open
USB0_OTG_ID	I	OTG ID input (Ch0)	—	—	Pull-Down
USB1_DP	—	USB data pin Data+ (Ch1)	—	—	Open*1
USB1_DM	—	USB data pin Data- (Ch1)	—	—	Open*1
USB1_OVRCUR	I	Over current detection input (Ch1)	L	—	Pull-Up
USB1_VBUSEN	O	VBUS output enable (Ch1)	H	0b	Open

Note 1. When it is not used permanently, connect to GND via a resistor of 10kΩ.

32.1.5 Power and GND pins

The following table shows Power and GND pins for USB block.

Table 32.4 Power and GND pins

Name	Description
USB_VDD18	Internal Regulator Power (1.8V), HS receiver power (1.8V)
USB_VDD33	IO power (3.3V)
USB_RREF	Reference voltage
VSS	GND

32.1.6 Interrupt

The following table shows interrupt list for USB block.

Table 32.5 USB interrupt

Name	Description	Active Level	Type
U2H0_INT	USB2.0 Host AHB Interrupt (Ch0)	H	Level-Sensitive
U2H0_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch0)	H	Level-Sensitive
U2H0_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch0)	H	Level-Sensitive
U2H0_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch0)	H	Level-Sensitive
U2H1_INT	USB2.0 Host AHB Interrupt (Ch1)	H	Level-Sensitive
U2H1_OHCI_INT	USB2.0 Host OHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_EHCI_INT	USB2.0 Host EHCI Interrupt (Ch1)	H	Level-Sensitive
U2H1_WAKEON_INT	USB2.0 Host EHCI Wakeup Interrupt (Ch1)	H	Level-Sensitive
U2H1_OBINT	USB2.0 Host OTG and Battery Charging Interrupt (Ch1)	H	Level-Sensitive
U2P_IXL_INT	USB2.0 Function controller Interrupt (Ch0)	H	Edge-Triggered
U2P_INT_DMA[1:0]	USB2.0 Function controller DMA transaction complete interrupt (Ch0)	H	Level-Sensitive
U2P_INT_DMAERR	USB2.0 Function controller DMA error response interrupt (Ch0)	H	Level-Sensitive

32.2 Register Configuration

32.2.1 Host controller Register

Refer to the **Section 32A, USB 2.0 Host Module**.

32.2.2 Function controller Register

Refer to the **Section 32B, USB 2.0 Function Module**.

32.2.3 USBPHY Control Register

USBPHY Control Register mainly controls reset and power down of the USB/PHY.

Base Address: H'0_11C4_0000 (Cortex-A55 Address Space)

The following table shows USBPHY Control Register list.

Prohibit to write undefined area.

Table 32.6 USBPHY Control Register List

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Reset register	RESET	R/W	H'0000_0133	H'000	32
Clock control register	UCLKCTL	R/W	H'0340_0303	H'018	32
Direct power down setting register	UDIRPD	R/W	H'0000_0000	H'01C	32
Connection control register	CON_CTRL	R/W	H'0000_0000	H'020	32
Clock status register	CLK_STAT	R	H'0000_0000	H'104	32

32.3 Register Descriptions

32.3.1 Reset register (RESET)

This register controls USB/PHY reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_pll reset	—	—	—	pllreset	—	—	sel_p2 reset	sel_p1 reset	—	—	phyrst_2	phyrst_1
Initial Value	0	0	0	0	0	0	0	1	0	0	1	1	0	0	1	1
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	sel_pllreset	0	R/W	Select USB/PHY PLL reset 1: register (by bit8: pllreset) 0: control by host controller (Ch0)
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	pllreset	1	R/W	PLL reset 1: PLL reset 0: deassert PLL reset
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	sel_p2reset	1	R/W	Select USB/PHY Port2 reset 1: register(phyrst_2) 0: Control by host controller (Ch1)
4	sel_p1reset	1	R/W	Select USB/PHY Port1 reset 1: register(phyrst_1) 0: Control by host controller (Ch0)
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	phyrst_2	1	R/W	USB/PHY reset (Port2) 1: USB/PHY reset 0: deassert USB/PHY reset Only when sel_p2reset=1, this bit is valid.
0	phyrst_1	1	R/W	USB/PHY reset (Port1) 1: USB/PHY reset 0: deassert USB/PHY reset Only when sel_p1reset=1, this bit is valid.

32.3.2 Clock control register (UCLKCTL)

This register controls USB/PHY clock.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	sel_sleepm	—	—	sleepm_2	sleepm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	1	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	sel_suspendm	—	—	suspendm_2	suspendm_1	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	1	1
R/W	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	sel_sleepm	0	R/W	Select SLEEPM control 1: register (controlled by bit 24: sleepm_1 and bit 25: sleepm_2) 0: Control by controller
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	sleepm_2	1	R/W	Sleep control (Port2) 1: Normal mode 0: Sleep mode
24	sleepm_1	1	R/W	Sleep control (Port1) 1: Normal mode 0: Sleep mode
23	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	—	1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
21, 20	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
19, 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17, 16	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
12	sel_suspendm	0	R/W	Select SUSPENDM control 1: register (controlled by bit 8: suspendm_1 and bit 9: suspendm_2) 0: control by controller
11, 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
9	suspend_2	1	R/W	Suspend control (Port2) 0: Suspend mode 1: Normal mode
8	suspend_1	1	R/W	Suspend control (Port1) 0: Suspend mode 1: Normal mode
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	—	All 1	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

32.3.3 Direct power down setting register (UDIRPD)

This register controls USB/PHY direct power down.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_udirpd	—	—	—	dirpd
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_udirpd	0	R/W	Select dirpd control 1: register (dirpd) 0: Control by host controller (Ch0)
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	dirpd	0	R/W	Power down control to reduce the power consumption of the USB/PHY when not using the USB function. 0: Normal operation 1: Power save

32.3.4 Connection control register (CON_CTRL)

This register controls USB/PHY connection

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	sel_connect	—	—	connect_2	connect_1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	sel_connect	0	R/W	Select USB connection notification control 1: register (controlled by bit0: connect_0 and bit1: connect_1) 0: Control by host controller
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	connect_2	0	R/W	Notice of USB connection (port2) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)
0	connect_1	0	R/W	Notice of USB connection (port1) Used to notify UTM + core of USB connection status 0: USB not connected (single end receiver disabled) 1: USB not connected (single end receiver enabled)

32.3.5 Clock status register (CLK_STAT)

This register shows USB/PHY clock status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	frclk60 lock	frclk48 lock	phy lock	—	—	plllock_ 2	plllock_ 1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	frclk60_lock	0	R	FRCLK60 LOCK status 0: UNLOCK 1: LOCK
5	frclk48_lock	0	R	FRCLK48 LOCK status 0: UNLOCK 1: LOCK
4	phylock	0	R	PHY PLL LOCK Status (Transceiver) 0: UNLOCK 1: LOCK
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	plllock_2	0	R	PLL LOCK status (port2) 0: UNLOCK 1: LOCK
0	plllock_1	0	R	PLL LOCK status (port1) 0: UNLOCK 1: LOCK

32.4 Operation

32.4.1 USB/PHY Initialization

In the initial state, the reset of USB/PHY Port1 and Port2 is controlled by the register in the USBPHY Control Register, and the reset is asserted, so the control is switched to controller by the following initialization.

Also, in the initial state, the USB/PHY PLL Reset is controlled by the Host Controller in the OTG Controller, but it needs to be switched to controlled by the USBPHY Control Register.

- **Initialization when starting only Port1 of USB/PHY (when Port2 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1022 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  Port1 of USB/PHY is controlled by Host Controller, and Port2 is reset by USBPHY Control Register.)

- **Initialization when starting only Port2 of USB/PHY (when Port1 is not used)**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1011 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  USB/PHY Port1 is reset by USBPHY Control Register, and port2 is controlled by Host Controller.)

- **Initialization when starting both Port1 and Port2 of USB/PHY**

  Write H'0000_1133 to the reset register (RESET) of USBPHY Control Register, and then write H'0000_1000 to release the reset.

  (By the above register settings, USBPHY Control Register controls the PLL Reset and the reset is released.

  USB/PHY Port1 is controlled by the Host Controller, and Port2 is controlled by the Host Controller.)

The common setting sequence both Host mode and Function mode including USB/PHY initialization is described in **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

32.4.2 Handling of permanently unused pin

Take the following measures when USB interface is not used permanently.

32.4.2.1 USB/PHY related pins

- When both Port1 and Port2 are unused

Take the following measures for the USB pins and power supply.

- Connect the USB0_DP/DM and USB1_DP/DM to GND via a resistor of 10kΩ.
- Set the RREF to Open.
- Connect USB_VDD18 to a 1.8V power supply. However, there is no need to separate the digital and analog power supplies.
- Connect USB_VDD33 to GND.
- Connect VSS to GND.

Also, perform the following control with software.

- Set the direct power down (via UDIRPD register). See 34.3.3 Direct power down for more information.

- When either Port1 or Port2 is unused

Supply all power.

Since USB_VDD18 / USB_VDD33 are common to 2 Port PHY, it is necessary to supply power even when one of the ports is not in use.

Make the following settings for unused port.

- Apply Port reset:
  - Apply reset to unused USB/PHY port by controlling the Reset register (RESET).
  - Set sel_p1reset=1 and phyrst_1=1 when USB/PHY Port1 is unused.
  - Set sel_p2reset=1 and phyrst_2=1 when USB/PHY Port2 is unused.

- Power down setting:
  - Set power down setting to unused USB/PHY port by controlling the Clock control register (UCLKCTL).
  - Set sel_suspendm=1 and suspendm_1=0 when USB/PHY Port1 is unused.
  - Set sel_suspendm=1 and suspendm_2=0 when USB/PHY Port2 is unused.

- Single-ended receiver stop:
  - Stop single-ended receiver of unused USB/PHY port by controlling the Connection control register (CON_CTRL).
  - Set sel_connect=1 and connect_1=0 when USB/PHY Port1 is unused.
  - Set sel_connect=1 and connect_2=0 when USB/PHY Port2 is unused.

32.4.2.2 Handling of USB controller related pins

- When Host controller is unused

The USB0_VBUSEN pin leaves open and fix the USB0_OVRCUR pin to 1 when USB/PHY port1 is unused.

The USB1_VBUSEN pin leaves open and fix the USB1_OVRCUR pin to 1 when USB/PHY port2 is unused.

- Function controller is unused

Fix the USB0_VBUSIN pin to 0 when USB/PHY port1 is unused.

32.4.3 Direct power down (DIRPD)

By directly controlling the power down signal of the USB/PHY with the USBPHY Control register, the USB/PHY can be put into a low power state regardless of the state of the controller.

When set to the direct power down state, all USB/PHY functions including the PLL will be stopped. Direct power down can only be used when the USB/PHY is unused (means both ports are unused).

Follow the procedure below to switch to / return to the direct power down mode.

For details on the USBPHY Control Register reset register and direct power down setting register used in the procedure below, refer to **Section 32.3.1, Reset register (RESET)** and **Section 32.3.3, Direct power down setting register (UDIRPD)**, respectively.

32.4.3.1 Enter to Direct power down mode

Follow the steps below to switch to direct power down mode.

(1) USB operation stop

Stop the operation of USB.

(2) Assert the direct power down signal.

It is asserted by setting H'0000_0010 in the direct power-down setting register (UDIRPD) and then setting H'0000_0011.

There are no timing restrictions when transitioning to direct power down. Immediately after setting, it shifts to power down mode.

32.4.3.2 Resume from Direct power down mode

Follow the steps below to recover from the direct power down mode.

(1) Assert a USB/PHY PLL reset.

The PLL reset is asserted by setting 1 to sel_pllreset bit of the Reset register (RESET) and then setting 1 to pllreset bit.

The reset period should be 1us or more.

(2) De-assert direct power down signal

Negate the direct power down signal after continuing to assert the PLL reset for more than 1us. It is negated by setting H'0000_0010 in the direct power down setting register (UDIRPD) and then setting H'0000_0000.

After negating the direct power down signal, keep asserting the PLL reset for at least 1us.

(3) De-assert USB/PHY PLL reset

After negating the direct power down signal, continue to assert the PLL reset for 1us or more, and then negate the PLL reset.

The PLL reset is negated by clearing the pllreset bit in the reset register (RESET) and then clearing the sel_pllreset.

The timing chart when returning from the direct putter down is shown below.

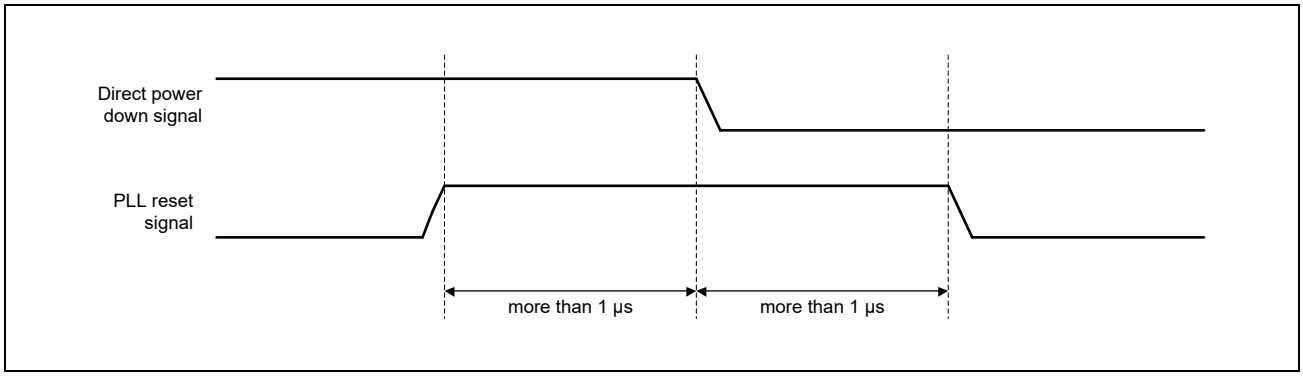

Figure 32.2 Resume from Direct power down mode

32.5 Usage Notes

32.5.1 Precautions in power down mode

When USB interface is unused, it can be set to power-down mode by register setting. For the setting, refer to **Section 32.3.3, Direct power down setting register (UDIRPD)**.

The precautions for power down mode are as follows.

- Once enter to power down, do not access the interface.
- Move to the power-down state after the USB is in unused state. If USB interface moves power-down state while it is operating, current may continue to flow to the USB side and it may damage device.

32A. USB 2.0 Host Module

32A.1 Overview

32A.1.1 Overview

This LSI has two USB 2.0 host/function modules. For each module, you can switch between the host mode and the peripheral mode by specifying the UCOM register setting. This section describes the circuits that are common to both modes, and the host controller itself.

32A.1.2 Features

This module has the following features:

Function	Description
Host function	• Supporting high-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) transfers • Compliant with Open Host Controller Interface (OHCI) Specification for USB Revision 1.0a • Compliant with Enhanced Host Controller Interface (EHCI) Specification for USB Revision 1.1*1
Other functions	• Battery charging (compliant with Battery Charging Specification Revision 1.2)*2 • Dual-role-device function (static switching between the USB host and USB peripheral functions)

Note 1. Some functions (specifications) are not supported.

Note 2. The setting for battery charging is handled by the host controller even if the function controller is selected. This LSI does not support DCP (Dedicated Charging Port) as a Downstream Port.

32A.1.2.1 EHCI v1.1 functions

Conventional host controller modules comply with EHCI Specification Revision.1.0. Meanwhile, this module supports the additional functions listed below to comply with EHCI v1.1 Addendum.

Note, however, that this module supports only the functions marked with a circle "✓" in the table below.

Function Name	Support
Per-Port Change Events	✓
Shorter Periodic Frame List	✓
Hardware Prefetching	—
Link Power Management (LPM)	✓

Of the three features to support, the registers associated with "Per-Port Change Events" and "Shorter Periodic Frame List" are listed below. For more information on each register, refer to the appropriate register specification of the **Section 32A.2, Register Descriptions**.

With regard to "Link Power Management (LPM)", it is described in **Section 32A.1.2.2, Link Power Management (LPM) function**.

Table 32A.1 Per-Port Change Events

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 18	Per-Port Change Event Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit 15	Per-Port Change Events Enable	R/W	Per-Port event notification setting. Writing 1b to this bit enables the Per-Port event notification function.
USBSTS (offset: H'124)	bit 16	Port-1 Change Detect	R/W(1)	If a port-1 change event is detected, 1b is written to this bit.
USBINTR (offset: H'128)	bit 16	Port-1 Change Event Enable	R/W	Enable/Disable setting of the above "port-1 Change Detect" field. To reflect the port event on the above field for the port, set corresponding bit to 1b.

Table 32A.2 Shorter Periodic Frame List

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: H'108)	bit 19	32-Frame Periodic List Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H'120)	bit[3:2]	Frame List Size	R/W	This bit determines the Frame List Size. To determine 32-frames, set this field 11b.

32A.1.2.2 Link Power Management (LPM) function

This module supports the power management function conforming to “USB 2.0 Link Power Management Addendum to the Universal Serial Bus v2.0 Specification” (abbreviated as LPM).

When the peripheral device which supports LPM function is connected to this module, the device can be moved to suspend state faster than conventional by using LPM function.

*In using LPM function: 8 to 10 µs

The relevant registers are listed in the following. Refer to the appropriate register specification of each register detail in **Section 32A.2, Register Descriptions**.

Relevant register	Relevant bit		Attribute	Function
HCCPARAMS (offset: H’108)	bit 17	Link Power Management Capability	R	This bit indicates to support this function. This bit is fixed to 1b.
USBCMD (offset: H’120)	bit[27:24]	Host-Initiated Resume Duration	R/W	The minimum duration time of K-state drive in resume from LPM state.
PORTSC1 (offset: H’164)	bit[31:25]	Device Address [7:0]	R/W	The device address of the destination of LPM Token. In using LPM function, this setting is needed. Set the address of the device connected to the corresponding port before sending LPM Token.
	bit[24:23]	Suspend Status [1:0]	R	The device response to LPM Token.
	bit 9	Suspend using L1	R/W	In using LPM function, set this bit 1b.
	bit 7	Suspend	R/W	When this bit is set to 1b this module starts LPM Token transaction, in condition of “Suspend using L1 bit = 1b” and “Device address field = H’000”.
PORT_LPM_CTR1 (offset: H’320)	bit[7:4]	NYET_RETRY_CNT_P1[3:0]	R/W	The number of retry for NYET response of device in LPM transaction.
	bit 3	REMOTEWAKE_EN_P1	R/W	Setting of LPM RemoteWakeup permission. 0b: permitted (default) 1b: not permitted
	bit 2	SLEEP_INT_EN_P1	R/W	In LPM transaction, setting to generate an interrupt or not when received a response other than ACK. 0b: not to generate an interrupt (default) 1b: to generate an interrupt
	bit 1	RETRY_ENABLE_NYET_P1	R/W	In LPM transaction, setting to the host behavior when received NYET response from the device. 0b: not to Retry (default) 1b: to Retry
	bit 0	HIRD_SEL_P1	R/W	Setting the duration time of the K-state drive, in resume of LPM state.

32A.1.2.3 OTG function

Detects changing of the USB0_OTG_ID pin by U2H0_OBINT interrupt and switches the Host/Function role. Confirm the IDCHG_STA bit of **Section 32A.2.4.5(2), OTG-BC Interrupt Status Register (offset: H'804)** and the IDMON bit of **Section 32A.2.4.5(5), Line Control Port 1 Register (offset: H'810)**.

Host/Function role switching is performed by the OTG_PERI bit of **Section 32A.2.4.5(1), Common Control Register (offset: H'800)**.

OTG_PERI bit
0 : Host mode
1 : Function mode

32A.1.2.4 Battery-charging function

The Control and monitoring of the Battery Charging I/F of the USBPHY is set in the UCOM register of this module. The detail of the UCOM register, refer to **Section 32A.2.4.5, UCOM Register**.

32A.1.2.5 Suspend extension function

This module implements the following two suspend extension functions to reduce power consumption by stopping PLL of USBPHY.

The detail of the register, refer to **Section 32A.2.4.4(6), Suspend Control Register (offset: H'308)**.

[Relevant register]

Suspend Control Register (offset: H'308)

[Functional specification]

Function		Relevant bit	
[1]	Function to assert USBPHY SUSPENDM by asserting the Suspend bit in the OHCI/EHCI Operational Register	bit 31	SUSPENDM_ENABLE
[2]	Function to forcibly assert USBPHY SUSPENDM	bit 0	GLOBAL_SUSPENDM_P1

32A.1.3 Support of USB-Related Specifications

USB-Related Specification or Function			Support
Host function	High Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓
		Isochronous IN/OUT transfer	✓
		Isochronous Highband transfer	✓
		Interrupt IN/OUT transfer	✓
	Full Speed	Bulk IN/OUT transfer	✓
		Control IN/OUT transfer	✓
		Isochronous IN/OUT transfer	✓
		Interrupt IN/OUT transfer	✓
	Low Speed	Control IN/OUT transfer	✓
		Interrupt IN/OUTtransfer	✓
	No. of hub connection stages	HS: 5 stages	✓
		FS: 5 stages	✓
	Support of EHCI V1.1	Hardware Prefetching	×
		Link Power Management	✓
		Per-Port Change Events	✓
		Shorter Periodic Frame List	✓
Battery-charging function (hereafter called the “BC function”)			✓
Dual role device * Function to statically switch between the host and peripheral modes			✓

Remarks: ✓: support
×: no support

32A.2 Register Descriptions

32A.2.1 Register Attributes

Table 32A.3 Register Attributes

Register Attribute	Description
R/W	Register bits can be read and written.
R/W(1)	Register bits can be read. A clear bit may be set by writing “1”; writing 0 to R/W(1) bits has no effect.
R/W(0)	Register bits can be read. A clear bit may be set by writing “0”; writing 1 to R/W(0) bits has no effect.
R	Register bits can only be read.
W	Register bits can only be written.
Reserved	Reserved bits are Read Only field.

32A.2.2 Base Address

Table 32A.4 Base Addresses for Each Channel of the USB Host Module

Channel	Base Address	
0	H’0_11C5_0000	(Cortex-A55 Address Space)
1	H’0_11C7_0000	(Cortex-A55 Address Space)

32A.2.3 Register Overview

Register Name	Abbreviated Name	R/W	Initial Value	Offset Address	Access Size	Remarks
HcRevision	HcRevision	R	H'0000_0000	H'000	32	OHCI Operation Registers

32A.2.4 Description of Registers

32A.2.4.1 OHCI Operational Register

(1) HcRevision Register

Abbreviated name of register: HcRevision

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	Revision							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Revision	All 0	R	This field indicates the version of HCI specifications implemented in this host controller module. Because this module conforms to OHCI standard 1.0a, H'10 is indicated.

(2) HcControl Register

Abbreviated name of register: HcControl

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RWC	—	HCFS		BLE	CLE	IE	PLE	CBSR	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The write value should always be 0.
9	RWC	0	R/W	Remote Wakeup Connected This bit indicates whether the host controller supports remote wakeup signaling. Software should set this bit to 1b in the initialization sequence if it is required to suppor remote wakeup. Note that this bit can be initialized at hardware reset only. 0b: The remote wakeup is not supported. 1b: The remote wakeup is supported
8	—	0	R	Reserved The write value should always be 0.
7, 6	HCFS	All 0	R/W	Host Controller Functional State This field indicates the operating state of the host controller. 00b: USB Reset 01b: USB Resume 10b: USB Operational 11b: USB Suspend When the state is changed to USB Operational, the host controller module starts SOF transmission at 1 ms boundary. This field is basically controlled by software, but it can be controlled by the host controller in the state of USB Suspend only. If the host controller (in the state of USB Suspend) detects a Remote Wakeup signal from the connecting device, the state in this field is changed to USB Resume. Note that the reset value of this field differs between hardware reset and software reset. Hardware reset: 00b (USB Reset) Software reset: 11b (USB Suspend)
5	BLE	0	R/W	BulkList Enable This bit sets whether the bulk list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the bulk list, this bit must be 0b. 0b: The processing of the Bulk list is disabled. 1b: The processing of the Bulk list is enabled
4	CLE	0	R/W	ControlList Enable This bit sets whether the control list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. When you correct the control list, this bit must be 0b. 0b: The processing of the Control list is disabled. 1b: The processing of the Control list is enabled.

Bit	Bit Name	Initial Value	R/W	Description
3	IE	0	R/W	Isochronous Enable This bit sets whether the isochronous ED processing is performed. The setting value of this bit is enabled from the next frame. If the host controller module detects isochronous ED (F = 1) during the periodic list processing, it checks the bit and determines whether to perform isochronous ED processing. 1b: The processing of the isochronous ED is continued. 0b: The periodic list processing is stopped, and the bulk/control list processing is started. 0b: The processing of the isochronous ED is disabled. 1b: The processing of the isochronous ED is enabled.
2	PLE	0	R/W	Periodic List Enable This bit indicates whether the periodic list processing is performed for the next frame. The setting value of this bit is enabled from the next frame. The host controller module checks this bit before starting the periodic list processing. 0b: The processing of the periodic list is disabled. 1b: The processing of the periodic list is enabled.
1, 0	CBSR	All 0	R/W	Control Bulk Service Ratio This field defines the service ratio of the control transfer and bulk transfer. When the periodic list is processed, the service ratio defined in this field is used for transfer.

CBSR	No. of Control EDs Over Bulk EDs Served
00b	1 : 1
01b	2 : 1
10b	3 : 1
11b	4 : 1

(3) HcCommandStatus Register

Abbreviated name of register: HcCommandStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOC	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	BLF	CLF	HCR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17, 16	SOC	All 0	R	Scheduling Overrun Count This field counts the number of scheduling overrun. This field is initialized to 00b, and is counted up every time scheduling overrun is detected. After the field is incremented to 11b, it returns to 00b. Even if the SO (Scheduling Overrun) bit in the HcInterrupt Status register is set, this field is counted up when scheduling overrun is detected.
15 to 3	—	All 0	R	Reserved The write value should always be 0.
2	BLF	0	R/W	BulkList Filled This bit indicates whether TD exists in the bulk list. To add TD to ED in the bulk list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the bulk list. If this bit is set to 0b, the host controller does not start the list processing. If this bit is set to 1b, the host controller starts processing of the bulk list, and sets this bit to 0b. When the host controller finds TD in the bulk list, it sets this bit to 1b again, and continues processing of the bulk list. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the bulk list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the BLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the bulk list. 1b: TD exists in the bulk list.

Bit	Bit Name	Initial Value	R/W	Description
1	CLF	0	R/W	ControlList Filled This bit indicates whether TD exists in the control list. To add TD to ED in the control list, set this bit to 1b. The host controller checks this bit when it starts processing of the head ED in the control list. If this bit is set to 0b, the host controller does not start the processing of the control list. If this bit is set to 1b, the host controller starts processing of the control list, and set this bit to 0b. When the host controller finds TD in the control list, it sets this be to 1b again, and continues the list processing. When the host controller finishes the list processing, this bit is set to 0b. However, if TD is not found in the control list, or if this bit is not set to 1b, this bit remains to be 0b, and the list processing stops. To rebuild the list and start the list processing, before you set the CLE bit of the HcControl register and start the list processing, you need to set this bit. 0b: TD does not exist in the control list. 1b: TD exists in the control list.
0	HCR	0	W	Host Controller Reset This bit is used to start OHCI software reset for the host controller. When this bit is set to 1b, the operating status of the host controller is changed to USB Suspend regardless of the functional state of the host controller. Also, the most OHCI Operational registers and OHCI control circuits are initialized. When the software reset finishes, the host controller clears this bit to 0b.

(4) HcInterruptStatus Register

Abbreviated name of register: HcInterruptStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSC	FNO	UE	RD	SF	WDH	SO
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSC	0	R/W	Root Hub Status Change Interrupt bit that indicates that the state of the HcRhStatus register or HcRhPortStatus1 register has changed. When the Root Hub status is changed, the host controller sets this bit to 1b. Writing 1b to this bit clears the interrupt. 0b: The status of root hub has not changed. 1b: The status of root hub has changed.
5	FNO	0	R/W	Frame Number Overflow Interrupt bit that indicates that the MSB in the FrameNumber (FN) field of theHcFmNumber register has changed. When the MSB in the Frame Number field is changed from 0 to 1, or from 1 to 0, this bit is set after HccaFrameNumber is updated. Writing this bit to 1b clears the interrupt. 0b: The overflow of frame number has not occurred. 1b: The overflow of frame number has occurred.
4	UE	0	R/W	Unrecoverable Error Interrupt bit that indicates that a system error that is not related to the USB (for example, an error on the system bus) has been detected. Writing this bit to 1b clears the interrupt. 0b: The unrecoverable error has not occurred. 1b: The unrecoverable error has occurred.
3	RD	0	R/W	Resume Detected Interrupt bit that indicates that Resume has been detected. When the host controller detects the Resume signal (RemoteWakeup) from an USB device, it sets this bit to 1b. This bit is not set when the Resume signal is sent by setting the HCFS field to USB Resume. Writing this bit to 1b clears the interrupt. 0b: The host controller has not detected resume signaling (RemoteWakeup). 1b: The host controller has detected resume signaling (RemoteWakeup).

Bit	Bit Name	Initial Value	R/W	Description
2	SF	0	R/W	Start of Frame Interrupt bit that indicates that Hcca Frame Number was updated when each frame started. The host controller sends an SOF packet and updates HccaFrameNumber at the same time, and sets this bit to 1b. Writing this bit to 1b clears the interrupt. 0b: The host controller has not started new frame. 1b: The host controller has started new frame.
1	WDH	0	R/W	Writeback DoneHead Interrupt bit that indicates that the host controller has written the contents of HcDoneHead to HccDoneHead. The host controller sets this bit to 1b immediately after it updates HccaDoneHead. Note that HccaDoneHead is not updated until this bit is cleared. Writing this bit to 1b clears the interrupt. This bit must be cleared only after the contents of HccaDoneHead are saved. 0b: The write back to HccaDoneHead has not occurred. 1b: The write back to HccaDoneHead has occurred.
0	SO	0	R/W	Scheduling Overrun Interrupt bit that indicates that overrun of the USB schedule occurred. When USB scheduling overrun occurs, the host controller updates HccaFrameNumberl, and sets this bit to 1b. When this bit is set, the SchedulingOverrunCount field of the HcCommandStatus register is also incremented. Writing this bit to 1b clears the interrupt. 0b: The scheduling overrun has not occurred. 1b: The scheduling overrun has occurred.

(5) HcInterruptEnable Register

Abbreviated name of register: HcInterruptEnable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MIE	OCE	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCE	FNOE	UEE	RDE	SFE	WDHE	SOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	MIE	0	R/W	Master Interrupt Enable This bit sets whether each Interrupt Enable setting (which is set in HcInterruptEnable [30:0]) is enabled. If this bit is set to 0b, all OHCI interrupts are masked. To clear this bit, set the MID bit (bit 31) of the HcInterruptDisable register to 1b. 0b: All interrupts are disabled. 1b: Interrupts that are set to 1b are enabled.
30	OCE	0	R/W	OC (Ownership Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes OC (OwnershipChange). To clear this bit, set the OCD bit (bit 30) of the HcInterruptDisable register to 1b. 0b: OC (OwnershipChange) interrupt is disabled. 1b: OC (OwnershipChange) interrupt is enabled.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCE	0	R/W	RHSC (RootHub Status Change) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RHSC (RootHub Status Change). To clear this bit, set the RHSCD bit (bit 6) of the HcInterruptDisable register to 1b. 0b: RHSC (RootHub Status Change) interrupt is disabled. 1b: RHSC (RootHub Status Change) interrupt is enabled.
5	FNOE	0	R/W	FNO (Frame Number Overflow) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes FNO (Frame Number Overflow). To clear this bit, set the FNOD bit (bit 5) of the HcInterruptDisable register to 1b. 0b: FNO (Frame Number Overflow) interrupt is disabled. 1b: FNO (Frame Number Overflow) interrupt is enabled.
4	UEE	0	R/W	UE (Unrecoverable Error) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes UE (Unrecoverable Error). To clear this bit, set the UED bit (bit 4) of the HcInterruptDisable register to 1b. 0b: UE (Unrecoverable Error) interrupt is disabled. 1b: UE (Unrecoverable Error) interrupt is enabled.
3	RDE	0	R/W	RD (Resume Detect) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes RD (Resume Detect). To clear this bit, set the RDD bit (bit 3) of the HcInterruptDisable register to 1b. 0b: RD (Resume Detect) interrupt is disabled. 1b: RD (Resume Detect) interrupt is enabled.

Bit	Bit Name	Initial Value	R/W	Description
2	SFE	0	R/W	SF (Start of Frame) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SF (Start of Frame). To clear this bit, set the SFD bit (bit 2) of the HcInterruptDisable register to 1b. 0b: SF (Start of Frame) interrupt is disabled. 1b: SF (Start of Frame) interrupt is enabled.
1	WDHE	0	R/W	WDH (Writeback DoneHead) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes WDH (Writeback DoneHead). To clear this bit, set the WDHDD bit (bit 1) of the HcInterruptDisable register to 1b. 0b: WDH (Writeback DoneHead) interrupt is disabled. 1b: WDH (Writeback DoneHead) interrupt is enabled.
0	SOE	0	R/W	SO (Scheduling Overrun) Interrupt Enable bit. If this bit is set to 1b, the interrupt source becomes SO (Scheduling Overrun). To clear this bit, set the SOD bit (bit 0) of the HcInterruptDisable register to 1b. 0b: SO (Scheduling Overrun) interrupt is disabled. 1b: SO (Scheduling Overrun) interrupt is enabled.

(6) HcInterruptDisable Register

Abbreviated name of register: HcInterruptDisable

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MID	OCD	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W(1)	R/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

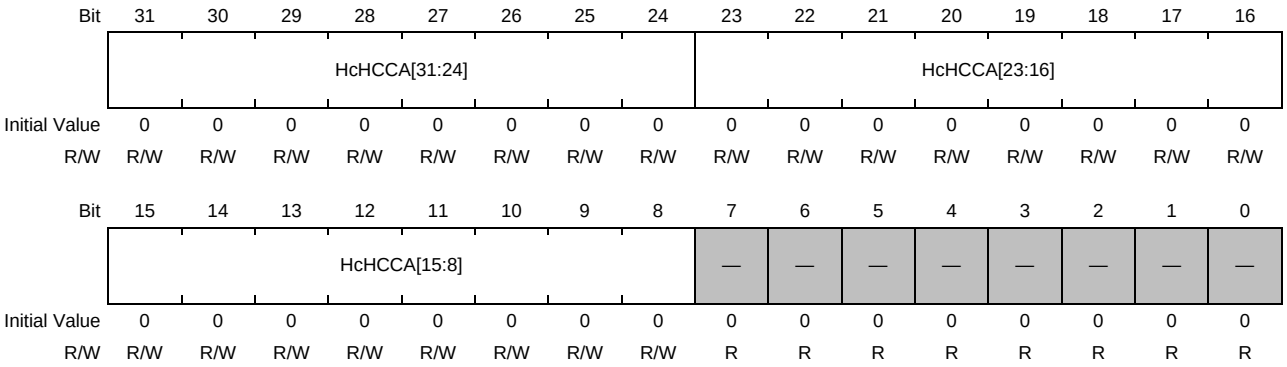
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	RHSCD	FNOD	UED	RDD	SFD	WDHD	SOD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31	MID	0	R/W (1)	Master Interrupt Disable This bit sets whether the Enable setting (for each interrupt) that is set by HcInterruptEnable[30:0] is disabled. If this bit is set to 1b, the MIE bit (bit 31) of the HcInterruptEnable register is cleared to 0b, and all OHCI interrupts are masked. Writing 0b to this bit is ignored.
30	OCD	0	R/W (1)	OC (Ownership Change) Interrupt Disable bit. If this bit is set to 1b, the OCE bit (bit 30) of the HcInterruptEnable register is cleared to 0b, and OC (Ownership Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
29 to 7	—	All 0	R	Reserved The write value should always be 0.
6	RHSCD	0	R/W (1)	RHSC (RootHub Status Change) Interrupt Disable bit. If this bit is set to 1b, the RHSCE bit (bit 6) of the HcInterruptEnable register is cleared to 0b, and RHSC (RootHub Status Change) is excluded from the interrupt source. Writing 0b to this bit is ignored.
5	FNOD	0	R/W (1)	FNO (Frame Number Overflow) Interrupt Disable bit. If this bit is set to 1b, the FNOE bit (bit 5) of the HcInterruptEnable register is cleared to 0b, and FNO (Frame Number Overflow) is excluded from the interrupt source. Writing 0b to this bit is ignored.
4	UED	0	R/W (1)	UE (Unrecoverable Error) Interrupt Disable bit. If this bit is set to 1b, the UEE bit (bit 4) of the HcInterruptEnable register is cleared to 0b, and UE (Unrecoverable Error) is excluded from the interrupt source. Writing 0b to this bit is ignored.
3	RDD	0	R/W (1)	RD (Resume Detected) Interrupt Disable bit. If this bit is set to 1b, the RDE bit (bit 3) of the HcInterruptEnable register is cleared to 0b, and RD (Resume Detected) is excluded from the interrupt source. Writing 0b to this bit is ignored.
2	SFD	0	R/W (1)	SF (Start of Frame) Interrupt Disable bit. If this bit is set to 1b, the SFE bit (bit 2) of the HcInterruptEnable register is cleared to 0b, and SF (Start of Frame) is excluded from the interrupt source. Writing 0b to this bit is ignored.
1	WDHD	0	R/W (1)	WDH (Writeback DoneHead) Interrupt Disable bit. If this bit is set to 1b, the WDHE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and WDH (Writeback DoneHead) is excluded form the interrupt source. Writing 0b to this bit is ignored.

Bit	Bit Name	Initial Value	R/W	Description
0	SOD	0	R/W (1)	SO (Scheduling Overrun) Interrupt Disable bit. If this bit is set to 1b, the SOE bit (bit 1) of the HcInterruptEnable register is cleared to 0b, and SO (Scheduling Overrun) is excluded from the interrupt source. Writing 0b to this bit is ignored.

(7) HcHCCA Register

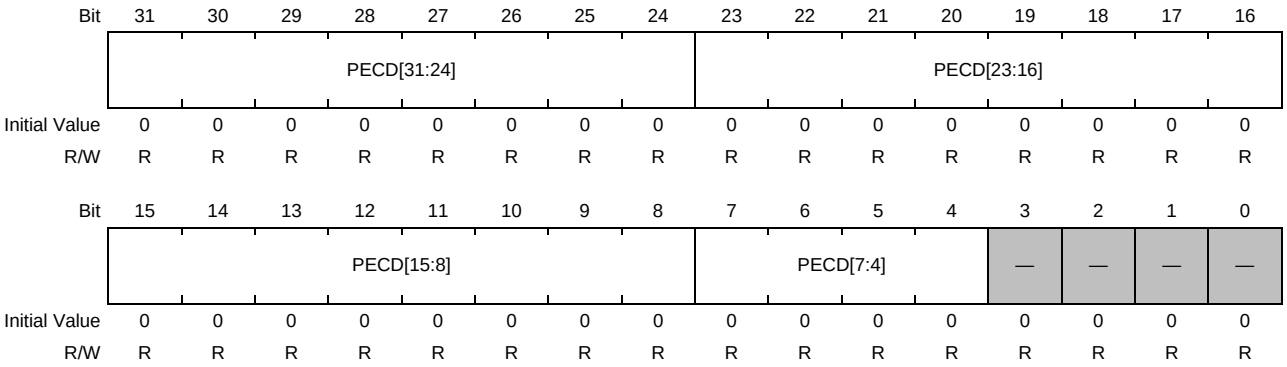
Abbreviated name of register: HcHCCA



Bit	Bit Name	Initial Value	R/W	Description
31 to 8	HcHCCA	All 0	R/W	This field sets the base address (of the RAM) that is assigned as the Host Controller Communication Area. This field must be set at initialization. The host controller requests (as HCCA) 256-byte area from the base address specified in this field.
7 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) HcPeriodicCurrentED Register

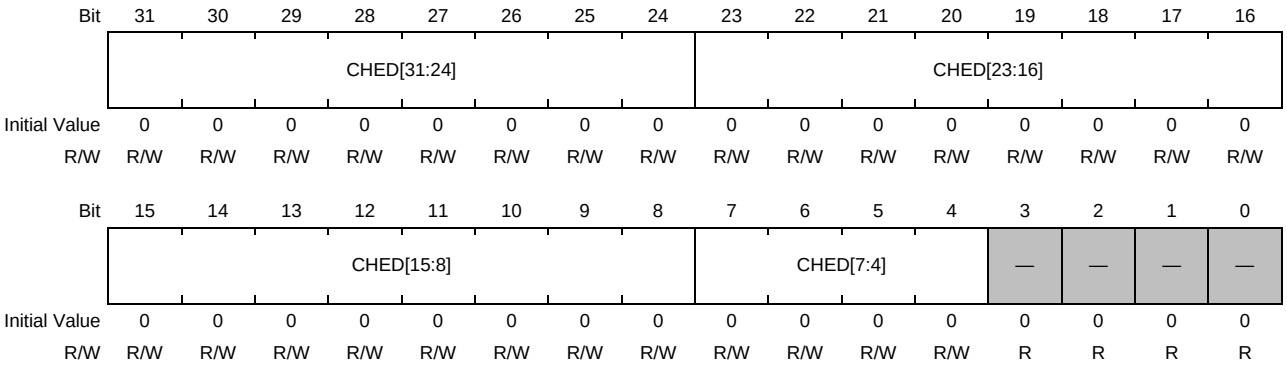
Abbreviated name of register: HcPeriodCurrentED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	PECD	All 0	R	Period Current ED This pointer indicates the physical address of ED in the periodic list that is currently processed. The host controller updates this pointer when the list processing of the periodic ED finishes.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(9) HcControlHeadED Register

Abbreviated name of register: HcControlHeadED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CHED	All 0	R/W	Control Head ED This field specifies the physical address of the head ED of the control list. These bits must be set for control transfer before the CLE bit of the HcControl register is set. The host controller starts processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(10) HcControlCurrentED Register

Abbreviated name of register: HcControlCurrentED

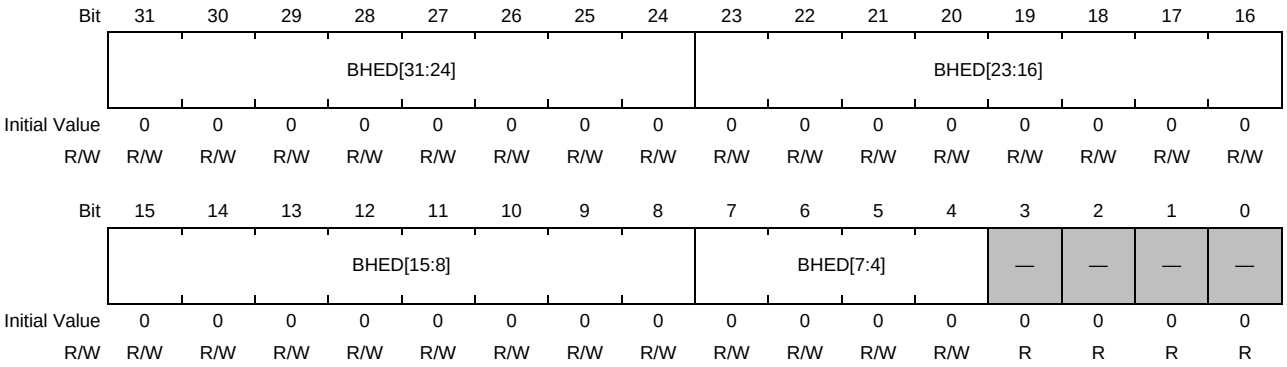
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CCED[31:24]								CCED[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCED[15:8]								CCED[7:4]				—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	CCED	All 0	R/W	Control Current ED This pointer indicates the physical address of the ED that is currently processed in the control list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the control list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcControlHeadED field are copied to the HcControlCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the control list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(11) HcBulkHeadED Register

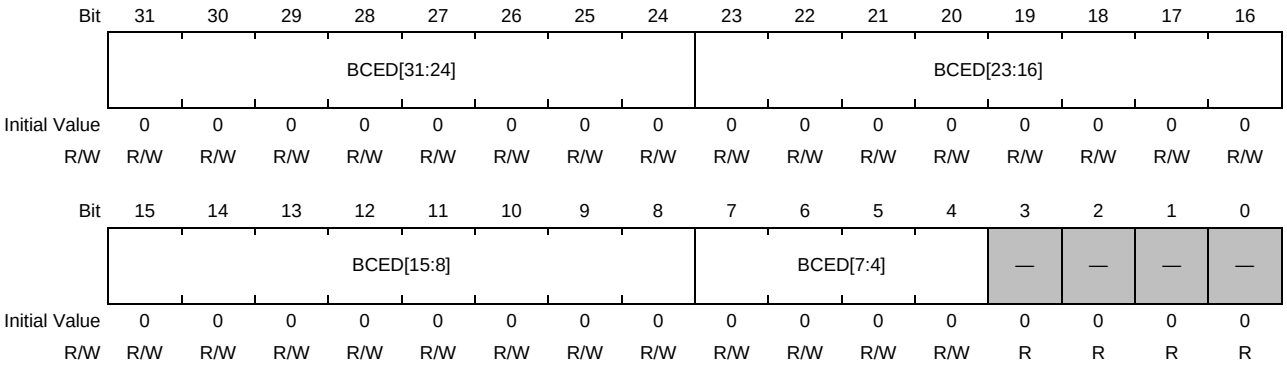
Abbreviated name of register: HcBulkHeadED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BHED	All 0	R/W	Bulk Head ED This field specifies the physical address of the head ED of the bulk list. This field must be set for bulk transfer before the BLE bit of the HcControl register is set. The host controller starts the processing of the control list from the HcBulkHeadED pointer.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(12) HcBulkCurrentED Register

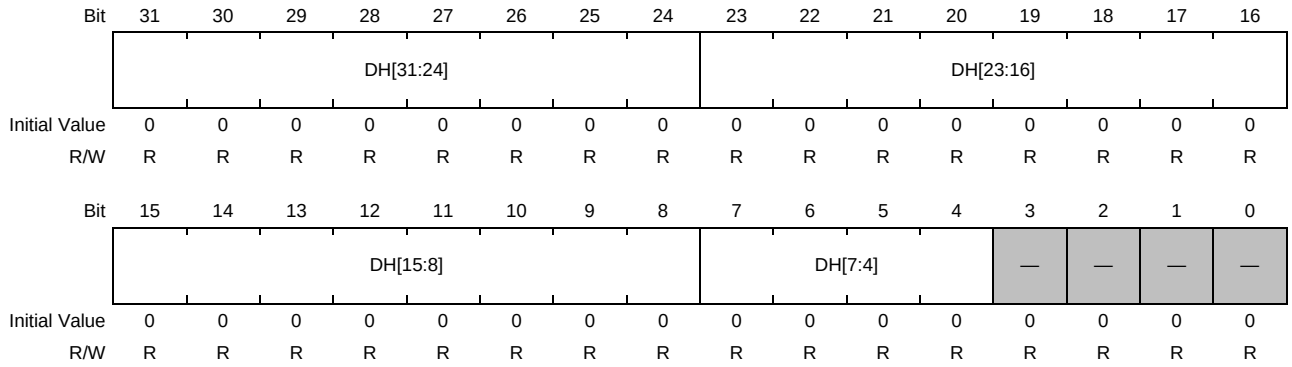
Abbreviated name of register: HcBulkCurrentED



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	BCED	All 0	R/W	Bulk Current ED This pointer indicates the physical address of the ED that is currently processed in the bulk list. After the current ED processing finishes, this pointer proceeds to the next ED. The host controller continues the list processing until the end of the frame. When the end of the bulk list is reached, the host controller checks the ControlListFilled bit of the HcCommandStatus register. If the corresponding bit is set to 1b, the contents of the HcBulkHeadED field are copied to the HcBulklCurrentED field, and the ControlListFilled bit is cleared. If the corresponding bit is set to 0b, nothing is performed. Update of this register is allowed only when the ControlListEnable bit of the HcControl register is cleared. If the ControlListEnable bit is set to 1b, the value of this register is only read. This register is initially set to H'0 to indicate the end of the bulk list.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(13) HcDoneHead Register

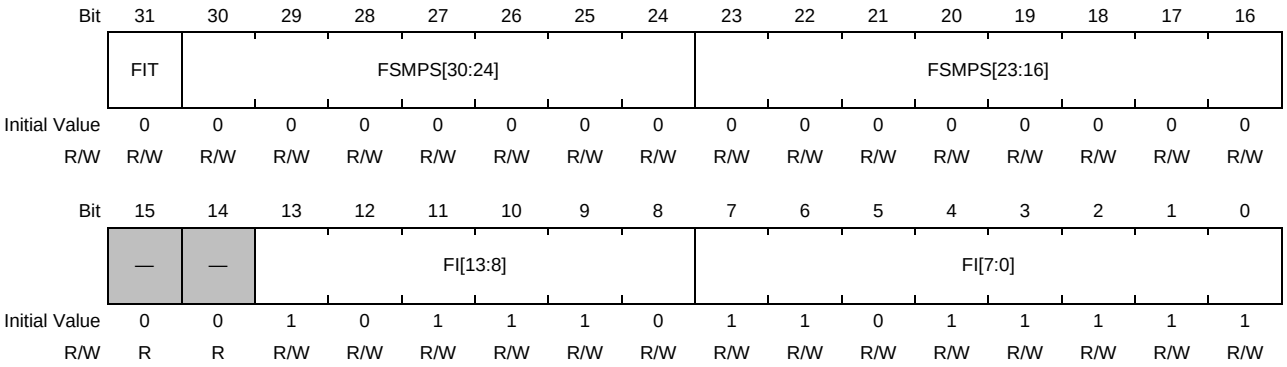
Abbreviated name of register: HcDoneHead



Bit	Bit Name	Initial Value	R/W	Description
31 to 4	DH	All 0	R	Done Head This field indicates the physical address of the HcDoneHead of the host controller. The physical address of the TD that lately finished and is added to the Done queue. After the TD processing finishes, the host controller writes the contents of the HcDoneHead to the NextTD field of the TD. At the same time, the host controller overwrites the contents of HcDoneHead with the TD address. After the host controller writes the contents of this register into HCCA, it sets 0b to this register. Then, the WritebackDoneHead bit of the HcInterruptStatus register is set to 1b.
3 to 0	—	All 0	R	Reserved The write value should always be 0.

(14) HcFmInterval Register

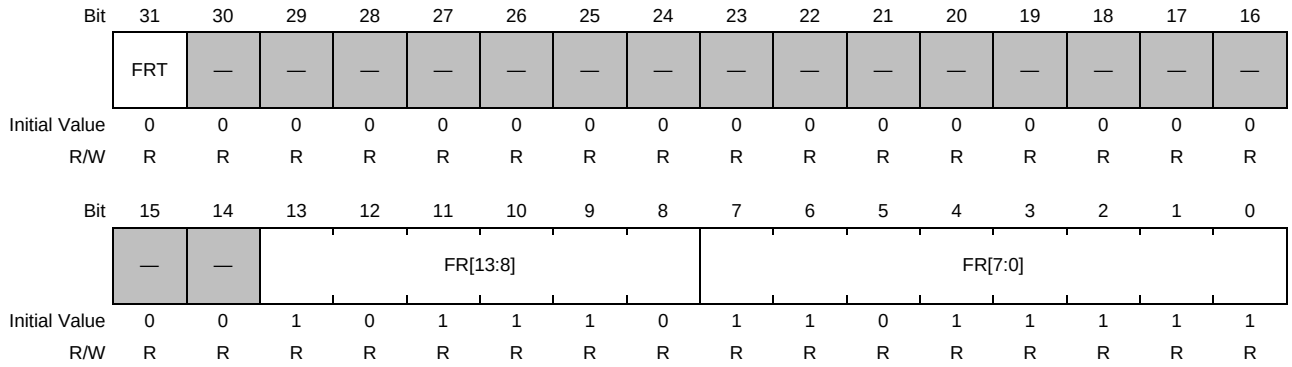
Register abbreviation: HcFmInterval



Bit	Bit Name	Initial Value	R/W	Description
31	FIT	0	R/W	Frame Interval Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FI field is updated, the toggle value is written to this bit. When the FI field value is applied to the FR field of the HcFmRemaining register, the value of this bit is also applied to the FRT bit of the HcFmRemaining register. By checking the toggle value in the FRT bit of the cFmRemaining register, the software can check whether the value in the FI field has been applied to the FR field of the HcFmRemaining register.
30 to 16	FSMPS	All 0	R/W	FS Largest Data Packet This field sets the maximum amount of data (bits) that the host controller can send and receive without the fear of schedule overrun. The host controller compares the current frame position and the setting value in this field to determine the length (of the frame) that is ready to be transferred. This value differs depending on the capacity of the system bus and other reasons, estimate the value and set it to this field. *Note*: The maximum setting value for this field is H'2778. Do not set any value that is larger than H'2778.
15, 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FI	H'2EDF	R/W	Frame Interval This field is used to set the length of the frame (bit time) used for Full Speed. Set the value of this field to "H'2EDF" so that 1 frame (= 1 ms) of USB standard is satisfied.

(15) HcFmRemaining Register

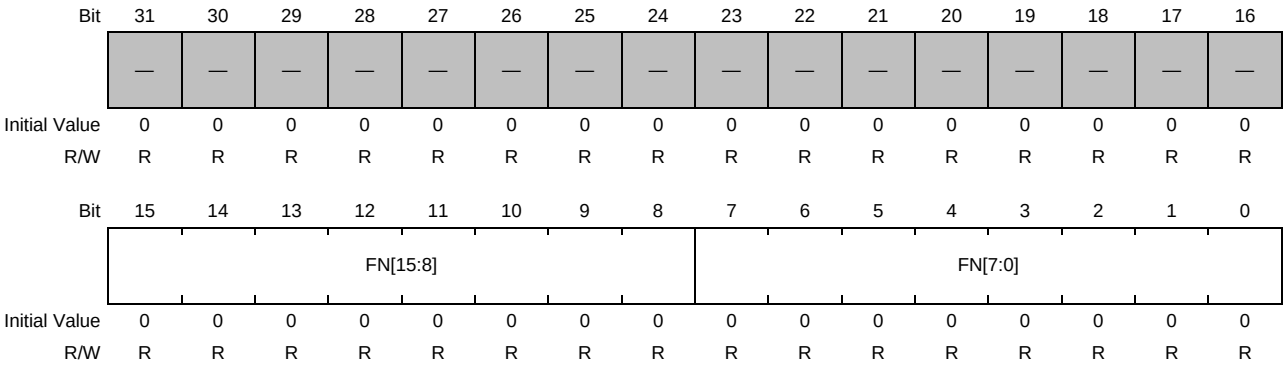
Register abbreviation: HcFmRemaining



Bit	Bit Name	Initial Value	R/W	Description
31	FRT	0	R	Frame Remaining Toggle This bit is used to synchronize the frame setting value with the hardware (host controller). When the FR (Frame Remaining) field is set to H'0000, the host controller copies the FI (Frame Interval) field value to the FR field, and copies the FIT (Frame Interval Toggle) bit value to this bit. This bit can be used to check that the FI field of the HcFmInterval register has been correctly copied to the FR field.
30 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	FR	H'2EDF	R	Frame Remaining This field indicates the current frame value for 14-bit down counter. The value in this field counts down as time passes. When the value becomes H'0000, the value of FI (Frame Interval) of the HcFmInterval register is loaded. When the state of the host controller is changed to the USB Operational state, the host controller reloads the value in the FI (Frame Interval) field of the HcFmInterval register, and the new value is used from the next SOF.

(16) HcFmNumber Register

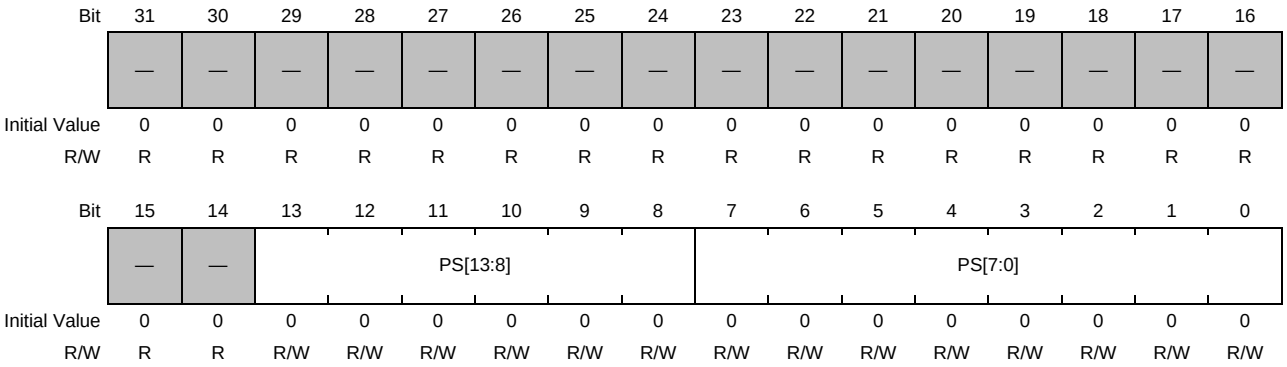
Register abbreviation: HcFmNumber



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 0	FN	All 0	R	Frame Number This field indicates the number of passed frames. When the HcFmRemaining register is reloaded, this field is incremented. If this field is reached to H'FFFF, the value is rolled over to H'0000. When the state of the host controller is changed to the USB Operational state, this field is automatically incremented. After the host controller increments the frame number at the frame boundary and sends SOF, the contents of this field are written to HCCA. This is performed before the host controller reads the first ED of the frame. After writing to HCCA, the host controller sets the SF bit of the HcInterruptStatus register.

(17) HcPeriodicStart Register

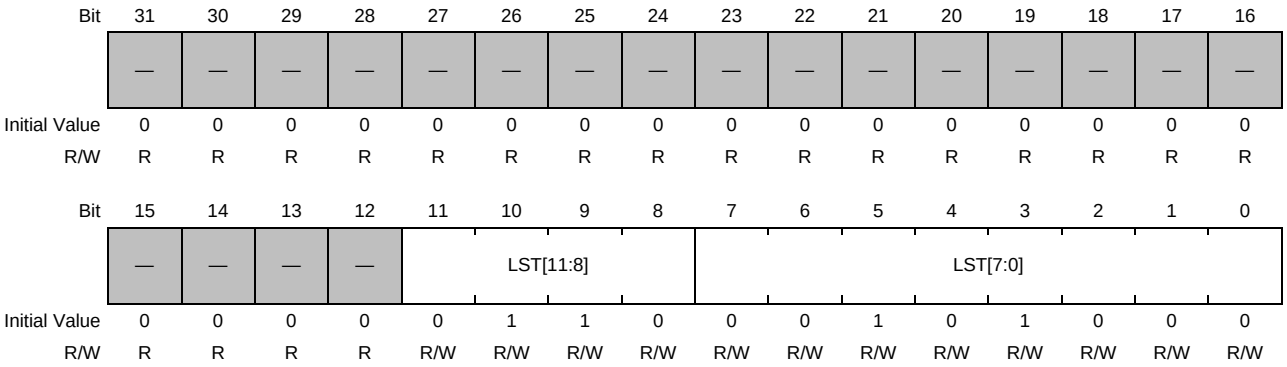
Register abbreviation: HcPeriodicStart



Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	PS	All 0	R/W	Periodic Start This field indicates the time the host controller starts the periodic list processing in the frame. Estimate an appropriate value, and set the value to this field at the initial setting of the host controller. OHCI standard recommends that you set this setting value to about 90% of the FI field value of the HcFmInterval register. The recommended value is H'2A2F. When the value in the FR field of the HcFmRemaining register reaches the value set to this field, the periodic list processing is given priority over the control/bulk list processing. Therefore, after the currently running control or bulk transfer finishes, the host controller starts the Interrupt list processing.

(18) HcLSThreshold Register

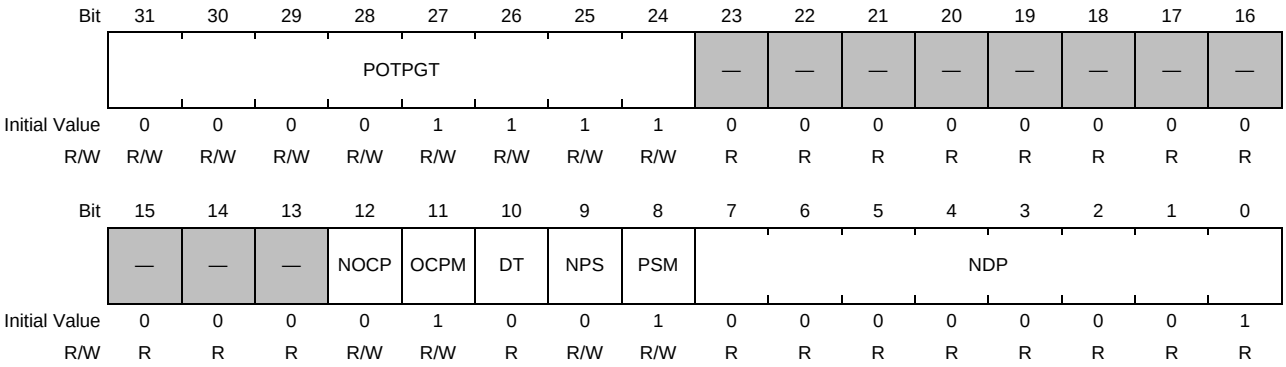
Register abbreviation: HcLSThreshold



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved The write value should always be 0.
11 to 0	LST	H'628	R/W	LS Threshold This field indicates the threshold value of whether transfer is available for the remaining time of the LS transfer frame. If the value of the FR field of the FmRemaining register is larger than the value set to this field, the host controller can start LS transfer.

(19) HcRhDescriptorA Register

Register abbreviation: HcRhDescriptorA



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	POTPGT	H'0F	R/W	PowerOn To PowerGood Time This field indicates the time for waiting until software can access the root hub port after the power is supplied to the port. The unit of time is 2 ms. Therefore, the wait time is POTPGT × 2 ms.
23 to 13	—	All 0	R	Reserved The write value should always be 0.
12	NOCP	0	R/W	No OverCurrent Protection This bit sets whether the overcurrent function of the root hub is supported. If this bit is set to 0b, the overcurrent state is reported depending on the setting of the OCPM bit. 0b: The overcurrent state is supported. 1b: The overcurrent state is not supported. If you do not require the overcurrent function, set this bit to 1b once the module is released from module standby. For details, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.
11	OCPM	1	R/W	OverCurrent Protection Mode This bit sets how to report the overcurrent state of the root hub. If this bit is reset, this bit must indicate the same mode as the PSM (Power Switching Mode) bit. This bit is valid only when the NOCP (NoOverCurrent Protection) bit is cleared (0b). 0b: The overcurrent state is collectively reported for all ports. 1b: The overcurrent state is reported for each port.
10	DT	0	R	Device Type This bit indicates that the root hub is not a composite device. This bit is always 0b because the root hub is not allowed to be a composite device.
9	NPS	0	R/W	No Power Switching This bit sets how to control the port power. If this bit is set to 0b, the PSM bit is used to set whether the power control is collectively performed for all ports or is performed for each port. 0b: The port power can be switched between on and off. 1b: The power is always on while the host controller is running.
8	PSM	1	R/W	Power Switching Mode This bit sets how to control the power switch for each port of the root hub. This bit is valid only when the NPS bit is 0b. 0b: The power of all ports is collectively controlled. 1b: The power of ports is controlled for each port. If the PPCM (PortPower Control Mask) bit of the HcRhDescriptorB register is set, each port responds only to the Set/ClearPortPower command. If the PPCM bit is cleared, each port is controlled by the Set/ClearGlobalPower command.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	NDP	H'01	R	Number Down stream Ports This field indicates the number of downstream ports supported by the root hub.

(20) HcRhDescriptorB Register

Register abbreviation: HcRhDescriptorB

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PPCM	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DR	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	PPCM	0	R/W	PortPower Control Mask This bit sets the port power control command when the PSM (Power Switching Mode) bit of the HcRhDescriptorA register is set. If this bit is 0b, the Global Power Control command (Set/ClearGlobalPower) is used for control. If this bit is 1b, the Port Power Control command (Set/ClearPortPower) is used for control. If the PSM bit is 0b, this bit is ignored.
16 to 2	—	All 0	R	Reserved The write value should always be 0.
1	DR	0	R/W	Device Removable This bit indicates whether each port of the root hub is removable. If this bit is 0b, the connected device is removable. If this bit is 1b, the connected device is not removable.
0	—	0	R	Reserved The write value should always be 0.

(21) HcRhStatus Register

Register abbreviation: HcRhStatus

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCIC	LPSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRWE	—	—	—	—	—	—	—	—	—	—	—	—	—	OCI	LPS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CRWE	0	W	Clear RemoteWakeup Enable This bit is used to clear the DRWE bit. If this bit is set to 1b, DRWE (Device RemoteWakeup Enable) bit can be cleared. Writing 0b to this bit has no effect.
30 to 18	—	All 0	R	Reserved The write value should always be 0.
17	OCIC	0	R/W (1)	OverCurrent Indicator Change This bit is used to report the change in the OCI bit. If there is any change in the OCI bit, the host controller sets this bit to 1b. If 1b is written to this bit while this bit is set to 1b, this bit can be cleared. Writing 0b to this bit has no effect. 0b: There is no change in the Overcurrent state. 1b: There is a change in the Overcurrent state.
16	LPSC	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Local Power Status Change This bit is always read as 0b because the Local Power Status is not supported. [Write] Set Global Power If this bit is set to 1b, the power to the ports is turned on. The ports whose power is turned on are determined by the settings of the PSM (Power Switching Mode) bit and the PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

written to this bit	PSM	PPCM[N]	Description
0	—	—	Setting ignored
1	0	—	1b is set to the PPS bit.
	1	0	1b is set to the PPS bit.
		1	Setting ignored

Writing 0b to this bit has no effect.

15	DRWE	0	R/W	[Read] Device RemoteWakeup Enable This bit sets whether the RemoteWakeup event includes the CSC (Connect Status Change) bit. If this bit is set to 1b, the CSC bit of the HcRhPortStatus register becomes valid as the Resume event. If the CSC bit is changed to 1b, the state is changed from USB Suspend to USB Resume, and the Resume detection interrupt occurs. 0b: Connect Status Change is not the source of RemoteWakeup. 1b: Connect Status Change is the source of RemoteWakeup. [Write] Set RemoteWakeup Enable This bit is used to set the DRWE bit. Writing 0b to this bit has no effect.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>14 to 2</td><td>—</td><td>All 0</td><td>R</td><td>Reserved
The write value should always be 0.</td></tr>
<tr><td>1</td><td>OCI</td><td>0</td><td>R</td><td>Over Current Indicator
This bit is used to report the overcurrent state in the global overcurrent detection mode (OCPM bit = 0b).
This bit always indicates 0b when overcurrent for each port is reported (when OPCM bit = 1b).
0b: The port state is normal.
1b: The port is in the overcurrent state.</td></tr>
<tr><td>0</td><td>LPS</td><td>0</td><td>R/W</td><td>The meaning of this bit differs depending on whether the operation is read or write.
[Read] Local Power Status
This bit is always read as 0b because the Local Power Status is not supported.
[Write] Clear Global Power
If this bit is set to 1b, the power to the ports is turned off.
The ports whose power is turned off are determined by the settings of the PSM (Power Switching Mode) bit and PPCM (Port Power Control Mask) bit of the HcRhDescriptorA register.

(22) HcRhPortStatus[1:NDP] Register

Register abbreviation: HcRhPortStatus1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	PRSC	OCIC	PSSC	PESC	CSC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	LSDA	PPS	—	—	—	PRS	POCI	PSS	PES	CCS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The write value should always be 0.
20	PRSC	0	R/W (1)	Port Reset Status Change This bit indicates that port reset (bus reset) has finished. The host controller sets this bit when 10 ms port reset (bus reset) finishes. 0b: Port reset has not finished, or the PRS (Port Reset Status) bit is not changed. 1b: Port reset has finished.
19	OCIC	0	R/W (1)	Port OverCurrent Indicator Change This bit is set when the overcurrent state of the port is detected. This bit is set when the host controller changed the POCI bit value. This bit is valid only under the setting that the overcurrent state is reported for each port (OCPM bit = 1b). If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The overcurrent state has not changed. 1b: The overcurrent state has changed (POCI bit changed).
18	PSSC	0	R/W (1)	Port Suspend Status Change This bit indicates that the Resume sequence finished. This sequence includes 20 ms of the Resume signal, LS EOP, and 3 ms of resynchronization delay. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If the PRSC (Port Reset Status Change) bit is set, this bit is cleared. 0b: The Resume sequence has not finished. 1b: The Resume sequence has finished.
17	PESC	0	R/W (1)	Port Enable Status Change This bit indicates that the PES (Port Enable Status) bit was changed. If a hardware event clears the PES bit, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. 0b: The PES (Port Enable Status) bit has not changed. 1b: The PES (Port Enable Status) bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
16	CSC	0	R/W (1)	Connect Status Change This bit indicates that the CCS (Current Connect Status) bit was changed. If the Connect/Disconnect event occurs, this bit is set to 1b. If this bit is set to 1b, this bit is cleared. Writing 0b to this bit has no effect. If a request (Port Reset/Port Enable/Port Suspend) is received during the Disconnect status, this bit is set for reevaluation of device connection confirmation. 0b: The CCS (Current Connect Status) bit has not changed. 1b: The CCS (Current Connect Status) bit has changed.
15 to 10	—	All 0	R	Reserved The write value should always be 0.
9	LSDA	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Low Speed Device Attached This bit indicates the speed of the device connected to the port. This bit is valid only when the CCS (Current Connect Status) bit is set. 0b: Full Speed device is connected. 1b: Low Speed device is connected. [Write] Clear Port Power This bit is used to turn off the power of the port when the port is power controlled. Writing 1b to this bit turns off the port power. Writing 0b to this bit has no effect.
8	PPS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Power Status This bit indicates the power status of the port. This bit is cleared when the overcurrent is detected. 0b: Port power is off. 1b: Port power is on. [Write] Set Port Power This bit is used to turn on the power of the port when the port is power controlled. Writing 1b to this bit turns on the port power. Writing 0b has no effect.
7 to 5	—	All 0	R	Reserved The write value should always be 0.
4	PRS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Reset Status This bit indicates the port reset (bus reset) status. When 10 ms of port reset finishes, the PRSC (Port Reset Status Change) bit is set and this bit is cleared. When the CCS bit is cleared (when no device is connected), this bit cannot be set. 0b: Not during port reset 1b: During port reset [Write] Set Port Reset This bit is used to issue a port reset (bus reset) to the downstream port. Writing 1b to this bit starts 10 ms of port reset. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to ports to which no device is connected, that port reset was performed.

Bit	Bit Name	Initial Value	R/W	Description
3	POCI	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port OverCurrent Indicator This bit indicates that the downstream port is in the overcurrent status. This bit is valid only when the setting is specified that the overcurrent status is reported for each port (OCPM bit = 1b). On the other hand, if the setting is specified that the overcurrent status is reported for all ports, this bit is always read as 0b. 0b: The port is in normal status. 1b: The port is in overcurrent status. [Write] Clear Suspend Status This bit is used to finish the Suspend status and start the Resume sequence. Writing 1b to this bit starts the Resume sequence. Writing 0b has no effect. The Resume sequence starts only when PSS (Port Suspend Status) is set.
2	PSS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Suspend Status This bit indicates that the port status is in Suspend or Resume sequence. 0b: The port is not in Suspend status. 1b: The port is in Suspend status. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is cleared under the following conditions: • When the Resume sequence finished, and the PSSC (Port Suspend Status Change) bit is set • When the port reset finished, and the PRSC (Port Reset Status Change) bit is set • When the host controller is in the USB Resume state [Write] Set Port Suspend This bit is used to change the port status to Suspend. Writing 1b to this bit changes the status to Suspend. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report to the ports to which no device is connected that the Suspend command was issued.
1	PES	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Port Enable Status This bit indicates whether the port status is Enable or Disable. If the host controller detects a bus error (for example, overcurrent state, disconnect, port power off, and babble error), it clears this bit. Then, the PESC (PortEnableStatusChange) bit is set. When the CCS bit is cleared (when no device is connected), this bit cannot be set. This bit is set “when port reset finished and the PRSC bit is set” or “when the port status becomes Suspend and the PRSC bit is set”. 0b: The port status is Disable. 1b: The port status is Enable. [Write] Set Port Enable This bit is used to set the PES bit. Writing 1b to this bit changes the port status to Enable. Writing 0b to this bit has no effect. If CCS is cleared, this bit cannot be set. Instead, CSC is set to 1b. This is performed to report that the status of the ports to which no device is connected was tried to be changed to Enable.

Bit	Bit Name	Initial Value	R/W	Description
0	CCS	0	R/W	The meaning of this bit differs depending on whether the operation is read or write. [Read] Current Connect Status The current connection status of the downstream port is applied to this bit. 0b: No device is connected. 1b: A device is connected. [Write] Clear Port Enable This bit is used to clear the PES (Port Enable Status) bit. Writing 1b to this bit changes the port status to Disable. Writing 0b to this bit has no effect.

32A.2.4.2 EHCI Controller Capability Register

(1) HCIVERSION/CAPLENGTH Register

Register abbreviation: CAPL_VERSION

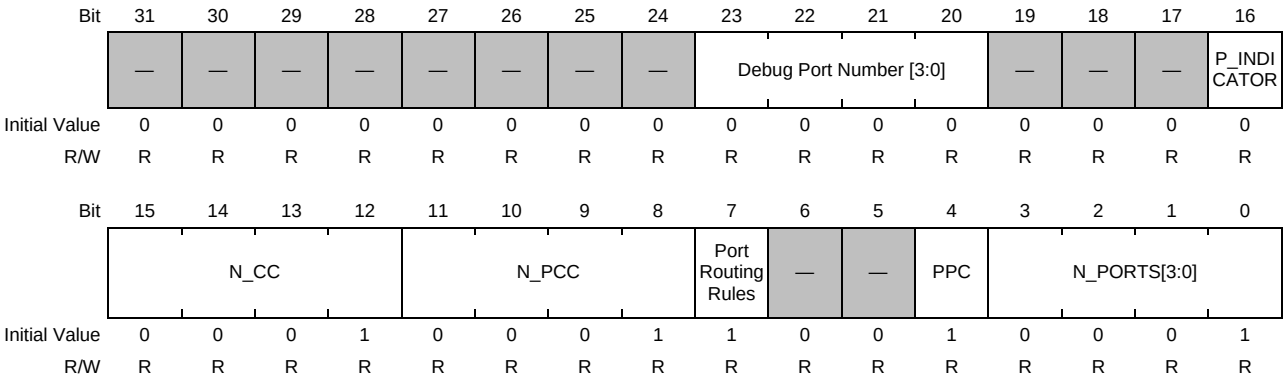
	—	—	—	—	—	—	—	—	Capability Registers Length[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	Interface Version Number	H'0110	R	This field indicates the EHCI version supported by the host controller. H'0110 is indicated because this host controller supports EHCI Rev1.1.
15 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 0	Capability Registers Length	H'20	R	This field is used as an offset that is added to the base address to find the start address of the EHCI Operational register. H'20 is indicated because the EHCI Operation register of this module starts from H'20.

(2) HCSPARAMS Register

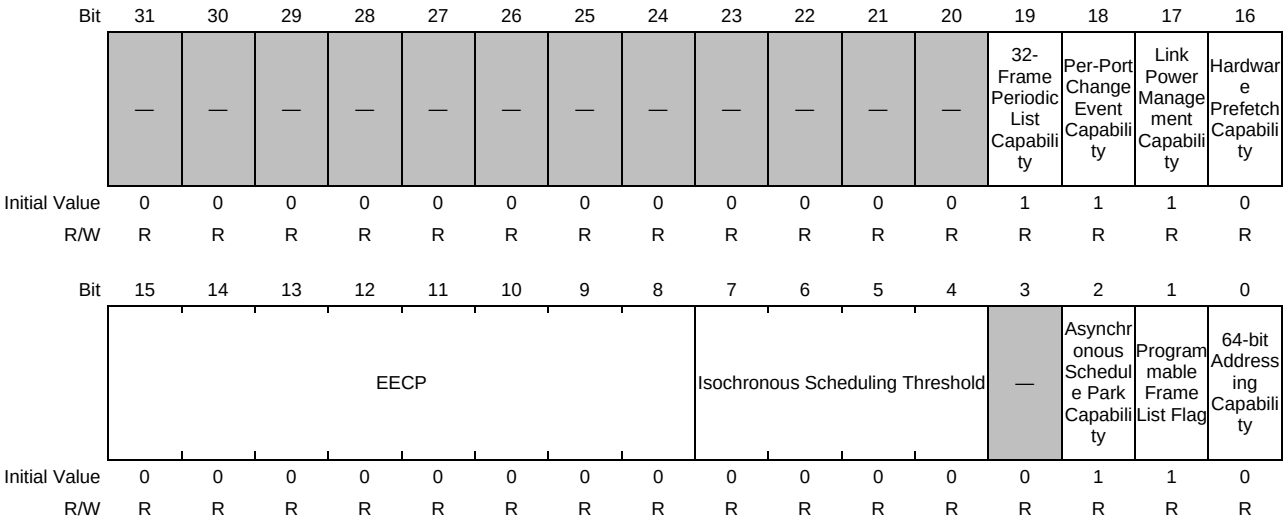
Register abbreviation: HCSPARAMS



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 20	Debug Port Number	All 0	R	This field indicates that the host controller port is a debug port. 0000b is indicated because this module does not have a debug port.
19 to 17	—	All 0	R	Reserved The write value should always be 0.
16	P_INDICATOR	0	R	Port Indicators This bit indicates whether the host controller supports port indicator control. 0b is indicated because this module does not support port indicator control.
15 to 12	N_CC	H'1	R	Number of Companion Controller This field indicates the number of OHCI host controllers implemented in this module. H'1 is indicated because this module has one OHCI host controller.
11 to 8	N_PCC	H'1	R	Number of Ports per Companion Controller This field indicates the number of ports supported by an OHCI host controller. The setting value of the Port_no field of the PCI Configuration EXT1 register is applied to this field.
7	Port Routing Rules	1	R	This bit indicates how individual ports are mapped to the OHCI host controller. This bit indicates 1b because, in this module, the contents of the HCSP_PORTROUTE register show the mapping method.
6, 5	—	All 0	R	Reserved The write value should always be 0.
4	PPC	1	R	Port Power Control This bit indicates how the port power of this module is controlled. 0b: The port power is always on. 1b: The PP bit of the PORTSC register controls the port power.
3 to 0	N_PORTS	H'1	R	This field indicates the number of physical downstream ports used by this module. 0001b: 1 Port

(3) HCCPARAMS Register

Register abbreviation: HCCPARAMS



Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved The write value should always be 0.
19	32-Frame Periodic List Capability	1	R	This bit indicates 1b because this module supports 32-Frame Periodic List defined in EHCI V1.1. This means that the Frame List Size field of the USBCMD register is set to 11b, so this module supports 32-Frame Periodic List.
18	Per-Port Change Event Capability	1	R	This bit indicates 1b because this module supports event detection function for ports that are defined in EHCI V1.1. This means that this module supports event detection function for ports, and is associated with the Pre-Port Change Event Enable field of the USBCMD register, Port-1 Change Detect field of the USBSTS register, and Port-1 Change Interrupt Enable field of the USBINT register. If this bit is 0b, the corresponding fields of the above registers are treated as Reserved.
17	Link Power Management Capability	1	R	This bit indicates 1b because this module supports LPM (Link Power Management) defined in EHCI V1.1. This means that this module supports LPM L1 state, and is controlled by the Suspend using L1 bit, Suspend Status bit, and Device Address field of the PORTSC register. If this bit is 0b, the corresponding bits and field of the above PORTC register are treated as Reserved.
16	Hardware Prefetch Capability	0	R	This bit indicates 0b because this module does not support the hardware prefetch function defined in EHCI V1.1.
15 to 8	EECP	All 0	R	This field indicates the offset address of the EHCI Extend Capabilities Registers. This field indicates H'00 because this module does not use EHCI Extend Capabilities Registers.
7 to 4	Isochronous Scheduling Threshold	All 0	R	This field indicates H'0 because this module does not support caches with isochronous data structure for the entire frame.
3	—	0	R	Reserved The write value should always be 0.
2	Asynchronous Schedule Park Capability	1	R	This bit indicates whether the Park mode is supported for High Speed QH (Queue Head) in an asynchronous schedule. This bit indicates 1b because this module supports the above function.

Bit	Bit Name	Initial Value	R/W	Description
1	Programmable Frame List Flag	1	R	This bit indicates the setting for the available frame list size. This bit indicates 1b for this module. If this bit is set to 1b, bit [3:2] (Frame List Size) of the USBCMD register can be used to set the available frame list size, and the frame list size smaller than 4 Kbyte is configurable.
0	64-bit addressing Capability	0	R	This bit indicates which type of memory pointer the data structure uses (32 bit address memory pointer or 64 bit address memory pointer). This bit indicates 0b for this module because this module has the data structure that uses 32 bit address memory pointer. 64 bit address is not supported.

(4) HCSP-PORTROUTE Register

Register abbreviation: HCSP_PORTROUTE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Companion Port Route[31:24]								Companion Port Route[23:16]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Companion Port Route[15:8]								Companion Port Route[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	Companion Port Route[31:0]	All 0	R	This field indicates the ports controlled by the OHCI host controller. This field indicates 0b for this module because this module has one OHCI host controller.

32A.2.4.3 HCI Operational Register

(1) USBCMD Register

Register abbreviation: USBCMD

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	Host-Initiated Resume Duration				Interrupt Threshold Control							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Per-Port Change Events Enable	—	—	—	Asynchronous Schedule Park Mode Enable	—	Asynchronous Schedule Park Mode Count		—	Interrupt on Async Advance Doorbell	Asynchronous Schedule Enable	Periodic Schedule Enable	Frame List Size		HCRESET	RS
Initial Value	0	0	0	0	1	0	1	1	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved The write value should always be 0.
27 to 24	Host-Initiated Resume Duration	All 0	R/W	This field indicates the minimum time of the K-state drive while the host controller resumes from the LPM (L1) state. The value in this field is sent to the connected device that has the LPM function via the HIDR field in the bmAttributes field of the LPM token. The encoded value of this field is defined as the name of the HIRD field in the LPM Token. Specifically, H'0 means 50 µs, and if the value is incremented by 1, 75 µs is incremented. For example, H'1 means 125 µs, and H'4 means 1175 µs.
23 to 16	Interrupt Threshold Control	H'08	R, R/W	This field indicates the maximum rate until the host controller issues an interrupt. Note that the setting values other than the following values are not guaranteed. Value / Maximum Interrupt Interval H'00 Reserved H'01 1 micro-frame H'02 2 micro-frames H'04 4 micro-frames H'08 8 micro-frames (default, equals to 1 ms) H'10 16 micro-frames (2 ms) H'20 32 micro-frames (4 ms) H'40 64 micro-frames (8 ms) Do not set H'00 to this field while the Halted bit is 0b.
15	Per-Port Change Events Enable	0	R/W	This field is used to enable the event report function of the ports defined by the Port-1 Change Detect field of the USBSTS register and the Port-1 Change Detect Enable field of the USBINTR register. 0b: The event report function of the ports is disabled. 1b: The event report function of the ports is enabled.
14 to 12	—	All 0	R	Reserved The write value should always be 0.
11	Asynchronous Schedule Park Mode Enable	1	R/W	This bit enables or disables the Asynchronous Schedule Park mode. 0b: The Park mode is disabled. 1b: The Park mode is enabled.

Bit	Bit Name	Initial Value	R/W	Description
10	—	0	R	Reserved The write value should always be 0.
9, 8	Asynchronous Schedule Park Mode Count	11b	R/W	This field sets the number of transactions that the host controller can serially execute for one QH (Queue Head) fetch in an asynchronous schedule. The valid value range is H'1 to H'3. This field is valid when bit 11 (Asynchronous Schedule Park Mode Enable) is 1b. Do not set H'0 to this field.
7	—	0	R	Reserved The write value should always be 0.
6	Interrupt on Async Advance Doorbell	0	R/W	This bit is used as the doorbell. In an asynchronous schedule processing, if you want an interrupt to occur before proceeding to the next QH (Queue), set this bit to 1b. After a QH processing normally finishes, the host controller clears this bit to 0b, and sets bit 5 (Interrupt on Async Advance bit) of the USBSTS register to 1b. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt occurs at the next interrupt timing. If the asynchronous schedule is disabled, do not write 1b to this bit.
5	Asynchronous Schedule Enable	0	R/W	This bit sets whether the host controller proceeds to the asynchronous list processing or skip the processing. 0b: The asynchronous list processing is skipped. 1b: Use the ASYNCLISTADDR register to proceed the asynchronous list processing.
4	Periodic Schedule Enable	0	R/W	This bit sets whether the host controller proceeds or skips the periodic list processing. 0b: The periodic list processing is skipped. 1b: Use the PERIODICLISTBASE register to proceed the periodic list processing.
3, 2	Frame List Size	0	R/W	This field specifies the frame list size. The setting value of this field determines the size of the Frame List Current index of the FRINDEX register. Value: the number of frames in Frame List 00b: 1024 frames (default) 01b: 512 frames 10b: 256 frames 11b: 32 frames
1	HCRESET	0	W	Host Controller Reset This bit is used to initialize the EHCI circuit of the host controller. If this bit is set to 1b, the host controller initializes the internal pipelines, counters, and state machines, and communications on the USB immediately stop. At this time, port reset is not issued to the downstream ports. Reset by this bit has no effect on the registers other than the EHCI Operational register. The EHCI Operational register is initialized, and the port owner returns to OHCI. Software must be reset to return the host controller to the operational state. When this reset processing finishes, the host controller sets this bit to 0b. Writing 0b to this bit cannot stop the reset processing. If the HCHalted bit of the USBSTS register is set to 0b, do not set 1b to this bit.
0	RS	0	R/W	Run/Stop This bit is used to run or stop the EHCI host controller. If this bit is set to 1b, the host controller starts operation. As long as this bit is set to 1b, the host controller continues running. If this bit is set to 0b, the host controller finishes the currently executing transaction and some other transactions, and then is changed to the Halt status. The HCHalted bit of the USBSTS register indicates that the host controller finished the transaction processing and entered into the stop status. If the host controller is in a status other than Halt (the HCHalted bit of the USBSTS register is 1b), do not write 1b to this bit.

(2) USBSTS Register

Register abbreviation: USBSTS

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	Port-1 Change Detect
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Asynchronous Schedule Status	Periodic Schedule Status	Reclamation	HCHalted	—	—	—	—	—	—	Interrupt on Async Advance	Host System Error	Frame List Rollover	Port Change Detect	USBERRINT	USBINT
Initial Value	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1Change Detect	0	R/W (1)	If this bit is set to 1b, it indicates that a change in the port status was detected. This bit is used only when the Per-Port Change Events Enable bit of the USBCMD register is set to 1b.
15	Asynchronous Schedule Status	0	R	This bit indicates the current status of the asynchronous schedule. 0b: The asynchronous schedule is disabled. 1b: The asynchronous schedule is enabled. If this bit and bit 5 (Asynchronous Schedule Enable) of the USBCMD register have the same value, the asynchronous schedule is enabled (1b) or disabled (0b).
14	Periodic Schedule Status	0	R	This bit indicates the current status of the periodic schedule. 0b: The periodic schedule is disabled. 1b: The periodic schedule is enabled. If this bit and bit 4 (Periodic Schedule Enable) of the USBCMD register have the same value, the periodic schedule is enabled (1b) or disabled (0b).
13	Reclamation	0	R	This bit is used to detect an empty asynchronous schedule. If this bit is 1b, the asynchronous schedule is empty. After reset or when a QH (H = 1) is fetched, the host controller clears this bit to 0b. Also, when the host controller executes an asynchronous transaction or detects a start event, it sets this bit to 1b. If this bit is 0b and a QH (H = 1) is fetched, the host controller is entered into the Async Sched Sleeping mode.
12	HCHalted	1	R	If the Run/Stop bit of the USBCMD register is 1b, this bit indicates 0b. If the software or host controller sets the Run/Stop bit to 0b, the host controller stops operation, and sets 1b to this bit. 0b: The EHCI host controller is running. 1b: The EHCI host controller is stopped.
11 to 6	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	Interrupt on Async Advance	0	R/W (1)	This bit indicates the Async Advance Interrupt status. After the host controller fetches the QH, it checks bit 6 (Interrupt on Async Advance Doorbell [IAAD] bit) of the USBCMD Register. If the IAAD bit is set to 1b, the host controller clears the IAAD bit after the QH processing normally finishes, and sets this bit. If bit 5 (Interrupt on Async Advance Enable bit) of the UBINTR register is set to 1b, an interrupt due to this source will occur at the next interrupt timing after 1b is set to this bit. If HCD writes 1b to this bit, this bit can be cleared. Writing 0b to this bit has no effect. 0b: Async Advance Interrupt not occurred. 1b: Async Advance Interrupt status is detected.
4	Host System Error	0	R/W (1)	This bit is set to 1b if a serious error occurs in the host controller. If this error occurs, the host controller clears the Run/Stop bit of the USBCMD register to 0b so that the subsequent schedules are not executed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: No system error occurred. 1b: A system error occurred.
3	Frame List Rollover	0	R/W (1)	If a frame list rollover occurs, the host controller sets this bit to 1b. Specifically, when the Frame Index field of the FRINDEX register is returned to H'000 from the maximum value (rollover), the host controller sets this bit to 1b. The maximum value (the value at which rollover occurs) depends on the Frame List Size field of the USBCMD register. For example, if the Frame List Size is 1024 frame, rollover occurs every time FRIMDEX [13] toggles. If the Frame List Size is 512 frame, rollover occurs every time FRINDEX [12] toggles. If the Frame List Size is 256 frame, rollover occurs every time FRINDEX [11] toggles. Writing 1b to this bit can clears this bit. Writing 0b to this bit has no effect. 0b: The frame list is not returned to H'000. 1b: The frame list is returned to H'000 (rollover occurred).
2	Port Change Detect	0	R/W (1)	This bit indicates that the port status has changed. Among the ports for which the Port Owner bit of the PORTSC1 register is set to 0b, if any port satisfies one of the following conditions, the host controller sets this bit to 1b: • Connect or Disconnect status of a device is detected, and the Connect Status Change bit of the PORTSC1 register is changed from 0 to 1. • A change of the Enable status of the port is detected, and the Port Enable/Disable Change bit of the PORTSC1 register is changed from 0 to 1. • The overcurrent state is detected, and the Over-current Change bit of the PORTSC1 register is changed from 0 to 1. • J-K transition is detected on a port in the Suspend status, and the Force Port Resume bit of the PORTSC1 register is changed from 0 to 1. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect.
1	USBERRINT	0	R/W (1)	USB Error Interrupt This bit indicates that a USB transaction finished with an error. When a USB transaction finishes with an error, the host controller sets this bit to 1b. If 1b is set to the IOC bit of qTD at which an error interrupt occurred, 1b is set to both of this bit and USBINT bit. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: USB transaction is normal. 1b: USB transaction finished with an error.

Bit	Bit Name	Initial Value	R/W	Description
0	USBINT	0	R/W (1)	USB Interrupt This bit indicates that a USB transfer has finished. The host controller sets this bit to 1b if one of the following conditions is satisfied: • A USB transfer has finished. • A short packet is received. Even if a USB transfer finished with an error, if IOC (Interrupt On Complete) of the TD is set to 1b, this bit is set to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: A USB transfer has not finished. 1b: A USB transfer has finished.

(3) SBINTR Register

Register abbreviation: USBINTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	Port-1 Change Event Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

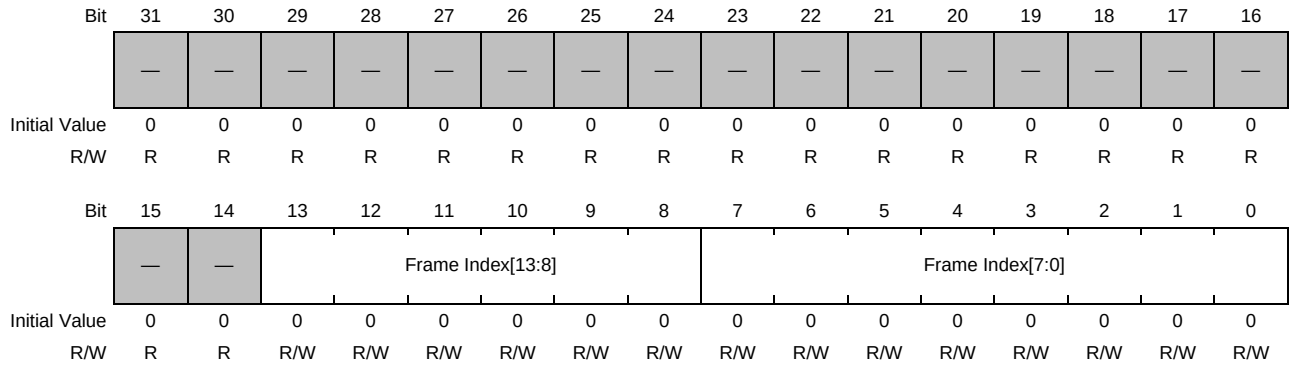
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	Interrupt on Async Advance Enable	Host System Error Enable	Frame List Rollover Enable	Port Change Detect Enable	USB Error Interrupt Enable	USB Interrupt Enable
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved The write value should always be 0.
16	Port-1 Change EventEnable	0	R/W	If this bit is 1b and the Port Change Detect bit of the USBSTS register is set to 1b, the host controller issues an interrupt.
15 to 6	—	All 0	R	Reserved The write value should always be 0.
5	Interrupt on Async Advance Enable	0	R/W	This bit sets whether bit 5 (Interrupt on Async Advance [IAA] bit) of the USBSTS register is enabled or disabled. If the IAA bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the IAA bit).
4	Host System Error Enable	0	R/W	This bit sets whether bit 4 (Host System Error [HSE] bit) of the USBSTS register is enabled or disabled. If the HSE bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the HSE bit).
3	Frame List Rollover Enable	0	R/W	This bit sets whether the bit 3 (Frame List Rollover [FLR] bit) of the USBSTS register is enabled or disabled. If the FLR bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the FLR bit).
2	Port Change Detect Enable	0	R/W	This bit sets whether bit 2 (Port Change Detect [PCD] bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the PCD bit).
1	USB Error Interrupt Enable	0	R/W	This bit sets whether bit 1 (USBERRINT bit) of the USBSTS register is enabled or disabled. If the USBERRINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBERRINT bit).

Bit	Bit Name	Initial Value	R/W	Description
0	USB Interrupt Enable	0	R/W	This bit sets whether bit 0 (IUSBINT bit) of the USBSTS register is enabled or disabled. If the USBINT bit is set to 1b while this bit is set to 1b, the host controller issues an interrupt at the next interrupt timing. 0b: Disabled. 1b: Enabled (an interrupt occurs via the USBINT bit).

(4) FRINDEX Register

Register abbreviation: FRINDEX



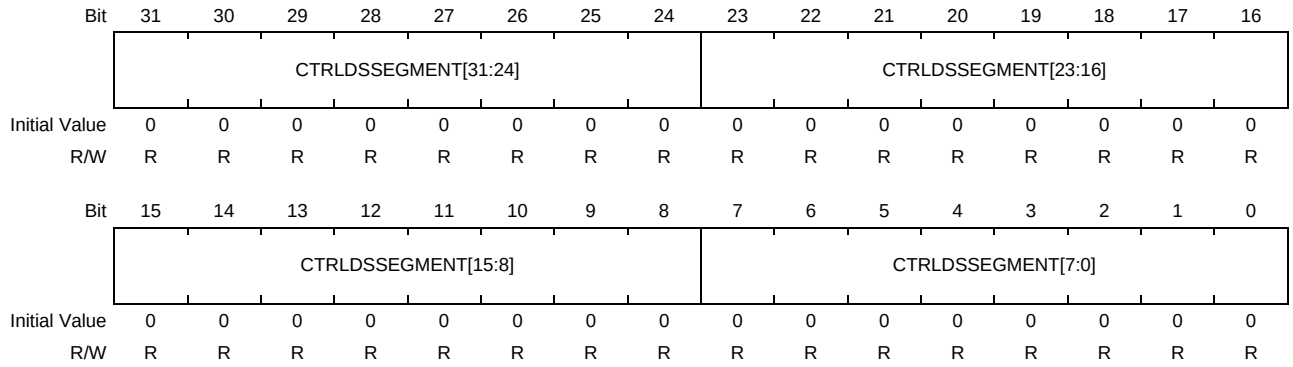
Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved The write value should always be 0.
13 to 0	Frame Index[13:0]	All 0	R/W	This field is used by the host controller to add an index to the periodic frame list. The value in this field is incremented at the end of a micro frame. Bit [N:3] of this field is used as the Frame List Current index. This means that, before the next index arrives, the current frame list is accessed 8 times. The value for N is determined, as follows, by the setting value of bit [3:2] (Frame List Size field) of the USBCMD register.

Frame List Size	Number of Frames	N
00b	1024	12
01b	512	11
10b	256	10
11b	32	12

Access this register only when the host controller is in stop status (bit 12 [HCHalted] = 1b). The setting value of this field is applied to the SOF frame number of the SOF token.

(5) CTRLDSSEGMENT Register

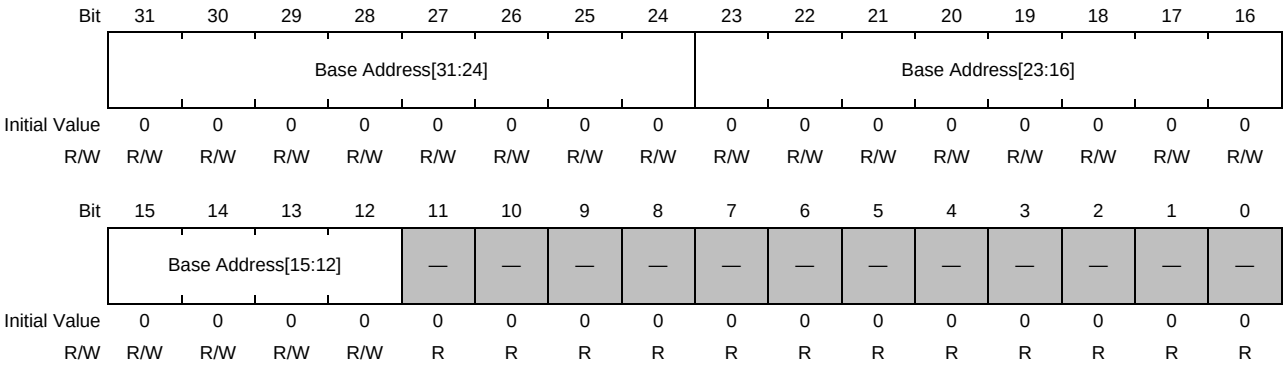
Register abbreviation: CTRLDSSEGMENT



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTRLDSSEGMENT	All 0	R	This register is not used because this module does not support 64-bit address method. Therefore, HCD must not access this register.

(6) PERIODICLISTBASE Register

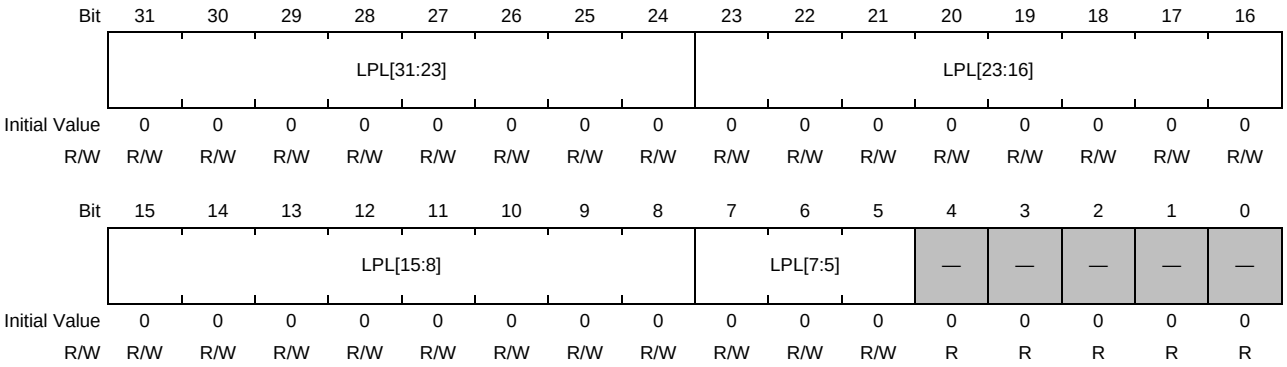
Register abbreviation: PERIODICLISTBASE



Bit	Bit Name	Initial Value	R/W	Description
31 to 12	Base Address	All 0	R/W	This field indicates the head address of the periodic frame list on the system memory. The host controller loads the contents of this register before starting the list processing. The host controller determines the frame list to be processed by using this field and Frame Index of the FRINDEX register. Align the address of the periodic frame list by 4 Kbyte. Normal operation is not guaranteed if any of these bits are changed during operation.
11 to 0	—	All 0	R	Reserved The write value should always be 0.

(7) ASYNCLISTADDR Register

Register abbreviation: ASYNCLISTADDR



Bit	Bit Name	Initial Value	R/W	Description
31 to 5	LPL	All 0	R/W	Link Pointer Low This field indicates the address (on the system memory) of the Asynchronous Queue Head to be processed next time. Align the address of Asynchronous Queue Head by 32 byte.
4 to 0	—	All 0	R	Reserved The write value should always be 0.

(8) CONFIGFLAG Register

Register abbreviation: CONFIGFLAG

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The write value should always be 0.
0	CF	0	R/W	Configuration Flag This bit controls which of OHCI or EHCI is routed by the port routing control circuit by default. At the end of the host controller configuration, this bit is set to 1b. 0b: The port routing control circuit routes each port to the OHCI host controller by default. 1b: The port routing control circuit routes each port to the EHCI host controller by default.

(9) PORTSC1Register

Register abbreviation: PORTSC1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Device Address							Suspend Status[1]	Suspend Status[0]	WKOC_E	WKDSCNNT_E	WKCNNT_E	Port Test Control

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	Device Address	All 0	R/W	This field indicates the USB device address (7 bits) of the device connected to the down port. This address is used when the LPM Token is sent. If the value of this filed is H'00, it means that no device that needs to use this field has been connected.
24, 23	Suspend Status	All 0	R	This field indicates the response from the connected device to the LPM Token (L1 transition request). 00b: The device succeeded transition to the L1 state (ACK received from the device). 01b: The device has not changed to the L1 state (NYET received from the device). 10b: The device does not support the L1 state transition (STALL received from the device). 11b: Other response (for example, Timeout error) Change this field only when the Suspend bit is 0b.
22	WKOC_E	0	R/W	Wake on Overcurrent Enable By writing 1b to this bit, the overcurrent state can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
21	WKDSCNNT_E	0	R/W	Wake on Disconnect Enable By writing 1b to this bit, device disconnection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.
20	WKCNNT_E	0	R/W	Wake on Connect Enable By writing 1b to this bit, device connection can be detected as an EHCI Wakeup event. If bit 12 (PP [Port Power] bit) is 0b, this bit becomes 0b.

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>19 to 16</td><td>Port Test Control</td><td>All 0</td><td>R/W</td><td>This field is controlled by the test mode.
If the value of this field is other than 0000b, it indicates that this module is running in the test mode.
<table>

The write value should always be 0.</td></tr>
<tr><td>13</td><td>Port Owner</td><td>1</td><td>R/W</td><td>This bit indicates which of OHCI or EHCI has the port ownership.
0b: EHCI has the port ownership.
1b: OHCI has the port ownership.
When bit 0 (Configure Flag bit) of the CONFIGFLA register is changed from 0b to 1b, this bit becomes 0b. If bit 0 (Configure Flag bit) of the CONFIGFLA register is 0b, this bit becomes 1b.
If the connected device is not a High Speed device, this bit is set to 1b to transfer the port ownership to OHCI.</td></tr>
<tr><td>12</td><td>PP</td><td>0</td><td>R/W</td><td>Port Power
This bit controls power supply to the port.
If this bit is 0b, power is not supplied to the port. Therefore, the port does not function, and does not recognize connection and disconnection.
If overcurrent is detected while this bit is set to 1b, the host controller clears this bit to 0b, and the power supplied to the port is stopped.
Note: As described later, if the PPC bit is 0b, this bit is fixed to 1b, so the power supplied to the port is not stopped.
The function of this bit differs depending on the value of bit 4 (PPC [Port Power Control] bit) of the HCSPARAMS register.
<table>

</table>

<table>
<tr><th>Bit</th><th>Bit Name</th><th>Initial Value</th><th>R/W</th><th>Description</th></tr>
<tr><td>9</td><td>Suspend using L1</td><td>0</td><td>R/W</td><td>Suspend using L1 (LPM) control bit.
If 1b is written to the Suspend bit (bit 7) while this bit is 1b, the state of this module is changed to the LPM state.
Writing to this bit is possible only when the Suspend bit (bit 7) is 0b.
0b: Suspend using L2
1b: Suspend using L1 (LPM)
If this bit is 1b and the Device Address field is other than H’0000, when the Suspend bit is set to 1b, the host controller generates an LPM Token to change the state to the L1 state.
If this bit is 0b, the host controller operates as L2 Suspend.</td></tr>
<tr><td>8</td><td>Port Reset</td><td>0</td><td>R/W</td><td>This bit indicates the reset status of the port.
0b: The port is not being reset.
1b: The port is being reset.
If 1b is written to this bit while this bit is 0b, the bus reset sequence defined in USB 2.0 standard starts. To finish the bus reset sequence, 0b must be written to this bit. Note that this bit must remain 1b long time enough to guarantee that the bus reset sequence defined in USB 2.0 standard will be complete.
If bit 12 (HCHalted) of the USBSTS register is 1b, do not set this bit to 1b.
If any of the PP (Port Power) bit, Port Owner bit, and Current Connect Status bit is in the following status, this bit becomes 0b.
Note: Even if 1b is written to this bit, the bus reset sequence does not start.
• PP (Port Power) bit = 0b
• Port Owner bit = 1b
• Current Connect Status bit = 0b</td></tr>
<tr><td>7</td><td>Suspend</td><td>0</td><td>R/W</td><td>This bit indicates the Suspend control and status of the port.
This bit and bit 2 (Port Enabled/Disabled bit) indicate the following port status.
<table>
<tr><th>Port Enabled</th><th>Suspend</th><th>Port Status</th></tr>
<tr><td>0b</td><td>—</td><td>Disable</td></tr>
<tr><td>1b</td><td>0b</td><td>Enable</td></tr>
<tr><td></td><td>1b</td><td>Suspend</td></tr>
</table>
To change the port state to L1 or L2 Suspend, set this bit to 1b.
Whether the host controller supports L1 Suspend state or L2 Suspend state depends on the value in the Suspend Using L1 bit.
In the Suspend state, data transfer to the downstream port is blocked by this port (except for port reset). If this bit is set to 1b during data transfer, blocking of transfer data does not occur until the current data transfer finishes.
Writing 0b to this bit has no effect.
This bit can be set to 1b only when all the following conditions are satisfied: “PP (Port Power) bit = 1b”, “Port Owner bit = 0b”, and “Current Connect Status bit = 1b”. If any of the following conditions is satisfied, the host controller clears this bit:
• “Resume is complete” is detected.
• The PR bit is set to 1b when PR (Port Reset) bit is 0b.
• The port owner is 1b (OHCI).
• The PP (Port Power) bit is set to 0b.
• The Port Enabled/Disabled bit is set to 0b.</td></tr>
</table>

Bit	Bit Name	Initial Value	R/W	Description
6	Force Port Resume	0	R/W	This bit indicates that the Resume state of the port is detected. 0b: Resume signal is not detected or output. 1b: Resume (K-state) is detected or output. When the port is in Suspend state, if the host controller detects transition of the state from J to K (if RemoteWakeup is detected from the connected device), it sets this bit to 1b. The host controller also sets the Port Change Detect bit or Port-1 Changes Detect bit of the USBSTS register to 1b. If this bit is set to 1b, the host controller does not set 1b to the Port Change Detect bit and Port-1 Changes Detect bit of the USBSTS register. While this bit is 1b, the Resume signal (FS K) is driven onto the USB bus. For L2 transition, this bit must be cleared to 0b after an appropriate time has passed. By writing 0b to this bit while this bit is 1b, the port status is recovered to be the HS Idle status. This bit remains 1b until the port is recovered. The host controller must finish transition to the HS Idle state within 2msec since this bit is cleared to 0b. On the other hand, for L1 transition, the host controller sends a Resume signal at necessary timing, and this bit is cleared to 0b at Resume recovery. Note that the software sets the length of the Resume signal driven by the host controller, by using the Host-Initiated Resume Duration field of the USBCMD register. If the Port Power (PP) bit is 0b, this bit becomes 0b.
5	Over-current Change	0	R/W (1)	This bit indicates that bit 4 (Over-current Active bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. 0b: Over-current Active bit has not changed. 1b: Over-current Active bit has changed.
4	Over-current Active	0	R	This bit indicates the overcurrent status of the port. If the host controller detects overcurrent, it disables the port, and set this bit to 1b. After the overcurrent state is released, the host controller automatically clears this bit from 1b to 0b. 0b: The port is not in overcurrent state. 1b: The port is in overcurrent state.
3	Port Enable/ Disable Change	0	R/W (1)	This bit indicates that the host controller detected frame babble. If the Host Controller detects frame babble, it disables the port and sets this bit to 1b. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: Frame babble has not occurred. 1b: Frame babble is detected.
2	Port Enabled/ Disabled	0	R/W	This bit indicates the Enable/Disable status of the port. The host controller resets the port, and enables the port if the connected device is recognized as an HS device, and sets this bit to 1b. The software cannot set this bit to 1b. If the host controller detects disconnection of a device or other errors, it disables the port, and clears this bit to 0b. The port also becomes disabled when 0b is written to this bit. If the port is disabled, data transfer to the downstream port is blocked except for port reset. If Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the port becomes enabled, and this bit is set to 1b. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The port is disabled. 1b: The port is enabled.
1	Connect Status Change	0	R/W (1)	This bit indicates that bit 0 (Current Connect Status bit) has changed. Writing 1b to this bit can clear this bit. Writing 0b to this bit has no effect. If the Port Power (PP) bit is 0b, this bit becomes 0b. 0b: The Current Connect Status bit has no change. 1b: The Current Connect Status bit has changed.

Bit	Bit Name	Initial Value	R/W	Description
0	Current Connect Status	0	R	This bit indicates the connection status of the port. If the host controller detects connection of a device, it sets this bit to 1b. Also, if Port Test Control [3:0] = 0101b (Test FORCE_ENABLE), the Host Controller sets this bit to 1b even if no device is connected. On the other hand, if the host controller detects disconnection of a device, it sets this bit to 0b. If the Port Power (PP) bit is 0b, or the Port Owner (PO) bit is 0b, this bit becomes 0b. 0b: No device is connected to the port. 1b: A device is connected to the port.

32A.2.4.4 AHB Bridge Register

(1) INT_ENABLE Register

Abbreviated name of register: INT_ENABLE

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
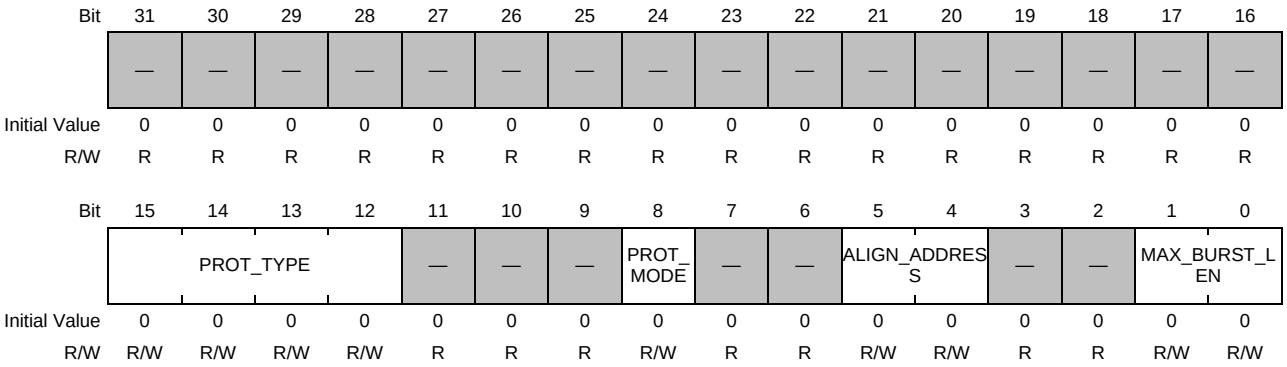
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R	R	R	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved The write value should always be 0.
4	WAKEON_INT	0	R/W (1)	This bit indicates the state of WAKEON interrupt from the HOST module. Writing 1b to this bit can clear this bit. 0b: No WAKEON interrupt 1b: WAKEON interrupt
3	UCOM_INT	0	R	This bit indicates the state of interrupt from the UCOM register. To clear the interrupt, use the UCOM2 Register. 0b: No UCOM register interrupt 1b: UCOM register interrupt
2	USBH_INTB	0	R	This bit indicates the state of EHCI interrupt. To clear the interrupt, use the USBSTS Register (of the EHCI Operational Register). 0b: No INTB interrupt 1b: INTB interrupt
1	USBH_INTA	0	R	This bit indicates the state of OHCI interrupt. To clear the interrupt, use the HcInterruptStatus Register (of the OHCI Operational Register). 0b: No INTA interrupt 1b: INTA interrupt
0	AHB_INT	0	R/W (1)	This bit indicates that a BUS Master error occurred. Writing 1b to this bit can clear this bit. 0b: No bus error occurred. 1b: A bus error occurred.

(3) AHB_BUS_CTR Register

Abbreviated name of register: AHB_BUS_CTR



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved The write value should always be 0.
15 to 12	PROT_TYPE	All 0	R/W	This field sets MHPROT [3:0] used when the BUS Master interface issues a transfer request. bit 15 0b: Cache disabled. 1b: Cache enabled. bit 14 0b: Buffer disabled. 1b: Buffer enabled. bit 13 0b: User access 1b: Privileged access bit 12 0b: Operation code 1b: Data
11 to 9	—	All 0	R	Reserved The write value should always be 0.
8	PROT_MODE	0	R/W	This bit selects the mode of MHPROT [3:0] used when the Master interface issues a transfer request. 0b: The value of PROT_TYPE is output as MHPROT [3:0]. 1b: When a DMA transfer is performed, MHPROT [3:0] is set to 0000b if the final burst is performed, or MHPROT [3:0] is set to the PROT_TYPE value if another burst transfer is performed.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5, 4	ALIGN_ADDRESS	All 0	R/W	This field sets the address boundary used when the BUS Master interface issues a burst transfer. 00b: A burst transfer is issued so that not to exceed 1-Kbyte boundary. 01b: A burst transfer is issued so that not to exceed 64-byte boundary. 10b: A burst transfer is issued so that not to exceed 32-byte boundary. (The maximum burst length is INCR8. This is because, if INCR16 is used, 32-byte boundary is exceeded.) 11b: A burst transfer is issued so that not to exceed16 byte boundary. (The maximum burst length is INCR4. This is because, if the length is at least INCR8, 16-byte boundary is exceeded.)
3,2	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	MAX_BURST_LEN	All 0	R/W	This field selects the maximum burst length used when the BUS Master interface issues a transfer request. 00b: INCR16 01b: INCR8 10b: INCR4 11b: SINGLE

(4) USBCTR Register

Abbreviated name of register: USBCTR

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	DIRPD	PLL_RST	USBH_RST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved The write value should always be 0.
2	DIRPD	0	R/W	USBPHY Standby Mode Control 0b: USBPHY normal operating mode 1b: USBPHY standby mode *Note*: When the USB module is not in use, setting this bit to 1 reduces power consumption by the USBPHY module. Only set it to 1 when the USB module is not in use. In transitions from USBPHY standby mode to USBPHY normal operating mode, assert the reset signal for the USBPHY module for at least 1 µs before the transition.
1	PLL_RST	1	R/W	This bit controls resetting of the USBPHY module. 0b: The USBPHY reset is released. 1b: The USBPHY module is reset.
0	USBH_RST	0	W	Software reset to this module. Setting this bit to 1b resets this module entirely. This bit is always read as 0b. *Note*: Set this bit only when the BUS Master interface of this module is not running. Access to this module becomes valid 10 CLK (internal bus clock [P1ϕ]) after this bit is written. 0b: Nothing occurs. 1b: Reset is issued to this module.

(5) Register Enable/Clock Gating Control Register (offset: H'304)

Abbreviated name of register: REGEN_CG_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NONUSE_CLK_MSK	—	HOST_CLK_MSK	PERI_CLK_MSK	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	NONUSE_CLK_MSK	0	R/W	This bit is used to mask the clock for the unused host or peripheral controller, depending on the setting value of the OTG_PERI bit of the COMMCTRL register. 0b: Do not mask the clock. 1b: Mask the clock. For details, see **Section 32A.3.1.2, Specifications of NONUSE_CLK_MSK operation**.
30	—	0	R	Reserved The write value should always be 0.
29	HOST_CLK_MSK	0	R/W	This bit is used to forcibly mask clock supply to the host controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
28	PERI_CLK_MSK	0	R/W	This bit is used to forcibly mask the clock supply to the peripheral controller. 0b: Do not mask the clock supply. 1b: Mask the clock supply. For details, see **Section 32A.3.1.3, Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations**.
27 to 24	—	All 0	R	Reserved The write value should always be 0.
23 to 0	—	All 0	R	Reserved The write value should always be 0.

(6) Suspend Control Register (offset: H'308)

Abbreviated name of register: SPD_CTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SUSPENDM_ENABLE	SLEEPM_ENABLE	—	—	—	—	—	—	WKCNNT_ENABLE	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R

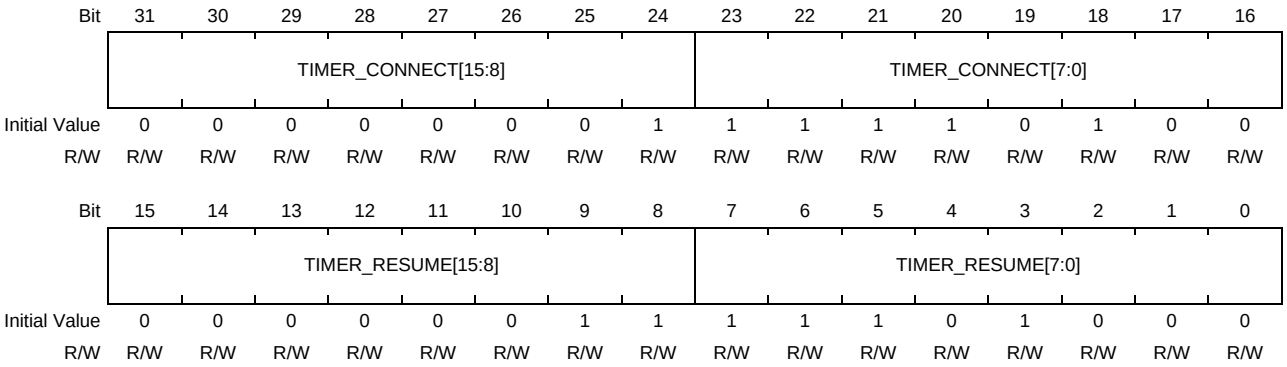
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GLOBAL_SUSPENDM_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SUSPENDM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the suspend status (the state in which PHY built-in PLL is stopped) when this module is changed to the USB Suspend mode. If this bit is set to 1b, the Suspend related bits of the OHCI/EHCI Operational registers below are set. If this module is changed to the USB Suspend mode, USBPHY is placed into the suspend status. [This function is valid for the following OHCI/EHCI Operational registers] EHCI: bit [7] (Suspend bit) of the PORTSC1 register OHCI: bit [2] (PSS bit) of the HcRhPortStatus register OHCI: bit [7:6] (HCFS field) of the HcControl register
30	SLEEPM_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (when the OTG_PERI bit of the COMMCTRL register is 0b). This bit is used to place USBPHY into the sleep status when the LPM function is used to change to the L1 Suspend mode. (In the sleep status, the PHY built-in PLL is running, but the 60MHz clock from USBPHY is gated.) This bit is valid when "Suspend using L1" of the POTSC register is 1b. If this bit is set to 1b, an L1 transition request is issued to the device. If the request is accepted, USBPHY is placed into the sleep status after the following EHCI register bit is set to 1b. [This function is valid for the following OHCI/EHCI Operational register] EHCI: bit [7] (Suspend bit) of the PORTSC1 register
29 to 24	—	All 0	R	Reserved The write value should always be 0.
23	WKCNNT_ENABLE	0	R/W	The setting of this bit is valid only in the Host mode (the OTG_PERI bit of the COMMCTRL register is 0b). If this bit is set to 1b, when a device disconnect occurs while USBPHY is in the suspend or sleep status, the suspend or sleep status is released. This bit is valid only when the SUSPENDM_ENABLE bit (bit 31) or SLEEP_ENABLE bit (bit 30) is 1b. *Note*: To set 1b to the SUSPENDM_ENABLE bit (bit 31) or SLEEPM_ENABLE bit (bit 30), as the general rule, set this bit to 1b. If, in the above case, this bit is not set to 1b, the suspend or sleep status cannot be released even if a device disconnect occurs.
22 to 1	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	GLOBAL_SUSPENDM_P1	0	R/W	The setting of this bit is valid regardless of the value of the OTG_PERI bit of the COMMCTRL register. This bit is used to forcibly place USBPHY into the suspend status (in which the PHY built-in PLL is stopped). If this bit is set to 1b, USBPHY is placed into the suspend status, regardless of the operating status and port status of the host controller. *Note*: – Do not set this bit to 1b during data transfer. We recommend that you set this bit to 1b after “stopping the EHCI/OHCI list processing” and “placing the port in the Disable status”. – If the SUSPENDM_ENABLE bit (bit 31) is 1b, do not set this bit to 1b.

(7) Suspend/Resume Timer Setting Register

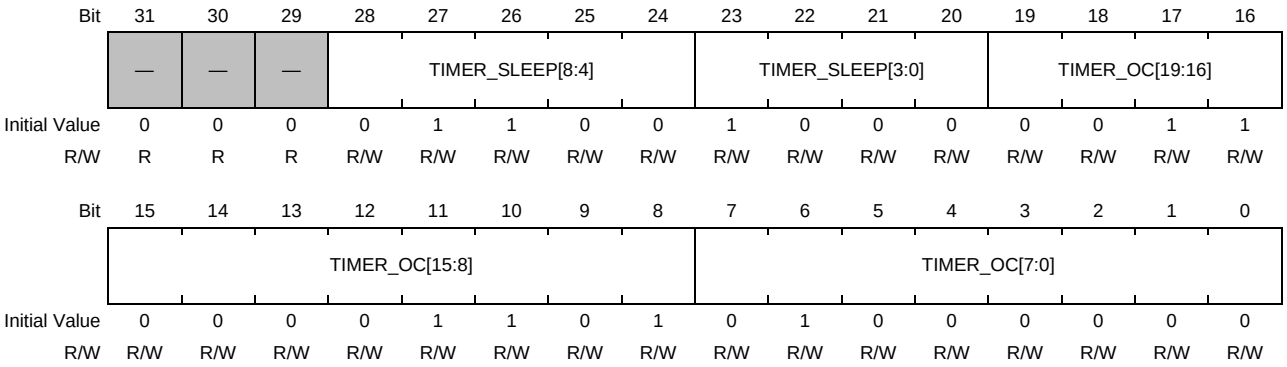
Abbreviated name of register: SPD_RSM_TIMSET



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TIMER_CONNECT[15:0]	H'01F4	R/W	This field indicates the timer value used by USBPHY to detect Device Connect/Disconnect of the device in the suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether Connect/Disconnect occurs is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 2.5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least H'FA
15 to 0	TIMER_RESUME[15:0]	H'03E8	R/W	This field indicates the timer value used by USBPHY to detect RemoteWakeup signal from the device in suspend status (in which the PHY built-in PLL is stopped) when the SUSPENDM_ENABLE bit of the SPD_CTRL register is set to 1b. When USBPHY is in suspend status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 5 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: At least H'1F4

(8) Overcurrent Detection/Sleep Timer Setting Register

Abbreviated name of register: OC_SLP_TIMSET



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved The write value should always be 0.
28 to 20	TIMER_SLEEP[8:0]	H'0C8	R/W	This field indicates the timer value used by USBPHY when the SLEEPM_ENABLE bit of the SPD_CTRL register is set to 1b. This timer value is used to measure the time for detecting RemoteWakeup reception and Resume-K drive time during sleep status (in which the PHY built-in PLL is running, but 60MHz clock from the USBPHY is gated). When USBPHY is in sleep status, whether the RemoteWakeup signal or not is judged by the internal bus clock (P1ϕ). According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes 1 µs. 1 bit = 1 cycle (µs) (Setting guideline) For 100 MHz: H'064
19 to 0	TIMER_OC[19:0]	H'30D40	R/W	This field indicates the timer value used for overcurrent detection. If the overcurrent input (OVRCUR) set in this field is continuously asserted (0b) for the duration set in this register, this module determines that overcurrent occurred. According to the internal bus clock (P1ϕ) frequency, specify the setting so that this timer value becomes at least 1 ms. 1 bit is 1 cycle (µs). (Setting guideline) For 100 MHz and 1 ms: At least H'1_86A0

(9) SBRN_FLADJ_PORTWAKECAP Register

Abbreviated name of register: SBRN_FLADJ_PW

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PORTWAKECAP[15:8]								PORTWAKECAP[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLADJ[7:0]								SBRN[7:0]							
Initial Value	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PORTWAKECAP[15:0]	H'0003	R/W	This field is used to mask the ports (of the connected device) that are used for Wakeup event. Operation on this field has no effect on the operation of the HOST module.
15 to 8	FLADJ[7:0]	H'20	R, R/W	This field adjusts the length of one micro frame by 16HS bit time unit. The initial value indicates H'20 (60000d HS bit time).
7 to 0	SBRN[7:0]	H'20	R	This field indicates the Serial Bus Release Number. The fixed value "H'20" is indicated.

(10) PORT_LPM_CTR1 Register

Abbreviated name of register: PORT_LPM_CTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	NYET_RETRY_CNT_P1[3:0]				REMOTEWAKE_EN_P1	SLEEP_INT_EN_P1	RETRY_ENABLE_NYET_P1	HIRD_SEL_P1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The write value should always be 0.
7 to 4	NYET_RETRY_CNT_P1[3:0]	All 0	R/W	This field sets the number of retries that are allowed when the response from the device in the LPM transaction was NYET. The setting value of this bit is valid if the RETRY_ENABLE_NYET_P1 bit (bit 1) is 1b. 0000b: No retry. 0001b to 1111b: Retries the set number of times. (MAX: 15 retries)
3	REMOTEWAKE_EN_P1	0	R/W	This bit is used to indicate the value of the RemoteWakeup bit of the LPM Token. 0b: RemoteWakeup is supported. 1b: RemoteWakeup is not supported.
2	SLEEP_INT_EN_P1	0	R/W	This bit is used to enable an interrupt to occur when a status other than ACK is received in the LPM transaction. The Per-Port Change interrupt can occur. 0b: No interrupt occurs. 1b: An interrupt occurs.
1	RETRY_ENABLE_NYET_P1	0	R/W	This bit is used to set the behavior of the host controller when a response from the device is NYET in an LPM transaction. 0b: No retry. 1b: Retries are made.

Bit	Bit Name	Initial Value	R/W	Description
0	HIRD_SEL_P1	0	R/W	This bit sets the time for K drive for when recovered from the Sleep state. Based on the setting values of this bit and EHCI USBCMD Register bit [27:24], the K drive time is determined as follows.

USBCMD Register	HIRD_SEL_P1 (Setting value of this bit)	
bit [27:24]	0b	1
0000b	75 µs	50 µs
0001b	100 µs	125 µs
0010b	150 µs	200 µs
0011b	250 µs	275 µs
0100b	350 µs	350 µs
0101b	450 µs	425 µs
0110b	950 µs	500 µs
0111b	1950 µs	575 µs
1000b	2950 µs	650 µs
1001b	3950 µs	725 µs
1010b	4950 µs	800 µs
1011b	5950 µs	875 µs
1100b	6950 µs	950 µs
1101b	7950 µs	1025 µs
1110b	8950 µs	1100 µs
1111b	9950 µs	1175 µs

32A.2.4.5 UCOM Register

(1) Common Control Register (offset: H'800)

Abbreviated name of register: COMMCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OTG_PERI	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	OTG_PERI	1	R/W	This bit specifies whether this module is set to the host mode or function mode. 0b: Host mode 1b: Function mode
30 to 0	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.

(2) OTG-BC Interrupt Status Register (offset: H'804)

Abbreviated name of register: OBINTSTA

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_STA	DMMONCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W(1)	R/W(1)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_STA	—	PDDETCHG1_STA	VBSTAINT_STA	VBSTACHG_STA	OCINT_STA	IDCHG_STA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R/W(1)	R	R/W(1)	R/W(1)	R/W(1)	R/W(1)	R/W(1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_STA	0	R/W (1)	This bit is set if the DPMON bit of the LINECTRL1 register has changed. 0b: The DPMON bit of the LINECTRL1 register has not changed. 1b: The DPMON bit of the LINECTRL1 register has changed.
16	DMMONCHG_STA	0	R/W (1)	This bit is set if the DMMON bit of the LINECTRL1 register has changed. 0b: The DMMON bit of the LINECTRL1 register has not changed. 1b: The DMMON bit of the LINECTRL1 register has changed.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_STA	0	R/W (1)	This bit is set if the CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The CHGDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b 1b: The CHGDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_STA	0	R/W (1)	This bit is set if the PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b. 0b: The PDDETSTS bit of the BCCTRL1 register has not changed from 0b to 1b. 1b: The PDDETSTS bit of the BCCTRL1 register has changed from 0b to 1b.
3	VBSTAINT_STA	0	R/W (1)	This bit is set if the value of the VBSTA bit of the VBCTRL register is equal to the value set to the VBLVL bit of the VBCTRL register. However, after this bit is set when the VBSTA bit and the VBLVL bit become equal, this bit might be cleared afterward. In such a case, if the value of the VBSTA bit has not changed, this bit is not be set, even if the value of the VBSTA bit is equal to the value of the VBLVL bit. Then, if the value of the VBSTA bit changes and becomes equal to the VBLVL bit again, this bit is set again. 0b: The VBSTA bit of the VBCTRL register is not equal to the value set to the VBLVL bit of the VBCTRL register. 1b: The VBSTA bit of the VBCTRL register becomes equal to the value set to the VBLVL bit of the VBCTRL register.
2	VBSTACHG_STA	0	R/W (1)	This bit is set if the state of the VBSTA bit of the VBCTRL register has changed. 0b: The VBSTA bit of the VBCTRL register has not changed. 1b: The VBSTA bit of the VBCTRL register has changed.
1	OCINT_STA	0	R/W (1)	This bit is set if the OVRCUR pin is asserted. 0b: The OVRCUR pin is not asserted (and remains 1b). 1b: The OVRCUR pin is asserted (and became 0b).

Bit	Bit Name	Initial Value	R/W	Description
0	IDCHG_STA	1	R/W (1)	This bit is set if the input value from the OTG_ID pin has changed. 0b: There is no change in the OTG_ID pin. 1b: There is a change in the OTG_ID pin. *Note*: The initial value is 1. Before using this bit, clear the status.

(3) OTG-BC Interrupt Enable Register

Abbreviated name of register: OBINTEN

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DPMONCHG_EN	DMMONCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CHGDETCHG1_EN	—	PDDETCHG1_EN	VBSTAINT_EN	VBSTACHG_EN	OCINT_EN	IDCHG_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved The write value should always be 0.
17	DPMONCHG_EN	0	R/W	DPMONCHG_STA bit interrupt enable 0b: Interrupt via the DPMONCHG_STA bit is disabled. 1b: Interrupt via the DPMONCHG_STA bit is enabled.
16	DMMONCHG_EN	0	R/W	DMMONCHG_STA bit interrupt enable 0b: Interrupt via the DMMONCHG_STA bit is disabled. 1b: Interrupt via the DMMONCHG_STA bit is enabled.
15 to 7	—	All 0	R	Reserved The write value should always be 0.
6	CHGDETCHG1_EN	0	R/W	CHGDETCHG1_STA bit interrupt enable 0b: Interrupt via the CHGDETCHG1_STA bit is disabled. 1b: Interrupt via the CHGDETCHG1_STA bit is enabled.
5	—	0	R	Reserved The write value should always be 0.
4	PDDETCHG1_EN	0	R/W	PDDETCHG1_STA bit interrupt enable 0b: Interrupt via the PDDETCHG1_STA bit is disabled. 1b: Interrupt via the PDDETCHG1_STA bit is enabled.
3	VBSTAINT_EN	0	R/W	VBSTAINT_STA bit interrupt enable 0b: Interrupt via the VBSTAINT_STA bit is disabled. 1b: Interrupt via the VBSTAINT_STA bit is enabled.
2	VBSTACHG_EN	0	R/W	VBSTACHG_STA bit interrupt enable 0b: Interrupt via the VBSTACHG_STA bit is disabled. 1b: Interrupt via the VBSTACHG_STA bit is enabled.
1	OCINT_EN	0	R/W	OCINT_STA bit interrupt enable 0b: Interrupt via the OCINT_STA bit is disabled. 1b: Interrupt via the OCINT_STA bit is enabled.
0	IDCHG_EN	0	R/W	IDCHG_STA bit interrupt enable 0b: Interrupt via the IDCHG_STA bit is disabled. 1b: Interrupt via the IDCHG_STA bit is enabled.

(4) VBUS Control Register

Abbreviated name of register: VBCTRL

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VGPUO	—	—	—	VBOUT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved The write value should always be 0.
29	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
28 to 22	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
21	—	0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
20 to 17	—	All 0	R	Reserved The write value should always be 0.
16	—	1	R	Reserved The write value should always be 1.
15 to 5	—	All 0	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
4	VGPUO	0	R/W	The level corresponding to the inverse of this bit (in terms of positive logic) is output from the OTG_EXICEN pin. This bit is used, for example, for control of the external power IC.
3 to 1	—	All 0	R	Reserved The write value should always be 0.
0	VBOUT	0	R/W	This bit is one of the VBUSEN control bits. This bit is used to assert VBUS by controlling the external power IC. 0b: VBUS output disable 1b: VBUS output enable If overcurrent occurs, this bit is automatically cleared to 0.

(5) Line Control Port 1 Register (offset: H'810)

Abbreviated name of register: LINECTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DPMLVL[1:0]		—	—	DPRPU_EN	DP_RPU	DPRPD_EN	DP_RPD	DMRPD_EN	DM_RPD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	DPMON	DMMON	—	IDMON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved
25, 24	DPMLVL[1:0]	All 0	R	These bits are used to detect through an interrupt that D+ and Din port 1 change to specified states. Specify the state of D+ in port 1 in DPMLVL[1] and the state of Din DPMLVL[0]; when both D+ and D- in port 1 become equal to the specified values (not when only either of the two is equal to the specified value), OBINTSTA.DPMINTSTA is set and a corresponding interrupt occurs if its occurrence is not masked. This function is used to detect a specified bus state such as J-state, K-state, or SE0.
23, 22	—	All 0	R	Reserved
21	DPRPU_EN	0	R/W	This bit enables the DP_RPU (bit 20) setting for pullup control of D+ in port 1. 0: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is disabled. 1: DP_RPU (bit 20) setting for pullup control of D+ in port 1 is enabled.
20	DP_RPU	0	R/W	This bit controls pullup of D+ in port 1. This control is enabled only when DPRPU_EN (bit 21) = 1. Note that if this bit is cleared to 0 when DPRPU_EN (bit 21) = 1, D+ is in the floating state while no device drives the USB bus. Note also that setting DPRPD_EN (bit 19) and DP_RPD (bit 18) to enabled is prohibited while this bit is set to enabled - that is, enabling both pullup and pulldown of D+ together is prohibited. 0: Pullup of D+ in port 1 is disabled. 1: Pullup of D+ in port 1 is enabled.
19	DPRPD_EN	0	R/W	This bit enables DP_RPD (bit 18) to control USB bus (DP) 15 kΩ Pulldown resister. 0b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is disabled. 1b: Control of DP-side 15 kΩ Pulldown resister by DP_RPD (bit 18) is enabled.
18	DP_RPD	0	R/W	This bit controls USB bus (DP) 15 kΩ Pulldown resister when DPRPD_EN (bit 19) = 1b. 0b: DP-side 15 kΩ Pulldown resister is OFF. 1b: DP-side 15 kΩ Pulldown resister is ON.
17	DMRPD_EN	0	R/W	This bit enables DM_RPD (bit 16) to control USB bus (DM) 15 kΩ Pulldown resister. 0b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is disabled. 1b: Control of DM-side 15 kΩ Pulldown resister by DM_RPD (bit 16) is enabled.
16	DM_RPD	0	R/W	This bit controls USB bus (DM) 15 kΩ Pulldown resister when DMRPD_EN (bit 17) = 1b. 0b: DM-side 15 kΩ Pulldown resister is OFF. 1b: DM-side 15 kΩ Pulldown register is ON.
15 to 4	—	All 0	R	Reserved The write value should always be 0.
3	DPMON	0	R	This bit indicates the value of USB bus DP.

Bit	Bit Name	Initial Value	R/W	Description
2	DMMON	0	R	This bit indicates the value of USB bus DM.
1	—	0	R	Reserved The write value should always be 0.
0	IDMON	0	R	This bit indicates the value of the OTG_ID pin.

(6) BC Control Port 1 Register

Abbreviated name of register: BCCTRL1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PDDETSTS	CHGDETSTS	—	—	DCPMODE	VDMSRCE	IDPSINKE	VDPSRCE	IDMSINKE	IDPSRCE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	H'00_C000	R	Reserved When read, the initial value is read. When writing, be sure to write the initial value.
9	PDDETSTS	0	R	This bit indicates the USBPHY Portable Device Detect signal state.
8	CHGDETSTS	0	R	This bit indicates the USBPHY Charging Downstream Port Detect signal state.
7, 6	—	All 0	R	Reserved The write value should always be 0.
5	DCPMODE	0	R	If USBPHY is used as DCP (Dedicated Charging Port), this bit is set to 1b.
4	VDMSRCE	0	R/W	This bit controls the USBPHY built-in VDM_SRC circuit. If this bit is set to 1b, VDM_SRC goes ON, and the DM pin is driven.
3	IDPSINKE	0	R/W	This bit controls the USBPHY built-in Portable Device Detect circuit. If this bit is set to 1b, Portable Device detection is enabled.
2	VDPSRCE	0	R/W	This bit controls the USBPHY built-in VDP_SRC circuit. If this bit is set to 1b, VDP_SRC goes ON, and the DP pin is driven.
1	IDMSINKE	0	R/W	This bit controls the USBPHY built-in Charging Downstream Port Detect circuit. If this bit is set to 1b, Charging Downstream Port detection is enabled.
0	IDPSRCE	0	R/W	This bit controls the USBPHY built-in IDP_SRC circuit. If this bit is set to 1b, IDP_SRC goes ON, and the DP pin is driven.

32A.3 Clock Signals

32A.3.1 Clock Gating Specifications

32A.3.1.1 Overview of clock gating

Because this module has a feature of switching the host controller and peripheral controller, clock supply to the unused controller might not be necessary.

Therefore, three clock gating control bits are allocated in the Register Enable/Clock Gating Control Register for the purpose of reducing power consumption by implementing clock gating for the “circuits that do not require clock supply temporarily.”

The clock gating control bits can be controlled to gate the clock that is supplied to the host controller or the peripheral controller.

[Target Register]

Register Enable/Clock Gating Control Register (offset:H’304)

[Functional specification]

bit	Symbol	Functional specification
31	NONUSE_CLK_MSK	Gating clocks for unused host controller or peripheral controller.
29	HOST_CLK_MSK	Gating clocks for host controller.
28	PERI_CLK_MSK	Gating clocks for peripheral controller.

32A.3.1.2 Specifications of NONUSE_CLK_MSK operation

This function automatically gates the clock to the unused host controller or the unused peripheral controller.

This function is enabled if the NONUSE_CLK_MSK bit (bit 31) is set to 1b.

If it is no problem whether the clock supply to the unselected function is stopped, use this function.

The following table shows the operating specifications of this function, based on the setting of the OTG_PERI bit (bit 31) of the Common Control Register (offset: H’800).

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
1	0	0	0		✓
			1	✓	

[Note on using the NONUSE_CLK_MSK bit]

If the NONUSE_CLK_MSK bit is used, as the general rule, set the HOST_CLK_MSK/PERI_CLK_MSK bit to 0b.

If the HOST_CLK_MSK/PERI_CLK_MSK bit is 1b, the effect of clock gating becomes logical OR of each bit.

32A.3.1.3 Specifications of PERI_CLK_MSK and HOST_CLK_MSK operations

This function forcibly gates the clock to the host controller and function controller.

The following table shows the operating specifications of this function.

Clock Gating Register Setting			Host/Peripheral Switching Setting	Gating Target	
			Register		
NONUSE_CLK_MSK	HOST_CLK_MSK	PERI_CLK_MSK	OTG_PERI	Host Controller	Function Controller
0	1	0	—	✓	
	0	1	—		✓
	1	1	0	✓	✓

Note: If the HOST_CLK_MSK/PERI_CLK_MSK bit is used, as the general rule, set the NONUSE_CLK_MSK bit to 0b.
If the NONUSE_CLK_MSK bit is set t0 1b, the effect of clock gating becomes logical OR of each bit.

32A.4 Interrupt Sources

32A.4.1 Interrupt Signals

This module has the five interrupt signals listed below.

Interrupt Source Name	Interrupt Type	Pulse/ Level	Active Level
U2H_INT	BUS Master interrupt signal. This signal is asserted when a bus error occurs in the BUS Master. Interrupt control is performed by the AHB Bridge Register.	Level	H
U2H_OHCI_INT	OHCI interrupt signal This signal is asserted during FS/LS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the OHCI Operational Register.	Level	H
U2H_EHCI_INT	EHCI interrupt signal. This signal is asserted during HS transfer, when data transfer finishes or when the change of the USB bus state is detected. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_WAKEON_INT	EHCI Wakeup interrupt signal. This signal is asserted by an EHCI Wakeup event. Interrupt control is performed by the EHCI Operational Register.	Level	H
U2H_OBINT	OTG/Battery Charging interrupt signal. This signal is asserted by OTG or Battery Charging related event. Interrupt control is performed by the UCOM2 Register.	Level	H

32A.4.2 Interrupt Sources and Control

32A.4.2.1 U2H_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the register below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H’200) bit[0] (AHB_INTEN)

[Interrupt source]

A bus error (MHRESP = 1b) occurs in the AHB master.

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H’204) bit[0] (AHB_INT)

32A.4.2.2 U2H_OHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[1] (USBH_INTAEN)

OHCI Operational Register HcInterruptEnable Register (offset:H'010) bit[31], bit[6:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting							
			HcInterruptEnable						
		USBH_INTAEN	bit [31] MIE	bit [6] RHSCE	bit [5] FNOE	bit [3] ROE	bit [2] SFE	bit [1] WDHE	bit [0] SOE
1	Device connection is detected.	✓	✓	✓					
2	Device disconnection is detected.	✓	✓	✓					
3	Port power is OFF (excluding overcurrent detection).	✓	✓	✓					
4	Babble error is detected during a USB transfer.	✓	✓	✓					
5	Resume is complete.	✓	✓	✓					
6	Overcurrent is detected.	✓	✓	✓					
7	Bus reset is complete.	✓	✓	✓					
8	When the HcRhDescritorB Register DR bit is 1b, OHCI becomes "USB Operational" (HCFS[1:0] bit = 10b) or "USB Suspend" (HCFS[1:0] bit = 11b).	✓	✓	✓					
9	When no device is connected (CCS bit = 0b), 1 is written to bit [0] (Clear Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
10	When no device is connected (CCS bit = 0b), 1 is written to bit [1] (Set Port Enable) of the OHCI HcRhPort Status register.	✓	✓	✓					
11	When no device is connected (CCS bit = 0b), 1 is written to bit [2] (Set Port Suspend) of the OHCI HcRhPort Status register.	✓	✓	✓					
12	When no device is connected (CCS bit = 0b), 1 is written to bit [3] (Clear Suspend Status) of the OHCI HcRhPort Status register.	✓	✓	✓					
13	When no device is connected (CCS bit = 0b), 1 is written to bit [4] (Set Port Reset) of the OHCI HcRhPort Status register.	✓	✓	✓					
14	When no device is connected (CCS bit = 1b), the port power is turned off.	✓	✓	✓					
15	The MSB of bit [15:0] (Frame Number) of the HcFmNumber register has changed.	✓	✓		✓				
16	RemoteWakeup signal (Resume signal) is detected from a device.	✓	✓			✓			
17	HccaFrameNumber is updated. (Almost the same meaning as SOF is sent.)	✓	✓				✓		
18	A transfer finishes (including an error), and the host module updated HccaDoneHead.	✓	✓					✓	
19	USB schedule overrun occurred for the frame.	✓	✓						✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

OHCI Operational Register HcInterruptStatus Register (offset:H'00C) bit[6:0]

32A.4.2.3 U2H_EHCI_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.
AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[2] (USBH_INTBEN)

EHCI Operational Register USBINTR Register (offset:H'128) bit[17:16], bit[5:0]*1

Note 1. Enable the bit required as the assertion source.

Also, control the relevant bit(s) in the register below as required.

EHCI Operational Register USBCMD Register (offset:H'120) bit[15], bit[6]

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting									
			USBCMD		USBINTR						
			bit [15]	bit [6]	bit [17]	bit [16]	bit [5]	bit [3]	bit [2]	bit [1]	bit [0]
		USBH_INTBEN	Per-Port Change Event	Doorbell	Port-1 Change	Event	Async Advance	Frame List Rollover	Port Change	USB ERRINT	USB INT
[1]	Device connection is detected.	✓							✓		
[2]	Device disconnection is detected.	✓							✓		
[3]	Overcurrent is detected.	✓							✓		
[4]	RemoteWakeup signal (Resume Signal) is detected from a device.	✓									
[5]	Babble status of the USB bus is detected.	✓							✓		
[6]	USB transfer with "qTD IOC = 1b" normally finishes.	✓									✓
[7]	Short packet is received.	✓									✓
[8]	USB transfer finished with an error. (Retry transfer failed three times. A bubble error was detected. STALL was received.)	✓								✓	
[9]	The QH processing normally finished while the USBCMD Register bit [6] (Interrupt on Async Advance Doorbell) is 1b.	✓		✓			✓				
[10]	The FRINDEX Register FrameIndex bit returned from the maximum value to H'000 (rollover detected).	✓						✓			
[11]	The Port Change Detect event (interrupt source 1 to 5) was detected.	✓	✓			✓					

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

EHCI Operational Register USBSTS Register (offset:H'124) bit[17:16], bit[5:0]

32A.4.2.4 U2H_WAKEON_INT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[4] (WAKEON_INTEN)

EHCI Operational Register PORTSC[1:2] Register (offset:H'164/H'168) bit[22:20]*1

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

Interrupt Source		Registers That Require Interrupt Enable Setting			
			PORTSC		
		WAKEON_INTEN	bit [22]	bit [21]	bit [20]
			WKOC_E	WKDSCNNT_E	WKCNNT_E
1	Device connection is detected.	✓			✓
2	Device disconnection is detected.	✓		✓	
3	Overcurrent is detected.	✓	✓		
4	RemoteWakeup signal (Resume Signal) is detected from a device.	✓			

[Clearing the interrupt]

To clear the interrupt, write 1b to the relevant bit in the register below.

AHB Bridge Register INT_STATUS Register (offset:H'204) bit[4] (WAKEON_INT)

32A.4.2.5 U2H_OBINT assertion source and control

[Interrupt enable control by register]

Assert the interrupt enable bit in the registers below. The interrupt signal is asserted when an interrupt source occurs.

AHB Bridge Register INT_ENABLE Register (offset:H'200) bit[3] (UCOM_INTEN)

UCOM Register OTG-BC Interrupt Enable Register (offset:H'808) bit[27:24], bit[18:16], bit[12:8], bit[3:0]*[1]

Note 1. Enable the bit required as the assertion source.

[Interrupt source]

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [17]	bit [16]
	Interrupt Source	UCOM_INTEN	DPMONCHG_EN	DMMONCHG_EN
1	The DP pin has changed.	✓	✓	
2	The DM pin has changed.	✓		✓

		Registers That Require Interrupt Enable Setting		
			OTG-BC Interrupt Enable	
			bit [6]	bit [4]
	Interrupt Source	UCOM_INTEN	CHGDETCHG1_EN	PDDETCHG1_EN
1	The portable device detection signal has changed.	✓		✓
2	The charging port detection signal has changed.	✓	✓	

		Registers That Require Interrupt Enable Setting				
			OTG-BC Interrupt Enable			
			bit [3]	bit [2]	bit [1]	bit [0]
	Interrupt Source	UCOM_INTEN	VBSTAINT_EN	VBSTACHG_EN	OCINT_EN	IDCHG_EN
1	It is detected that the value of the VBUSIN pin becomes equal to the value set to bit [21] (VBLVL) of the VBUS Control Register.	✓	✓			
2	The VBUSIN pin has changed.	✓		✓		
3	Overcurrent is detected. (The change of the OVRCUR pin from 1 to 0b is detected.)	✓			✓	
4	The OTG_ID pin has changed.	✓				✓

[Clearing the interrupt]

To clear the interrupt, write 1b to the bit corresponding to the interrupt source in the register below to clear the interrupt.

UCOM Register OTG-BC Interrupt Status Register (offset:H'804) bit[27:24], bit[18:16], bit[12:8], bit[3:0]

32A.4.3 Timing of De-asserting Interrupt Signals

After the register access to clear an interrupt source, it may take time to begin clearing the interrupt triggered by the interrupt source. Therefore, take a measure to prevent the false recognition of interrupts during the period from the end of the register clear access until the next interrupt is recognized.

32A.5 Power-Saving Function

This module controls power consumption by using the following two methods:

1. Controlling the SUSPENDM/SLEEPM pin of USBPHY
2. Using clock gating to stop the clock to the host controller or peripheral controller.

32A.5.1 Controlling the SUSPENDM and SLEEPM Pins of the USBPHY

You can expect the following power-saving effects by asserting the SUSPENDM and SLEEPM pins of the USBPHY:

- Reducing the power consumption by the USBPHY
- Reducing the power consumption by the host core by stopping the clocks from the USBPHY

As described at **Section 32A.1.2.5, Suspend extension function**, by default, the SUSPENDM and SLEEPM pins of the USBPHY are not asserted even when EHCI and OHCI are put into the Suspended state.

See **Section 32A.2.4.4(6), Suspend Control Register (offset: H'308)** and control the relevant registers appropriately.

32A.5.2 Controlling the Clock-Gating Function

See **Section 32A.2.4.4(5), Register Enable/Clock Gating Control Register (offset: H'304)** and **Section 32A.3.1, Clock Gating Specifications**, then control the relevant registers appropriately.

32A.6 Battery Charging

32A.6.1 Support of charging port

The charging port refers to a port that supplies power in compliance with the Battery Charging Specification. The charging port is usually installed on the host controller.

Charging ports can be generally classified by function as described below.

Type	Function
CDP (Charging Downstream Port)	Downstream port that can supply power in compliance with the Battery Charging Specification. This type of charging port detects a portable device, and after the handshake (for Battery Charging) finishes, it proceeds to the usual device connect sequence (and operates as the usual host).
DCP (Dedicated Charging Port)	Port that provides only power supply function in compliance with the Battery Charging Specification. This type of charging port does not operate as the usual host.
SDP (Standard Downstream Port)	Standard Downstream Port that is not compliant with the Battery Charging Specification. This type of charging port supplies power in the range conforming to the conventional USB 2.0 standard, and operates as the usual host.

32A.6.2 Support of portable device

A portable device refers to a device that is supplied power (or that requests power supply) in compliance with the Battery Charging Specification. The portable port is usually installed in the peripheral controller.

32A.7 Bus Master

32A.7.1 Functional specifications of the bus master

32A.7.1.1 Supported bus master functions

Function as the BUS MASTER	Status
Residual burst after an error response is received	The transfer is not stopped.
1 Kbyte boundary processing	The fixed length burst (INCRx) across 1 Kbyte boundary is not performed.

32A.7.1.2 Issuing requests for different types of bus transfer

MHTRANS[1:0]	MHSIZE[2:0]	MHWRITE	MHBURST[2:0]	Reply	Remarks
IDLE (00b)	—	—	—	—	—
BUSY (01b)	—	—	—	—	Not issued.
NONSEQ (10b)	32-bit (010b)	WRITE	SINGLE INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ			
	8-bit (000b) 16-bit (001b)	WRITE	SINGLE	OKAY/ERROR	8-bit/16-bit transfer is issued (SINGLE only). A response error is reported by an interrupt.
	other than the above	—	—	—	Not issued.
SEQ (11b)	32-bit (010b)	WRITE	INCR4 INCR8 INCR16	OKAY/ERROR	32-bit transfer is issued. A response error is reported by an interrupt, and the transfer is not stopped.
		READ		OKAY/ERROR	
	other than the above	—	—	—	Not issued.

32A.7.1.3 Supported responses

Response type	Response	Remarks
OKAY	Enable	Supported.
ERROR	Enable	A response error is reported by an interrupt, and termination of transfer (Early Burst Termination) is not performed.

32A.7.1.4 Protection control information

The value of MHPROT[3:0] can be set in the PROT_TYPE bits (bits [15:12]) in the AHB_BUS_CTR Register (offset: H’208).

Also, when the PROT_MODE bit (bit 8) in the AHB_BUS_CTR Register is set, only the last data transfer in an EHCI/OCHI DMA transfer can be handled as a non-buffered transfer, and other transfers can be handled as buffered transfers.

32A.7.1.5 Maximum burst length

The maximum burst length can be selected from SINGLE, INCR4, INCR8, and INCR16 by using the MAX_BURST_LEN bits (bit[1:0]) in the AHB_BUS_CTR Register (offset: H’208). The maximum burst length is common to reading and writing.

32A.7.1.6 Boundary of transfer data

The value of MHADDR[31:0] bits does not exceed 1 KB boundary during a burst transfer. Also, you can change the address boundary for burst transfer to 16, 32, or 64 bytes by writing a value to the ALIGN_ADDRESS bits (bit[5:4]) in the AHB_BUS_CTR Register (offset: H’208).

32A.7.1.7 Start address of fixed-length INCR burst transfer

The following table lists the values of the lower bits of MHADDR to be applied when a fixed-length INCR burst transfer starts.

ALIGN_ADDRESS Setting	Fixed length Start Address of INCR Burst		
	INCR4	INCR8	INCR16
00b (Aligned at the 1-Kbyte boundary)	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3D0 H'3D4 H'3D8 H'3DC H'3E0 H'3E4 H'3E8 H'3EC H'3F0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3C8 H'3CC H'3D0 H'3D4 H'3D8 H'3DC H'3E0	MHADDR[9:0] = H'000 H'004 H'008 H'00C H'010 : H'3B8 H'3BC H'3C0
01b (Aligned at the 16-byte boundary)	MHADDR[3:0] = H'0	-- (Not issued)	-- (Not issued)
10b (Aligned at the 32-byte boundary)	MHADDR[4:0] = H'00 H'04 H'08 H'0C H'10	MHADDR[4:0] = H'00	-- (Not issued)
11b (Aligned at the 64-byte boundary)	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20 H'24 H'28 H'2C H'30	MHADDR[5:0] = H'00 H'04 H'08 H'0C H'10 H'14 H'18 H'1C H'20	MHADDR[5:0] = H'00

32A.8 Overcurrent Control and VBUS Control

32A.8.1 OVRCUR/VBUSEN pin

Overcurrent detection on the USB port and port power (VBUS) control are performed by the external power IC connected to this module.

This module pin	Input/Output	Level	Description
OVRCURI	Input	L	Overcurrent status was detected.
		H	Overcurrent status was not detected.
VBUSEN	Output	L	Port Power (VBUS) OFF
		H	Port Power (VBUS) ON

32A.8.2 Overcurrent detection timer setting

This module detects overcurrent when the OVRCUR pin remains asserted (0b) for a set period.

The period over which assertion of the OVRCUR pin is required (“vercurrent detection time”) can be set in the following register.

Register	Overcurrent detection/sleep timer setting register (offset: H'310)
Bits	TIMER_OC[19:0]
Initial value	H'3_0D40

The overcurrent detection time can be converted from the setting value of the above register, taking that one bit equal to the internal bus clock (P1ϕ) cycle.

Therefore, set the value of the above register at initial configuration, considering “the internal bus clock (P1ϕ) frequency to be used” and “the overcurrent detection time you want to specify”.

32A.8.3 Port Power (VBUS) control specifications

VBUSEN can be controlled by the Port Power bit of the EHCI/OHCI Operational register or by the VBOUT bit of the VBUS Control Register. Which of the above bit controls VBUSEN is determined by the PMODEPFS register on the general input/output port.

The following table describes control examples by the Port Power bit of the EHCI/OHCI Operational register.

Situation		Register		bit
EHCI control		PORTSC1 (offset: H'164)		bit 12 (PP)
OHCI control	Global control*1	ON setting	HcRhStatus Register (offset: H'050)	bit 16 (Set Global Power)
		OFF setting		bit 0 (Clear Port Status)
	Selective control*2	ON setting	HcRhPortStatus1 Register (offset: H'054)	bit 8 (Set Port Power)
		OFF setting		bit 9 (Clear Port Power)

Note 1. Global control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 0b
or
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 0b

Note 2. Selective control refers to the status in which the register settings are as follows:
HcRhDescriptorA Register (offset: H'048) bit 8 (PSM) = 1b
and
HcRhDescriptorB Register (offset: H'04C) bit 17 (PPCM[1]) = 1b

However, if the register settings are as follows, the VBUSEN pin is always asserted (1b), and the Port Power (VBUS) becomes ON, regardless of the OVRCUR pin's status.

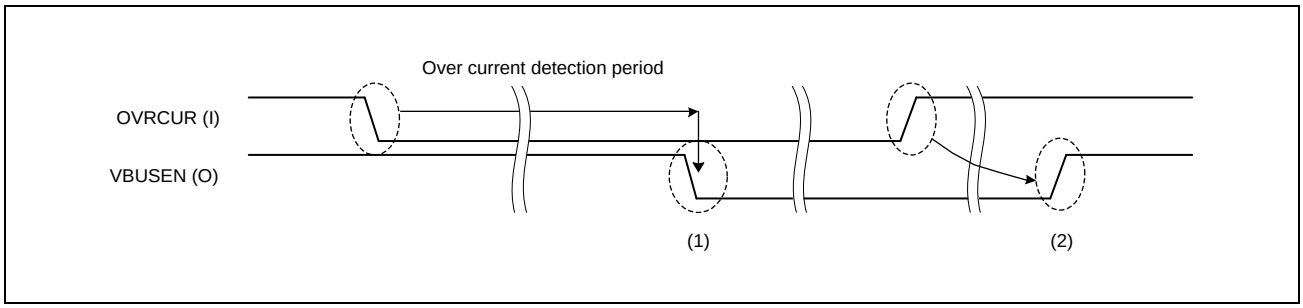
Specify the settings as necessary (for example, your system needs that VBUS is always ON).

EHCI Operational	OHCI Operational				
HCSPARAMS (offset: H'104)	HcRhDescriptorA (offset: H'048)			HcRhDescriptorB (offset: H'04C)	Pin Operation
PPC (bit 4)	NOCP (bit 12)	NPS (bit 9)	PSM (bit 8)	PPCM[1] (bit 17)	When the OVRCUR pin is asserted (0b)
0	—	—	—	—	Fixed to 1b
—	1	—	—	—	Fixed to 1b
—	—	1	—	—	Fixed to 1b
1	0	0	0	—	0b
			1	0	
				1	

32A.8.4 Timing Chart for Overcurrent Detection and Recovery

The figure below shows the assertion/de-assertion timings of the OVRCUR and VBUSEN pins signals at overcurrent detection and recovery.

Note that this timing chart is on the assumption that the changes of register settings to fix the Port Power bit to asserted state (see **Section 32A.8.3, Port Power (VBUS) control specifications**) have not been made.



1. When the OVRCUR pin is kept asserted (0b) for the overcurrent detection time, this module determines the occurrence of overcurrent, and then de-asserts the VBUSEN pin (0b).
2. After the overcurrent status has been resolved, and de-assertion of the OVRCUR pin (1b) is confirmed, 1b is written to the Port Power bit described in **Section 32A.8.3, Port Power (VBUS) control specifications** to turn on the Port Power (Vbus).

NOTE

Before the Port Power bit is set by firmware, be sure to check that the OVRCUR pin has been deasserted.

32A.9 Procedure for Setting this Module

32A.9.1 Host/Peripheral Common Setting Sequence

The following shows the necessary sequence common to both host and peripheral modes.

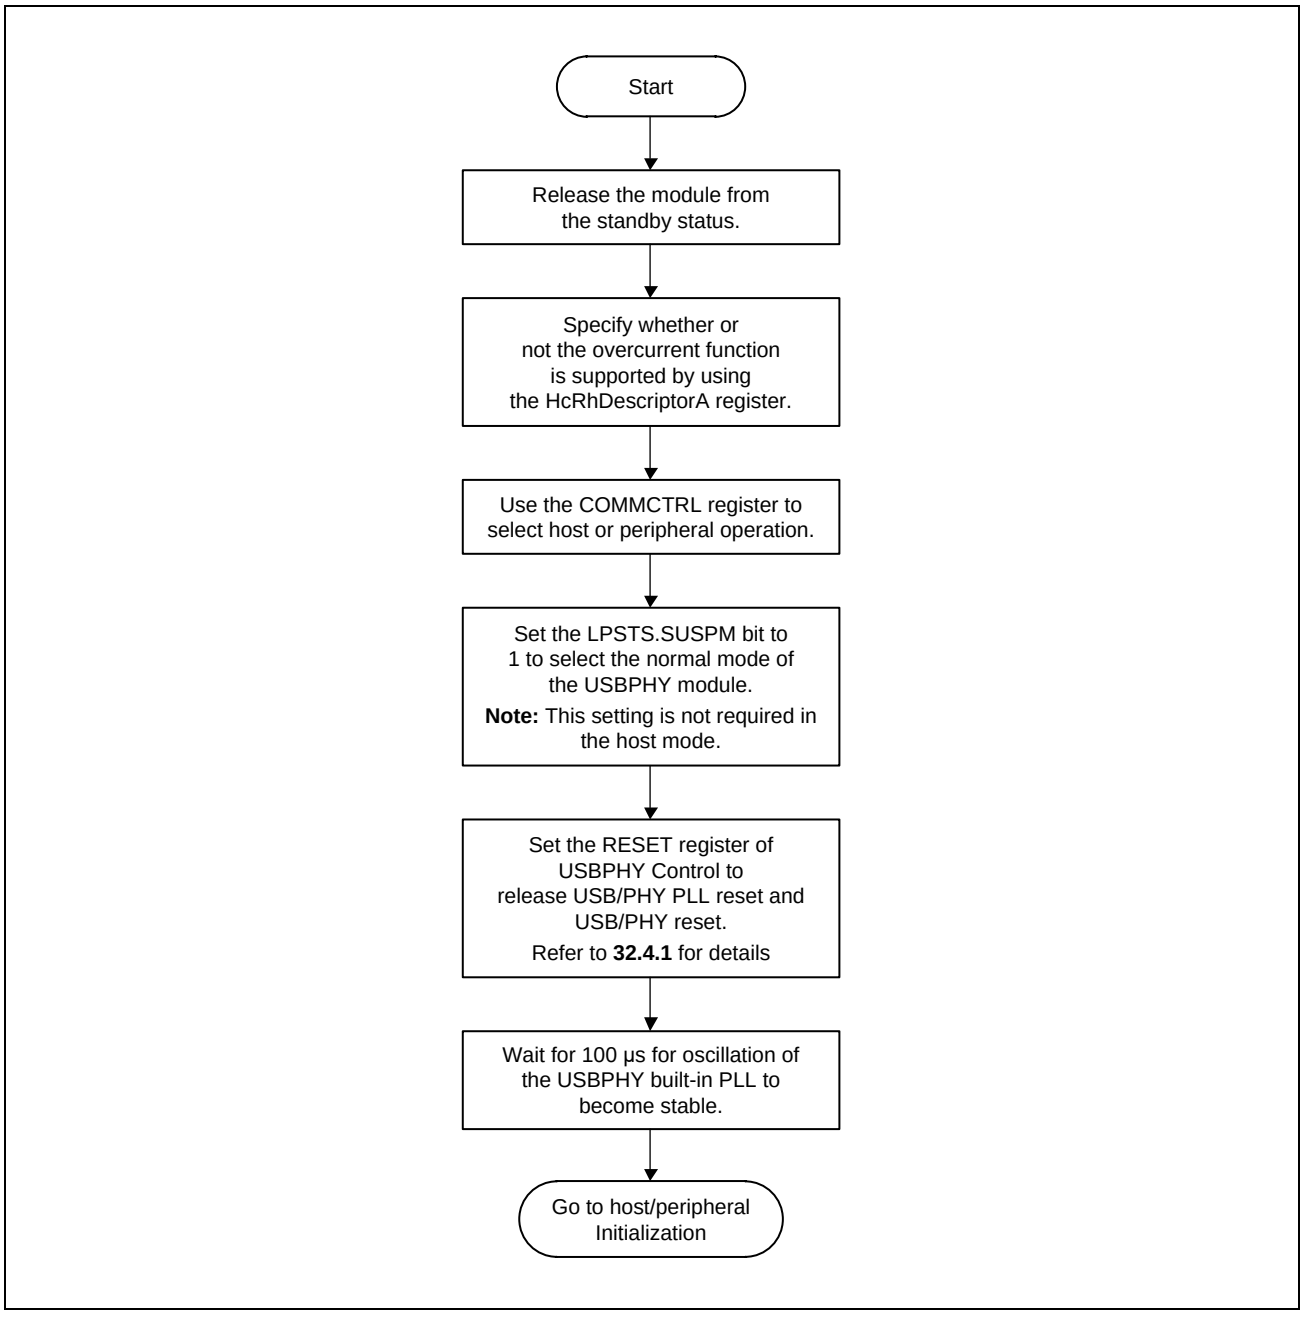


Figure 32A.1 Sequence Common to Both Host and Peripheral Modes

32A.9.2 Initialization Sequence

The following shows the initialization sequence in the Host mode

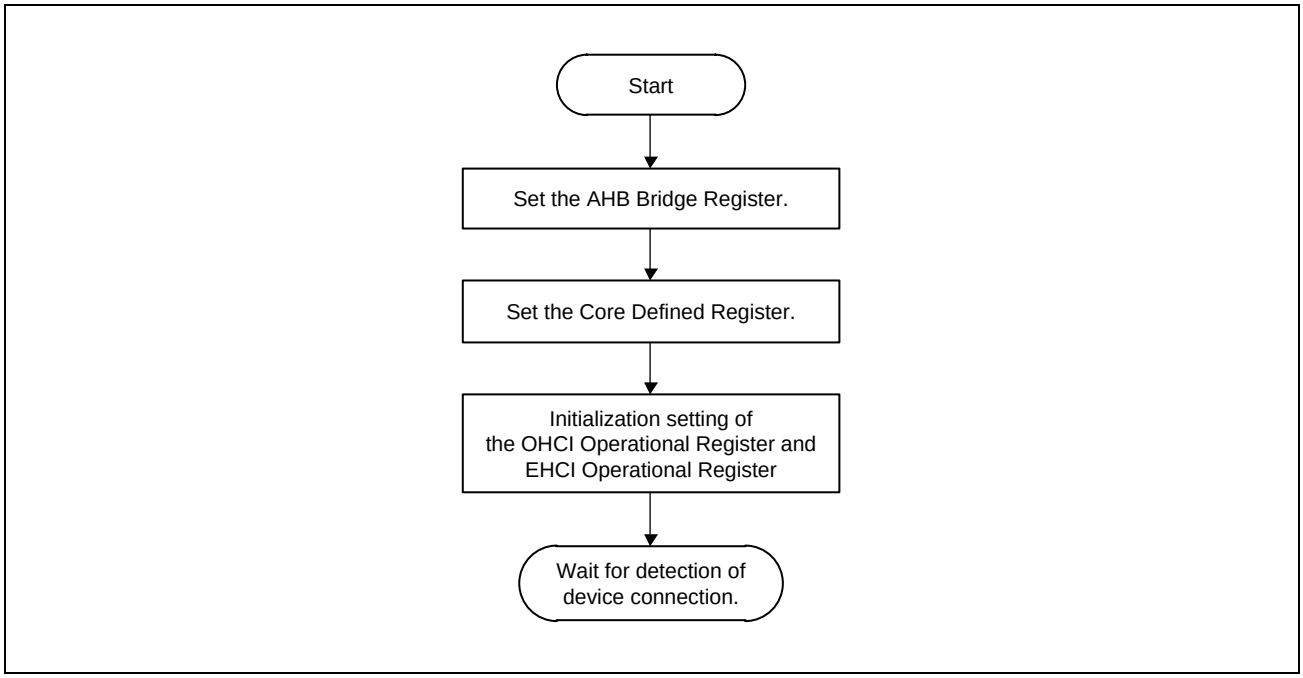

Figure 32A.2 Initialization Sequence

32A.9.3 Flow of Error Handling

While operating this module, if the operation falls into an abnormal state and recovery to the normal flow seems difficult, perform the following steps for reset.

[When an abnormality occurs while EHCI is running]

1. Write 1b to the HCRESET bit (bit 1) of the EHCI Operational Register USBCMD Register (offset: H’120) to execute EHCI software reset.
2. Re-initialize the EHCI Operational Register.

[When an abnormality occurs while OHCI is running]

1. Write 1b to the HCR bit (bit 0) of the OHCI Operational Register HcCommandStatus Register (offset: H’008) to execute OHCI software reset.
2. Re-initialize the OHCI Operational Register.

32B. USB 2.0 Function Module

32B.1 Overview

32B.1.1 Overview

This LSI has two channels of USB 2.0 host/function module. Switching between the host and peripheral functions for each channel is possible by setting the UCOM register.

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

This chapter describes the peripheral controller. For details on the host/peripheral common circuit and battery charging, see **Section 32A, USB 2.0 Host Module**.

This module is a universal serial bus (USB) controller that has peripheral functions.

This module supports high-speed and full-speed transfer defined by the Universal Serial Bus Specification Revision 2.0.

This module supports all transfer types defined in the USB Specification. This module incorporates 8 Kbytes of buffer memory for data transfer, and can use a maximum of 10 pipes. You can assign any endpoint number to any pipe other than pipe 0 in conformity to the peripheral equipment or system to communicate with.

32B.1.2 Features

32B.1.2.1 Peripheral controller supporting high-speed USB

(1) On-chip peripheral USB controller

32B.1.2.2 Support of all types of USB transfer

(1) Supporting all types of USB transfer, including isochronous transfer

(2) Control transfer

(3) Bulk transfer

(4) Interrupt transfer (high-bandwidth transfers not supported)

(5) Isochronous transfer (high-bandwidth transfers not supported)

32B.1.2.3 Bus interface

(1) Includes a two-channel DMA interface

32B.1.2.4 Pipe configuration

(1) 8 Kbytes of buffer memory for USB communications for each channel

(2) Up to 10 pipes (including the default control pipe) selectable for each channel

(3) Programmable pipe configuration

(4) Any endpoint number assignable to pipes other than pipe 0

Table 32B.1 Pipe Settings

PIPE	Transfer Type	Double buffer	Continuous transfer mode	Buffer size
PIPE0	Control	—	—	Fixed to 64 bytes/ 256 bytes (CNTMD = 1)
PIPE1	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE2	Iso/Bulk	✓	✓ (Bulk only)	Up to 2 Kbytes
PIPE3	Bulk	✓	✓	Up to 2 Kbytes
PIPE4	Bulk	✓	✓	Up to 2 Kbytes
PIPE5	Bulk	✓	✓	Up to 2 Kbytes
PIPE6	Int	—	—	Fixed to 64 bytes
PIPE7	Int	—	—	Fixed to 64 bytes
PIPE8	Int	—	—	Fixed to 64 bytes
PIPE9	Int	—	—	Fixed to 64 bytes

32B.1.2.5 Features of peripheral functions

(1) Support of high-speed transfer (at 480 Mbps) and full-speed transfer (at 12 Mbps)

(2) Automatic recognition of high-speed or full-speed operation based on automatic response to the reset handshake

(3) Control transfer stage monitoring function

(4) Device state monitoring function

(5) Automatic response to SET_ADDRESS request

(6) NAK response interrupt (NRDY)

(7) SOF interpolation

32B.1.2.6 Features of DMA transfer

DMA transaction mode: Fetching in both register and link modes are supported.

Interrupt: Level is supported.

Transfer size: A transfer size from 1 to 128 bytes can be selected separately for the transfer source and transfer destination.

Skip (scatter/gather) function: The access size and skip size can be specified separately for the transfer source and destination.

Suspend function: A running DMA transaction can be suspended temporarily.

Interval function: The interval of DMA transfers can be specified to control the bus occupancy.

32B.1.2.7 Other functions

(1) Byte endian swap function to support both big endian and little endian as data formats (when using only CFIFO)

(2) Transfer ending function using a transaction counter

(3) SOF pulse output function

(4) BRDY interrupt event notification timing change function (BFRE)

(5) Function (SHTNAK) to set NAK in the response PID when transfer ends

(6) Support of the Link Power Management (LPM) ECN, making available a new low-power-consumption state (L1 state)

32B.1.3 Overview of Functions

32B.1.3.1 Automatic recognition of USB transfer speed

This module automatically recognizes USB transfer speed.

(1) Methods of FIFO buffer memory access

This module supports the two types of access described below to the FIFO buffer memory for USB data transfer.

(a) Access from the CPU

Specify a FIFO port address, and then write data to or read data from the FIFO buffer memory.

(b) Direct memory access (DMA)

Selecting a pipe window and setting the DMA control registers enables writing data to or reading data from the FIFO buffer memory.

32B.1.3.2 USB event

This module notifies the event in USB operation by issuing an interrupt.

You can specify whether to enable notification by interrupt for individual interrupt types and sources through software settings.

32B.1.3.3 USB data transfer

This module performs all types of USB data transfer: control transfer, bulk transfer, interrupt transfer, and isochronous transfer. The following pipe resources are available for individual transfer types:

(1) One pipe dedicated to control transfer

(2) Four pipes dedicated to interrupt transfer

(3) Three pipes dedicated to bulk transfer

(4) Two pipes selectively used for bulk or isochronous transfer

For each pipe, specify the settings, including transfer type, endpoint number, and maximum packet size, required for USB transfer according to the system.

This module can incorporate up to 8 Kbytes of buffer memory. For the pipes dedicated to bulk transfer and those selectively used for bulk transfer or isochronous transfer, allocate buffer memory and specify a buffer operating mode and other necessary settings according to the system. Setting the buffer operating mode enables high-speed data transfers with fewer interrupts to be performed by using double-buffering and continuous transfer of data packets.

32B.1.3.4 SOF pulse output function

This module has a function to output an SOF pulse to indicate the timing of SOF packet transmission. This module asserts a SOF pulse output signal when an SOF packet is received. This module outputs pulses at regular intervals based on an SOF interpolation timer even when an SOF packet is damaged.

32B.1.4 Restriction matter and Notes

32B.1.4.1 Restriction matter

(1) Restrictions on the USB specifications

It’s no support About below of USB 2.0 specification

- HighBandWidth transfer is no support

(2) Restrictions on DMA Master

- DAD = 1 (destination address fixed) and can not use skip transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use skip transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- DAD = 1 (destination address fixed), and can not use the beat unalign transfer of destination side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- SAD = 1 (source address fixed), and can not use beat unalign transfer of source side. When forwarding by such setting, movement is unsettled. Should not do such transmission.
- When REQD =1, SBE = 1 (sweep mode) and compulsion discharge function can not use.

32B.1.4.2 Notes

(1) DMA transfer and passing problem of interrupt signal in DMA Master construction.

(a) Overview

A USBFDMAmn interrupt (m, n = 0, 1) might occur before the last data of DMA transaction is written to the write-target device.

(b) Plan to avoid

A plan to avoid the above problem is indicated below.

Plan to avoid 1) HPROT is set as non bufferable.

According to the DMA mode, set 0 in the DPR[2] bit in the CHEXT_n register or the LDPR[2] bit in the DCTRL register, set the HPROT signal as non bufferable, and then perform the DMA transaction.

If all transfers are set to non bufferable, transfer efficiency might fall.

In such cases, set the most part of transaction as bufferable and perform a transfer, and then perform the last transfer by setting a register set or descriptor as non bufferable.

(2) Setting for battery charging when the peripheral controller is selected

The setting for battery charging is handled by the host controller even if the peripheral controller is selected.

32B.2 Registers

How to read the register table

(1) Bit number:

(2) State after reset: Initial state of the register that occurs immediately after a reset “Power on Reset” indicates the initial state at power-on reset.
The state after USB reset is the initial state of the register that occurs when this module detects a USB bus reset.
Significant points regarding reset operation are indicated in notes.
“—” indicates that a user’s setting is retained without this module operation having been performed. “X” indicates that the value is undefined.

(4) Access condition: The condition to be met when this module accesses the register for an operation.

R: Reading only
W: Writing only
R/W: Reading or writing
R(0): 0-reading only
W(1): 1-writing only

(5) Name: Bit symbol and bit name

(6) Function: Description of functions.

<Example of description>

(1) Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	A bit	B bit	C bit	—	—	—	—	—	—	—	—	—	—	—	—
(2) Initial Value	X	0	0	0												
R/W	X	0	—	—												

Bit	Bit Name	Initial Value	R/W	Description
15	—			Nothing is assigned. Fix this bit to 0.
14	A bit		R/W	AAA enable 0: Disables operation 1: Enables operation
13	B bit		R	BBB operation 0: Outputs low-level signal 1: Outputs high-level signal
12	C bit		R(0)/ W(1)	CCC control 0: ..... 1: .....
	(5)		(4)	(6)

32B.2.1 Base Address

Table 32B.2 Base addresses for each channel of the USB function module

Channel number	Base address
0	H'0_11C6_0000 (Cortex-A55 Address Space)

32B.2.2 List of Registers

Table 32B.3 lists the registers of this module.

Table 32B.3 List of Registers (1/3)

Address	Symbol	Name	Access unit
000	SYSCFG0	System Configuration Control Register 0	16-bit

32B.2.3 System Configuration Control Registers

32B.2.3.1 System Configuration Control Register 0 [SYSCFG0] <Address: H'000>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNEN	HSE	—	DRPD	DPRPU	—	—	—	USBE
Initial Value	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	CNEN	0	R/W	This bit prohibits or enables single-ended receiver operation. 0: Single-ended receiver operation prohibited 1: Single-ended receiver operation enabled
7	HSE	0	R/W	This bit prohibits or enables High-Speed operation. 0: High-Speed operation prohibited (Full-Speed) 1: High-Speed operation enable (The controller detects the communication speed.)
6	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
5	DRPD	1	R/W	D+/D- line resistor control Set this bit to 0 to use this module. For details, see Control of USB Data Bus Resistors.
4	DPRPU	0	R/W	D+ line resistor control This bit prohibits or enables D+ line pull-up for the peripheral controller function. For details, see Control of USB Data Bus Resistors. 0: Pull Up prohibited 1: Pull Up enabled
3 to 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	USBE	0	R/W	USB block operation prohibited This bit prohibits or enables USB block operation. 0: USB block operation prohibited 1: USB block operation enabled

Note: Data can be written to and read from this register even while the UTMI+PHY clock is stopped. However, if a value is set while the UTMI+PHY clock is stopped, the corresponding function takes effect after the oscillation of UTMI+PHY clock starts.

(1) Single-ended receiver operation enable (CNEN) bit

Setting this bit enables the single-ended receiver to operate. This bit is intended to prevent damage by inrush current that can be caused when the single-ended receiver in unattached status goes floating. This bit also allows the LNST bit to be referenced.

Set this bit when VBUS is detected as the result of a VBUS interrupt. Clear this bit when VBUS is removed.

(2) High-speed operation enable (HSE) bit

Setting this bit enables the high-speed operation. When this bit is 1, this module performs a high-speed or full-speed operation according to the result of reset handshake.

- When the HSE bit is 0, this module performs a full-speed operation.
- When the HSE bit is 1, this module executes the reset handshake protocol, and then automatically performs a high-speed or full-speed operation according to the result of reset handshake.

Rewriting the value of this bit must be done when the DPRPU bit is 0.

(3) D+/D- line resistor control (DRPD or DPRPU) bit

Table 32B.4 shows available settings of the resistors for the USB data bus. Use the DPRPU bit to select the USB data bus resistors.

Table 32B.4 Control of USB Data Bus Resistors

Setting		Control of USB Data Bus Resistors		
DRPD	DPRPU	D- Line	D+ Line	Remarks
0	0	Open	Open	
0	1	Open	Pull-Up	Specify the settings as shown in the left.
1	0	Pull-Down	Pull-Down	Initial state (When power on reset is canceled)
1	1	Pull-Down	Pull-Up	Setting prohibited

(a) D+ pull-up resistor control (DPRPU) bit

Setting this bit enables this module to notify the USB host of attaching by pulling up the D+ line voltage to 3.3 V. Clearing this bit enables this module to let the USB host know that the device has been detached by stopping pulling up the D+ line voltage.

(4) USB block operation enable (USBE) bit

This bit enables or disables the operation of the USB block of this module.

When this bit is changed from 1 to 0, this module initializes the bits shown in **Table 32B.5**.

Table 32B.5 Register Bits That Are Initialized by Writing 0 to the USBE Bit

Register Name	Bit Name
SYSSTS0	LNST
DVSTCTR0	RHST
INTSTS0	DVSQ
USBADDR	USBADDR
USBREQ	bRequest bmRequestType
USBVAL	wValue
USBINDX	wIndex
USBLENG	wLength

Note: Changing the value of this bit must be done when the SUSPENDM bit is 1 and after the oscillation of UTMI+PHY clock starts.

32B.2.3.2 System Configuration Control Register 1 [SYSCFG1] <Address: H'002>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT					
Initial Value	0	0	0	0	1	1	1	1	0	0	0	0	1	1	1	1
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	—	H'F	R	Nothing is assigned to these bits. Fix these bits to 0.
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5 to 0	BWAIT	H'0F	R/W	CPU bus access wait specification These bits specify the number of wait cycles for the access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (default) : 111111: 63 wait cycles (65 access cycles)

(1) CPU bus access wait specification (BWAIT) bits

These bits specify the wait cycles for the access to the HPB.

The following restriction is placed on the cycle of the access to the registers at address H'04 or after of this module: Restriction on wait cycle: The cycle of continuous accesses to registers of this module must be at least 67 ns.

To comply with this restriction, you must control the number of wait cycles with the internal bus clock (P1ϕ) frequency.

The default of wait cycles is 17 clock cycles (maximum limit). Select an optimum setting.

This setting is also applied to accesses to FIFO port registers. The maximum speeds of accesses to FIFO ports are as follows:

MBW = 10 (32-bit access width): Max 60 MBytes/sec
MBW = 01 (16-bit access width): Max 30 MBytes/sec
MBW = 00 (8-bit access width): Max 15 MBytes/sec

32B.2.4 System Configuration Status

32B.2.4.1 System Configuration Status Register (SYSSTS0) <Address: H'004>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LNST	
Initial Value	—	—	0	0	0	0	0	0	0	0	0	0	0	—	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	See above	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	LNST	All 0	R	USB Line status monitor The USB line status is displayed. *Note*: See the detailed description.

(1) Line status monitor (LNST) bits

Table 32B.6 shows the line status of the USB data bus of this module. This module monitors the line status (status of the D+ and D- lines) of the USB data bus in the LNST bits of the SYSSTS0 register.

Referencing the LNST bits must be done only after the USBE bit is set and attaching is performed (the DPRPU bit is set).

Table 32B.6 Line Status of USB Data Bus

LNST [1]	LNST [0]	Full-Speed operation	High-Speed operation	Chirp operation
0	0	SE0	Squelch	Squelch
0	1	J State	Unsquelch	Chirp J
1	0	K State	Invalid	Chirp K
1	1	SE1	Invalid	Invalid

Note: Chirp: State in which high-speed operation is enabled (HSE = 1) and the reset handshake protocol is being executed
Squelch: SE0 or idle state
Unsquelch: High-speed J or high-speed K state
Chirp J: Chirp J State
Chirp K: Chirp K State

32B.2.5 USB Signal Control Registers

32B.2.5.1 Device State Control Register 0 [DVSTCTR0] <Address: H'008>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	—	—	—	—	—	RHST		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R/W(1)	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R/W	Reserved. When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	WKUP	0	R/W (1)	Remote wakeup output This bit prohibits or enables Remote wakeup (resume signal output). 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output.
7 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	RHST	All 0	R	Reset handshake This bit indicates the reset handshake status. *Note*: See the detailed description.

(1) Remote wakeup (resume signal output) enable (WKUP) bit

When this bit is set, this module outputs the remote wakeup signal to the USB.

This module manages the time of remote wakeup signal output. When the WKUP bit is set, this module outputs the K state for 10 ms, and then clears the WKUP bit.

The USB Specification requires the USB idle state to be retained for at least 5 ms before the remote wakeup signal is sent. Therefore, even if the WKUP bit is set immediately after the suspended state is detected, this module waits for 2 ms, and then outputs the K state.

Writing 1 to the WKUP bit must be done only when the device is in the suspended state (DVSQ = 1xx) and remote wakeup is allowed by the USB host.

When setting the WKUP bit, do not stop the internal clock even if the device is in the suspended state. (Write 1 to the WKUP bit when the SUSPM bit is 1.)

When the WKUP bit is set at a transition to the L1 state, this module outputs the K state for 50 µs, and then clears the WKUP bit. In the L1 state, setting the WKUP bit must be done only when the DVSQ[4] bit is 1.

(2) Reset handshake status (RHST) bits

This module outputs the result of reset handshake to this bit. **Table 32B.7** lists the results of reset handshake.

Table 32B.7 Reset Handshake Status

Bus State	Value of RHST Bit
Powered or disconnected state	000
Reset handshake in process	100
Full-speed connection	010
High-speed connection	011

If the HSE bit is 1, the RHST bits indicate 100 when this module detects a USB bus reset. Then, after this module has output Chirp K, these bits indicate 011 when this module detects Chirp JK from the USB host three times. If the status is not fixed to High-Speed within 2.5 ms after Chirp K is output, these bits indicate 010.

If the HSE bit is 0, the RHST bits indicate 010 when this module detects a bus reset.

After this module has detected a USB reset, a DVST interrupt occurs when the value of the RHST bits is fixed to 010 or 011.

32B.2.6 Test Mode Register

32B.2.6.1 USB Test Mode Register [TESTMODE] <Address: H'00C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST			
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	—	0	R/W	Reserved.When read, the initial value is read. When writing, be sure to write the initial value.Operation is not guaranteed if a value other than the initial value is written.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11	—	0	R/W	Reserved.When read, the initial value is read. When writing, be sure to write the initial value.Operation is not guaranteed if a value other than the initial value is written.
10 to 4	—	H'10	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	UTST	All 0	R/W	Test mode See the detailed description.

(1) Test mode (UTST) bits

When a value is written to these bits, this module outputs a USB test signal during high-speed operation.

Table 32B.8 lists the test modes of this module.

Table 32B.8 List of test mode operation

Test mode	Value of UTST Bits
Normal operation	0000
Test_J	0001
Test_K	0010
Test_SE0_NAK	0011
Test_Packet	0100
Test_Force_Enable	—
Reserved	0101 to 0111

Write a value to these bits according to the SetFeature request sent from the USB host during high-speed communication. When these bits contain a value from 0001 to 0100, this module does not enter the suspended state.

To perform a normal USB communication after setting a test mode, perform Power on reset.

32B.2.7 FIFO Port Registers

32B.2.7.1 CFIFO Port Register [CFIFO] <Address: H'014>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIFOPORT (Low)															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT	All 0	R/W	FIFO port These bits are accessed to read received data from the FIFO buffer or to write send data to the FIFO buffer.

(1) FIFO port control bits (for FIFOPORT)

The send/receive buffer memory of this module has a FIFO structure (FIFO buffer). Use FIFO port registers to access the FIFO buffer. The FIFO port consists of the port register (CFIFO) to read data from and write data to the FIFO buffer, the register (CFIFOSEL) to select the pipe to be allocated to the FIFO port, and the control register (CFIFOCTR).

Individual FIFO ports have the following features:

1. The CFIFO port must be used to access the FIFO buffer through the DCP.
2. When functions specific to FIFO ports are used, the pipe number (selected pipe) specified in the CURPIPE bits cannot be changed.
3. The registers configured for a FIFO port do not affect any other FIFO ports.
4. The FIFO buffer memory can be accessed by either the CPU or SIE. Access by the CPU is not possible while the SIE has the right of access to the FIFO buffer memory.

(2) FIFO port bits (CFIFO)

When one of these registers is accessed, this module accesses the FIFO buffer allocated to the pipe number specified in the CURPIPE bits in the corresponding pipe select register (CFIFOSEL).

These registers can be accessed only when the FRDY bit of the respective control registers (CFIFOCTR) is 1 (or when the UCL_Dx_DREQ output is asserted by this module).

The valid bits of these registers vary depending on the values of the NBW and BIGEND bits. The valid bits are shown in **Table 32B.9** to **Table 32B.11**.

Table 32B.9 Endian Operation in 32-Bit Access (When MBW = 10)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	N + 3 address	N + 2 address	N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	N + 2 address	N + 3 address

Table 32B.10 Endian Operation in 16-Bit Access (When MBW = 01)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1		even-numbered address	odd-numbered address
1	even-numbered address	odd-numbered address	Writing: invalid Reading: prohibited*1	

Table 32B.11 Endian Operation in 8-Bit Access (When MBW = 00)

BIGEND	b31 to b24	b23 to b16	b15 to b8	b7 to b0
0	Writing: invalid Reading: prohibited*1			Writing: valid Reading: valid
1	Writing: valid Reading: valid	Writing: invalid Reading: prohibited*1		

Note 1. Reading words or bytes from an invalid register is prohibited.

32B.2.7.3 CFIFO Port Select Register [CFIFOSEL] <Address: H'020>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	—	—	MBW		—	BIGEND	—	—	ISEL	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R	R	R/W	R/W	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies DTLN read mode for the CFIFOCTR register. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11, 10	MBW	0	R/W	CFIFO port access bit width This bit specifies the bit width for access to the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
8	BIGEND	0	R/W	FIFO port byte endian control This bit specifies the byte endian of the CFIFO port. 0: Little endian 1: Big endian
7, 6	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
5	ISEL	0	R/W	FIFO port access direction with DCP selected This bit specifies the FIFO port access direction when DCP is selected for the CURPIPE bits. 0: Selects reading of buffer memory. 1: Selects writing of buffer memory.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification This bit specifies the pipe number used for accessing the CFIFO port. 0000: DCP 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9 ↓ 1110: PIPE14 1111: PIPE15

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the CFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the CFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) CFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the CFIFO port.

If you start reading after setting a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, do not change the value of these bits until data is all read.

Also, to set a value in these bits when the pipe specified in the CURPIPE bits is in the receiving direction, temporarily change the original value of the CURPIPE bits to a different value, and then set the values of the CURPIPE and MBW bits at the same time.

For how to change the value of the CURPIPE bits, see the description of the CURPIPE bits.

When the pipe specified in the CURPIPE bits is in the sending direction, you cannot change the bit width from 8 bits to 16 bits or 32 bits or from 16 bits to 32 bits while writing to the buffer memory is in process.

Even with the 16-bit width or 32-bit width setting, you can write data also to odd bytes by using byte access control.

(4) FIFO port byte endian control (BIGEND) bit

This bit is used to specify the byte endian of the CFIFO port.

For details see **Section 32B.2.7.2(1), FIFO port control bits (for FIFOPORT)**.

(5) FIFO port access direction with DCP selected (ISEL) bit

To change the value of this bit when the specified pipe is DCP, write a value to this bit, read the bit, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of the bit is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

Set this bit simultaneously with setting of the CURPIPE bits.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number of the pipe through which to read or write data via the CFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

32B.2.7.4 D0FIFO Port Select Register [D0FIFOSEL] <Address:H'028>
D1FIFO Port Select Register [D1FIFOSEL] <Address:H'02C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW		—	—	—	—	—	—	CURPIPE			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R(0)/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read count mode This bit specifies Dx_FIFOCTR DTLN read mode. 0: Clears the DTLN bits when all received data is read. 1: Decrements the value of the DTLN bits each time received data is read.
14	REW	0	R(0)/W	Buffer pointer rewind Set this bit to 1 to rewind the buffer pointer. 0: Does not rewind the buffer pointer. 1: Rewinds the buffer pointer.
13	DCLRM	0	R/W	Automatic buffer memory clear mode after reading data through the specified pipe This bit prohibits or enables automatic buffer memory clear after data is read through the specified pipe. 0: Automatic FIFO buffer clear prohibited 1: Automatic FIFO buffer clear enabled
12	DREQE	0	R/W	UCL_Dx_DREQ output enable This bit prohibits or enables the output of the UCL_Dx_DREQ signal. 0: Output prohibited 1: Output enabled
11, 10	MBW	All 0	R/W	DxFIFO port access bit width This bit specifies the bit width for access to the DxFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited
9 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	CURPIPE	All 0	R/W	FIFO port access pipe specification 0000: No specification 0001: PIPE1 0010: PIPE2 ↓ 1000: PIPE8 1001: PIPE9

(1) Read count mode (RCNT) bit

When this bit is 0, this module clears the DTLN bits in the DxFIFOCTR register when all received data has been read from the FIFO buffer allocated to the pipe (selected pipe) specified in the CURPIPE bits (or, in the case of double-buffer configuration, when all relieved data has been read from one buffer).

With this bit is 1, this module decrements the value of the DTLN bits in the DxFIFOCTR register each time received data is read from the FIFO buffer allocated to the specified pipe.

(2) Buffer pointer rewind (REW) bit

When this bit is set during data reading from the FIFO buffer while the selected pipe is in the receiving direction, reading can be restarted from the first data in the FIFO buffer (or, in the case of a double-buffer configuration, rereading can be started from the first data in the FIFO buffer being read).

Do not set this bit at the same time as changing the value of the CURPIPE bits. Before setting this bit, always check that the FRDY bit is 1.

If you want to redo writing to the FIFO buffer from the first data in the FIFO buffer when the selected PIPE is in the sending direction, use the BCLR bit.

(3) Automatic FIFO buffer clear enable (DCLRM) bit

This bit is used to enable or disable the mode to automatically clear the FIFO buffer memory after reading data from the specified pipe. With this bit set, this module performs the “BCLR = 1” processing on the FIFO buffer, if a zero-length packet is received when the FIFO buffer allocated to the specified pipe is empty or if data reading ends because a short packet is received when the BFRE bit is 1.

Always clears this bit when you use this module with the BRDYM bit set.

(4) UCL_Dx_DREQ output enable (DREQE) bit

This bit is used to enable or disable the output of the UCL_Dx_DREQ signal.

When enabling the UCL_Dx_DREQ signal, set this bit always after setting a value in the CURPIPE bits. When changing the value of the CURPIPE bits, change the value always after clearing this bit.

(5) DxFIFO port access bit width (MBW) bits

These bits are used to specify the bit width for the access to the DxFIFO port. For details, see **Section 32B.2.7.3(3), CFIFO port access bit width (MBW) bits**.

(6) FIFO port access pipe specification (CURPIPE) bits

These bits are used to specify the pipe number through which to read or write data via the DxFIFO port.

If you change the value of these bits, write a desired value to these bits, read these bits, and then check that the written value is the same as the read value before proceeding to the next processing.

Do not specify the same pipe number for the CURPIPE bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. If the value of these bits is changed in the middle of an access to the FIFO buffer, the access is held. Therefore, the same access can be resumed after these bits are restored to the original value.

32B.2.7.5 CFIFO Port Control Register [CFIFOCTR] <Address: H'022>
D0FIFO Port Control Register [D0FIFOCTR] <Address: H'02A>
D1FIFO Port Control Register [D1FIFOCTR] <Address: H'02E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	—	DTLN											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W(1)	R(0)/W(1)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W(1)	Buffer memory valid flag Specify 1 for this bit when writing to the FIFO buffer on the CPU side through the pipe specified in CURPIPE (current pipe) ends. 0: Invalid 1: Writing complete
14	BCLR	0	R(0)/W(1)	CPU buffer clear Specify 1 for this bit to clear the FIFO buffer on the CPU side of the current pipe. 0: Invalid 1: CPU buffer memory clear
13	FRDY	0	R	FIFO port ready This bit indicates whether the FIFO port can be accessed. 0: The FIFO port cannot be accessed. 1: The FIFO port can be accessed.
12	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
11 to 0	DTLN	All 0	R	Receive data length These bits indicate the length of receive data.

(1) Buffer memory valid flag (BVAL)

When the pipe (selected pipe) specified in the CURPIPE bits is in the sending direction, this bit must be set in the cases descried below. This module switches the FIFO buffer from the CPU side to the SIE side to enable data sending.

(1) To send short packets, set this bit when data writing ends.

(2) To send zero length packets, set this bit before writing data to the FIFO buffer.

(3) Set this bit after writing, to the pipe in continuous transfer mode, the data of which the size is a positive integral multiple of the maximum packet size and less than the buffer size.

When the maximum packet size of data is written to the pipe in non-continuous transfer mode, this module sets this bit to switch the FIFO buffer from the CPU side to the SIE side and enable data sending.

When this bit and the BCLR bit are set at the same time when the specified pipe is in the sending direction, this module clears the data that has been written so far and enables zero-length packets to be sent.

Setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit. Do not set this bit when the specified pipe is in the receiving direction.

(2) CPU buffer clear (BCLR) bit

When this bit is set, this module clears the FIFO buffer on the CPU side among the FIFO buffers allocated to the specified pipe.

Even if the two FIFO buffers in a double-buffer configuration are allocated to the specified pipe and the both buffers can be read, this module clears only one of the two buffers.

If this bit is set when the specified pipe is the DCP, this module clears the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or it is on the SIE side. To clear the buffer on the SIE side, set this bit always after setting the PID bits for DCP to “NAK”.

When the specified pipe is other than the DCP, setting this bit must be done only when the FRDY bit in the corresponding port control register is 1. If you want to check the value of the FRDY bit after setting this bit, wait at least 80 ns after setting this bit, and then reference the FRDY bit.

(3) FIFO port ready (FRDY) bit

This bit indicates whether the FIFO port can be accessed from the CPU. This bit is operated by this module.

In the cases described below, even when this module sets this bit, data cannot be read from the FIFO port because the FIFO buffer does not contain data to be read. In these cases, set the BCLR bit to clear the FIFO buffer to enable the next sending and receiving of data.

(1) A zero-length packet has been received while the FIFO buffer allocated to the specified pipe is empty.

(2) A short packet has been received and data reading has ended while the BFRE bit is 1.

(4) Receive data length (DTLN) bits

These bits indicate the length of receive data. These bits are operated by this module. During reading of the FIFO buffer, the value of these bits varies depending on the value of the RCNT bit as described below.

(1) When the RCNT bit is 0:
This module indicates a receive data length by using these bits until the CPU ends reading all received data from one FIFO buffer.
When the BFRE bit is 1, this module retains the receive data length until the BCLR bit is set even if reading of received data has ended.

(2) When the RCNT bit is 1:
This module decrements the value of these bits each time the CPU reads data.
(The value is decremented by 1 when the MBW bits are 00, by 2 when the MBW bits are 01 or by 4 when the MBW bits are 10.)

When the CPU ends reading from one FIFO buffer, this module clears these bits. If reading of one of the FIFO buffers in a double-buffer configuration, however, ends before reading of received data from the other FIFO buffer ends, these bits indicate the receive data length for the other FIFO buffer at the end of reading from the FIFO buffer of which reading ends earlier.

When these bits are read during reading of the FIFO buffer when the RCNT bit is 1, this module updates the value of these bits within 150 ns after a cycle of read access to the corresponding FIFO port.

32B.2.8 Interrupt Enable Registers (INTENBx, BRDYENB, NRDYENB, BEMPENB)

32B.2.8.1 Interrupt Enable Register 0 [INTENB0] <Address: H'030>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

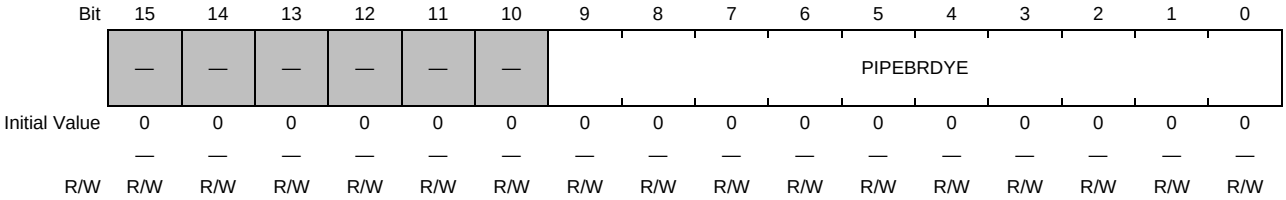
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable This bit prohibits or enables a USB interrupt when a VBINT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
14	RSME	0	R/W	Frame number update interrupt enable Resume interrupt enable This bit prohibits or enables a USB interrupt when a RESM interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
13	SOFE	0	R/W	This bit prohibits or enables a USB interrupt when a SOF interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
12	DVSE	0	R/W	Device state transition interrupt enable This bit prohibits or enables a USB interrupt when a DVST interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
11	CTRE	0	R/W	Control transfer stage transition interrupt enable This bit prohibits or enables a USB interrupt when a CTRT interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer empty interrupt enable This bit prohibits or enables a USB interrupt when a BEMP interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer not ready response interrupt enable This bit prohibits or enables a USB interrupt when an NRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer ready interrupt enable This bit prohibits or enables a USB interrupt when a BRDY interrupt is detected. 0: Interrupt output prohibited 1: Interrupt output enabled
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.2.8.2 BRDY Interrupt Enable Register [BRDYENB] <Address: H'036>



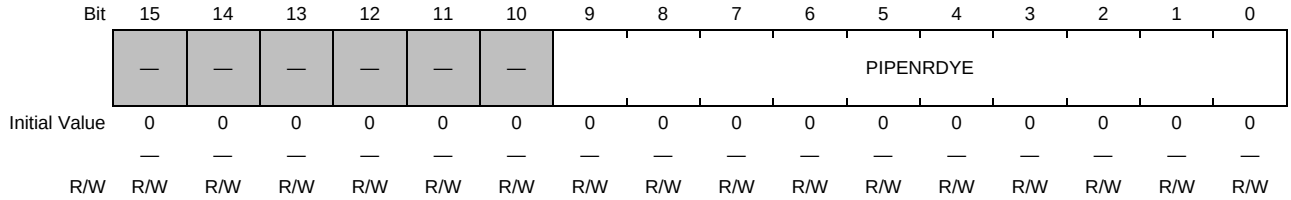
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDYE	All 0	R/W	Pipe BRDY interrupt enable These bits prohibit or enable the BRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe BRDY interrupt enable (PIPEBRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register, sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBRDY bits in the BRDYSTS register is 1 and software changes the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.8.3 NRDY Interrupt Enable Register [NRDYENB] <Address: H'038>



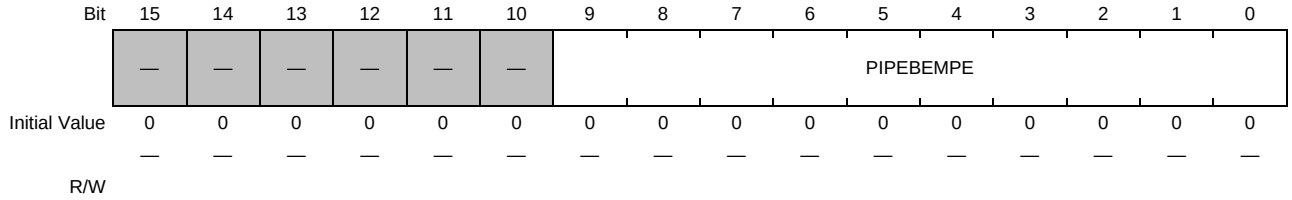
Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDYE	All 0	R/W	Pipe NRDY interrupt enable These bits prohibit or enable the NRDY bit to be set when a BRDY interrupt to a pipe is detected. 0: Interrupt output prohibited 1: Interrupt output enabled

(1) Pipe NRDY interrupt enable (PIPENRDYE) bits

When this module detects a BRDY interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPENRDY bit in the NRDYSTS register, sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPENRDY bits in the NRDYSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.8.4 BEMP Interrupt Enable Register [BEMPENB] <Address: H'03A>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMPE	All 0	R/W	Pipe BEMP interrupt enable These bits prohibit or enable the BEMP bit to be set when a BRDY interrupt to a pipe is detected 0: Interrupt output prohibited 1: Interrupt output enabled

Note: Bit numbers correspond to pipe numbers.

(1) Pipe BEMP interrupt enable (PIPEBEMPE) bits

When this module detects a BEMP interrupt to the pipe for which is set 1 in this register, this module sets the corresponding PIPEBEMP bit in the BEMPSTS register, sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

When at least one of the PIPEBEMP bits in the BEMPSTS register is 1 and the corresponding interrupts enable bit in this register changes from 0 to 1, this module asserts the interrupt.

32B.2.9 SOF Control Register

32B.2.9.1 SOF Pin Configuration Register [SOFCFG] <Address: H'03C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	BRDYM	—	—	SOFM		—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6	BRDYM	0	R/W	PIPEBRDY interrupt status clear timing This bit specifies the timing at which the PIPEBRDY interrupt is to be cleared. 0: Software clears the status. 1: Hardware clears the status by reading from or writing to the FIFO buffer. This bit can be set only during initialization (before communication). The setting cannot be changed after communication.
5, 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3, 2	SOFM	All 0	R/W	SOF function setting These bits are used to select SOF pulse output mode. 00: SOF output disabled 01: SOF output in units of 1 ms 10: µSOF output in units of 125 µs 11: Reserved
1, 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.2.10 Interrupt Status

32B.2.10.1 Interrupt Status Register 0 [INTSTS0] <Address: H'040>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ			VALID	CTSQ		
Initial Value	0	0	0	0	0	0	0	0	—	0	0	0	0	0	0	0
	—	—	—	1	—	—	—	—	—	0	0	1	—	—	—	—
R/W	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R	R	R	R	R	R	R	R/W(0)	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W(0)	Change detection interrupt status This bit indicates the VBUS change detection interrupt status. 0: No VBUS interrupt is generated. 1: A VBUS interrupt is generated.
14	RESM	0	R/W(0)	Resume interrupt status This bit indicates the resume detection interrupt status. 0: No resume interrupt is generated. 1: A resume interrupt is generated.
13	SOFR	0	R/W(0)	Frame number update interrupt status This bit indicates the frame number update interrupt status. 0: No SOF interrupt is generated. 1: A SOF interrupt is generated.
12	DVST	0	R/W(0)	Device state transition interrupt status This bit indicates the device state transition interrupt. 0: No device state transition interrupt is generated. 1: A device state transition interrupt is generated.
11	CTRT	0	R/W(0)	Control transfer stage transition interrupt status This bit indicates the status of a control transfer stage transition interrupt. 0: No control transfer stage transition interrupt is generated. 1: A control transfer stage transition interrupt is generated.
10	BEMP	0	R	BEMP interrupt status This bit indicates the BEMP interrupt status. 0: No BEMP interrupt is generated. 1: A BEMP interrupt is generated.
9	NRDY	0	R	NRDY interrupt status This bit indicates the NRDY interrupt status. 0: No NRDY interrupt is generated. 1: An NRDY interrupt is generated.
8	BRDY	0	R	BRDY interrupt status This bit indicates the BRDY interrupt status. 0: No BRDY interrupt is generated. 1: A BRDY interrupt is generated.
7	VBSTS	0	R	VBUS input status This bit indicates the VBUS pin input status. 0: The VBUS pin is at the low level. 1: The VBUS pin is at the high level.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	DVSQ	All 0	R	Device state These bits indicate the device state. 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state
3	VALID	0	R/W(0)	USB request reception This bit indicates whether USB request reception is detected. 0: Not detected 1: A setup packet is received.
2 to 0	CTSQ	All 0	R	Control transfer stage These bits indicate the control transfer stage. 000: Idle or setup stage 001: Control reading data stage 010: Control reading status stage 011: Control writing data stage 100: Control writing status stage 101: Control writing (No Data) status stage 110: Control transfer sequence error 111: Reserved

Note: When you want to clear the status indicated by the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 to only the bit to be cleared and 1 to other bits. Do not write 0 to any status bit that is currently 0.

Note: This module detects a status change indicated by the VBINT or RESM bit in this register even while the clock is stopped (the SUSPM bit is 0), and reports an interrupt corresponding to the status bit if the interrupt is enabled. Clearing the interrupt status must be done after the clock enabled.

(1) VBUS change interrupt status (VBINT) bit

This module sets this bit when it detects a change of the level of the VBUS pin input (from the high level to low level, or vice versa). This module indicates the level of the VBUS pin input by the VBSTS bit. When a VBINT interrupt occurs, read the VBSTS bit several times to check for consistency and remove chattering.

(2) Resume interrupt status (RESM) bit

This module sets this bit when it is in the suspended state (DVSQ bits are 1XX) and detects a falling edge of the signal at the DP pin.

(3) Frame number update interrupt status (SOFR) bit

This module sets this bit under the following conditions:

This module sets this bit when the frame number is updated. (The frame number update interrupt is monitored at intervals of 1 ms.)

This module detects an SOFR interrupt based on SOF interpolation even when an SOF packet from the USB host is damaged.

(4) Device state transition interrupt status (DVST) bit

When this module detects a change of the device state, this module updates the value of the DVSQ bits, and sets this bit. When a device state transition interrupt occurs, clear the interrupt status before this module detects the next device state transition.

(5) Control transfer stage transition interrupt status (CTRT) bit

When this module detects a transition of control transfer stage, this module updates the value of the CTSQ bits and sets this bit.

When a control transfer stage transition interrupt occurs, clear the interrupt status before this module detects the next transition of control transfer stage.

(6) Buffer empty interrupt status (BEMP) bit

This module sets this bit when at least one of the PIPEBEMP bits in the BEMPSTS register corresponding to the pipes for which the PIPEBEMPE bit in the BEMPENB register is set (that is, when this module detects a BEMP interrupt to at least one of the pipes for which is enabled BEMP interrupt notification).

For the conditions to assert the PIPEBEMP status signal, see the description of the BEMPSTS register.

This module clears this bit when writes 0 to all the PIPEBEMP bits corresponding to the pipes for which a BEMP interrupt has been enabled by setting the PIPEBEMPE bit.

Cannot clear this bit even by writing 0.

(7) Buffer not-ready interrupt status (NRDY) bit

This module sets this bit when at least one of the PIPENRDY bits in the BNRDYSTS register corresponding to the pipes for which the PIPENRDYE bit in the NRDYENB register is set (that is, when this module detects an NRDY interrupt to at least one of the pipes for which is enabled NRDY interrupt notification).

For the conditions to assert the PIPENRDY status signal, see the description of the NRDYSTS register.

This module clears this bit when writes 0 to all the PIPENRDY bits corresponding to the pipes for which a NRDY interrupt has been enabled by setting the PIPENRDYE bit.

Software cannot clear this bit even by writing 0.

(8) Buffer ready interrupt status (BRDY) bit

This module sets this bit when at least one of the PIPEBRDY bits in the BRDYSTS register corresponding to the pipes for which the PIPEBRDYE bit in the BRDYENB register is set (that is, when this module detects an BRDY interrupt to at least one of the pipes for which is enabled BRDY interrupt notification).

For the conditions to assert the PIPEBRDY status signal, see the description of the BRDYSTS register.

This module clears this bit when writes 0 to all the PIPEBRDY bits corresponding to the pipes for which a BRDY interrupt has been enabled by setting the PIPEBRDYE bit.

Software cannot clear this bit even by writing 0.

32B.2.10.2 BRDY Interrupt Status Register [BRDYSTS] <Address: H'046>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPEBRDY									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBRDY	All 0	R/W(0)	Pipe BRDY interrupt status These bits indicate the BRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register when the BRDYM bit is 0, write 0 to only the bit to be cleared and 1 to other bit.

Note: When the BRDYM bit is 0, clearing the BRDY interrupt status must be done always before the next access to the FIFO.

(1) Pipe BRDY interrupt status (PIPEBRDY) bit

When this module detects a BRDY interrupt to a pipe, this module sets the corresponding PIPEBRDY bit in the BRDYSTS register. At that time, if already set the corresponding bit in the BRDYENB register, this module sets the BRDY bit in the INTSTS0 register, and asserts the interrupt.

Conditions to generate and clear a BRDY interrupt vary depending on the values of the BRDYM bit, and the BFRE bit for each pipe.

(a) BRDYM = 0 and BFRE = 0

When the BRDYM and BFRE bits are 0, the BRDY interrupt is generated to indicate that the FIFO port has become ready for access.

Under the conditions described below, this module generates an internal BRDY interrupt request trigger, and sets the PIPEBRDY bit corresponding to the pipe for which the request trigger is generated.

1. For the pipe in the sending direction

(a) When the DIR bit changes from 0 to 1

(b) When this module has ended sending packets through a pipe when data writing by the CPU to the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
In continuous transfer mode, a request trigger is generated when data has all been sent from one FIFO buffer.

(c) When, in a double-buffer configuration, one FIFO buffer is empty when writing to the other FIFO buffer has ended
If sending to one FIFO buffer has ended during writing to the other FIFO buffer, no request trigger is generated until the ongoing writing to the other FIFO buffer ends.

(d) When this module flushes the FIFO buffer allocated to the pipe of which the transfer type is isochronous.

(e) When the state of the FIFO buffer is changed from the write-disabled state to the write-enabled state by writing 1 to the ACLRM bit

No request trigger is generated when the pipe is the DCP (in other words, when data is sent by a control transfer).

2. For the pipe in the receiving direction

(a) When this module has ended receiving packets through a pipe and reading from the FIFO buffer is enabled when data reading by the CPU from the FIFO buffer allocated to that pipe is disabled (when the value read from the BSTS bit is 0)
No request trigger is generated for the transaction that involves a data PID mismatch.
In continuous transmission/reception mode, no request trigger is generated when the data size is the maximum packet size and the FIFO buffer still has a free space.
If a short packet is received, a request trigger is generated even when the FIFO buffer has a free space.
When the transaction counter is used, a request trigger is generated when the specified number of packets have been received.
In that case, the request trigger is generated even if the FIFO buffer has a free space.

(b) When, in a double-buffer configuration, one FIFO buffer is in the read-enabled state when reading from the other FIFO buffer has ended
If receiving from one FIFO buffer has ended during reading from the other FIFO buffer, no request trigger is generated until the ongoing reading from the other FIFO buffer ends.

This interrupt does not occur during the communication at the status stage of a control transfer.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to "0" by writing "0" to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to all the PIPEBRDY bits corresponding to other pipes.

Clearing the pipe BRDT interrupt status must be done always before the next access to the FIFO buffer.

(b) When BRDYM = 0 and BFRE = 1

When the BRDYM bit is 0 and the BFRE bit is 1, this module determines that a BRDY interrupt occurs when all the data for a transfer has been read through a receiving pipe, and sets the PIPEBRDY bit corresponding to the pipe.

This module determines that the last data in a transfer has been received when one of the following conditions is met:

1. A short packet or a zero-length packet has been received.
2. The transaction counter (TRNCNT bits) is used, and as many packets as the value of the TRNCNT bits have been received.

When one of the above conditions is met and reading of the relevant data has ended, this module determines that all the data in a transfer has been read.

If a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data in a transfer has been read when the FRDY bit is set and the DTLN bits are cleared in the corresponding FIFO Port Control Register. To start the next transfer in that case, write 1 to the BCLR bit in the corresponding FIFOCTR.

When the BRDYM bit is 0 and the BFRE bit is 1, this module does not detect any BRDY interrupt to the pipe in the sending direction.

The PIPEBRDY interrupt status of the corresponding pipe can be cleared to “0” by writing “0” to the corresponding bit. When clearing a PIPEBRDY bit by writing 0, write 1 to the PIPEBRDY bits corresponding to other pipes.

In this mode, do not change the value of the BFRE bit until all the processing for a transfer ends.

If you need to change the value of the BFRE bit during the transfer, set the ACLRM bit to clear all the FIFO buffers for the specified pipe.

(c) When BRDYM = 1 and BFRE = 0

When the BRDYM bit is 1 and the BFRE bit is 0, the values of individual PIPEBRDY bits interlock with the values of the BSTS bits for individual pipes. In other words, this module sets or clears the BRDY interrupt status of a pipe according to the state of the FIFO buffer allocated to the pipe.

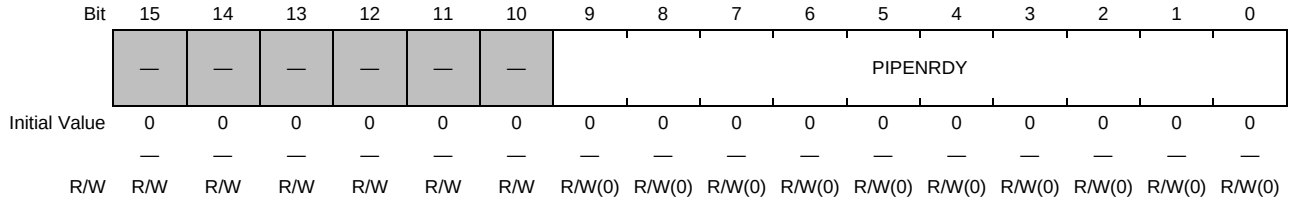
(a) For the pipe in the sending direction
This module sets the PIPEBRDY bit for the pipe when data can be written to the FIFO port or clears the PIPEBRDY bit when data cannot be written to the FIFO port.
The BRDY interrupt signal, however, is not asserted even when the sending pipe is write-enabled if the pipe is the DCP.

(b) For the pipe in the receiving direction
This module sets the PIPEBRDY bit for the pipe when data can be read from the FIFO port or clears the PIPEBRDY bit when all data has been read (that is, when data reading from the FIFO port is disabled).
If a zero-length packet is received when the FIFO buffer is empty, the PIPEBRDY bit corresponding to the specified pipe is kept being set and the BRDY interrupt signal is kept being asserted until sets the BCLR bit.

When the BRDYM bit is 1 and the BFRE bit is 0, this module cannot clear any PIPEBRDY bit.

When the BRDYM bit is 1, all the BFRE bits (for all pipes) must be 0.

32B.2.10.3 NRDY Interrupt Status Register [NRDYSTS] <Address: H'048>



Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPENRDY	All 0	R/W(0)	Pipe NRDY interrupt status These bits indicate the NRDY interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe NRDY interrupt status (PIPENRDY) bit

When this module issues an internal NRDY interrupt request for a pipe of which the PID is set to BUF, this module sets the PIPENRDY bit corresponding to the pipe in the NRDYSTS register. At that time, if the NRDYENB register bit corresponding to the pipe is set, this module sets the NRDY bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal NRDY interrupt request for individual pipes under the conditions described below. This module does not issue any interrupt request at the status stage of a control transfer.

(a) For the pipe in the sending direction

(1) When an IN token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer does not contain send data
When an IN token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module sends a zero- length packet, and sets the OVRN bit.

(b) For the pipe in the receiving direction

(1) When an OUT token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
If the transfer type of the pipe for which the interrupt is generated is isochronous transfer, this module issues an NRDY interrupt request, sets the PIPENRDY bit, and sets the OVRN bit.
If the transfer type of the pipe for which the interrupt is generated is not isochronous transfer, this module issues an NRDY interrupt request when sending an NAK Handshake signal after receiving the data that follows the OUT token, and sets the PIPENRDY bit.
Note, however, that this module does not issue an NRDY interrupt request when resending data (when a DATA-PID mismatch has occurred).
This module does not issue an NRDY interrupt request also when an error has occurred in a data packet.

(2) When a PING token is received in a situation where the PID bits corresponding to the specified pipe are 01 (BUF) and the FIFO buffer is full
When a PING token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit.

(3) When the transfer type of the specified pipe is isochronous transfer, the PID bits corresponding to the specified pipe are 01 (BUF), and data has not been received normally within an interval frame
When an SOF token is received, this module issues an NRDY interrupt request, and sets the PIPENRDY bit for the specified pipe.

32B.2.10.4 BEMP Interrupt Status Register [BEMPSTS] <Address: H'04A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPEBEMP									
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)	R/W(0)

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R/W	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
9 to 0	PIPEBEMP	All 0	R/W(0)	Pipe BEMP interrupt status These bits indicate the BEMP interrupt status of each pipe. 0: No interrupt is generated. 1: An interrupt is generated.

Note: Bit numbers correspond to pipe numbers.

Note: To clear the interrupt status indicated by a bit in this register, write 0 only to the bit and 1 to all other bit.

(1) Pipe BEMP interrupt status (PIPEBEMP) bit

When this module detects a BEMP interrupt to a pipe of which the PID is set to BUF, this module sets the PIPEBEMP bit corresponding to the pipe in the BEMPSTS register. At that time, if the BEMPENB register bit corresponding to the pipe is set, this module sets the BEMP bit in the INTSTS0 register, and asserts the interrupt.

This module issues an internal BEMP interrupt request for individual pipes under the conditions described below.

1. When data sending (including sending of zero-length packets) to a pipe in the sending direction has ended and the FIFO buffer allocated to the pipe is empty
   In a single-buffer configuration, this module generates a BRDY interrupt at the same time as issuing an internal BEMP interrupt request for the pipes other than the DCP.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When software (DMAC) has already started writing to the CPU-side FIFO buffer, in a double-buffer configuration, when sending data for one buffer ends

(b) When the buffer is cleared (to empty the buffer) by writing 1 to the ACLRM or BCLR bit

(c) During an IN transfer (sending zero-length packets) at the status stage of a control transfer

2. For the pipe in the receiving direction
   When the data larger than the specified maximum packet size has been received normally
   In that case, this module issues a BEMP interrupt request, sets the PIPEBEMP bit for the specified pipe, discards the received data, and changes the value of the PID bits for the specified pipe to 11 (STALL).
   Then, this module returns a STALL packet.
   Note, however, that this module does not issue the internal BEMP interrupt request in the following cases:

(a) When a CRC or bit stuff error has been detected in the received data

(b) When a SETUP transaction is being executed

Writing 0 to this bit clears the interrupt status.

Writing 1 to this bit causes no effect.

32B.2.11 Frame Number Registers (FRMNUM, UFRMNUM)

32B.2.11.1 Frame Number Register [FRMNUM] <Address: H'04C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—	FRNM										
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W(0)	R/W(0)	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W(0)	Overrun/underrun detection status This bit indicates whether an overrun or underrun is detected in the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
14	CRCE	0	R/W(0)	CRC error detection status This bit indicates the CRC error detection status for the pipe being used to perform an isochronous transfer. 0: No error 1: An error occurred.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	FRNM	All 0	R	Frame number These bits indicate the latest frame number.

Note: The OVRN bit is intended for debugging. When designing a system, design transfer timings appropriately to prevent buffer overruns and underruns.

(1) Overrun/underrun detection status (OVRN) bit

This module sets this bit when this module detects an overrun or underrun in a pipe of which the transfer type is isochronous transfer.

When this module detects an overrun or underrun, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

Software can clear this bit by writing 0 to this bit. If the CRCE bit should not be cleared together when this bit is cleared, write H'40.

When the peripheral controller function is selected

This module sets this bit in the following cases:

1. When an IN token is received although writing send data to the FIFO has not ended, in the case of a pipe that is in the sending direction and performs an isochronous transfer
2. When an OUT token is received although the free space of FIFO buffer is less than the size of one FIFO buffer, in the case of a pipe that is in the sending direction and performs an isochronous transfer

(2) CRC error detection status (CRCE) bit

This module sets this bit when this module detects a CRC or bit stuff error in a pipe of which the transfer type is isochronous transfer.

Software can clear this bit by writing 0 to this bit. If the OVRN bit should not be cleared together when this bit is cleared, write H’80.

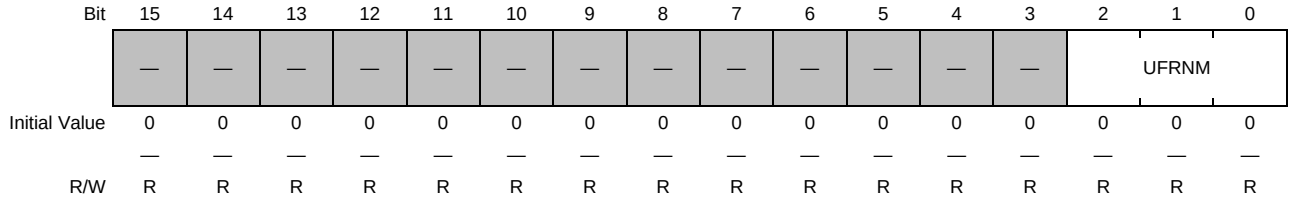
When this module detects a CRC error, this module issues an internal NRDY interrupt request. For details, see **Section 32B.2.10.3(1), Pipe NRDY interrupt status (PIPENRDY) bit**.

(3) Frame number (FRNM) bits

This module updates the value of these bits each time an SOF packet is received (once per 1 ms), and indicates the latest frame number in these bits.

When reading these bits, read them twice and check for consistency.

32B.2.11.2 Micro Frame Number Register [UFRMNUM] <Address: H'04E>



Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to these bits. Fix these bits to 0.
14 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	UFRNM	All 0	R	Micro frame These bits indicate the micro frame number.

(1) Micro frame number (UFRNM) bit

In high-speed transfer mode, this module writes the micro frame number to these bits. In a mode other than high-speed transfer mode, this module writes H'00 to these bits.

When reading these bits, read them twice and check for consistency.

32B.2.12 USB Address

32B.2.12.1 USB Address Register [USBADDR] <Address: H'050>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
6 to 0	USBADDR	All 0	R	USB address These bits indicate the USB address allocated by the host.

(1) USB address (USBADDR) bits

When this module has received and normally processed a SetAddress request, this module writes the received USB address to these bits.

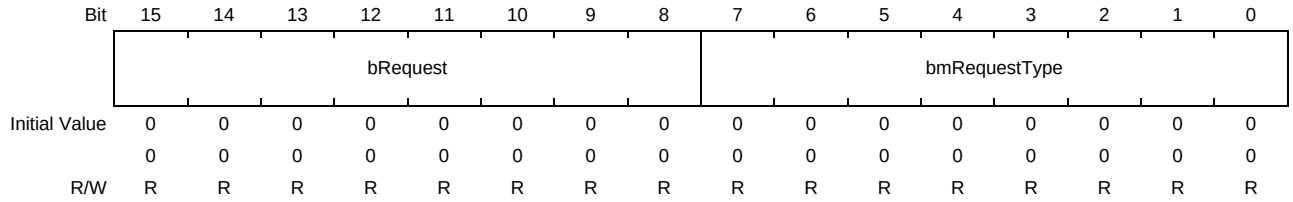
When this module detects a USB bus reset, this module writes H'00 to these bits.

32B.2.13 USB Request Registers

USB request registers are used to store control transfer setup requests.

These registers store the values set in the received USB requests.

32B.2.13.1 USB Request Type Register [USBREQ] <Address: H'054>



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	bRequest	All 0	R	Request Value of USBRequestbRequest
7 to 0	bmRequestType	All 0	R	Request type Value of USBRequestbmRequestType

(1) USB request (bRequest) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

(2) USB request type (bRmRequestType) bits

These bits indicate the value of the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.2 USB Request Value Register [USBVAL] <Address: H'056>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wValue															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wValue	All 0	R	Value Value of the wValue field in a USB request

(1) Value (wValue) bits

These bits indicate the value of the wValue field in a USB request.

These bits indicate the value of wValue field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.3 USB Request Index Register [USBINDX] <Address: H'058>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wIndex															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wIndex	All 0	R	Index Value of the wIndex field in a USB request

(1) Index (wIndex) bits

These bits indicate the value of the wIndex field in a USB request.

These bits indicate the value of wIndex field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.13.4 USB Request Length Register [USBLENG] <Address: H'05A>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	wLength															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	wLength	All 0	R	Length Value of the wLength field in a USB request

(1) Length (wLength) bits

These bits indicate the value of the wLength field in a USB request.

These bits indicate the value of wLength field in the USB request data this module has received in a SETUP transaction. Writing to these bits is ignored.

32B.2.14 DCP Configuration

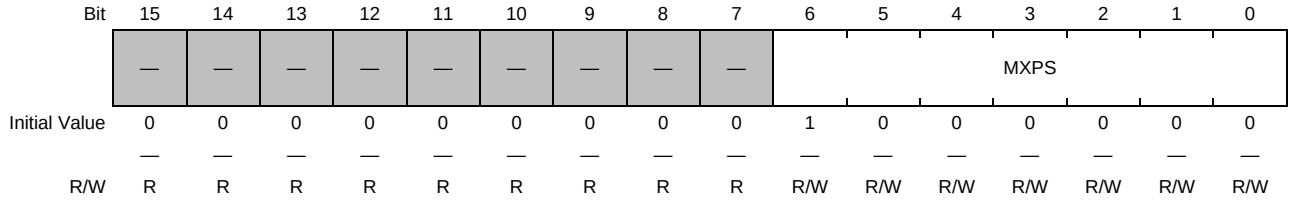
When performing a data communication by a control transfer, use the default control pipe (DCP).

32B.2.14.1 DCP Configuration Register [DCPCFG] <Address: H'05C>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	—	—	—	—	—	—	—	R/W	R/W	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0		Nothing is assigned to these bits. Fix these bits to 0.
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the default control pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the default control pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends 1: Disables the pipe when the transfer ends
6 to 0	—	All 0		Nothing is assigned to these bits. Fix these bits to 0.

32B.2.14.2 DCP Max. Packet Size Register [DCPMAXP] <Address: H’05E>



Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6 to 0	MXPS	H’40	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the DCP.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the DCP.

The default is H’40 (64 bytes).

The value of the MXPS bits must conform to the USB Specification.

Writing a value to the MXPS bits must be done when the PID is set to NAK and no value is set in the CURPIPE bits. If you need to change the value of these bits after changing the PID setting for the specified pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of these bits. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

32B.2.14.3 DCP Control Register [DCPCTR] <Address: H'060>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	—	—	—	—	—	SQCLR	SQSET	SQMON	PBUSY	—	—	CCPL	PID	
Initial Value	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W	R	R	R	R	R	R	R	R(0)/W(1)	R(0)/W(1)	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the accessibility status of the DCP FIFO buffer. 0: Buffer access is not possible. 1: Buffer access is possible.
14 to 9	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
8	SQCLR	0	R(0)/W(1)	Toggle bit clear This bit can set DATA0 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set This bit can set DATA1 as the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: Writing disabled 1: DATA1 specified
6	SQMON	0	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in DCP transfer. 0: DATA0 1: DATA1
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2	CCPL	0	R/W	Control transfer end enable Setting this bit permits the status stage of the control transfer to end. 0: Does not permit the control transfer to end. 1: Permits the control transfer to end.
1, 0	PID	All 0	R/W	Response PID These bits control responses from this module in control transfer. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the DCP. This bit is operated by this module. The meaning of this bit varies as follows depending on the value of the ISEL bit:

1. When ISEL = 0: This bit indicates whether receive data can be read from the FIFO buffer.
2. When ISEL = 1: This bit indicates whether send data can be written to the FIFO buffer.

(2) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the specified pipe. This module always clears this bit.

Do not set the SQCLR and SQSET bits at the same time.

Setting this bit must be done when the PID is set to NAK and no value is set in the CURPIPE bits.

If you need to set this bit after changing the PID setting for the specified pipe from BUF to NAK, check, that the PBUSY bit is 0 before setting this bit. If, however, this module has changed the PID setting from BUF to NAK, the value of the PBUSY bit need not be checked.

(4) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the specified pipe. This bit is operated by this module. When a transaction ends normally, this module toggles this bit.

This module, however, does not toggle this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

When a SETUP packet is received normally, this module sets this bit (to specify DATA1 as the expected value).

This module does not reference this bit in an IN or OUT transaction at the status stage. Also, this module does not toggle this bit even when the transaction ends normally.

(5) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the specified pipe starts. This module changes this bit from 1 to 0 when the transaction ends.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(6) Control transfer end enable (CCPL) bit

When software sets this bit when the PID of the specified pipe is BUF, this module ends the status stage of the ongoing control transfer.

In other words, in a control read transfer, this module sends an ACK handshake in response to an OUT transaction request from the USB host, and, in a control write or no-data control transfer, this module sends a zero-length packet in response to an IN transaction request from the USB host. If, however, a SetAddress request is detected, this module performs automatic response throughout the period from the setup stage to the end of the status stage regardless of the value of this bit.

When a new SETUP packet is received, this module changes this bit from 1 to 0.

When the VALID bit is 1, software cannot set this bit.

(7) Response PID (PID) bits

The setting of these bits must be changed from NAK to BUF when the data stage or status stage of a control transfer is executed.

This module changes the value of these bits in the following cases:

1. This module changes the value of these bits to 00 (NAK) when it receives a SETUP packet. At that time this module sets the VALID bit. Software cannot change the value of these bits until it clears the VALID bit.
2. When set these bits to 01 (BUF), this module changes the value of these bits to 11 (STALL) when it receives the data exceeding the specified maximum packet size.
3. This module changes the value of these bits to 1x (STALL) when it detects a sequence error in a control transfer.
4. This module changes the value of these bits to 00 (NAK) when it detects a USB reset.

This module does not reference these bits during SetAddress request processing (automatic processing).

32B.2.15 Pipe Configuration Registers (PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI)

To configure pipes 1 to 15, use the PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPExCTR, PIPExTRE, and PIPExTRN registers.

Select the pipes to be used by using the PIPESEL register, and then configure functions of individual pipes by using the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Note that you can use the PIPExCTR, PIPExTRE, and PIPExTRN registers for setting regardless of the pipe selection by the PIPESEL register.

32B.2.15.1 Pipe Window Select Register [PIPESEL] <Address: H'064>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	PIPESEL	All 0	R/W	Pipe window select These bits specify a pipe for registers at addresses H'68 to H'6E. 0000: No selection 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9

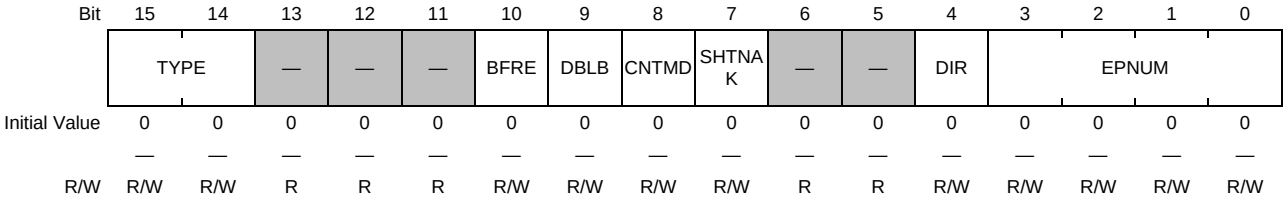
Note: When the PIPESEL bits are 0000, all bits of the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers are cleared. When the PIPESEL bits are 0000, writing to the registers at addresses H'68 to H'6E is ignored.

(1) Pipe Window select (PIPESEL) bits

When software a value from 0001 to 1111 to these bits, this module indicate the pipe information and settings corresponding to the registers at addresses H'68 to H'6E. After a pipe is selected by these bits, the values set in the areas at addresses H'68 to H'6E are applied, by this module, to the transfer operation using the selected pipe.

When writes 0000 to these bits, this module writes 0 to all bits of the registers at addresses H'68 to H'6E. Then, writing to the areas at addresses H'68 to H'6E is ignored.

32B.2.15.2 Pipe Configuration Register [PIPECFG] <Address: H'068>



Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TYPE		—	—	—	BFRE	DBLB	CNTMD	SHTNAK	—	—	DIR	EPNUM			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE	All 0	R/W	Transfer type These bits specify the transfer type of the pipe specified in the PIPESEL bit. 00: The pipe cannot be used. 01: Bulk transfer 10: Interrupt transfer 11: Isochronous transfer
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	BFRE	0	R/W	BRDY interrupt operation specification This bit specifies the timing at which this module notifies a BRDY interrupt relating to the specified pipe. 0: A BRDY interrupt is notified when data is sent or received. 1: A BRDY interrupt is notified when reading of data is completed.
9	DBLB	0	R/W	Double-buffer mode This bit specifies a single or double FIFO buffer to be used by the specified pipe. 0: Single buffer 1: Double buffer
8	CNTMD	0	R/W	Continuous transfer mode This bit specifies whether to use the specified pipe to perform communication in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode
7	SHTNAK	0	R/W	Pipe disable at transfer end When the specified pipe is in the receiving direction, this bit specifies whether to change the PID setting to NAK when the transfer ends. 0: Continues the pipe when the transfer ends. 1: Disables the pipe when the transfer ends.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
4	DIR	0	R/W	Transfer direction This bit specifies the transfer direction of the specified pipe. 0: Receiving direction 1: Sending direction
3 to 0	EPNUM	All 0	R/W	Endpoint number These bits specify the endpoint number of the specified pipe.

(1) Transfer type (TYPE) bits

These bits are used to specify the USB transfer type of the pipe (selected pipe) specified in the PIPESEL bits.

Table 32B.12 lists pipes and the transfer types specifiable in these bits.

Table 32B.12 Selected Pipes and the Transfer Types Specifiable in the TYPE Bits

Selected Pipe	TYPE Bits	USB Transfer Type
PIPE1 or PIPE2	01 or 11	Bulk or isochronous transfer
PIPE3 to PIPE5	01	Bulk transfer
PIPE6 to PIPE9	10	Interrupt transfer

Always specify a value other than 00 in these bits for a selected pipe before setting the PID of the selected pipe to BUF (to start USB communication using the selected pipe).

The value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK. If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(2) BRDY interrupt operation specification (BFRE) bit

This bit is valid when the selected PIPE is PIPE1 to PIPE5.

When set this bit and been using the selected pipe in the receiving direction (in other words, the DIR bit is 0), this module detects the end of transfer (when it occurs) and generates a BRDY interrupt when reading of the last packet ends.

If a BRDY interrupt occurs with the above settings, software must write 1 to the BCLR bit. The FIFO buffer allocated to the selected pipe remains unready for reception until 1 is written to the BCLR bit.

When set this bit and been using the selected pipe in the sending direction (in other words, the DIR bit is 1), this module does not generate any BRDY interrupt.

For details, see the description of the PIPEBRDY interrupt status bit.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Double-buffer mode (DBLB) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5.

When set this bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in the BUFSIZE bits in the PIPEBUF register.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(4) Continuous transfer mode (CNTMD) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5, and the transfer type of the selected pipe is bulk transfer.

This module determines whether data sending from or receiving in the FIFO buffer allocated to the selected pipe has ended according to the value of this bit in the way described in **Table 32B.13**.

Table 32B.13 How to Determine the End of Data Sending from or Receiving in the FIFO Buffer According to the Value of the CNTMD Bit

CNTMD Bit Setting Value	How to Determine Whether Reading or Sending is Enabled
0	Condition for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): This module receives one packet
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): Either of the following conditions (1) and (2) is met: (1) Data for the maximum packet size is written to the FIFO buffer. (2) Data for the short packet (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit.
1	Conditions for enabling reading from the FIFO buffer when the receiving direction is set ("DIR = 0"): (1) The number of bytes in data received in the FIFO buffer allocated to the selected pipe becomes equal to the number of allocated bytes ((BUFSIZE + 1) * 64). (2) This module receives a short packet other than a zero-length packet. (3) This controller receives a zero-length packet when the FIFO buffer allocated to the selected pipe already contains data. (4) Packets are received as many times as the value of the transaction counter set for the selected pipe.
	Condition for enabling sending from the FIFO buffer when the sending direction is set ("DIR = 1"): One of the following conditions (1) to (3) is met: (1) The amount of written data becomes equal to the size of one FIFO buffer allocated to the selected pipe. (2) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer and then 1 is written in the BVAL bit. (3) Data for less than the size of one FIFO buffer allocated to the selected pipe (including the case of zero-byte data) is written to the FIFO buffer, and a transfer end signal is asserted at the same time of the last writing.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) PIPE disable at transfer end (SHTNAK) bit

This bit is valid when the selected pipe is PIPE1 to PIPE5 and is in the receiving direction.

When set this bit for a selected pipe in the receiving direction, this module changes the PID of the selected pipe to NAK when this module determines the end of data transfer to the selected pipe. This module determines the end of transfer when one of the following conditions (1) and (2) is met:

(1) This module has normally received short packet data (including zero-length packets).

(2) When using a transaction counter, this module has normally received as many packets as the value set in the transaction counter.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

For the pipes in the sending direction, this bit must be cleared.

(6) Transfer direction (DIR) bit

When writes 0 to this bit for a selected pipe, this module uses the selected pipe in the receiving direction. When software writes 1 to this bit for the selected pipe, this module uses the selected pipe in the sending direction.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after the USB communication using the selected pipe, not only check the values of above three kinds of register bits but also write 1 and 0 successively to the ACLRM bit to clear the FIFO buffer allocated to the selected pipe.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Endpoint number (EPNUM) bits

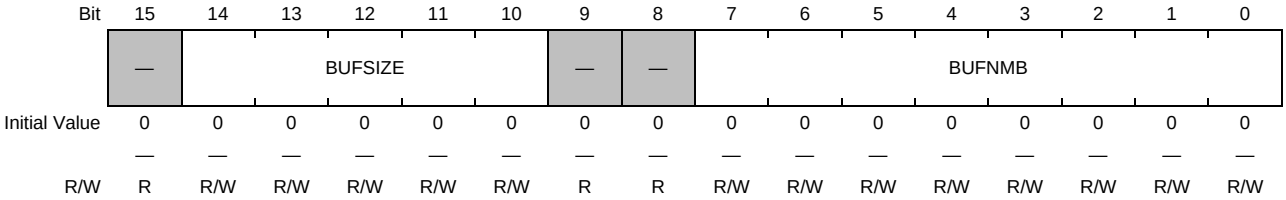
These bits are used to specify the endpoint number of the endpoint of a selected pipe. Note that specifying 0000 in these bits for a pipe means that the pipe is not used.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

The combination of the values of the DIR bit and EPNUM bits for a pipe must be unique among those for all pipes. (The setting "EPNUM = 000" [the selected pipe is not used] can be duplicated for multiple pipes.)

32B.2.15.3 Pipe Buffer Setting Register [PIPEBUF] <Address: H'06A>



Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14 to 10	BUFSIZE	All 0	R/W	Buffer size These bits specify the size of the FIFO buffer for the pipe specified in the PIPESEL bit. H'00: 64 bytes H'01: 128 bytes ... (H'1F: 2 Kbytes)
9, 8	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
7 to 0	BUFNMB	All 0	R/W	Buffer number These bits specify the FIFO buffer number of the specified pipe. (H'4 to H'7F)

Note: Changing values of these register bits for a selected pipe must be done when sets the PID of the selected pipe to NAK, and specifies no pipe in the CURPIPE bits.

Note: If you change values of these register bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the values of these bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Buffer size (BUFSIZE) bits

These bits are used to specify the size of the FIFO buffer to be allocated to the selected pipe. Specify the FIFO buffer size in units of blocks. One block has 64 bytes.

When set the DBLB bit for a selected pipe, this module allocates, to the selected pipe, two FIFO buffers, each of which has the FIFO buffer size specified in these bits.

The size of the FIFO buffer this module allocates to the selected pipe is as follows:

(BUFSIZE + 1) × 64 × (DBLB + 1) [bytes]

The following value can be specified in these bits:

(1) Any value from H'0 to H'1F when the selected pipe is PIPE1 to PIPE5.

(2) H'0 only when the selected pipe is PIPE6 to PIPE9.

In continuous transfer mode (CNTMD = 1), specify an integral multiple of the maximum packet size in the BUFSIZE bits.

(2) Buffer number (BUFNMB) bits

These bits are used to specify the block number of the first block in the FIFO buffer to be allocated to the selected pipe. This module allocates the following blocks of FIFO buffer to the selected pipe:

Block with block number “BUFNMB” to the block with block number “BUFNMB + (BUFSIZE + 1) × (DBLB + 1) - 1”

The value of these bits must be H’04 to H’7F. Note, however, that the following rules must be observed: Value " H’00" is exclusively used for DCP.

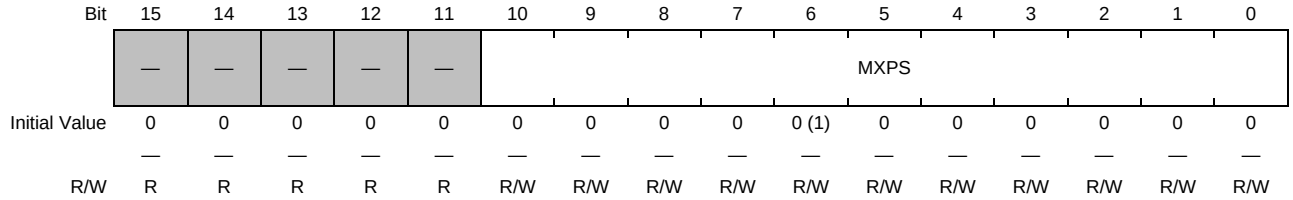
Value “H’04” is exclusively used for PIPE6. When, however, PIPE6 is not used, this value can be used for another pipe. If PIPE6 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’04 in the BUFNMB bits for PIPE6.

Value “H’05” is exclusively used for PIPE7. When, however, PIPE7 is not used, this value can be used for another pipe. If PIPE7 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’05 in the BUFNMB bits for PIPE7.

Value “H’06” is exclusively used for PIPE8. When, however, PIPE8 is not used, this value can be used for another pipe. If PIPE8 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’06 in the BUFNMB bits for PIPE8.

Value “H’07” is exclusively used for PIPE9. When, however, PIPE9 is not used, this value can be used for another pipe. If PIPE9 is selected, writing to the BUFNMB bits is ignored. Then, this module aromatically sets H’07 in the BUFNMB bits for PIPE9.

32B.2.15.4 Pipe Maximum Packet Size Register [PIPEMAXP] <Address: H'06C>



Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10 to 0	MXPS	*Note	R/W	Maximum packet size These bits specify the maximum data payload size (maximum packet size) for the specified pipe. For PIPE6 to PIPE8, a value from H'1 to H'40 (bytes) can be set.

Note: The initial value of the MXPS bits is H'00 when no pipe is specified in the PIPESEL bits in the PIPESEL register or H'40 when a pipe is specified in the PIPESEL bits.

(1) Maximum packet size (MXPS) bits

These bits are used to specify the maximum data payload size (maximum packet size) for the selected pipe.

The initial value of these bits is H'40 (64 bytes).

- For PIPE1 and PIPE2, a value from H'1 (1 byte) to H'400 (1024 bytes) can be specified.
- For PIPE3 to PIPE5, H'8 (8 bytes), H'10 (16 bytes), H'20 (32 bytes), H'40 (64 bytes), or H'200 (512 bytes) can be specified. (Bits [2:0] are excluded.)
- For PIPE6 to PIPE9, a value from H'1 (1 byte) to H'40 (64 bytes) can be specified.

The value of the MXPS bits for individual transfer type must conform to the USB Specification.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

When the MXPS bits are all 0, data must not be written to the FIFO buffer, and the PID setting must not be changed to BUF.

32B.2.15.5 Pipe Cycle Control Register [PIPEPERI] <Address: H'06E>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	— R	— R	— R	— R/W	— R	— R	— R	— R	— R	— R	— R	— R	— R	— R/W	— R/W	— R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	IFIS	0	R/W	Isochronous IN buffer flush This bit specifies whether to perform a buffer flush when the pipe specified in the PIPESEL bit is used for isochronous IN transfer. 0: Does not perform a buffer flush. 1: Performs a buffer flush.
11 to 3	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
2 to 0	IITV	All 0	R/W	These bits specify the transfer interval of the specified pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

(1) Isochronous IN buffer flush (IFIS) bit

When the selected pipe is used for isochronous IN transfer, this bit is used to specify this module automatically clears the FIFO buffer if this module fails to receive the IN token from the USB host in a (micro) frame sent at intervals specified in the IITV bits.

In double-buffer mode (DBLB = 1), this module clears only the data in one buffer used earlier than the other.

This module clears the FIFO buffer when it receives an SOF packet immediately after the (micro) frame in which the IN token hag to be received. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

(2) Interval error detection interval (IITV) bits

These bits specify the interval of interval error detection for the selected pipe. The value to be specified is the frame timing multiplied by an n-th power of 2.

Setting a value in these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of these bits for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of thee bits. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value specified in these bits to another after a USB communication, change the PID to NAK, and then set the ACLRM bit to initialize the interval timer before changing the value.

For PIPE3 to PIPE5 these bits are ignored. Write 0 to all these bits corresponding to PIPE3 to PIPE5.

You can specify a value in these bits when the transfer type of the selected pipe is isochronous.

(a) When the selected pipe is used for isochronous OUT transfer

If this module does not receive any data packet in the (micro) frame sent at intervals specified in the IITV bits, this module generates an NRDT interrupt.

This module generates an NRDY interrupt also if this module cannot receive data because an error, e.g., CRC error, has occurred in a data packet or because the FIFO buffer is full (such a situation might result if, for example, software [DMAC] delays in reading data from the FIFO buffer).

This module generates the NRDY interrupt when it receives an SOF packet. Even if the SOF packet is corrupted, this module generates the NRDY interrupt in the same timing to receive the SOF packet by the use of the internal interpolation function.

When, however, the value of the IITV bits is not 0, this module generates the NRDY interrupt every time an SOF packet is received at the specified intervals after interval counting starts.

If the PID of the selected pipe is changed to NAK after the interval timer starts, this module does not generate the NRDY interrupt even when it receives an SOF packet.

The condition for starting interval counting varies by the value of the IITV bits.

(a) When IITV = 0: Interval counting starts when the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	OUT	DATA0
Setting of PID bits	NAK	NAK	BUF			BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			0		
Start of interval counting			↑					

Figure 32B.1 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 0

(b) When IITV is not 0: Interval counting starts at the end of the first normal reception of data packet after the PID of the selected pipe is changed to BUF.

(Micro) frame	SOF	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0	SOF	SOF	OUT	DATA0
Setting of PID bits	NAK	BUF	BUF			BUF	BUF			BUF	BUF		
Whether token reception is expected (0: reception expected —: non-reception expected)	—	—	0			—	0			—	0		
Start of interval counting			↑										

Figure 32B.2 Relationship between (Micro) Frames and Whether Token Reception Is Expected When IITV = 1

(b) When the selected pipe is used for isochronous IN transfer

The IITV bits are used in combination with the setting of the IFIS bit to 1. When the IFIS bit is 0, this module sends a data packet in response to a received token regardless of the value of the IITV bits.

When the IFIS bit is 1, if this module does not receive any IN token in the (micro) frame sent at intervals specified in the IITV bits although the FIFO buffer has sendable data, this module clears the FIFO buffer.

This module clears the FIFO buffer also when it cannot receive an IN token normally because of a bus error, e.g., CRC error.

This module clears the FIFO buffer when it receives an SOF packet. Even if the SOF packet is corrupted, this module clears the FIFO buffer in the same timing to receive the SOF packet by the use of the internal interpolation function.

The condition for starting interval counting varies by the value of the IITV bits. (The condition is the same as that for isochronous OUT transfer.)

The interval counter is cleared when one of the following conditions (1) to (3) is met:

(1) This module is reset (then, also the IITV bits are cleared).

(2) The ACLRM bit is set.

(3) This module detects a USB bus reset.

32B.2.16 Pipe Control Registers (PIPExCTR)

32B.2.16.1 PIPE1 Control Register [PIPE1CTR] <Address: H'070>
PIPE2 Control Register [PIPE2CTR] <Address: H'072>
PIPE3 Control Register [PIPE3CTR] <Address: H'074>
PIPE4 Control Register [PIPE4CTR] <Address: H'076>
PIPE5 Control Register [PIPE5CTR] <Address: H'078>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	INBUFM	—	—	—	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R/W	R/W	R(0)/W(1)	R(0)/W(1)	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer status This bit indicates the FIFO buffer status of the specified pipe. 0: Buffer access is not possible. 1: Buffer access is possible.
14	INBUFM	0	R	Transmit buffer monitor When the specified pipe is in the sending direction, this bit indicates the FIFO buffer status of the specified pipe. 0: The FIFO buffer does not contain data that can be sent. 1: The FIFO buffer contains data that can be sent.
13 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	ATREPM	0	R/W	Automatic response mode This bit prohibits or enables automatic response of the specified pipe. 0: Automatic response prohibited 1: Automatic response enabled. (A zero-length packet response is sent during transmission. For reception, an NAK response is sent and an NRDY interrupt is generated.)
9	ACLRM	0	R/W	Automatic buffer clear mode This bit prohibits or enables automatic buffer clear mode for the specified pipe. 0: Prohibited 1: Enabled (all buffers are initialized)
8	SQCLR	0	R(0)/W(1)	Toggle bit clear Specify 1 in this bit to clear the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA0. 0: Writing disabled 1: DATA0 specified
7	SQSET	0	R(0)/W(1)	Toggle bit set Specify 1 in this bit to set the expected value of the sequence toggle bit for the next transaction in the specified pipe to DATA1. 0: Writing disabled 1: DATA1 specified
6	SQMON	0	R	Sequence toggle bit monitor This bit indicates the expected value of the sequence toggle bit for the next transaction in the specified pipe. 0: DATA0 1: DATA1

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	Pipe busy This bit indicates whether the specified pipe is being used in the USB bus. 0: The specified pipe is not used in the USB bus. 1: The specified pipe is being used in the USB bus.
4 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1, 0	PID	All 0	R/W	Response PID These bits specify the response method for the next transaction in the specified pipe. 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

This bit indicates whether the CPU can access the FIFO buffer allocated to the selected pipe. This bit is operated by this module.

The meaning of this bit varies as follows depending on the value of the values of the DIR, BFRE, and DCLRM bits:

Table 32B.14 BSTS Bit Operations

DIR bit Setting Value	BFRE bit Setting Value	DCLRM bit Setting Value	Meaning of the BSTS Bit
0	0	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
		1	Setting prohibited
	1	0	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible. This bit indicates 0 when 1 is written in the BCLF bit after reading data has finished.
		1	This bit indicates 1 when reading of received data from the FIFO buffer becomes possible, and indicates 0 when reading data has finished.
1	0	0	This bit indicates 1 when writing of send data in the FIFO buffer becomes possible, and indicates 0 when writing data has finished.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

(2) Transmit buffer monitor (INBUFM) bit

When the selected pipe is in the sending direction (DIR = 1), this module sets this bit when software (or the DMAC) has finished writing data to at least one FIFO buffer.

This module clears this bit when this module finishes sending all data from the FIFO buffer to which the data has been written. In double-buffer mode (DBLB = 1), this module clears this bit when this module has finished sending all data from the two FIFO buffers and software (or the DMAC) has not yet finished writing data to one FIFO buffer.

When the selected pipe is in the receiving direction (DIR = 0), this bit indicates the same value as that of the BSTS bit.

(3) Automatic response mode (ATREPM) bit

This bit can be set when the transfer type of the selected pipe is bulk transfer.

When this bit is 1, this module responds to tokens sent from the USB host as described below.

1. When the selected pipe is used for bulk IN transfer (TYPE = 01 and DIR = 1)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an IN token by sending a zero-length packet.
   Each time this module receives ACK from the USB host (the sequence of one transaction is receiving an IN token, sending a zero-length packet, and then receiving ACK), this module updates (toggles) the sequence toggle bit (DATA- PID).
   This module does not generate BRDY and BEMP interrupts.

2. When the selected pipe is used for bulk OUT transfer (TYPE = 01 and DIR = 0)
   When the ATREPM bit is 1 and the PID of the selected pipe is BUF, this module responds to an OUT token (or a PING token) by sending an NAK response and generates an NRDY interrupt.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

To perform a USB communication with this bit set, the FIFO buffer must be empty. No data must be written to the FIFO buffer during the USB communication with this bit set.

When the transfer type of the selected pipe is isochronous transfer, this bit must always be 0.

(4) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 32B.15 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 32B.16 shows the cases that require this processing.

Table 32B.15 Buffer Contents This Core Clears When the ACLRM Bit is Set

No.	Contents to be Cleared by Setting the ACLRM Bit
(1)	Whole contents of the FIFO buffer allocated to the specified pipe (if the double buffer is set, both FIFO buffers are cleared)
(2)	If the transfer type of the specified pipe is Isochronous transfer, the interval count value is cleared.

Table 32B.16 Cases Requiring the ACLRM Bit to be Set

No.	Cases when Data Clear is Required
(1)	The whole contents of the FIFO buffer allocated to the specified pipe needs to be cleared.
(2)	The interval count value needs to be reset.
(3)	The value of the BFRE bit is changed.
(4)	The value of the DBLB bit is changed.
(5)	Forced termination of the transaction count function is performed.

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(5) Sequence toggle bit clear (SQCLR) bit

When software sets this bit, this module specifies DATA0 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQCLR bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(6) Sequence toggle bit set (SQSET) bit

When software sets this bit, this module specifies DATA1 as the expected value of the sequence toggle bit for the selected pipe. This module always clears this bit.

Writing 1 to the SQSET bit must be done when the PID of the selected pipe is NAK.

If you write 1 to this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(7) Sequence toggle bit monitor (SQMON) bit

This bit indicates the expected value of the sequence toggle bit for the selected pipe. This bit is operated by this module.

When the transfer type of the selected pipe is other than isochronous transfer, this module toggles this bit when a transaction ends normally. This module, however, does not toggles this bit if a DATA-PID mismatch occurs during a transfer in the receiving direction.

(8) Pipe busy (PBUSY) bit

This module changes this bit from 0 to 1 when a USB transaction using the selected pipe starts. This module changes this bit from 1 to 0 when the transaction ends normally.

Reading this bit after software sets the PID to NAK enables you to check whether you can change pipe settings.

(9) Response PID (PID) bits

These bits are used to specify, the type of response of this module for individual pipes.

The default of PID is NAK. When the selected pipe is used for USB transfers, the PID setting muse be changed to BUF. For the basic operations (without communication packet errors involved) of this module depending on the value of the PID bits, see **Table 32B.17**.

If you have changed the PID of a selected pipe from BUF to NAK while the selected pipe is performing a USB communication, check, that the PBUSY bit is 0 to confirm that the USB transfer through the selected pipe has actually changed to the NAK status. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

This module changes the value of the PID bits in the following cases:

1. When the selected pipe is in the receiving direction and set the SHTNAK bit for the selected pipe, this module sets the PID to NAK when this module recognizes the end of a transfer.
2. When this module has received a data packet of which the payload size is larger than the maximum packet size, this module sets the PID to STALL (PID = 11).
3. If this module detects a USB bus reset, this module sets the PID to NAK.

To change the PID from NAK (PID = 00) to STALL, write 10 to the PID bits. To change the PID from BUF (PID = 01) to STALL, write 11 to the PID bits.

To change the PID from STALL (PID = 11) to NAK, write 10 to the PID bits once, and then write 00 to the PID bits. To change the PID from STALL to BUF, change the PID to NAK once, and then change it to BUF.

Table 32B.17 Core Operations Depending on the PID Setting

PID bit Setting Value	Transfer Type (TYPE Bit Setting Value)	Transfer Direction (DIR Bit Setting Value)	Operation of This Core
00 (NAK)	Bulk ("TYPE = 01"), or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a NAK response for a token from the USB host.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	Does not respond to a token from the USB host.
		Sending direction ("DIR = 1")	Sends a zero-length packet for a token from the USB host.
01 (BUF)	Bulk ("TYPE = 01")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK or NYET response. If receiving data is not possible, this module sends an NAK response. For a PING Token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Interrupt ("TYPE = 10")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data and then sends an ACK response. If receiving data is not possible, this module sends an NAK response.
	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends an NAK response.
	Isochronous ("TYPE = 11")	Receiving direction ("DIR = 0")	For an OUT token from the USB host, if the FIFO buffer corresponding to the specified PIPE can receive data, this module receives data. If receiving data is not possible, this module discards data.
		Sending direction ("DIR = 1")	If the corresponding FIFO buffer is available for sending data, this module sends data in response to a token from the USB host. If sending data is not possible, this module sends a zero-length packet.
10 (STALL) or 11 (STALL)	Bulk ("TYPE = 01") or Interrupt ("TYPE = 10")	Independent of the setting value	Sends a STALL response for a token from the USB host.
	Isochronous ("TYPE = 11")	Independent of the setting value	Does not respond to a token from the USB host.

1, 0	PID	All 0	R/W	Response PID These bits specifies the response method for the next transaction in the specified pipe 00: NAK response 01: BUF response (according to the buffer status) 10: STALL response 11: STALL response

(1) Buffer status (BSTS) bit

See **Section 32B.2.16.1(2), Transmit buffer monitor (INBUFM) bit**.

(2) Automatic buffer clear mode (ACLRM) bit

When you need to clear the whole FIFO buffer allocated to the selected pipe, write 1 and 0 successively to the ACLRM bit.

Table 32B.18 shows the buffer contents this module clears when 1 and 0 are written successively to the ACLRM bit.

Table 32B.19 shows the cases that require this processing.

Table 32B.18 Buffer Contents This Core Clears when the ACLRM Bit is Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	All contents of the FIFO buffer allocated to the selected pipe

Table 32B.19 Cases Requiring the ACLRM Bit to be Set

No.	Contents Cleared by ACLRM Bit Operation
(1)	When clearing contents of the FIFO buffer allocated to the selected pipe
(2)	When resetting the interval counter
(3)	When the value of the BFRE bit is changed
(4)	When the transaction count function is terminated forcibly

Changing the value of this bit for a selected pipe must be done while the PID of the selected pipe is NAK and the selected pipe is not specified in the CURPIPE bits.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(3) Sequence toggle bit clear (SQCLR) bit

See **Section 32B.2.16.1(5), Sequence toggle bit clear (SQCLR) bit**.

(4) Sequence toggle bit set (SQSET) bit

See **Section 32B.2.16.1(6), Sequence toggle bit set (SQSET) bit**.

(5) Sequence toggle bit monitor (SQMON) bit

See **Section 32B.2.16.1(7), Sequence toggle bit monitor (SQMON) bit**.

	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	— R	— R	— R	— R	— R	— R	— R/W	— R(0)/W(1)	— R	— R	— R	— R	— R	— R	— R	— R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
9	TRENB	0	R/W	Transactio n counter enable This bit enables or disables the transaction counter. 0: Disables the transaction counter. 1: Enables the transaction counter.
8	TRCLR	0	R(0)/W(1)	Transactio n counter clear This bit clears the transaction counter to 0. To clear the counter, write 1 to this bit. 0: Invalid 1: Clears the current transaction counter.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

Note: Changing values of these register bits for a selected pipe must be done when the PID of the selected pipe is NAK. If you change the value of a bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that the PBUSY bit is 0 before changing the value of the bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

(1) Transaction counter enable (TRENB) bit

When software sets this bit for the selected pipe in the receiving direction after specifying a total number of packets in the TRNCNT bits, this module performs the following control when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits:

1. When the continuous transfer mode is used (CNTMD = 1), this module switches the FIFO buffer to the CPU side at the end of reception even if the FIFO buffer is not full.
2. When the SHTNAK bit is 1, this module changes the PID of the selected pipe to NAK when it finishes receiving the same number of packets as the total number specified in the TRNCNT bits.
3. When the DENDE bit is 1 and the PKTMD bit is 0, this module asserts the DEND signal when reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.
4. When the BFRE bit is 1, this module asserts the BRDY interrupt signal when it finishes reading the last data after having received the same number of packets as the total number specified in the TRNCNT bits.

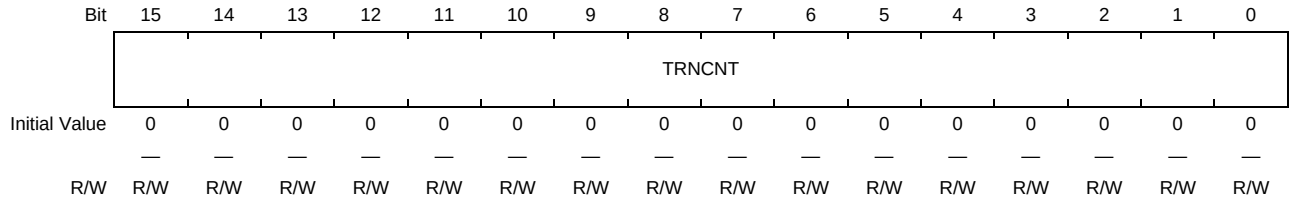
For the pipe in the sending direction, write 0 to this bit (TRENB bit). When not using the transaction count function, write 0 to this bit.

When using the transaction count function, specify a value in the TRNCNT bits before writing 1 to this bit. Also, write 1 to this bit before receiving the first packet among those to be counted by the transaction count function.

(2) Transaction counter clear (TRCLR) bit

When software sets this bit for a selected pipe, this module clears the current value of the transaction counter corresponding to the selected pipe, and then clears this bit.

32B.2.17.2 PIPE1 Transaction Counter Register [PIPE1TRN] <Address: H'092>
PIPE2 Transaction Counter Register [PIPE2TRN] <Address: H'096>
PIPE3 Transaction Counter Register [PIPE3TRN] <Address: H'09A>
PIPE4 Transaction Counter Register [PIPE4TRN] <Address: H'09E>
PIPE5 Transaction Counter Register [PIPE5TRN] <Address: H'0A2>



Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT	All 0	R/W	When writing: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When reading: Indicates the specified number of transactions if TRENB is 0. Indicates the number of the currently counted transaction if TRENB is 1.

(1) Transaction counter (TRNCNT) bits

When software writes 1 to the TRENB bit after setting the total number of packets to be received for the selected pipe in the receiving direction, this module performs the control described in **Section 32B.2.17.1(1), Transaction counter enable (TRENB) bit**.

When the TRENB bit is 0, this module indicates, by these bits, the number of transactions set.

When the TRENB bit is 1, this module indicates, by these bits, the current number of transactions counted.

This module increments the value of the TRNCNT bits by 1 when the status of reception meets all the following conditions (a) to (c):

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is not equal to "current count + 1."

(c) The payload size of received packets has reached the value of the MXPS bits.

This module clears the TRNCNT bits to 0 when any of the following conditions (1) to (3) is met:

(1) All the following conditions (a) to (c) are met:

(a) The TRENB bit is 1.

(b) When a packet is received, the value of the TRCNT bits is equal to "current count + 1. "

(c) The payload size of received packets has reached the value of the MXPS bits.

(2) Both of the following conditions (a) and (b) are met:

(a) The TRENB bit is 1.

(b) A short packet has been received.

(3) The following condition is met:

(a) Written 1 to the TRCLR bit.

For the pipe in the sending direction, write 0 to these bits (TRNCNT bits). When not using the transaction count function, write 0 to these bits.

Changing the value of these bits for a selected pipe must be done while the PID of the selected pipe is NAK and the TRENB bit is 0.

If you change the value of this bit for a selected pipe after having changed the PID of the selected pipe from BUF to NAK, check, that, and the PBUSY bit is 0 before changing the value of this bit. Note, however, that, if this module has changed the PID of the selected pipe to NAK, the value of the PBUSY bit need not be checked.

If you change the value of these bits, write 1 to the TRCLR bit before writing 1 to the TRENB bit.

32B.2.18 Low Power Control Register

32B.2.18.1 Low Power Control Register [LPCTRL] <Address: H'100>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HWUPM	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved Nothing is assigned to these bits. Fix these bits to 0.
7	HWUPM	0	R/W	0: Resumes the PHY from the low-power mode while the internal bus clock (P1ϕ) is operating. 1: Enables resume from the low-power mode while the internal bus clock (P1ϕ) is stopped.
6 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) HWUPM

This bit is used to specify whether to enable resumption from the low-power mode even while the internal bus clock (P1ϕ) is stopped.

0: Disables resumption while the internal bus clock (P1ϕ) is stopped.

1: Enables resumption while the internal bus clock (P1ϕ) is stopped.

This bit specifies whether to detect resume signaling while the internal bus clock (P1ϕ) is stopped. Whether to resume is controlled by the L1EXTMD bit. To resume from the low-power mode (LPM L1 state) while the internal bus clock (P1ϕ) is stopped, set both this bit and the L1EXTMD bit.

32B.2.19 Low Power Status Register

32B.2.19.1 Low Power Status Register [LPSTS] <Address: H'102>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	SUSPM	0	R/W	USBPHY Suspend M control This bit controls the Suspend M signal to the USBPHY. 0: USBPHY suspend mode 1: USBPHY normal mode
13 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) USBPHY SuspendM control (SUSPM) bit

This bit is used to control the SuspendM signal to the USBPHY. By default, the value of this bit is 0 and the USBPHY is in suspend mode. To operate this module, write 1 to this bit.

When the SUSPM bit is 0 (that is, when the UTMI clock is stopped), data cannot be written to this module, but can only be read from this module. Note, however, that data can be written to the registers listed in **Table 32B.20**.

Table 32B.20 Registers That Allow Writing when the SUSPM Bit is 0

Address	Register Name
H'000	SYSCFG0
H'002	BUSWAIT
H'100	LPCTRL
H'102	SUSPMODE

Note that the values written to the SYSCFG0 register while the USBPHY clock is stopped (SUSPM = 0) will be applied after the USBPHY clock starts (SUSPM = 1).

When the L1EXTMD bit is 0, this bit (SUSPM bit) is controlled (set or cleared) by software. When L1EXTMD bit is 1, this bit is controlled by software for the transition to the L1 or L2 state, and controlled by hardware for resumption from the L1 or L2 state, regardless of the level (L1 or L2).

32B.2.20 PHY Function Control Register

32B.2.20.1 PHY Function Control Register [PHYFUNCTR] <Address: H'104>

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
10	DmPuDwn	1	R	Dm Pulldown monitor bit
9	DpPuDwn	1	R	Dp Pulldown monitor bit
8 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) DmPuDwn

DmPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DM side is disabled.

1: 15-kΩ Pulldown resistor control on the DM side is enabled.

(2) DpPuDwn

DpPulldown monitor bit (read only)

0: 15-kΩ Pulldown resistor control on the DP side is disabled.

1: 15-kΩ Pulldown resistor control on the DP side is enabled.

32B.2.22 Peripheral L1 Control Register 1 (PL1CTRL)

32B.2.22.1 Peripheral L1 Control Register 1 [PL1CTRL1] <Address: H'144>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	L1EXTMD	—	—	HIRDTHR[3:0]				DVSQ[3:0]				L1NEGOMD	L1RESPMD[1:0]		L1RESPEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R		R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
14	L1EXTMD	0	R/W	USBPHY control mode on resumption from the L1 state This bit controls the USBPHY resume operation on resumption from the L1 state. 0: Does not set the Suspend M bit when the Host K signal is received. 1: Sets the Suspend M bit when the Host K signal is received
13, 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	HIRDTHR[3:0]	All 0	R/W	L1 response negotiation threshold HIRD threshold to be used for the L1NEGOMD bit The format is the same as the HIRD field of the HL1CTRL register.
7	DVSQ[3]	0	R	DVSQ extension bit This bit combined with the device state (DVSQ[2:0]) bit indicates the L1 state. 0000b: Powered state 0001b: Default state 0010b: Address state 0011b: Configured state 01xxb: Suspended state 10xxb: L1 state
6 to 4	DVSQ[2:0]	All 0	R	These bits mirror the DVSQ[2:0] bits in INTSTS0.
3	L1NEGOMD	0	R/W	L1 response negotiation control This bit sets the negotiation function using for the HIRD value. 0: Returns an ACK response if the received HIRD value is larger than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. 1: Returns an ACK response if the received HIRD value is smaller than the value of the HIRDTHR[3:0] bits. In other cases (including same values), an NYET response is returned. This bit is valid only when the value of the L1RESPMD[1:0] bit is 11b.
2, 1	L1RESPMD[1:0]	All 0	R/W	L1 response mode These bits specify how to respond to an LPM token. 00b: NYET 01b: ACK 10b: STALL 11b: Response according to the value of the L1NEGOMD bit
0	L1RESPEN	0	R/W	L1 response enable This bit enables an L1 response. 0: Does not support LPM. 1: Supports LPM.

(1) L1 EXT mode (L1EXTMD) bit

This bit specifies how to control the SuspendM bit upon receiving the Host K signal when the USBPHY is stopped by setting the SuspendM bit in the L1 state.

0: Does not set the SuspendM bit when this module is resumed from the L1 state.

1: Sets the SuspendM bit when this module is resumed from the L1 state.

NOTES

1. The Host K period lasts a minimum of 50 µs. Therefore, the USBPHY might be unable to be resumed within the Host K period if the software settings for resume same as those for the suspend state are applied. Because the initial value of this bit is controlled by software, set this bit at initialization when the L1 state is to be supported.
2. For the transition to the L1 state, the SuspendM bit is controlled by software regardless of the value of this bit.
3. When this bit is set, the SuspendM bit will be set also at resumption from the L2 state.

(2) HIRD negotiation threshold (HIRDTHR[3:0]) bits

These bits specify the value of HIRD threshold to be used for the negotiation specified by the L1NEGOMD bit.

The format of the value is the same as that of the HIRD field in the HL1CTRL register.

(3) Device state extension (DVSQ[3]) bit

This bit is used as the fourth bit for the device state (DVSQ) bits.

0000b: Powered state

0001b: Default state

0010b: Address state

0011b: Configured state

01xxb: Suspended state

10xxb: L1 state

(4) Device status (DVSQ[2:0]) bits

These bits mirror the DVSQ[2:0] bits in the Interrupt Status Register (INTSTS0).

(5) L1 negotiation mode (L1NEGOMD) bit

This bit is used to specify the negotiation function using the HIRD value.

0: Returns an ACK response when the received HIRD value is larger than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

1: Returns an ACK response when the received HIRD value is smaller than the value in HIRDTHR[3:0] bits, or returns an NYET response in other cases.

This bit is valid only when the value of L1RESPMD[1:0] bits is 11b.

(6) L1 response mode (L1RSPMD[1:0]) bits

When the L1RSPED bit is set, this module respond to an LPM token according to the value of these bits. These bits specify how to respond to the LPM token.

00b: NYET

01b: ACK

10b: STALL

11b: Response according to the value of L1NEGOMD bit

(7) L1 response enable (L1RSPEN) bit

When this bit is 0, this module does not respond to the LPM token it receives. When this bit is 1, this module responds to the LPM token (it receives) according to the value of the LPMRESPMD[1:0] bits.

32B.2.23 Peripheral L1 Control Register 2

32B.2.23.1 Peripheral L1 Control Register 2 [PL1CTRL2] <Address: H'146>

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
12	RWEMON	0	R/W	This bit reflects the value of the RWE bit in the LPM token received last.
11 to 8	HIRDMON[3:0]	All 0	R/W	These bits reflect the value of the HIRD field in the LPM token received last.
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

(1) RWE value monitor (RWEMON) bit

This bit is referenced to monitor the value of the RWE bit in a received LPM token.

This bit reflects the value of the RWE bit in the LPM token received last.

(2) HIRD value monitor (HIRDMON) bits

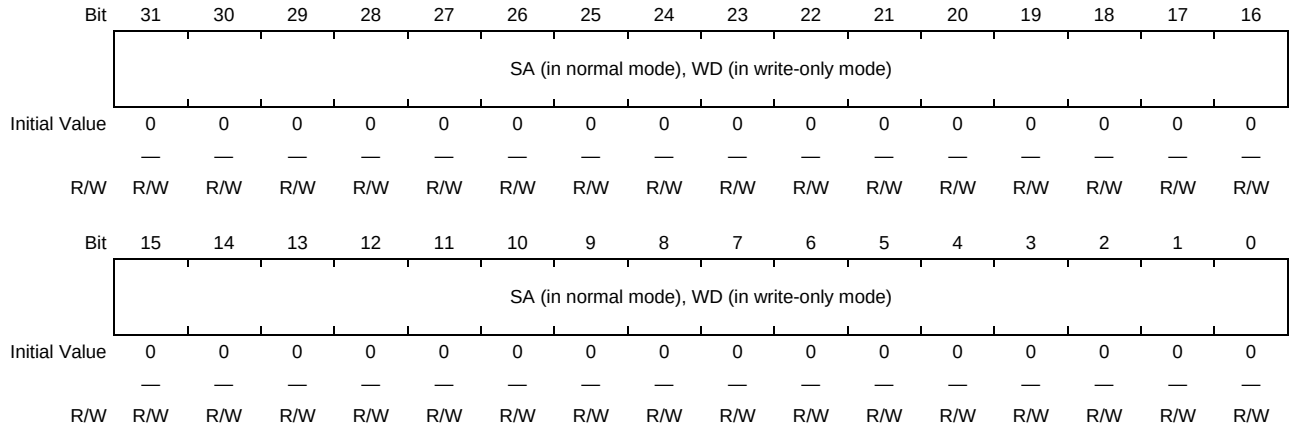
These bits are referenced to monitor the value of the HIRD field in a received LPM token.

These bits reflect the value of the HIRD field in the LPM token received last.

32B.3 Next Register Set

32B.3.1 Next Source Address Register n

32B.3.1.1 Next0 Source Address Register ch0 [N0SA_0] <Address: H'400>
Next1 Source Address Register ch0 [N1SA_0] <Address: H'40C>
Next0 Source Address Register ch1 [N0SA_1] <Address: H'440>
Next1 Source Address Register ch1 [N1SA_1] <Address: H'44C>

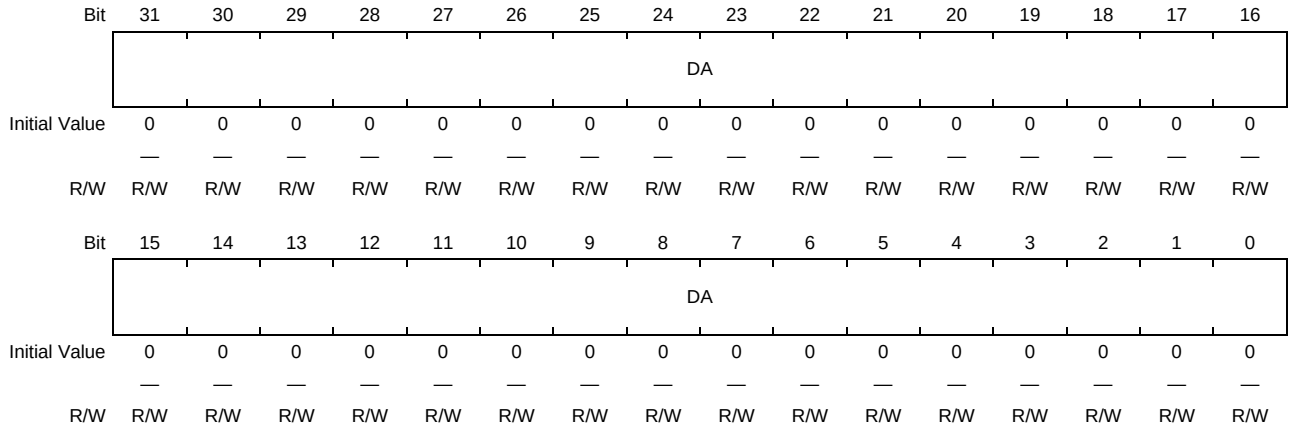


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SA (in normal mode)	All 0	R/W	Source Address These bits specify the start address of the DMA transfer source.
	WD (in write-only mode)	All 0	R/W	Write Data These bits specify the write data in write-only mode.

Note: In a transfer in link mode, the data in the N0SA_n register is overwritten with descriptor read data.

32B.3.2 Next Destination Address Register n

32B.3.2.1 Next0 Destination Address Register ch0 [N0DA_0] <Address: H'404>
Next1 Destination Address Register ch0 [N1DA_0] <Address: H'410>
Next0 Destination Address Register ch1 [N0DA_1] <Address: H'444>
Next1 Destination Address Register ch1 [N1DA_1] <Address: H'450>

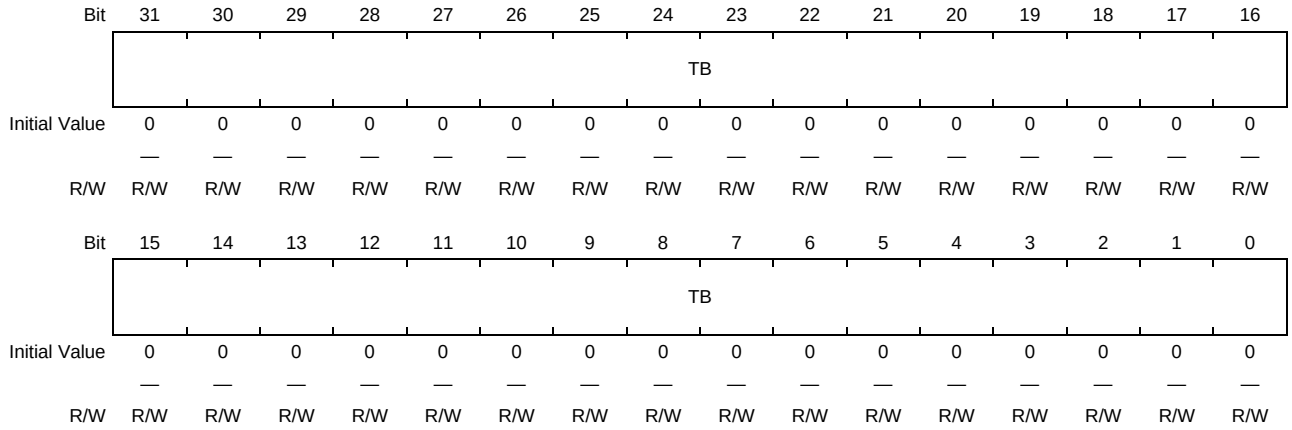


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DA	All 0	R/W	Destination Address These bits specify the start address of the DMA transfer destination.

Note: In a transfer in link mode, the data in the N0DA_n register is overwritten with descriptor read data.

32B.3.3 Next Transaction Byte Register n

32B.3.3.1 Next0 Transaction Byte Register ch0 [N0TB_0] <Address: H'408>
Next1 Transaction Byte Register ch0 [N1TB_0] <Address: H'414>
Next0 Transaction Byte Register ch1 [N0TB_1] <Address: H'448>
Next1 Transaction Byte Register ch1 [N1TB_1] <Address: H'454>



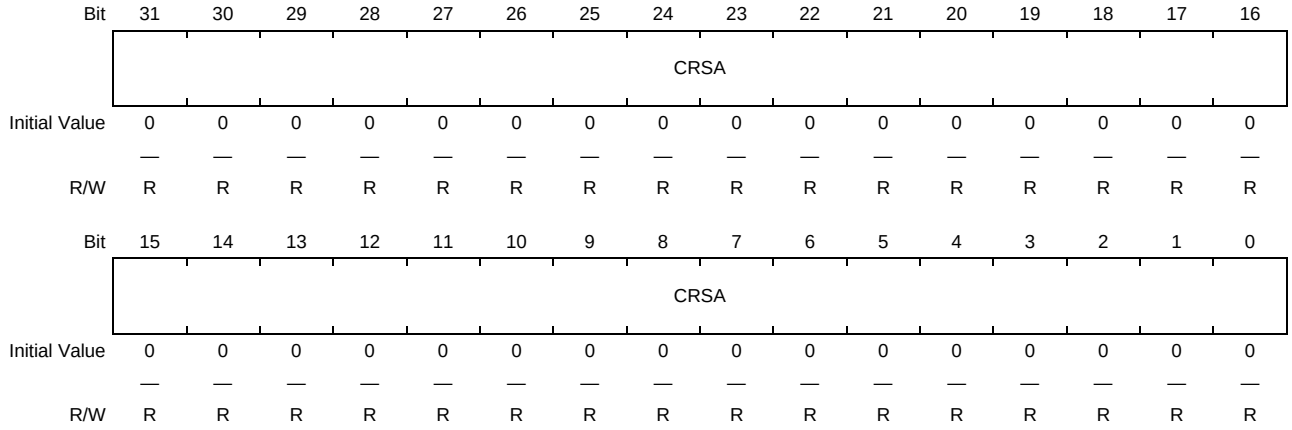
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TB	All 0	R/W	Transaction Byte These bits specify the total number of transfer bytes. *Note*: Do not start a DMA transaction with 0 set in these bits.

Note: The N0TB_n register is overwritten by the descriptor read data during link mode transfer.

32B.4 Current Register Set

32B.4.1 Current Source Address Register

32B.4.1.1 Current Source Address Register ch0 [CRSA_0] <Address: H'418>
Current Source Address Register ch1 [CRSA_1] <Address: H'458>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRSA	All 0	R	Current Source Address Register This register indicates the read address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the SAD bit in the CHCFG_n register is 1, the value of this register is fixed. When the WONLY bit in the CHCFG_n register is 1, the value of this register is undefined.) The initial value of this register is loaded from the following register: In register mode: A transfer source address is loaded from the Next0/1 Register Set. In link mode: A transfer source address is loaded from the descriptor. (The descriptor read data is input to the N0SA_n register, and is loaded into the CRSA_n register when a transfer starts.) The value of this register is incremented when a read transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.4.2 Current Destination Address Register

32B.4.2.1 Current Destination Address Register ch0 [CRDA_0] <Address: H'41C>
Current Destination Address Register ch1 [CRDA_1] <Address: H'45C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRDA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRDA	All 0	R	Current Destination Address Register This register indicates the write address for the next DMA transaction. The value of this register is incremented automatically while DMA transactions are in process. (When the DAD bit in the CHCFG_n register is 1, the value of this register is fixed.) The initial value of this register is loaded from the following register: In register mode: A transfer destination address is loaded from the Next0/1 Register Set. In link mode: A transfer destination address is loaded from the descriptor. (The descriptor read data is input to the N0DA_n register, and is loaded into the CRDA_n register when a transfer starts.) The value of this register is incremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.4.3 Current Transaction Byte Register

32B.4.3.1 Current Transaction Byte Register ch0 [CRTB_0] <Address: H'420>
Current Transaction Byte Register ch1 [CRTB_1] <Address: H'460>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRTB															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRTB	All 0	R	Current Transaction Byte Register This register indicates the remaining number of transfer bytes in the ongoing DMA transaction. The value of this register is decremented automatically while the DMA transaction is in process. The initial value of this register is loaded from the following register: In register mode: The number of transfer bytes is loaded from the Next0/1 Register Set. In link mode: The number of transfer bytes is loaded from the descriptor. (The descriptor read data is input to the N0TB_n register, and is loaded into the CRTB_n register when a transfer starts.) The value of this register is decremented when a write transfer ends. Read this register after DMA stops (that is, after the TACT bit in the CHSTAT_n register is cleared). (Handle the value read during DMA only as a reference value.)

32B.5 Channel Register Set

32B.5.1 Channel Status Register n

32B.5.1.1 Channel Status Register ch0 [CHSTAT_0] <Address: H'424>
Channel Status Register ch1 [CHSTAT_1] <Address: H'464>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DNUM	All 0	R	Data Number These bits indicate the amount of valid data in the buffer. The indicated amount of data is the amount of the data that was read from the source but has not yet been written to the destination. (Unit: byte) Incrementing condition: • A DMA read transfer ends. Decrementing condition: • A DMA write transfer ends. Clearing conditions: • A condition for clearing the EN bit is met. • "1" is written to the SWRST bit in the CHCTRL_n register.
23 to 19	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
18	SWPRQ	0	R	Sweep Request This bit indicates the state of sweep request. This bit indicates the state of software sweep request (which has been activated by the SETSSWPRQ bit in the CHCTRL_n register). 1: The sweep request signal has been asserted. 0: The sweep request signal has not been asserted. Setting condition: • The SETSSWPRQ bit in the CHCTRL_n register is asserted. Clearing conditions: • The buffer becomes empty because of sweep. • "1" is written to the CLRHSWPRQM bit in the CHCTRL_n register. • "1" is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
17	DMARQM	0	R	DMAREQ Mask This bit indicates the state of temporary masking of the DMA transfer request from the USB control. 1: The request is temporarily masked. 0: The request is released from temporary masking. Setting condition: ● The SETDMARQM bit in the CHCTRL_n register is set. Clearing conditions: ● “1” is written to the CLRDMARQM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
16	INTM	0	R	Interrupt Mask This bit indicates the state of temporary masking of the output from the USBFDMAmn interrupt. 1: The output is temporarily masked. 0: The output is released from temporary masking. Setting condition: ● “1” is written to the SETINTM bit in the CHCTRL_n register. Clearing conditions: ● “1” is written to the CLRINTM bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
15 to 12	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
11	MODE	0	R	DMA Mode This bit indicates the DMA mode. The indicated value is the value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode
10	DER	0	R	Descriptor Error This bit indicates whether the data read from the descriptor is invalid (LV = 0) (regardless of the value of the DIM bit in the CHCFG_n register). 0: No descriptor error has occurred. 1: A descriptor error has occurred. Setting condition: ● In link mode, when the DRRP bit in the CHCFG_n register is 0, the LV bit value read from the descriptor is 0. Clearing conditions: ● “1” is written to the CLRDER bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
9	DW	0	R	Descriptor WriteBack This bit indicates whether data is being written back to the descriptor. If a bus error occurs during write-back to the descriptor, this bit retains 1. 0: Status other than write-back to the header in link mode 1: (When the ER bit in the CHSTAT_n register is 0) Data is being written back to the header in link mode. (When the ER bit in the CHSTAT_n register is 1) A bus error has occurred during write-back to the header in link mode. Setting condition: ● Write-back to the header is started in link mode. Clearing conditions: ● Write-back to the header in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.

Bit	Bit Name	Initial Value	R/W	Description
8	DL	0	R	Descriptor Load This bit indicates whether data is being read from the descriptor. If a bus error occurs during descriptor reading, this bit retains 1. 0: Status other than descriptor reading 1: (When the ER bit is 0) Descriptor reading is in process in link mode. (When the ER bit is 1) A bus error has occurred during descriptor reading in link mode. Setting condition: ● Descriptor reading is started in link mode. Clearing conditions: ● Descriptor reading in link mode ends with an OK response. ● “1” is written to the SWRST bit in the CHCTRL_n register. If the bit retains 1 because of an error response, this bit can be cleared only by setting the SWRST bit.
7	SR	0	R	Selected Register Set In register mode, this bit indicates the register set that is selected. 0: Next0 Register Set 1: Next1 Register Set Setting condition: ● The RSEL bit in the CHCFG_n register is set. Clearing condition: ● The RSEL bit in the CHCFG_n register is cleared.
6	TC	0	R	Terminal Count This status bit indicates whether the DMA transaction has ended. This bit is set only when the TCM bit in the CHCFG_n register is 0. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● In register mode, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 1, transfer of the total number of transfer bytes specified in the CRTB bits ends. ● In link mode, when the WBD bit in the header of the descriptor is 0, write-back to the descriptor ends. Clearing conditions: ● “1” is written to the CLRTC bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.
5	END	0	R	USBFDMAmn Interrupted This bit indicates whether the DMA transaction has ended and an USBFDMAmn interrupt has occurred. 0: The DMA transfer has not ended. 1: The DMA transfer has ended. Setting conditions: ● The condition for setting the TC bit is met, and the DEM bit in the CHCFG_n register is 0. ● In link mode, when the descriptor is read, the LV bit in the header is 0, and the DRRP and DIM bits in the CHCFG_n register are 0. Clearing conditions: ● “1” is written to the CLREND bit in the CHCTRL_n register. ● “1” is written to the SWRST bit in the CHCTRL_n register.

Bit	Bit Name	Initial Value	R/W	Description
4	ER	0	R	Error This bit indicates whether an error response has been received and a DMAERR interrupt has occurred during the DMA transfer. 0: No error response has been received. 1: An error response has been received. Setting condition: ● An error response is received in a bus cycle. Clearing condition: ● “1” is written to the SWRST bit in the CHCTRL_n register.
3	SUS	0	R	Suspend This bit indicates whether the channel is suspended. For details, see **Section 32B.9.13.8(2), Suspension**. 0: Channel_n is not suspended. 1: Channel_n is suspended. Setting condition: ● “1” is written to the SETSUS bit in the CHCTRL_n register during the DMA transfer using channel_n, and, thereby, the inside of the channel is suspended. Clearing conditions: ● “1” is written to the CLRSUS bit in the CHCTRL_n register. ● “1” is written to the CLREN bit in the CHCTRL_n register. ● A condition for clearing the EN bit in the CHSTAT_n register.
2	TACT	0	R	Transaction Active This bit indicates whether the DMAC is operating. This bit is used to check whether the channel is stopped fully. For details, see **Section 32B.9.13.8, Transfer state**. 0: The DMA in channel_n is stopped. 1: The DMA in channel_n is operating. Setting condition: ● “1” is written to the SETEN bit in the CHCTRL_n register (to start descriptor reading or wait for a DMA request). Clearing condition: ● The internal state is the idle state (the EN bit in the register has been cleared, and all transfers have ended).
1	RQST	0	R	Request This bit indicates whether a transfer request has been received. 0: No DMA transfer request has been received. 1: A DMA transfer request has been received. Setting conditions: ● “1” is written to the STG bit in the CHCTRL_n register. ● A DMA transfer request is received from the USB control. Clearing conditions: ● “1” is written to the SWRST bit in the CHCTRL_n register. ● “1” is written to the CLRRQ bit in the CHCTRL_n register. ● In single transfer mode (the TM bit in the CHCFG_n register is 0), a transfer is executed on the side specified by the REQD bit in the CHCFG_n register ● In register mode, all DMA transactions are complete (the REN bit in the CHCFG_n register is 0). ● In link mode, the DMA transfer of the last descriptor (LE = 1) ends. ● In link mode, a DMA transfer is stopped during descriptor reading (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0). ● In link mode, when the DEM bit in the CHCFG_n register is 0, a DMA transaction ends. ● The master interface receives a bus error signal.

Bit	Bit Name	Initial Value	R/W	Description
0	EN	0	R	Enable This bit indicates whether the operation of DMA channel n is enabled or stopped. 0: Operation is stopped. 1: Operation is enabled. Setting conditions: • “1” is written to the SETEN bit in the CHCTRL_n register. Clearing conditions: • “1” is written to the SWRST bit in the CHCTRL_n register. • “1” is written to the CLREN bit in the CHCTRL_n register. • An error response is received during transfer. • In register mode, all DMA transactions are completed (the REN bit in the CHCFG_n register is 0). • In link mode, DMA transfer of the last descriptor (the LE bit is 1) ends (if the WBD bit is 0, write- back to the descriptor ends). • In link mode, reading of a descriptor is stopped (the LV bit is 0 and the DRRP bit in the CHCFG_n register is 0).

Note 1. When the ER bit in the CHSTAT_n register is set, treat the corresponding series of transfers as invalid transactions.

Note 2. To interrupt a DMA transaction, mask or clear transfer requests or clear the EN bit in the CHSTAT_n register. (For the procedure to interrupt, see **Section 32B.9.13.8(3), Transfer suspension**.)

Note 3. If the DMA transfer request from the USB control and the transfer request by software (setting the STG bit in the CHCFG_n register) are used together, the cause of activating the request that takes effect cannot be identified. Therefore, design the system so that only one type of transfer requests is used.

Note 4. When using the transfer request by software, operate the STG bit for a new transfer request only after the DMA transfer requested last ends (after checking the end of the last DMA transfer by referencing the Current Register Set or another method).

32B.5.2 Channel Control Register n

32B.5.2.1 Channel Control Register ch0 [CHCTRL_0] <Address: H'428>
Channel Control Register ch1 [CHCTRL_1] <Address: H'468>

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read
19	CLRDMARQM	0	R/W	Clear DMAREQ Mask Writing 1 to this bit releases the DMA transfer requests from the USB control from temporary masking. Writing 1 to this bit also clears the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Releases the DNA transfer requests from masking set by using the SETDMARQM bit. 0: Has no effect on operation.
18	SETDMARQM	0	R/W	SET DMAREQ Mask Writing 1 to this bit temporarily masks the DMA transfer requests from the USB control. Writing 1 to this bit also sets the DMARQM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the DMA transfer requests from the USB control. 0: Has no effect on operation.
17	CLRINTM	0	R/W	Clear Interrupt Mask Writing 1 to this bit releases the USBFDMAmn interrupt from masking. Writing 1 to this bit also clears the INTM bit in the CHSTATn register. Releasing the INT_DMA[n] pin output from masking when the LVINT bit in the DCTRL register and the END bit in the CHSTAT_n register are 1 activates the INT_DMA[n] pin output. (The pin output is not activated if the LVINT bit is 0.) When this bit is read, 0 is read. 1: Releases the pin output from masking set by using the SETINTM bit. 0: Has no effect on operation.
16	SETINTM	0	R/W	SETINTMSet Interrupt Mask Writing 1 to this bit temporarily masks the USBFDMAmn interrupt. Writing 1 to this bit also sets the INTM bit in the CHSTATn register. When this bit is read, 0 is read. 1: Masks the USBFDMAmn interrupt. 0: Has no effect on operation.
15	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.

Bit	Bit Name	Initial Value	R/W	Description
14	SETSSWPRQ	0	R/W	Set Software Sweep Request Writing 1 to this bit sweeps out the data stored in the buffer to the destination (see **Section 32B.9.13.3(1), Forced software sweeping request**). When this bit is read, 0 is read. 1: Writes, to the destination, the data that is stored in the buffer and has not yet been written to the destination. 0: Has no effect on operation. If the destination asserts a hardware request (REQD = 1), the sweep operation cannot be used.
13	—	0	R	Reserved area. Write 0 to this bit. When this bit are read, 0 is read.
12	SETREN	0	R/W	Set Register Set Enable Writing 1 to this bit sets the REN bit in the CHCFG_n register. When this bit is read, 0 is read. 1: Sets the REN bit in the CHCFG_n register. 0: Has no effect on operation.
11, 10	—	All 0	R	Reserved area. Write 0 to these bits. When these bits are read, 0 is read.
9	CLRSUS	0	R/W	Clear Suspend Writing 1 to this bit when the SUS bit in the CHSTAT_n register is 1 releases the ongoing DMA transfer from the suspended state. When this bit is read, 0 is read. 1: Releases the ongoing DMA transfer from the suspended state. 0: Has no effect on operation.
8	SETSUS	0	R/W	Set Suspend Writing 1 to this bit when the EN bit in the CHSTAT_n register is 1 suspends the ongoing DMA transfer. When this bit is read, 0 is read. 1: Suspends the ongoing DMA transfer. 0: Has no effect on operation.
7	CLRDER	0	R/W	Clear DER Writing 1 to this bit clears the DER bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the DER bit. 0: Has no effect on operation.
6	CLRTC	0	R/W	Clear TC Writing 1 to this bit clears the TC bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the TC bit. 0: Has no effect on operation.
5	CLREND	0	R/W	Clear End Writing 1 to this bit clears the END bit in the CHSTAT_n register. Writing 1 to this bit also clear the USBFDMAmn interrupt. When this bit is read, 0 is read. 1: Clears the END bit. 0: Has no effect on operation.
4	CLRRQ	0	R/W	Clear Request Writing 1 to this bit clears the RQST bit in the CHSTAT_n register. When this bit is read, 0 is read. 1: Clears the RQST bit in the CHSTAT_n register. 0: Has no effect on operation.

Bit	Bit Name	Initial Value	R/W	Description
3	SWRST	0	R/W	Software Reset Writing 1 to this bit clears individual bits in the CHSTAT_n register (for the bits to be cleared, see the description of each bit). Setting this bit must be done when the EN and TACT bits are 0. When this bit is read, 0 is read. 1: Clears individual bits in the CHSTAT_n register. 0: Has no effect on operation.
2	STG	0	R/W	Software Trigger Writing 1 to this bit makes software set an internal transfer request. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority. When this bit is read, 0 is read. 1: Makes software set a transfer request (set the RQST bit in the CHSTAT_n register). 0: Has no effect on operation.
1	CLREN	0	R/W	Clear Enable Writing 1 to this bit clears the EN bit in the CHSTAT_n register (for details, see **Section 32B.9.13.8(3) Transfer suspension**). When this bit is read, 0 is read. 1: Disables DMA transfers (clears the EN bit in the CHSTAT_n register). 0: Has no effect on operation.
0	SETEN	0	R/W	Set Enable Writing 1 to this bit enables DMA transfers in DMA channel n. If this bit and the SWRST bits are set at the same time, clearing by the SWRST bit takes priority, and DMA transfers do not start. When this bit is read, 0 is read. 1: Enables DMA transfers (sets the EN bit in the CHSTAT_n register). 0: Has no effect on operation.

Note: Temporary masking (using the CLRDMARQM, and SETDMARQM bits) of the DMA transfer requests from the USB control applies to only the resources for channel n. Setting the SETDMARQM bit for channel n does not affect the operation of channel m.

32B.5.3 Channel Configuration Register

32B.5.3.1 Channel Configuration Register ch0 [CHCFG_0] <Address: H'42C>
Channel Configuration Register ch1 [CHCFG_1] <Address: H'46C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SDS				DRRP	—	—	—	—	—	—	—	REQD	—	—	SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	DMS	0	R/W	DMA Mode Select This bit specifies the DMA mode to be used. 0: Register mode (default) 1: Link mode
30	REN	0	R/W	Register Set Enable This bit specifies whether to successively perform, after a DMA transaction ends, another DMA transaction using the Next Register Set selected by the RSEL bit. This bit is valid only in register mode. 0: Does not perform the DMA transaction successively. 1: Performs the DMA transaction successively. Setting conditions: • "1" is written to this bit. • "1" is written to the SETREN bit in the CHCTRL_n register. Clearing conditions: • "0" is written to this bit. • The REN bit is 1, and a DMA transaction ends. To re-set the REN bit during a transaction, we recommend you to use the SETREN bit in the CHCTRL_n register.
29	RSW	0	R/W	Register Select Switch This bit specifies whether to automatically invert the RSEL bit after a DMA transaction ends. This bit is valid only in register mode. 0: Does not invert the RSEL bit after a DMA transaction ends. (Default) 1: Inverts the RSEL bit after a DMA transaction ends.
28	RSEL	0	R/W	Register Set Select This bit is used to select the Next Register Set to be used for the next DMA transaction. This bit is valid only in register mode. When the RSW bit is 1, this bit is inverted automatically at the end of a DMA transaction. 0: Uses the Next0 Register Set. (Default) 1: Uses the Next1 Register Set. Transition condition: A DMA transaction ends with the RSW bit set.

Bit	Bit Name	Initial Value	R/W	Description
27	SBE	0	R/W	Sweep Buffer Enable This bit specifies whether to sweep (write) the data already read and stored in the buffer and stop transfer when the EN bit in the CHSTAT_n register is cleared during a DMA transaction. The sweep mode can be used only when the REQD bit is 0. 0: Stops transfer without sweeping out the buffer. (Default) 1: Stops transfer after sweeping out the buffer.
26	DIM	0	R/W	Descriptor Interrupt Mask This bit specifies whether to mask the USBFDMAmn interrupt when the LV bit value read from descriptor header is 0. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Mask the USBFDMAmn interrupt.
25	TCM	0	R/W	DMATC Mask This bit is used to mask the DMATC signal, which is sent from the DMAC to USB control. When this bit is 1 at the time the DMATC signal is to be output, the DMATC signal is not asserted. Also, the TC bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is automatically cleared. In link mode, this bit is not cleared automatically. Use this bit when you control DMA transfers by software. 0: Does not mask the DMATC signal. (Default) 1: Masks the DMATC signal. Clearing condition: A DMA transaction ends with the TCM bit set.
24	DEM	0	R/W	USBFDMAmn Mask When this bit is 1 at the time the USBFDMAmn interrupt is not asserted. Also, the END bit in the CHSTAT_n register is not asserted in that case. In register mode, this bit is not cleared automatically. In link mode, this bit is automatically cleared. 0: Does not mask the USBFDMAmn interrupt. (Default) 1: Masks the USBFDMAmn interrupt. Clearing condition: A DMA transaction ends with the DEM bit set.
23	WONLY	0	R/W	Write Only Mode This bit is used to switch the transfer operation mode to the write-only mode (see **Section 32B.9.12.2, Write only mode**). 0: Normal operation (default) 1: Write-only mode
22	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
21	DAD	0	R/W	Destination Address Direction This bit specifies the direction of counting the transfer-destination address in DMA channel n. If the transfer destination is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer destination uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.
20	SAD	0	R/W	Source Address Direction This bit specifies the direction of counting the transfer-source address in DMA channel n. If the transfer source is on the USB control side, write 1 (fixed) to this bit. 0: Incrementing (default) 1: Fixed When the transfer source uses the skip mode or is beat-unaligned, do not specify 1 (fixed) in this bit.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	DDS[3:0]	All 0	R/W	Destination Data Size These bits specify the size of DMA transfer data. When the transfer destination is on the USB control side, select the normal mode. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
15 to 12	SDS[3:0]	All 0	R/W	Source Data Size These bits specify the size of DMA transfer data. Use bit 3 to switch between the normal and skip modes. 0: Normal mode (default) 1: Skip mode Use bits 2 to 0 to specify the size of transfer data. (For specifiable values, see **Table 32B.21**.) 000: 8 bits (default) 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits 101: 256 bits 110: 512 bits 111: Setting prohibited
11	DRRP	0	R/W	Descriptor Read Repeat This bit switches the operation to be performed when the LV value in the header read from the descriptor is 0. (See **section 32B.9.12.1(2)(a), Operation flow of link mode**.) • 0: This module sets the DER bit in the CHSTAT_n register, and then stops descriptor reading. (Default) • 1: This module keeps reading the same descriptor until the LV value changes to 1, and, when the LV value becomes 1, starts the DMA transfer using the values in the descriptor. The interval of descriptor reading is controlled by using the DSCITVL register.
10 to 7	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
6, 5	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 1.
4	—	0	R	Nothing is assigned to this bit. Fix this bit to 0.
3	REQD	0	R/W	Request Direction This bit specifies whether the USB control is on the transfer source side or it is on the transfer destination side. 0: The USB control is on the transfer source side. (Default) 1: The USB control is on the transfer destination side.
2, 1	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
0	SEL	0	R/W	Terminal Select This bit selects the FIFO channel to be used on the USB control side. 0: D0FIFO 1: D1FIFO

The range of values specifiable in the SDS[2:0] and DDS[2:0] bits depends on the data bus width, number of implemented buffer stages, and whether the address to be accessed is beat-aligned or not (beat-unaligned). The table below shows the range of specifiable values.

Table 32B.21 Range of Sizes That Can Be Specified in SDS and DDS Bits

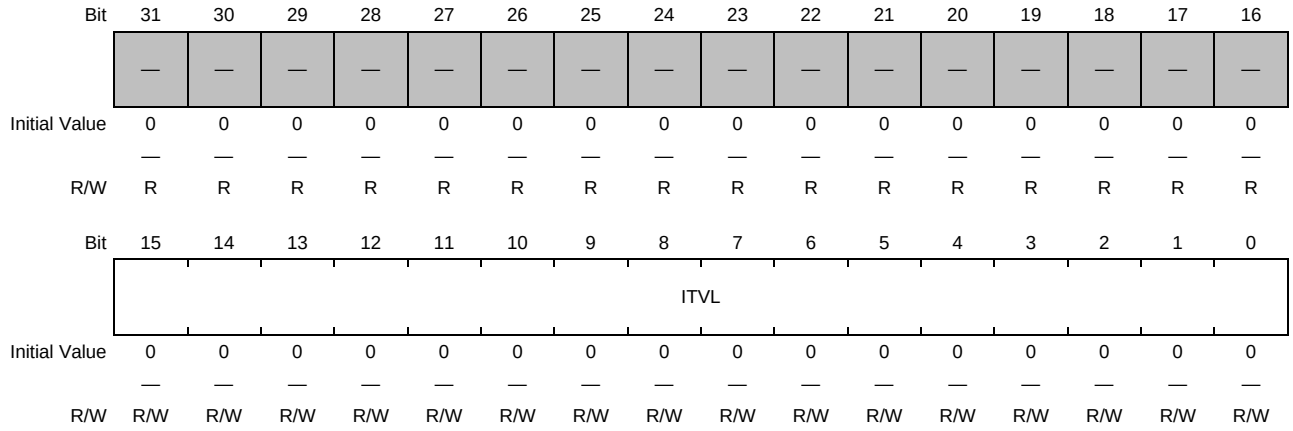
Transfer Address	REQD	SDS[2:0]	DDS[2:0]
Beat aligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)
	1	8 to 32 bits (000 to 010) 128 to 512 bits (100 to 110)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.
Beat unaligned	0	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)
	1	8 to 32 bits (000 to 010) 128 to 256 bits (100 to 101)	This data size should be equal to that of the MBW bits in the DxFIFOSEL register.

Note: When the destination is beat-unaligned with REQD = 0 or the source is beat-unaligned with REQD = 1, specify values in the range of specifiable values for beat-unaligned transfer addresses in both of the SDS[2:0] and DDS[2:0] bits.
Even if the transfer source and destination are beat-aligned when a DMA transaction starts, they might become beat-unaligned in the middle of the transaction when a skip transfer is used. If this might occur, perform settings in the first place on the assumption that the transfer source and destination are beat-unaligned.
If software cannot determine whether the transfer source and/or destination is beat-aligned, use values in the range of specifiable values for beat-unaligned transfer addresses.

32B.5.4 Channel Interval Register n

For details, see **Section 32B.9.13.6, Interval Count Function**.

32B.5.4.1 Channel Interval Register ch0 [CHITVL_0] <Address: H'430>
Channel Interval Register ch1 [CHITVL_1] <Address: H'470>



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
15 to 0	ITVL	All 0	R/W	Interval These bits specify the DMA transfer interval.

32B.5.5 Channel Extension Register n

32B.5.5.1 Channel Extension Register ch0 [CHEXT_0] <Address: H'434>
Channel Extension Register ch1 [CHEXT_1] <Address: H'474>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	DPR				—	—	—	—	SPR			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
11 to 8	DPR	All 0	R/W	Destination PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA write transfer. The initial value of these bits is H'0.
7 to 4	—	All 0	R/W	Nothing is assigned to these bits. Fix these bits to 0.
3 to 0	SPR	All 0	R/W	Source PROT These bits specify the value to be output to the MHPROT[3:0] pin in a DMA read transfer. The initial value of these bits is H'0.

32B.6 Link Register Set

When software sets a descriptor address in the NXLA_n register and starts the DMAC, hardware loads the value set in the NXLA_n register into the CRLA_n register. Then, the descriptor is read, and the DMAC starts a DMA transaction according to the values read from the descriptor. The value in the NXLA_n register is automatically updated to the Next Link Address value read from the descriptor, and the updated value is used as the descriptor address in the next DMA transaction.

32B.6.1 Next Link Address Register n (NXLA_n)

32B.6.1.1 Next Link Address Register ch0 [NXLA_0] <Address: H'438>
Next Link Address Register ch1 [NXLA_1] <Address: H'478>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NXLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	NXLA	All 0	R/W	Next Link Address
1, 0		All 0	R	These bits specify the link-destination address. Upper two bits are fixed to 0, and only the address aligned with a word boundary can be set.

32B.6.2 Current Link Address Register n (CRLA_n)

32B.6.2.1 Current Link Address Register ch0 [CRLA_0] <Address: H'43C>
Current Link Address Register ch1 [CRLA_1] <Address: H'47C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CRLA															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

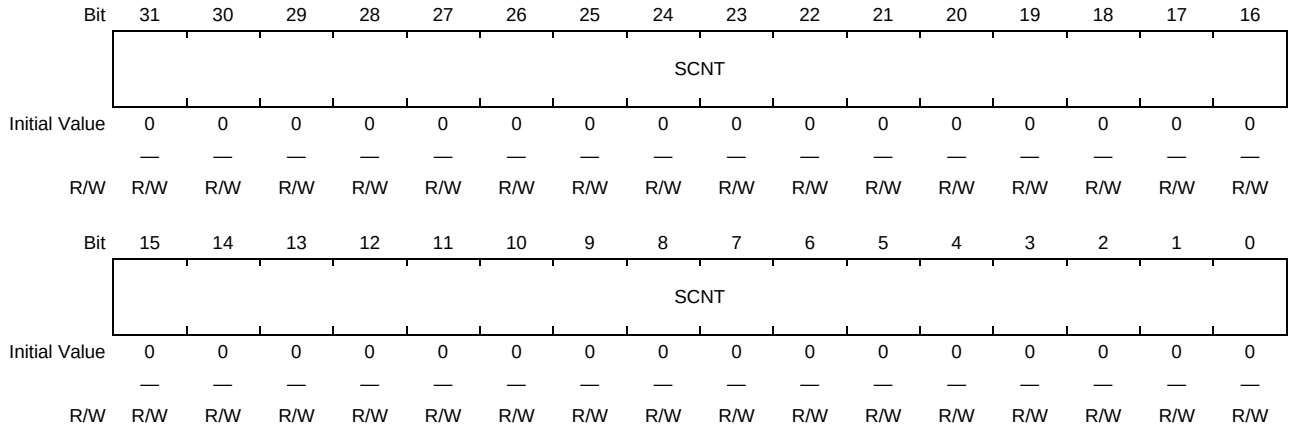
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CRLA	All 0	R	Current Link Address These bits indicate the address of the descriptor being used for current transaction.

32B.7 Skip Register Set

This register set is used to specify settings for a skip (scatter/gather) transfer.

32B.7.1 Source Continuous Register n

32B.7.1.1 Source Continuous Register ch0 [SCNT_0] <Address: H'600>
Source Continuous Register ch1 [SCNT_1] <Address: H'620>

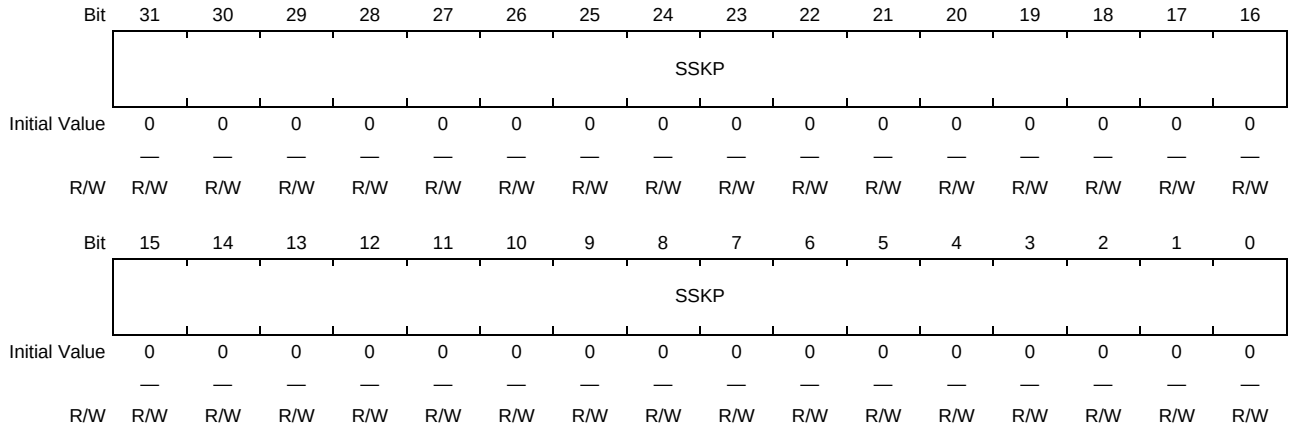


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SCNT	All 0	R/W	Source Continuous These bits specify the size of the space to be accessed continuously by source address access. (Unit: byte)

Note: This register is used in pair with the SSKP_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the SCNT bits set to 0.

32B.7.2 Source Skip Register n

32B.7.2.1 Source Skip Register ch0 [SSKP_0] <Address: H'604>
Source Skip Register ch1 [SSKP_1] <Address: H'624>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSKP	All 0	R/W	Source Skip These bits specify the size of area to be skipped in a source address access. (Unit: byte)

Note: This register is used in pair with the SCNT_n register (see **Figure 32B.3**). To use this mode, set the SDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer source side, the SAD bit in the CHCFG_n register must not set to 1 (Fixed).

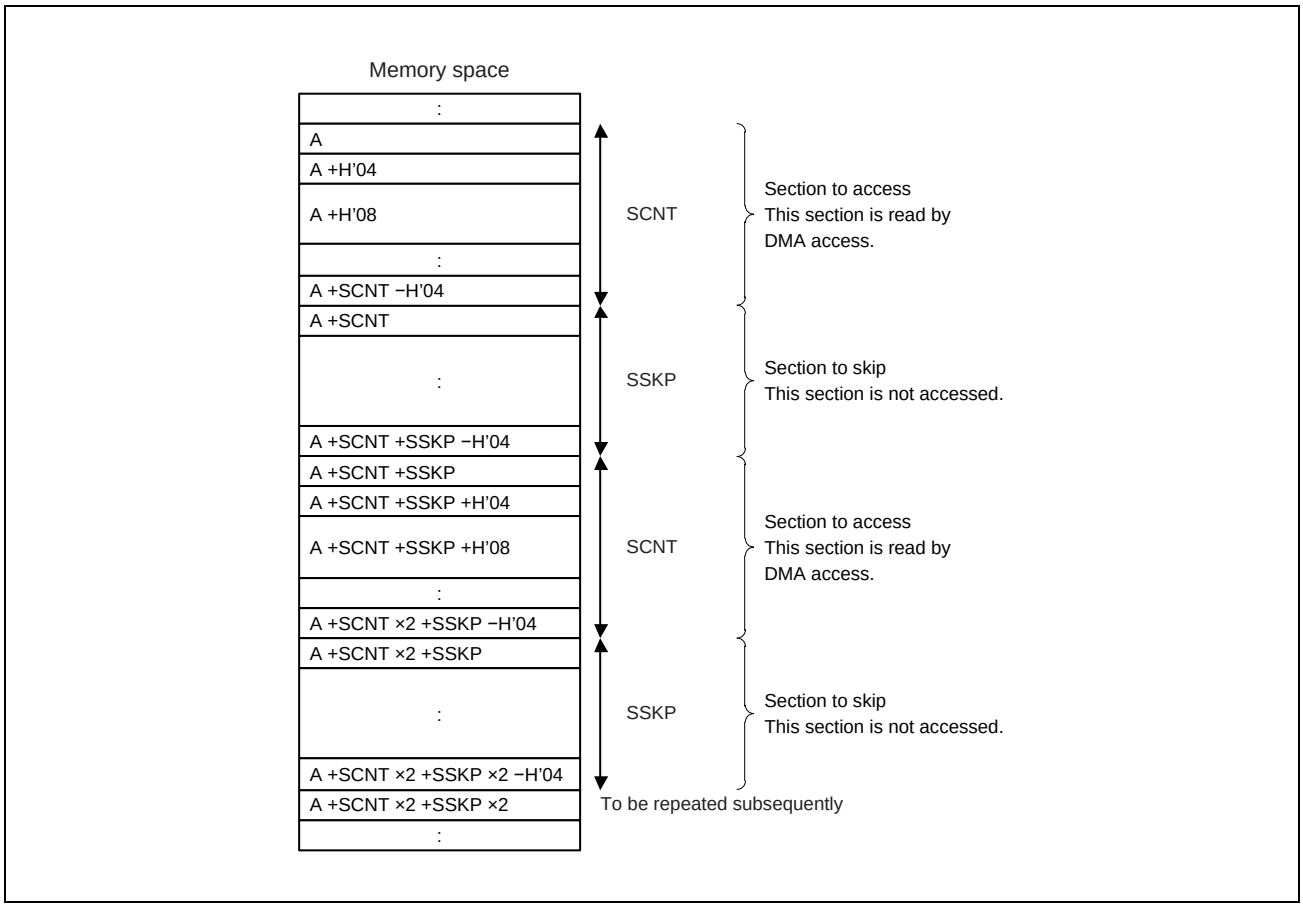


Figure 32B.3 Relationship between SSKP and SCNT

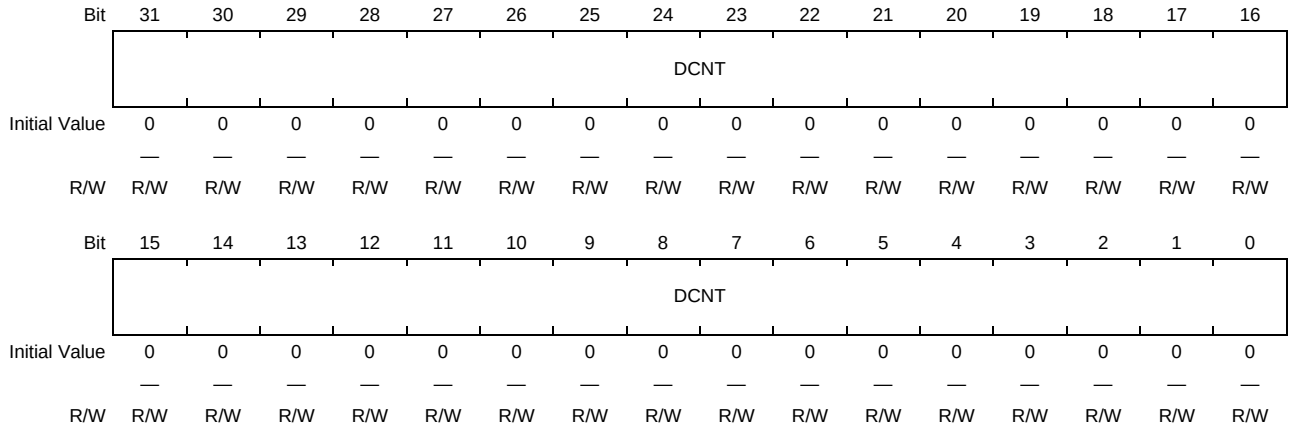
You can specify values of the SCNT and SSKP bits regardless of the source address and the value of the SDS field in the CHCFG_n register. The DMAC performs access based on the size specified in the SDS field, and fetches only valid data into the buffer (see **Section 32B.9.14.1(1), Read access**).

32B.7.3 Destination Continuous Register n

32B.7.3.1 Destination Continuous Register ch0 [DCNT_0] <Address: H'608>
Destination Continuous Register ch1 [DCNT_1] <Address: H'628>

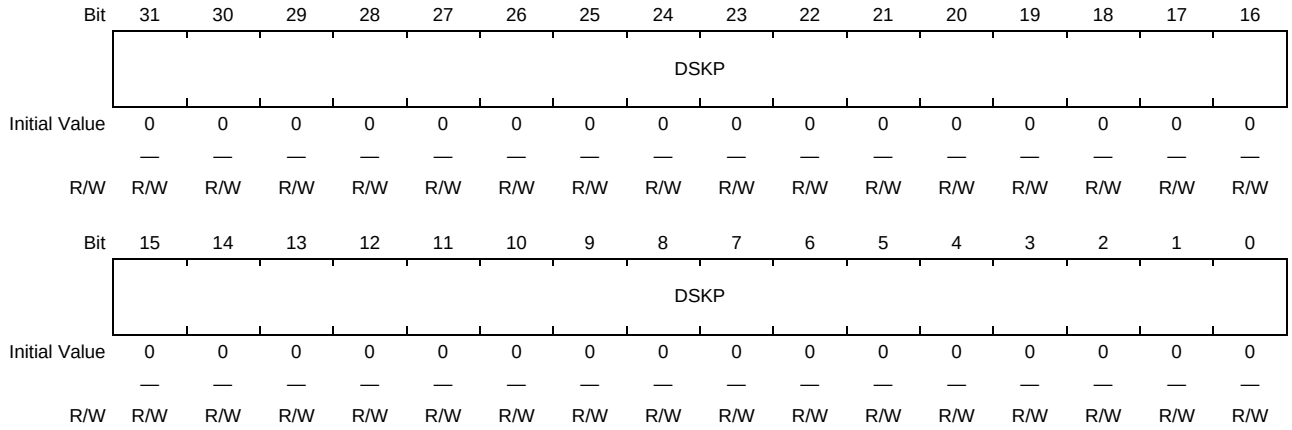


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DCNT	All 0	R/W	Destination Continuous These bits specify the size of the space to be accessed continuously by destination address access. (Unit: byte)

Note: This register is used in pair with the DSKP_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed). Do not perform a skip transfer with the DCNT bits set to 0.

32B.7.4 Destination Skip Register n

32B.7.4.1 Destination Skip Register ch0 [DSKP_0] <Address: H'60C>
Destination Skip Register ch1 [DSKP_1] <Address: H'62C>



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSKP	All 0	R/W	Destination Skip These bits specify the size of area to be skipped in a destination address access. (Unit: byte)

Note: This register is used in pair with the DCNT_n register (see **Figure 32B.4**). To use this mode, set the DDS[3] bits in the CHCFG_n register to 1. To perform a skip transfer on the transfer destination side, the DAD bit in the CHCFG_n register must not be set to 1 (Fixed).

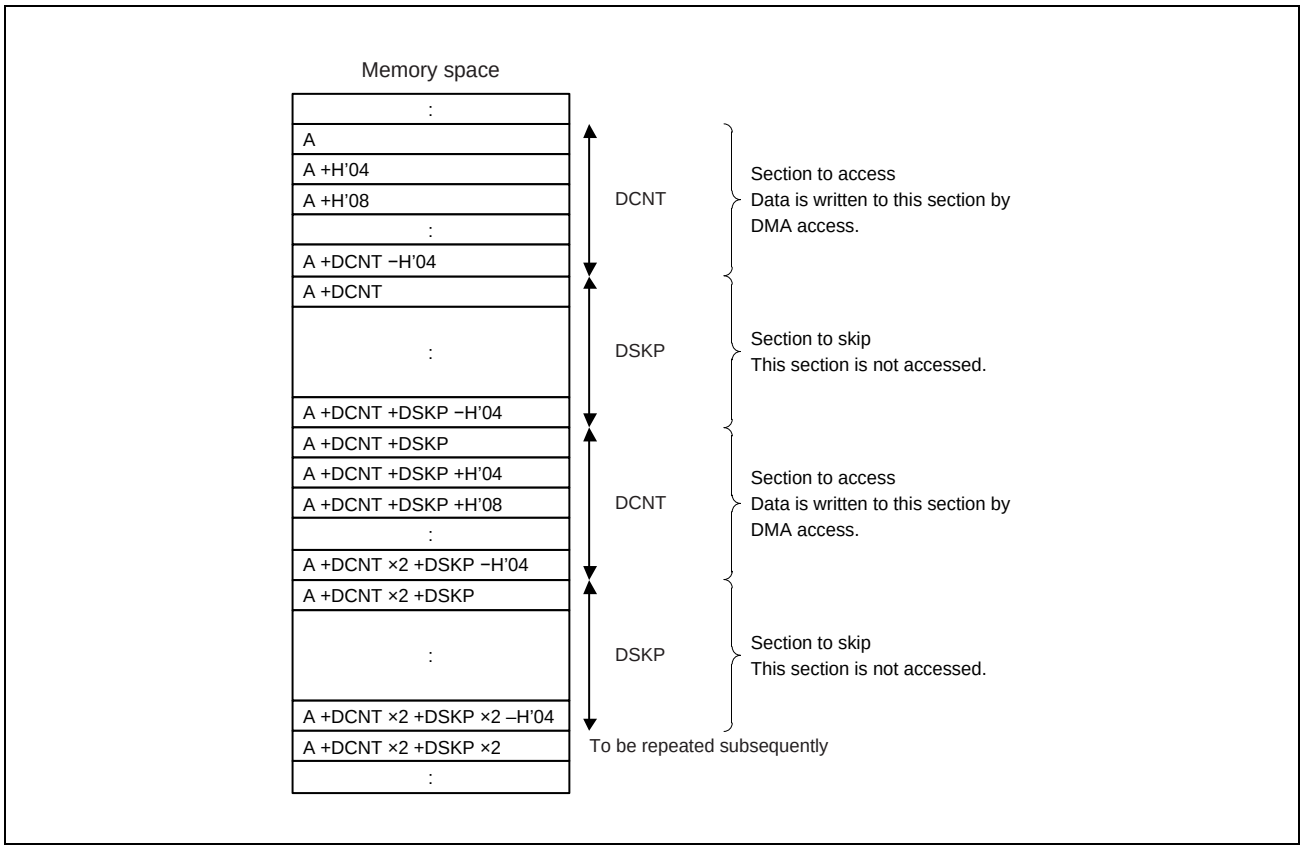


Figure 32B.4 Relationship between DSKP and DCNT

You can specify values of the DCNT and DSKP bits regardless of the destination address and the value of the DDS field in the CHCFG_n register. The DMAC performs write access to only the specified space that has a combined size not more than the size specified in the DDS field (see **Section 32B.9.14.1(1), Read access**).

32B.8 DMA Register Set

The registers described below are shared by all channels.

32B.8.1 DMA Control Register

32B.8.1.1 DMA Control Register [DCTRL] <Address: H'700>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LWPR				—	—	—	—	LDPR			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LVINT	PR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
27 to 24	LWPR	All 0	R/W	Link WriteBack PROT These bits specify the value to be output to the MHPROT[3:0] pin at write-back to the descriptor in link mode.
23 to 20	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
19 to 16	LDPR	All 0	R/W	Link Descriptor PROT These bits specify the value to be output to the MHPROT[3:0] pin at reading of the descriptor in link mode.
15 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	LVINT	0	R/W	Level Interrupt To use this module, be sure to set this bit to 1.
0	PR	0	R/W	Priority This bit specifies the transfer priority control mode (see **Section 32B.9.13.2, DMA channel priority control**). 0: Fixed priority mode 1: Round-robin mode

32B.8.2 Descriptor Interval Register n

32B.8.2.1 Descriptor Interval Register [DSCITVL] <Address: H'704>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DITVL								—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
15 to 8	DITVL	All 0	R/W	Descriptor Interval These bits specify the interval of descriptor read operation. The descriptor will be re-read at intervals of "value of DITVL x 256."
7 to 0	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.

32B.8.3 DMA Control Register

32B.8.3.1 DMA Status EN Register [DSTAT_EN] <Address: H'710>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EN1	EN0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	EN1	0	R	This bit indicates the state of the EN bit for DMA channel 1.
0	EN0	0	R	This bit indicates the state of the EN bit for DMA channel 0.

32B.8.4 DMA Status ER Register

32B.8.4.1 DMA Status ER Register [DSTAT_ER] <Address: H'714>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ER1	ER0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	ER1	0	R	This bit indicates the state of the ER bit for DMA channel 1.
0	ER0	0	R	This bit indicates the state of the ER bit for DMA channel 0.

32B.8.5 DMA Status END Register

32B.8.5.1 DMA Status END Register [DSTAT_END] <Address: H'718>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	END1	END0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	END1	0	R	This bit indicates the state of the END bit for DMA channel 1.
0	END0	0	R	This bit indicates the state of the END bit for DMA channel 0.

32B.8.6 DMA Status TC Register

32B.8.6.1 DMA Status TC Register [DSTAT_TC] <Address: H'71C>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TC1	TC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	TC1	0	R	This bit indicates the state of the TC bit for DMA channel 1.
0	TC0	0	R	This bit indicates the state of the TC bit for DMA channel 0.

32B.8.7 DMA Status SUS Register

32B.8.7.1 DMA Status SUS Register [DSTAT_SUS] <Address: H'720>

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TC1	TC0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Nothing is assigned to these bits. Fix these bits to 0.
1	SUS1	0	R	This bit indicates the state of the SUS bit for DMA channel 1.
0	SUS0	0	R	This bit indicates the state of the SUS bit for DMA channel 0.

32B.9 Functions

32B.9.1 System Control and Oscillation Control

This chapter describes register manipulations required to perform initial setup of this module. This chapter also describes the registers required to control power consumption.

For the parts of the sequence that are required in both host and peripheral modes, see **Section 32A.9.1, Host/Peripheral Common Setting Sequence**.

32B.9.1.1 USB data bus resistor control

This module controls switchover between the pull-up resistors for the D+ signal and the pull-down resistors for the D- signal of the USBPHY. Use the DPRPU bit and DRPD bit in the SYSCFG0 register to set pull-up or pull-down of each signal.

Recognize that a connection to the USB host is established, and then set 1 for the DPRPU bit in the SYSCFG0 register to pull up the D+ signal.

After connected to the host, this module automatically switches the resistor when the state changes to reset handshake, suspend, or resume.

If 0 is set for the DPRPU bit in the SYSCFG0 register during communication with the host, the pull-up resistor (or termination resistor) for the USB data line is disabled. This can notify the host controller of disconnection of a device.

32B.9.2 Interrupt Function

32B.9.2.1 Overview of Interrupt Function (other than DMA Master)

The following shows a list of interrupt functions of this module. An interrupt is notified as U2P_IXL_INT. Check the status register to identify the interrupt factor. The interrupt from this module is not asserted when the supply of the internal bus clock (P1ϕ) is stopped.

Table 32B.22 List of Interrupt functions

Bit	Interrupt name	Interrupt factor	Related status
VBINT	VBUS interrupt	The status change of the VBUS input pin is detected. (Changes from L to H and from H to L are detected.)	VBSTS
RESM	Resume interrupt	In the suspended state, a change of the USB bus status is detected (from J-State to K-State or from J-State to SE0).	—
SOFR	Frame number update interrupt	If SOFRM is 0: An SOF packet with a different frame number is received. If SOFRM is 1: An SOF with µframe number 0 cannot be received due to a problem such as packet corruption.	—
DVST	Device state transition interrupt	A transition of a device state is detected. USB bus reset detected Suspended state detected Set Address request received Set Configuration request received	DVSQ
CTRT	Control transfer stage transition interrupt	A transition of a control transfer stage is detected. Setup stage completed ControlWrite transfer status stage transition ControlRead transfer status stage transition Control transfer completed Control transfer sequence error	CTSQ
BEMP	Buffer empty interrupt	All data in the buffer memory is sent and the buffer becomes empty. A packet exceeding the maximum packet size is received.	PIPEBEMP
NRDY	Buffer not ready interrupt	A token is received when the PID setting is BUF and the buffer memory is not available for sending and receiving data. A CRC error or bit stuff error occurs when data is received in isochronous transfer. An interval error occurs when data is received in isochronous transfer.	PIPENRDY
BRDY	Buffer ready interrupt	The buffer becomes ready (available for reading or writing data).	PIPEBRDY

The following shows the relationship between interrupts of this module.

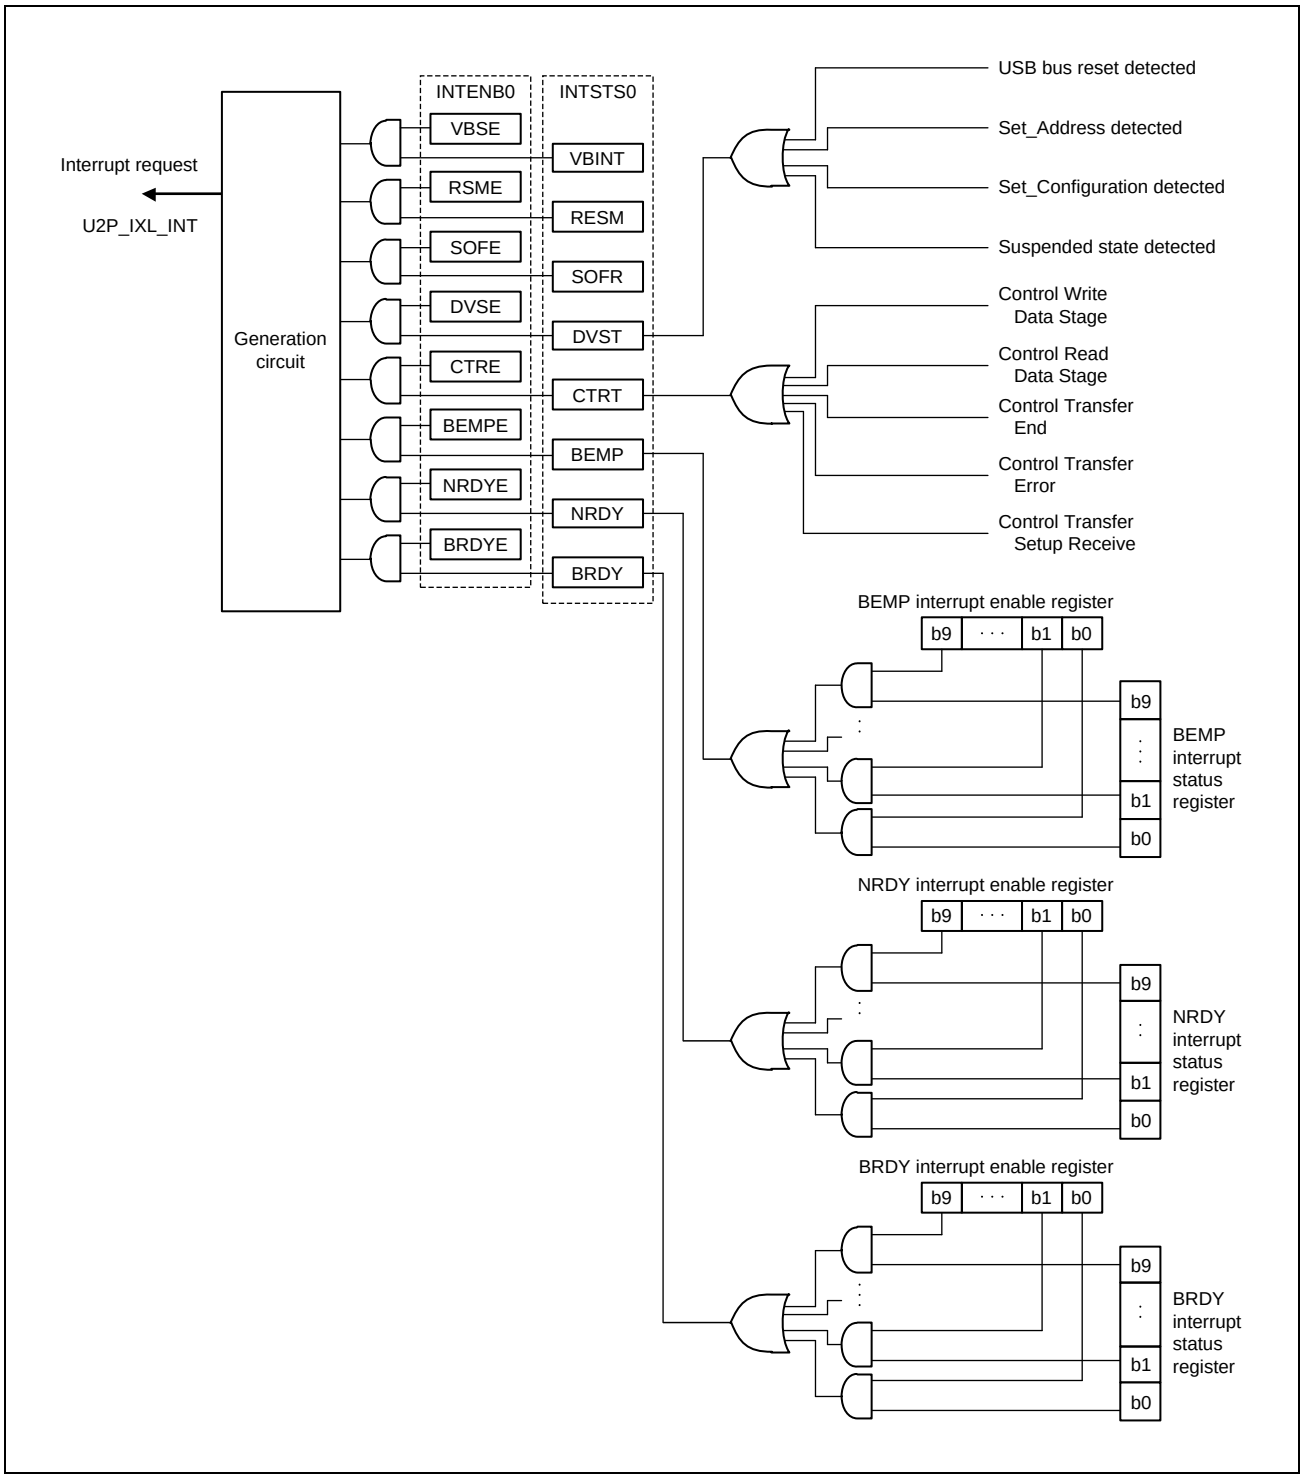

Figure 32B.5 Interrupt Association Diagram

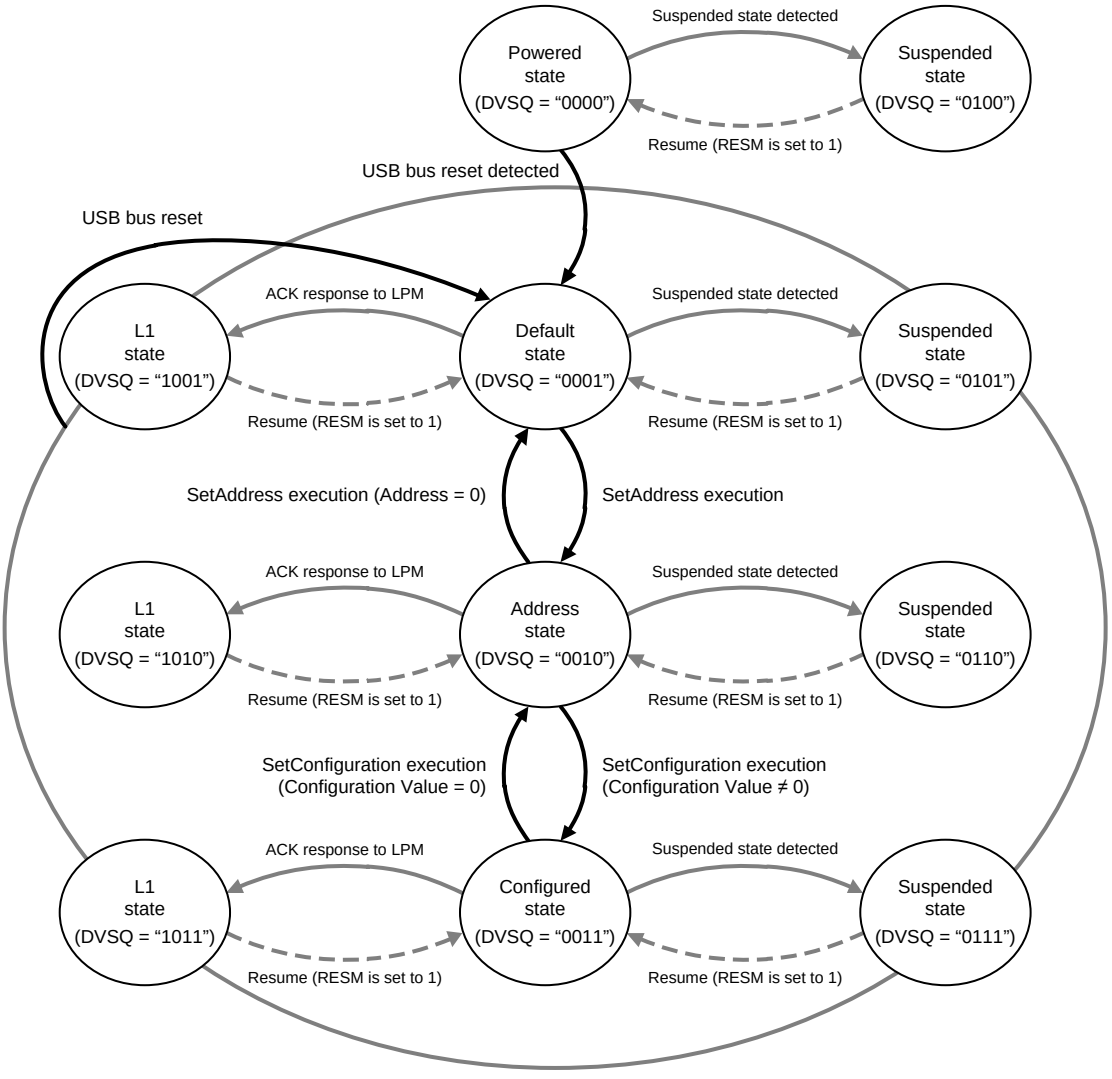
32B.9.2.2 Device State Transition Interrupts

Figure 32B.6 shows the device state transition diagram of this module.

This module manages device states and generates device state transition interrupts. However, resumption from the suspended state (resume signal detection) is detected by a resume interrupt.

Device state transition interrupts can be enabled and prohibited by using the INTENB0 register. A device state for which a transition has occurred can be checked in the DVSQ bits in the INTSTS0 register.

To trigger a transition to the default state, a device state transition interrupt is generated after a reset hand-shake protocol ends.



Note: When a transition indicated by a solid line occurs, the DVST bits are set to 1.
When a transition indicated by a broken line occurs, the RESM bit is set to 1.

Figure 32B.6 Device State Transition Diagram

32B.9.2.3 Control Transfer Stage Transition Interrupts

Figure 32B.7 shows the control transfer stage transition diagram of this module. This module manages a sequence of control transfers, and generates a control transfer stage transition interrupt. Control transfer stage transition interrupts can be enabled and prohibited by using the INTENB0 register. A transfer stage for which a transition has occurred can be checked in the CTSQ bits in the INTSTS0 register.

The following describes sequence errors that can occur during control transfer. If an error occurs, the PID bits in the DCPCTR register are set to 1X (STALL).

(1) For Control Read transfer

(a) An OUT or PING token is received in a situation where data has not been transferred yet for an IN token of the data stage.

(b) An IN token is received in the status stage.

(c) A data packet "DATAPID = DATA0" is received in the status stage.

(2) For Control Write transfer

(a) An IN token is received in a situation where an ACK response has not been sent yet for an OUT token of the data stage.

(b) The first data packet ”DATAPID = DATA0” is received in the data stage.

(c) An OUT or PING token is received in the status stage.

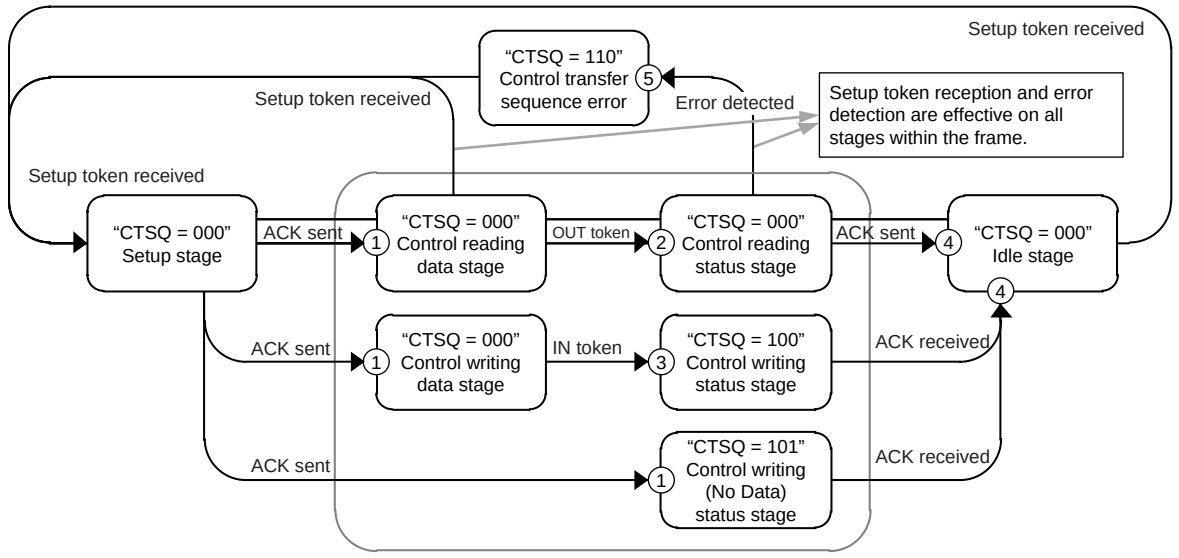
(3) For Nodata Control transfer

(a) An OUT or PING token is received in the status stage.

If the amount of received data exceeds the value of the wLength field in a USB request in the Control Write transfer data stage, this module cannot identify this situation as a control transfer sequence error. If a packet other than a zero-length packet is received in the Control Read transfer status stage, this module sends an ACK response and then terminates processing normally.

If a CTRT interrupt is generated (SERR bit is set to 1) due to a sequence error, the CTSQ bits retain 110 until the system writes 0 to the CTRT bits to clear the interrupt status.

Therefore, as long as the CTSQ bits retain 110, even if a new USB request is received, a CTRT interrupt that reports completion of a setup stage is not generated. (Information on completion of the setup stage is retained by this module, and a CTRT interrupt is generated after the interrupt status is cleared.)



Note: CTRT interrupt

① Setup stage completed

② ControlRead transfer status stage transition

③ ControlWrite transfer status stage transition

④ Control transfer completed

⑤ Control transfer sequence error

Figure 32B.7 Control Transfer Stage Transition Diagram

32B.9.2.4 Interrupts Relating to DMA Master

Table 32B.23 List of Interrupts

Interrupt Name	Interrupt Type
USBFDMAmn (m, n = 0, 1)	A DMA transaction ends.
	An invalid descriptor is read in link mode.
USBFDMAERRm (m = 0, 1)	An error response is returned for a transfer issued by the master interface.

This module has two types of DMA interrupts USBFDMAmn and USBFDMAERRm.

(1) USBFDMAmn interrupt (m, n = 0, 1)
This interrupt occurs when a DMA transaction ends or when an invalid descriptor is read in link mode.
An interrupt is divided for each DMA channel. USBFDMAm0 corresponds to the interrupt for DMA 0ch, and USBFDMAm1 corresponds to the interrupt for DMA 1ch.

(2) USBFDMAERRm interrupt
This interrupt occurs when an error response is returned for a transfer issued by the master interface. This interrupt applies to all DMA channels.

USBFDMAmn interrupt output can be temporarily masked by setting a register.

Interrupt detection can also be masked by setting the register. If interrupt detection is masked, the status register that indicates generation of an interrupt does not change.

On the other hand, a USBFDMAERRm interrupt signal does not have the masking function.

32B.9.3 Pipe Control

Table 32B.24 lists the pipe settings for this module. For USB data transfer, logical pipes called endpoints are used to enable data communication. This module provides 16 pipes for data transfer. Set each pipe according to the specification of the system.

Table 32B.24 PIPE Settings

Register Name	Bit Name	Setting	Comment
DCPCFG	TYPE	Specifies the transfer type.	Pipes 1 to 9: Settable
PIPECFG	BFRE	Selects BRDY interrupt mode.	Pipes 1 to 5: Settable
	DBLB	Selects double-buffer configuration.	Pipes 1 to 5: Settable
	CNTMD	Selects continuous transfer or non-continuous transfer.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5: Settable
	DIR	Selects transfer direction.	Settable to IN or OUT
	EPNUM	Endpoint number	Pipes 1 to 9: Settable Set to a value other than “0000” when a pipe is in use.
	SHTNAK	Disables pipes when transfer is completed.	DCP: Settable Pipes 1, 2: Settable only in bulk transfers Pipes 3 to 5 Settable
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Unsettable (fixed to 64/256 (CNTMD = 1) bytes) Pipes 1 to 5: Settable (up to 2 Kbytes specifiable) Pipes 6 to 9: Unsettable (fixed to 64 bytes)
	BUFNMB	Buffer memory number	DCP: Unsettable (fixed to area 0 to 3 hex) Pipes 1 to 5 Settable (area 8 to 87 hex specifiable) Pipes 6 to 9: Unsettable (fixed to area 4 to 7 hex)
DCPMAXP PIPEMAXP	MXPS	Maximum packet size	Setting conforming to the USB specification.
PIPEPERI	IFIS	Buffer flush	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
	IITV	Interval counter	Pipes 1, 2: Settable only in isochronous transfers Pipes 3 to 5: Unsettable Pipes 6 to 9: Unsettable
DCPCTR PIPExCTR	BSTS	Buffer status	DCP state switched between receive and transmit buffer by ISEL bit
	INBUFM	IN buffer monitor	Available only for pipes 3 to 5
	ACLRM	Auto buffer clear	Pipes 1 to 9: Settable
	SQCLR	Sequence clear	Clears data toggle bit.
	SQSET	Sequence set	Sets data toggle bit.
	SQMON	Sequence monitor	Monitors data toggle bit.
	PBUSY	Pipe busy monitor	
	PID	Response PID	
DCPCTR PIPExCTR	ATREPM	Auto response mode	Pipes 1 to 5: Settable
PIPExTRE	TRENB	Transaction count enable	Pipes 1 to 5: Settable
	TRCLR	Current transaction counter clear	Pipes 1 to 5: Settable
PIPExTRN	TRNCNT	Transaction counter	Pipes 1 to 5: Settable

32B.9.3.1 Maximum packet size setting

Use the MXPS bits in the DCPMAXP and PIPEMAXP registers to specify the maximum packet size for each pipe. The default control pipe (DCP) and pipes 1 to 5 can be set to any of the maximum packet sizes defined by the USB specification. For pipes 6 to 9, 64 bytes are the upper limit of the maximum packet size. Set the maximum packet size before starting transfer (by setting “PID = BUF”).

DCP: Set 64 for high-speed operation.

DCP: Set 8, 16, 32, or 64 for full-speed operation. Pipes 1 to 5: Set 512 for high-speed bulk transfer.

Pipes 1 to 5: Set 8, 16, 32, or 64 for full-speed bulk transfer.

Pipes 1, 2: Set a value from 1 to 1024 for high-speed isochronous transfer.

Pipes 1, 2: Set a value from 1 to 1023 for full-speed isochronous transfer.

Pipes 6 to 9: Set 64.

High-bandwidth transfers used for interrupt transfers and isochronous transfers are not supported.

32B.9.3.2 Response PID

Set the response PID for each pipe with the PID bits in the DCPCTR and PIPExCTR registers.

(1) Response PID setting
The response PID specifies the response to a transaction from the host.

a) NAK: Always sends a NAK response to a generated transaction.

b) BUF: Responds to a transaction in accordance with the buffer memory state.

c) STALL: Always sends a STALL response to a generated transaction.

Regardless of the value set in the PID bits, an ACK is always sent as a response to a setup transaction and a USB request is stored in corresponding registers.

This module might write data to the PID bits depending on the transaction result. This module writes data to the PID bits in the following cases:

a) NAK:

(A) The SETUP token is received normally (for the DCP only).

(B) If 1 is set for the SHTNAK bit in the PIPECFG register during bulk transfer, a short packet is received.

(C) If 1 is set for the SHTNAK bit during bulk transfer, the transaction counter finishes.

b) BUF:

This module does not write "BUF".

c) STALL:

(A) When a maximum packet size over error is detected in a received data packet

(B) When a control transfer sequence error is detected

32B.9.3.3 Pipe control register switching procedure

The following bits in the pipe control registers can be modified only when USB transmission is disabled (PID = NAK).

Figure 32B.8 shows the procedure for changing the pipe control register state from the USB transmission enabled (PID = BUF) state.

The registered that cannot be manipulated in the USB transmission enabled (PID = BUF) state are as follows:

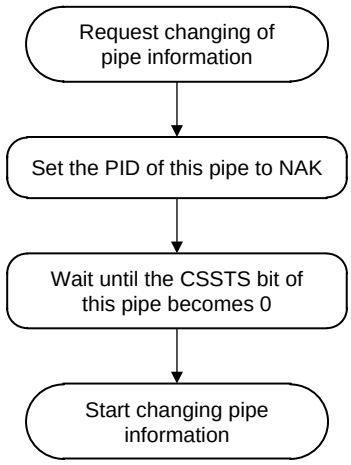
(1) All bits in the DCPCFG and DCPMAXP registers

(2) SQCLR and SQSET bits in the DCPCTR register

(3) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(4) ATREPM, ACLRM, SQCLR, and SQSET bits in the PIPExCTR register

(5) All bits in the PIPExTRE and PIPExTRN registers



Note: If the pipe is detached during a USB transaction, the PBUSY bit might remain 1.

Figure 32B.8 Procedure for Changing Pipe Information from USB Transmission Enabled (PID = BUF) State

In addition, for the settings of the following bits in pipe control registers, only the pipe information that is not set for the CURPIPE bit in the CPU, DMA0, or DMA1 FIFO port can be changed.

Registers that cannot be set with pipe information that is set for the CURPIPE bit in a FIFO port:

(6) All bits in the DCPCFG and DCPMAXP registers

(7) All bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers

(8) ACLRM bit in the PIPExCTR register

If you change the pipe information, make sure that the setting of CURPIPE is different from the new pipe number. For the default control pipe (DCP), after modifying the pipe information, use the BCLR bit to clear the buffer.

32B.9.3.4 Data PID sequence bit

When a normal data transfer is performed during bulk transfer or interrupt transfer, or in the data stage of control transfer, this module automatically toggles the sequence bit of a data PID. The sequence bit of the next data PID to be transferred can be confirmed with the SQMON bit in the DCPCTR or PIPExCTR registers. For data transmission, the sequence bit is switched when an ACK handshake is received. For data reception, the sequence bit is switched when an ACK handshake is sent. The data PID sequence bit can be changed by using the SQCLR and SQSET bits in the DCPCTR and PIPExCTR registers.

During control transfer, this module automatically sets the sequence bit when the stage changes. When the setup stage finishes, the data PID is set to DATA1. In the status stage, this module responds with “PID = DATA1” without referencing the sequence bit.

Note that, the data PID sequence bit must set, when a clear feature request is sent or received.

Also note that for isochronous transfer setting pipes, you cannot use the SQSET bit to manipulate the sequence bit.

32B.9.4 FIFO Buffer

This section describes the processing related to the FIFO buffer of this module.

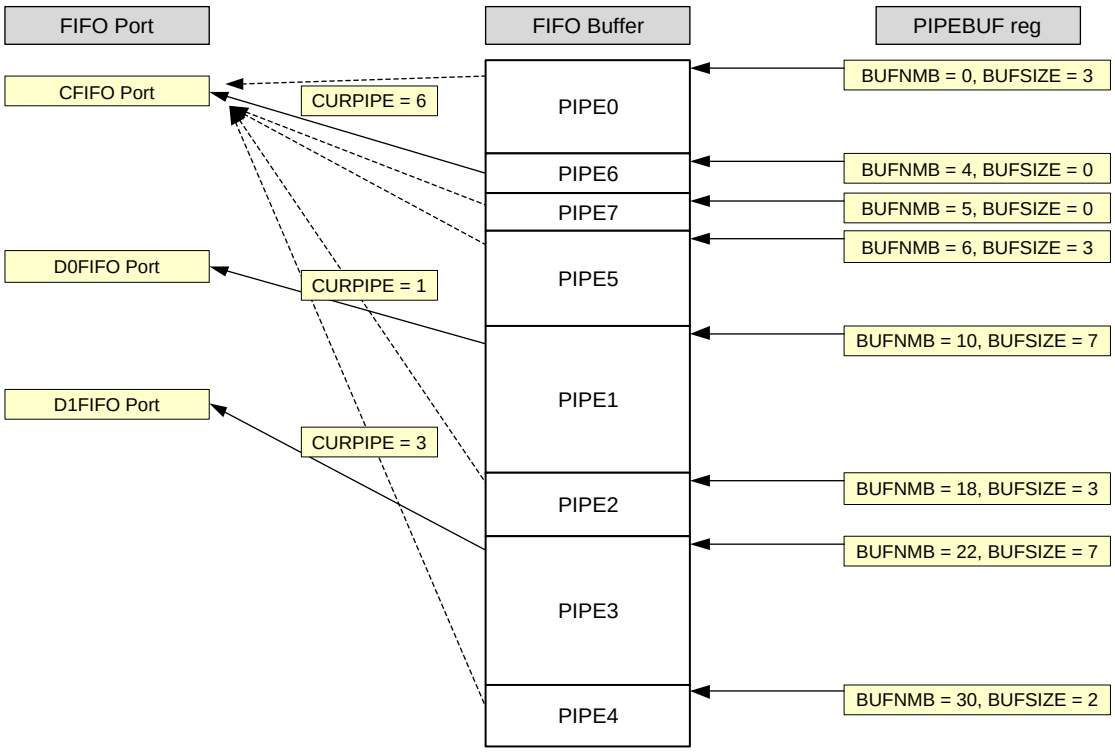
32B.9.4.1 FIFO buffer allocation

Figure 32B.9 shows an example of FIFO buffer memory mapping of this module. The FIFO buffer area is shared by the CPU and this module. The FIFO buffers can be accessed by either the system (CPU) or this module (SIE).

An independent FIFO buffer area is allocated for each pipe. The memory area is made up of memory blocks (1 block = 64 bytes) and is specified by the starting block number and the number of blocks (specified by the BUFNMB and BUFSIZE bits in the PIPEBUF register). When the CNTMD bit in the PIPExCFG register is used to set "continuous transfer mode", the value set with the BUFSIZE bit must be an integral multiple of the maximum packet size. If the double-buffer configuration is selected by the DBLB bit in the PIPExCFG register, two memory areas the size of which is specified by the BUFSIZE bit in the PIPEBUF register are allocated to a single pipe.

FIFO ports are used to access the FIFO buffer (data read/write). The pipe number of a pipe to be assigned to a FIFO port is specified by the CURPIPE bits in the CFIFOSEL/DxFIFOSEL register.

The FIFO buffer status of each pipe can be confirmed by using the BSTS and INBUFM bits in the DCPCTR and PIPExCTR registers. The access right of a FIFO port can be confirmed by using the FRDY bit in the CFIFOCTR/ DxFIFOCTR register.



Note: If pipes 8 and 9 are not in use: Settings such as BUFSIZE are unspecified.

Figure 32B.9 Example of FIFO Buffer Memory Mapping

32B.9.4.2 Clearing FIFO buffers

Table 32B.25 lists the modes in which this module can clear the FIFO buffer. Clearing of the FIFO buffer is controlled by the following bits.

Table 32B.25 List of FIFO Buffer Clearing Modes

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR register DxFIFOCTR register	DxFIFOSEL register	PIPExCTR register
Function	The FIFO buffer on the CPU side is cleared.	The FIFO buffer is automatically cleared after the data is read from the specified pipe.	The buffer is automatically cleared to discard all the received packets.
Clearing method	Write “1” to clear.	1: Mode enabled 0: Mode disabled	1: Mode enabled 0: Mode disabled

32B.9.5 FIFO Port Functions

This section describes FIFO port functions. **Table 32B.26** shows the FIFO port function settings for this module.

If data write access is enabled and data is written up to buffer full state (in non-continuous transfer: maximum packet size), the port automatically goes to the USB bus transmittable state. To enable transmission of data smaller than the buffer full (in non-continuous transfer: less than the maximum packet size), the BVAL bit in the CFIFOCTR/ DxFIFOCTR register must be used to set write end.

To send a zero-length packet, the BCLR bit of that register must be used to clear the buffer before the BVAL bit is used to write end.

When all the data is read in a read access, the port automatically enters the state in which new packets can be received. However, when a zero-length packet is received (DTLN = 0), no data can be read, and therefore the buffer must be cleared by using the BCLR bit.

The receive data length is confirmed with the DTLN bits in the CFIFOCTR/DxFIFOCTR register.

Table 32B.26 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DxFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Rewinds buffer memory (re-read, re-write)	
	DCLRM	Reads received data of the specified pipe, and then automatically clears the received data	DxFIFO only
	DREQE	Asserts DREQ signal	DxFIFO only
	MBW	Specifies FIFO port access bit width	
	BIGEND	Selects FIFO port endian	CFIFO only
	ISEL	Specifies FIFO port access direction	DCP only
	CURPIPE	Selects current pipe	
C/DxFIFOCTR	BVAL	Finishes buffer memory write	
	BCLR	Clears CPU-side buffer memory	
	FRDY	Monitors FIFO port ready	
	DTLN	Confirms received data length	

32B.9.5.1 FIFO port selection

Table 32B.27 lists pipes that can be selected for each FIFO port.

Use the CURPIPE bits in the C/DxFIFOSEL register to select the pipe to be accessed. After selecting the pipe, confirm that the value written to the CURPIPE bits can be read correctly (if the previous pipe number is read out, this module is currently changing the pipe), confirm that FRDY = 1, and then access the FIFO port.

Figure 32B.10 shows the procedure for switching the pipe when accessing a FIFO port.

In addition, use the MBW bit to select the bus width with which to access the FIFO port. If the target pipe is the default control pile (DCP), the ISEL bit determines the buffer memory access direction. If the target pipe is not the DCP, the DIR bit in the PIPExCFG register determines the buffer memory access direction.

Table 32B.27 FIFO Port Access for Each Pipe

Pipe	Access Method	Usable Port
DCP	CPU access	CFIFO port register
Pipes 1 to 9	CPU access	CFIFO port register
	DMA access	DxFIFO port register

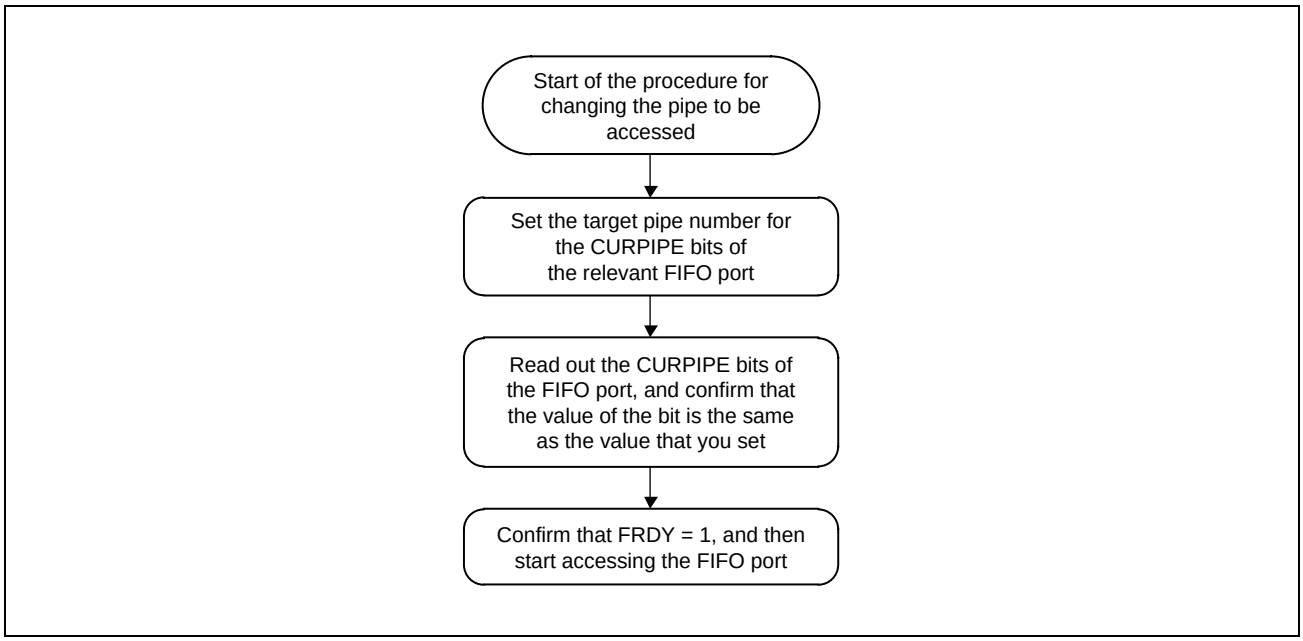


Figure 32B.10 Pipe Switching Procedure for FIFO Port Access

32B.9.5.2 DxFIFO automatic clear mode (DxFIFO port read direction)

This module automatically clears the buffer memory for a pipe when data is read out from the buffer memory if the DCLRM bit in the DxFIFOSEL register is set to 1.

Table 32B.28 shows the correspondence between packet reception and buffer memory clear processing by the software for each setting.

As shown in **Table 32B.28**, the buffer clearing conditions vary with the value that is set for the BFRE bit. However, using the DCLRM bit eliminates the need for buffer clear by the software even in states where clearing is required, which enables DMA transfers without using the software.

Note that for this function, only the buffer memory read direction can be set.

Table 32B.28 Relationship between Packet Reception and Buffer Memory Clear Processing by the Software

	Register Setting			
	DCLRM = 0		DCLRM = 1	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Clearing unnecessary		Clearing unnecessary	
Zero-length packet received	Clearing necessary			
Normal short packet received	Clearing unnecessary	Clearing necessary		
Transaction count end				

32B.9.5.3 BRDY interrupt timing selection function

The BFRE bit in the PIPECFG register can be set so that a BRDY interrupt is not generated when a data packet of maximum packet size is received.

When using a DMA transfer, this function enables an interrupt to be generated only when the last data is received. The “last data” here indicates either a short packet reception or the transaction count end. If the BFRE bit is set to 1, a BRDY interrupt is generated after the received data is read. By reading the DTLN bits in the DxFIFOCTR register, the receive data length of last data packet received just before the BRDY interrupt is generated can be confirmed.

Table 32B.29 shows when this module generates a BRDY interrupt.

Table 32B.29 BRDY Interrupt Generation Timing

	Register Setting	
Buffer State during Packet Reception	BFRE = 0	BFRE = 1
Buffer full (normal packet received)	When packet is received	No interrupt generated
Zero-length packet received	When packet is received	When packet is received
Normal short packet received	When packet is received	When received data has been read from the buffer memory
Transaction count end	When packet is received	When received data has been read from the buffer memory

The BFRE bit function is valid only in the reading direction from the buffer memory. For the writing direction, fix the BFRE bit to 0.

32B.9.6 Control Transfer (DCP)

In the data stage of control transfer, the default control pipe (DCP) is used to transfer data. For the DCP, a single 64-byte buffer is allocated as a fixed area that is used for both control reading and writing (in continuous transfer mode (CNTMD = 1), the size of this area is fixed to 256 bytes). The buffer memory can be accessed through the CFIFO port only.

32B.9.6.1 Control transfer

(1) Setup stage

This module always responds with ACK to any normal setup packet for this module. The following shows the behavior of this module in the setup stage:

1. When this module receives a new setup packet, this module sets the following bits:
   (a) VALID bit in the INTSTS0 register: 1
   (b) PID bit in the DCPCTR register: NAK
   (c) CCPL bit in the DCPCTR register: 0

2. When this module receives a data packet after receiving a setup packet, this module stores USB request parameters in the USBREQ, USBVAL, USBINDX, and USBLENG registers.

Response processing for control transfer must be performed after VALID is set to 0. While VALID is 1, PID cannot be set to BUF, and therefore the data stage cannot end.

By using a function of the VALID bit, when this module receives a new USB request during control transfer, this module can respond to the newest request, canceling the request that is being processed.

This module also automatically recognizes the type of transfer (ControlRead, ControlWrite, or NodataControl) from the direction bit (bit 8 of bmRequestType) and request data length (wLength) of the received USB request to manage stage transition. For an incorrect sequence, a control transfer stage transition interrupt occurs to report a sequence error to software. For details about stage management by this module, see **Figure 32B.7**.

(2) Data stage

Use the DCP to transfer data in response to the received USB request. Before the DCP buffer memory is accessed, use the ISEL bit in the CFIFOSEL register to specify the access direction.

A transaction is executed by setting the PID bit in the DCPCTR register to BUF.

The end of data transfer is detected with a BRDY or BEMP interrupt. For ControlWrite transfer, use a BRDY interrupt. For ControlRead transfer, use a BEMP interrupt.

For ControlWrite transfer in high-speed operation mode, an NYET handshake response is performed in accordance with the buffer memory state.

(3) Status stage

If the PID bit in the DCPCTR register is BUF, setting the CCPL bit to 1 terminates control transfer.

After control transfer is terminated by the above setting, this module automatically executes the status stage according to the data transfer direction determined in the setup stage, as shown below:

(a) For ControlRead transfer

Upon receiving a zero-length packet from the USB Host Controller, this module sends an ACK response.

(b) For ControlWrite or NodataControl transfer

This module sends a zero-length packet, and then receives an ACK response from the USB Host Controller.

(4) Control transfer automatic response function

This module automatically responds to any normal SET_ADDRESS request. However, if a SET_ADDRESS request has any of the following errors, software must respond, instead of this module:

(a) bmRequestType ≠ “H’00”

(b) wIndex ≠ “H’00”

(c) wLength ≠ “H’00”

(d) wValue > “H’7F”

(e) DVSQ = “011 (Configured) ”

Software must respond to all requests other than SET_ADDRESS.

32B.9.7 Bulk Transfer (Pipes 1 to 5)

The user can select the buffer memory usage method (single/double buffer, continuous/non-continuous transfer mode) for bulk transfers. The buffer memory size can be set up to 2 KB. The controller manages the buffer memory state and automatically responds to PING packets and NYET handshakes.

32B.9.7.1 NYET handshake control

Table 32B.30 lists responses to tokens received in a bulk or control transfer.

When an OUT token is received in a bulk or control transfer and there is only an open space for one packet in the buffer memory, this module sends a NYET response. However, when a short packet is received, this module sends an ACK response instead of a NYET response even under these conditions.

Table 32B.30 List of Responses to Received Tokens

PID bit value	Buffer memory state*1	Received token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	Receives data packet when OUT token is received*1
	RCV-BRDY	OUT	NYET	Receives data packet*2
	RCV-BRDY	OUT (Short)	ACK	Receives data packet*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/1	Sends data packet
	TRN-NRDY	IN	NAK	

Note: Details are described below.
RCV-BRDY*1: Buffer memory has a space for 2 packets or more when an OUT or PING token is received.
RCV-BRDY*2: Buffer memory has only a space for one packet when an OUT token is received.
RCV-NRDY: Buffer memory has no space for any packet when a PING token is received.
TRN-BRDY: Buffer memory has sent data when an IN token is received.
TRN-NRDY: Buffer memory has no send data when an IN token is received.

32B.9.8 Interrupt Transfer (Pipes 6 to 9)

This module performs an interrupt transfer in accordance with the period managed by the host controller. This module ignores (no response) PING packets in interrupt transfers. In addition, this module does not send a NYET handshake, but sends an ACK, NAK or STALL response.

Note that this module does not support high-bandwidth interrupt transfers.

32B.9.9 Isochronous Transfer (Pipes 1 and 2)

This module is provided with the following functions for isochronous transfers:

1. Notification of error information about isochronous transfers
2. Interval counter (IITV bit)
3. Data setup control for isochronous IN transfers (IDLY function)
4. Buffer flush function for isochronous IN transfers (IFIS bit)
5. SOF pulse output function

This module does not support high-bandwidth Isochronous transfers.

32B.9.9.1 Isochronous transfer error detection

This module has the following error information detection functions for the software to manage errors that occur during isochronous transfer.

Table 32B.31 and **Table 32B.32** describe the error checking procedure and interrupts that are generated.

1. PID error
   The PID of the received packet is invalid.
2. CRC error and bit stuffing error
   The received packet has a CRC error or invalid bit stuffing.
3. Max packet size over
   The data size of the received packet is larger than the preset maximum packet size.
4. Overrun error and underrun error
   (a) The buffer memory has no data when an IN token is received during IN-direction (send) transfer.
   (b) The buffer memory has no space although an OUT token is received during OUT-direction (receive) transfer.
5. Interval error
   An interval error occurs in the following cases:
   (a) An IN token cannot be received within the interval frame during isochronous IN transfer.
   (b) An OUT token cannot be received within the interval frame during isochronous OUT transfer.

Table 32B.31 Error Detection during Transmission/Reception of Token

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	No interrupt is generated (ignored as a corrupted packet).
3	Overrun error, underrun error	An NRDY interrupt is generated and the OVRN bit is set. A zero-length packet is sent in response to an IN token. A data packet is not received in response to an OUT token.
4	Interval error	An NRDY interrupt is not generated.

Table 32B.32 Error Detection during Reception of Data Packet

Error Detection Priority	Error Type	Interrupt Generated at Error Detection and Status
1	PID error	No interrupt is generated (ignored as a corrupted packet).
2	CRC error, bit stuffing error	An NRDY interrupt is generated and the CRCE bit is set.
3	Packet size error (too large packet)	A BEMP interrupt is generated and the PID bit is set to STALL.

32B.9.9.2 DATA-PID

This module does not support high-bandwidth transfers.

The following shows actions that can be taken in response to a received PID.

1. IN direction:

(a) DATA0: Used to send packets.

(b) DATA1: Not used to send packets.

(c) DATA2: Not used to send packets.

(d) mDATA: Not used to send packets.

2. OUT direction (in full-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are ignored.

(d) mDATA: Packets are ignored.

3. OUT direction (in high-speed operation):

(a) DATA0: Packets are received normally.

(b) DATA1: Packets are received normally.

(c) DATA2: Packets are received normally.

(d) mDATA: Packets are received normally.

32B.9.9.3 Interval counter

(1) Outline of operation

The IITV bit in the PIPEPERI register can be used to set the interval of isochronous transfer. The interval counter enables the functions listed in **Table 32B.33**.

Table 32B.33 Functions of the Interval Counter

Transfer Direction	Function	Detecting Condition
IN	Transmit buffer flush function	An IN token cannot successfully be received within the interval frame during isochronous IN transfer.
OUT	Notification of unreceived token	An OUT token cannot successfully be received within the interval frame during isochronous OUT transfer.

Counting of intervals is based on received SOF packets or interpolated SOFs. Therefore, even if SOF packets are damaged, the isochronism can still be maintained. Frame intervals are set as 2n (micro) frames, where n is the value of the IITV bit.

(2) Interval counter initialization

This module initializes the interval counter under the following conditions:

(a) Power on reset
The IITV bit is initialized.

(b) Clearing of the buffer memory by the ACLRM bit
The IITV bit is not initialized but the counter is initialized.

(c) USB bus reset

After the interval counter is initialized and a packet is successfully transferred, counting of intervals starts under the following conditions:

1) An SOF packet is received after data is sent in response to an IN token when PID = BUF.

2) An SOF packet is received after data is received in response to an OUT token when PID = BUF.

Note that the interval counter is not initialized in the following conditions:

(a) The PID bit is set to NAK or STALL.
The interval timer is not stopped at this interval. The transaction will be attempted at the next interval.

(b) USB bus reset or USB suspension
The IITV bit is not initialized. When an SOF packet is received, counting starts from the value existing before reception.

32B.9.9.4 Send data setup for isochronous transfer

This module becomes able to send data packets by isochronous transfer from the next frame after data is written to the buffer memory and then an SOF packet is detected. This is called “send data setup for isochronous transfer”.

This function can identify the frame with which data sending started.

If the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, only the buffer to which writing finished earlier can transfer data. Therefore, even when several IN tokens are received within the same frame, only one packet of data is sent from the buffer memory.

When an IN token is received, if the buffer memory is ready for sending data, the data is transferred and a normal response is returned. However, if the buffer memory is not ready for sending data, a zero-length packet is sent and an underrun error occurs.

Figure 32B.11 shows examples of sending using the send data setup function for isochronous transfer by setting “IITV = 0” (each frame) in this module.

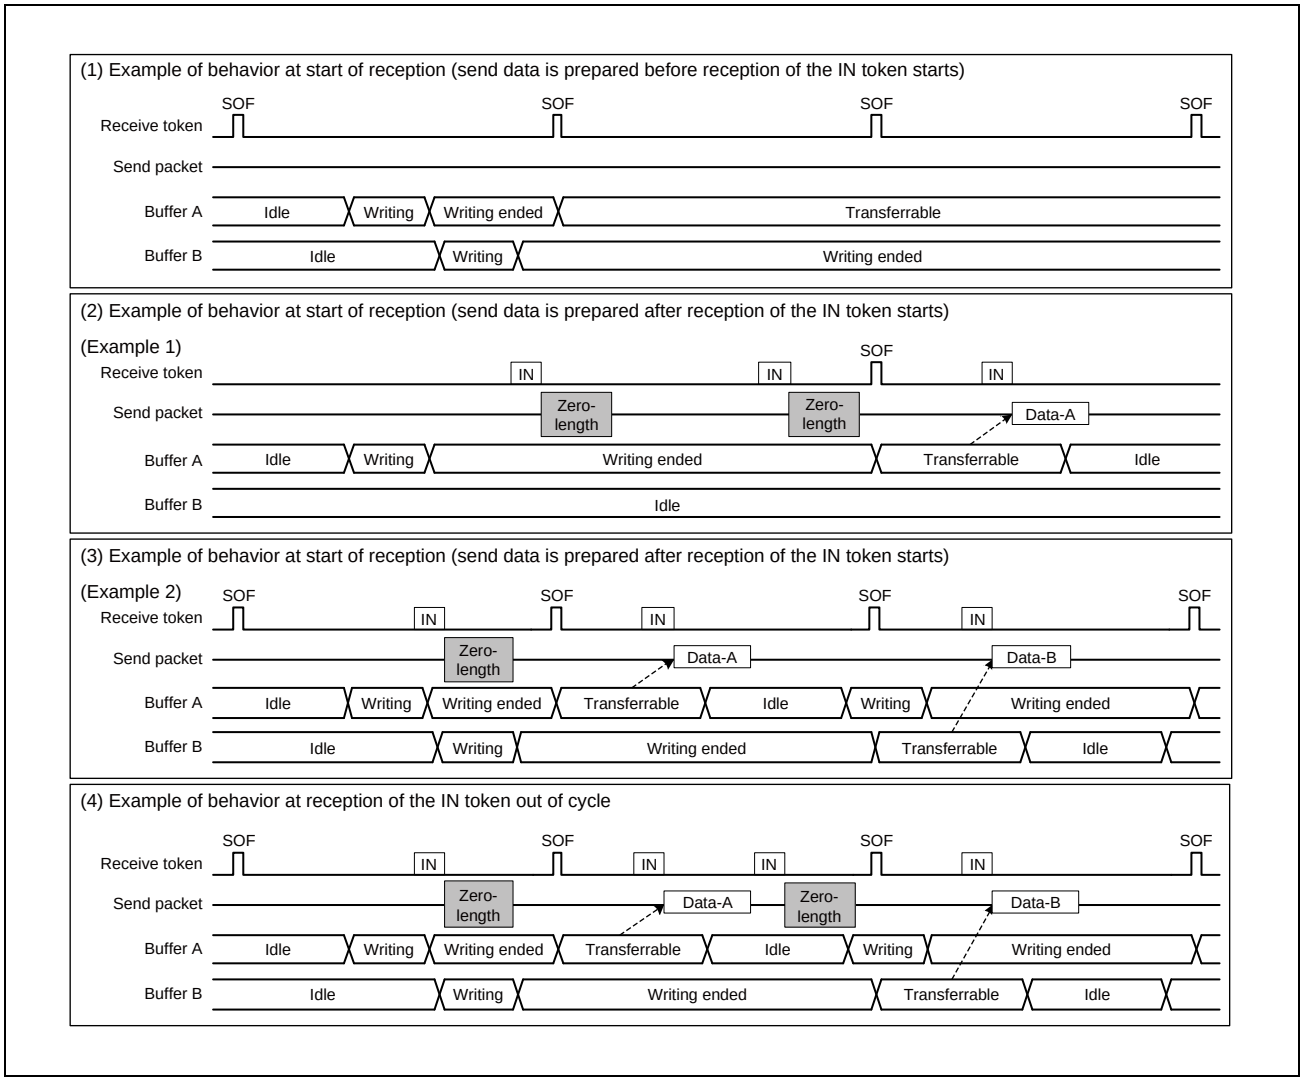

Figure 32B.11 Examples of Data Setup Function Behavior

32B.9.9.5 Transmit buffer flush for isochronous transfer

If this module does not receive an IN token in an interval frame and receives a (micro) SOF packet in the next frame during isochronous data transfer, this module handles the IN token as a corrupted token and clears the buffer that can send data to make the buffer writable.

At this time, if the buffer memory is in a double-buffer configuration and writing to both buffers has been completed, this module assumes the discarded buffer memory to be sent within the same interval frame. As a result, the buffer memory that is not discarded by reception of a (micro) SOF packet becomes to be able to transfer data.

The operation start timing of the buffer flush function varies with the value of the IITV bit.

1. If IITV is 0
   Buffer flush operation is performed from the first frame after the pipe is enabled.
2. If IITV is not 0
   Buffer flush operation is performed after the first successful transaction.

Figure 32B.12 shows an example of how the buffer flush function of this module behaves. For a token outside the set interval (token prior to the interval frame), however, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

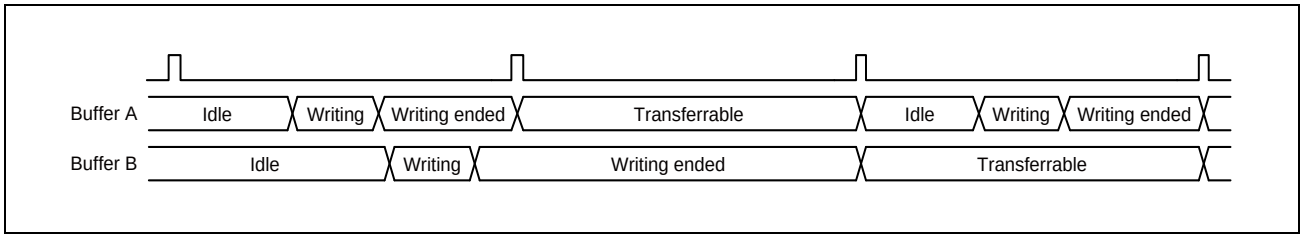

Figure 32B.12 Example of Buffer Flush Function Behavior

Figure 32B.13 shows an example of an interval error that occurs in this module.

There are five types of interval errors, as listed below. At timing (1) in the figure, an interval error occurs and the buffer flush function operates.

If an interval error occurs during IN transfer, the buffer flush function starts. If an interval error occurs during OUT transfer, an NRDY interrupt occurs.

Use the OVRN bit to determine whether an error is an NRDY interrupt (such as a receive packet error) or an overrun error.

In the figure, responses to tokens indicated as shaded boxes are made in accordance with the buffer memory state.

1. IN direction:

(a) If the buffer is ready to transfer data, data is transferred and a normal response is returned.

(b) If the buffer is not ready to transfer data, a zero-length packet is sent and an underrun error occurs.

2. OUT direction:

(a) If the buffer is ready to receive data, data is received and a normal response is returned.

(b) If the buffer is not ready to receive data, data is discarded and an overrun error occurs.

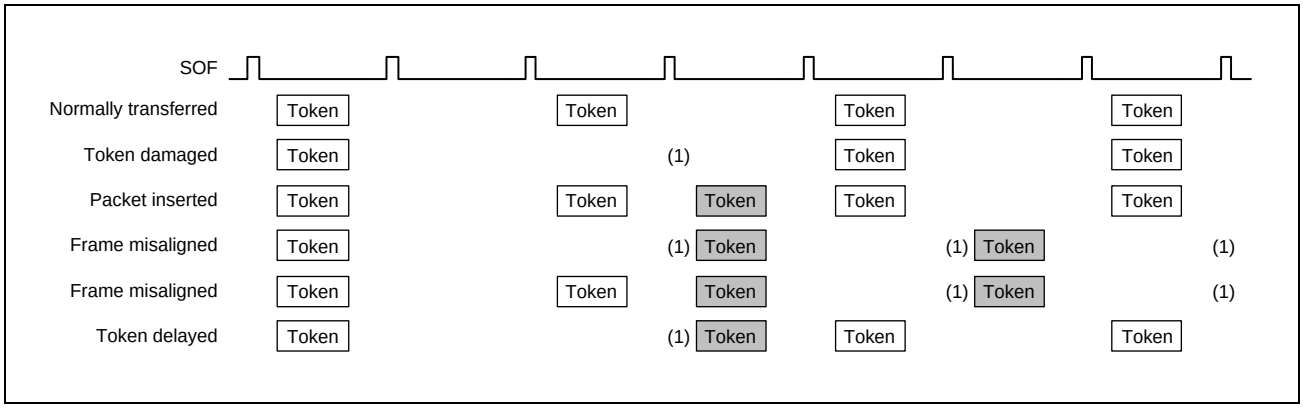

Figure 32B.13 Example of Occurrence of Interval Error (when IITV is 1)

32B.9.10 SOF Interpolation Function

If the controller cannot receive data at intervals of 1 ms (in full-speed operation) or 125 µs (in high-speed operation) due to corruption or missing of an SOF packet, the controller internally interpolates the SOF. The controller starts SOF interpolation upon receiving an SOF packet when both the USBE bit and SUSPM bit are set to 1.

The interpolation function is initialized under the following conditions:

(1) Power on reset

(2) USB bus reset

(3) Suspended state detected

The SOF interpolation operates according to the following specifications:

(1) Frame interval (125 µs or 1 ms) is based on the results of the reset handshake protocol.

(2) The interpolation function does not operate until an SOF packet is received.

(3) After receiving the first SOF packet, this module interpolates the SOF by using the 60-MHz internal clock to measure 125 µs or 1 ms.

(4) After receiving the second or a subsequent SOF packet, this module interpolates the SOF by using the previous reception interval.

(5) Interpolation is not performed in the suspended state or while a USB bus reset is being received.
(If this module enters the suspended state in high-speed operation, interpolation continues for 3 ms after receiving the last packet.)

The SOF interpolation function operates with the following functions:

(1) Updating of frame number or micro-frame number

(2) SOFR interrupt and micro SOF lock

(3) SOF pulse output

(4) Counting of isochronous transfer intervals

If an SOF packet is lost in full-speed operation, the FRNM bit in the FRMNUM register is not updated.

If a micro SOF packet is lost in high-speed operation, the UFRNM bit in the uFRMNUM register is updated.

However, if a micro SOF packet for which “micro-FRNM = 000” is set is lost, the FRNM bit is not updated. In this case, the FRNM bit is not updated even if subsequent micro SOF packets for which “micro-FRNM = 000” is not set are successfully received.

32B.9.11 Link Power Management Processing

According to the Link Power Management specification, the existing suspend state is redefined as the L2 state and a new L1 state is defined as a state where transition and resumption at a lower latency than L2 (suspend) are possible.

The table below compares the features of the L2 (suspend) state and L1 state.

Table 32B.34 Comparison Between Suspend (L2) State and L1 State

Item	L1	Suspend (L2)
Transition	LPM Transaction	3-ms idle period
Host-activated resumption	(Host) Minimum drive period specifiable by the host. Specified between 75 µs to 1.175 ms (Device) 10-µs K drive	(Host) Min. 20-ms K drive (Device) 10-ms K drive
Device-activated resumption	(Device) 50-µs K drive (Host) 60- to 990-µs K drive (Device) 10-µs K drive	(Device) 1-ms to 15-ms K drive (Host) Min. 20-ms K drive (Device) 10-ms K drive
Signaling	Low and Full Speed Idle	Low and Full Speed Idle

The following describes the processing for transition to and resumption from the L1 state.

32B.9.11.1 Descriptor

This module must return its own descriptor when receiving the GetDescriptor command.

Whether the contents of the descriptor to be returned need to be modified is dependent on whether this module responds to the transition to and resumption from the L1 state with an LPM transaction. The details are summarized in the table below.

Table 32B.35 Relationship between LPM Response and Descriptor

LPM Response	bcdUSB	Presence of USB 2.0 Ex.Desc	USB 2.0 Ex.Desc LPM	Response When LPM Is Received	Remarks
Not respond	0200	Not present	—	Not Respond	Standard action in the case where this module does not respond to LPM
	0201	Present	LPM = 0	STALL	This is when rejection of response to LPM is explicitly declared. In this case, it is necessary to send a STALL response instead of making no response.
Respond	0201	Present	LPM = 1	ACK or NYET	Standard action in the case where this module responds to LPM

Whether to respond to transition to and resumption from L1 is declared by the LPM bit of the USB 2.0 extension descriptor. To provide this module with the USB 2.0 extension descriptor, it is necessary to set the bcdUSB field of the device descriptor to 0201 or greater.

When not responding to LPM, set the bcdUSB value to 0200 without providing this module with the USB 2.0 extension descriptor. In this case, it is necessary to ignore any LPM token received.

When not responding to LPM, it is also possible to set bcdUSB to 0201 and set the LPM bit of the USB 2.0 extension descriptor to 0 (noncompliant). In this case, however, it is not allowed to ignore LPM and is necessary to send a STALL response.

When responding to LPM, set bcdUSB to 0201 and the LPM bit of the USB 2.0 extension descriptor to 1 (compliant). This grants this module to send an NYET or ACK in response to an LPM token.

32B.9.11.2 Basic processing

This module needs to execute the following processing.

1. Responds to the LPM token received from the host with “No response”, “ACK”, “NYET”, or “STALL” according to this module's own state.
2. Transitions to the L1 state if it fails to detect the retransmission of an LPM token for 8 μs after making an ACK response.
3. Detects a K drive of the host and performs resume processing to the idle state.
4. Performs resume processing to the idle state based on the Remote Wake signal.

For 1, the software specifies the response method according to the values of the L1RESPEN, L1RESPMD, and L1NEGOMD bits in the PL1CTRL register. The hardware makes the response that is designated by the software upon receiving an LPM token.

For 2, both retransmission control and transition to the L1 state are processed by the hardware. Transition to the L1 state can be identified through a DVST interrupt.

For 3, a RESM interrupt occurs on detection of host K in the L1 state.

For 4, starting the Remote Wake processing can be instructed to the hardware by setting the WKUP bit by the software. The specification stipulates that the software clears this bit on resumption from the L2 state. On the other hand, the hardware clears this bit on resumption from the L1 state.

32B.9.11.3 HIRD value negotiation

The HIRD value contained in the LPM token is the K period of the host on resumption from the L1 state.

This module can respond with ACK if the received HIRD value falls within the desired range as specified by the L1NEGOMD and HIRDTHR bits in the L1CTRL register; otherwise, this module can respond with NYET and request the host to modify the HIRD value.

NOTE

This HIRD value negotiation function must also be supported on the host side.

32B.9.12 DMA Mode

32B.9.12.1 Register mode/link mode

The DMS bit in the CHCFG_n register can be used to switch between register mode and link mode.

Table 32B.36 DMA mode settings

DMS (CHCFG)	Mode	Description
0	Register mode	Performs DMA transfer based on the values set by Next Register Set.
1	Link mode	Accesses the descriptor area, and executes DMA transfer based on the values set by descriptors. This module repeats descriptor reading and DMA transfer unless the descriptor settings are changed or the control register is used to stop the processing.

(1) Register mode

In register mode, this module executes DMA transfer based on the values set in internal registers.

Two sets of the transfer-source address, transfer-destination address, and number of bytes to be transferred can be held (in Next0 Register Set and Next1 Register Set registers). One of these Next registers can be used to execute transfer, and both Next registers can be used to execute continuous transfer.

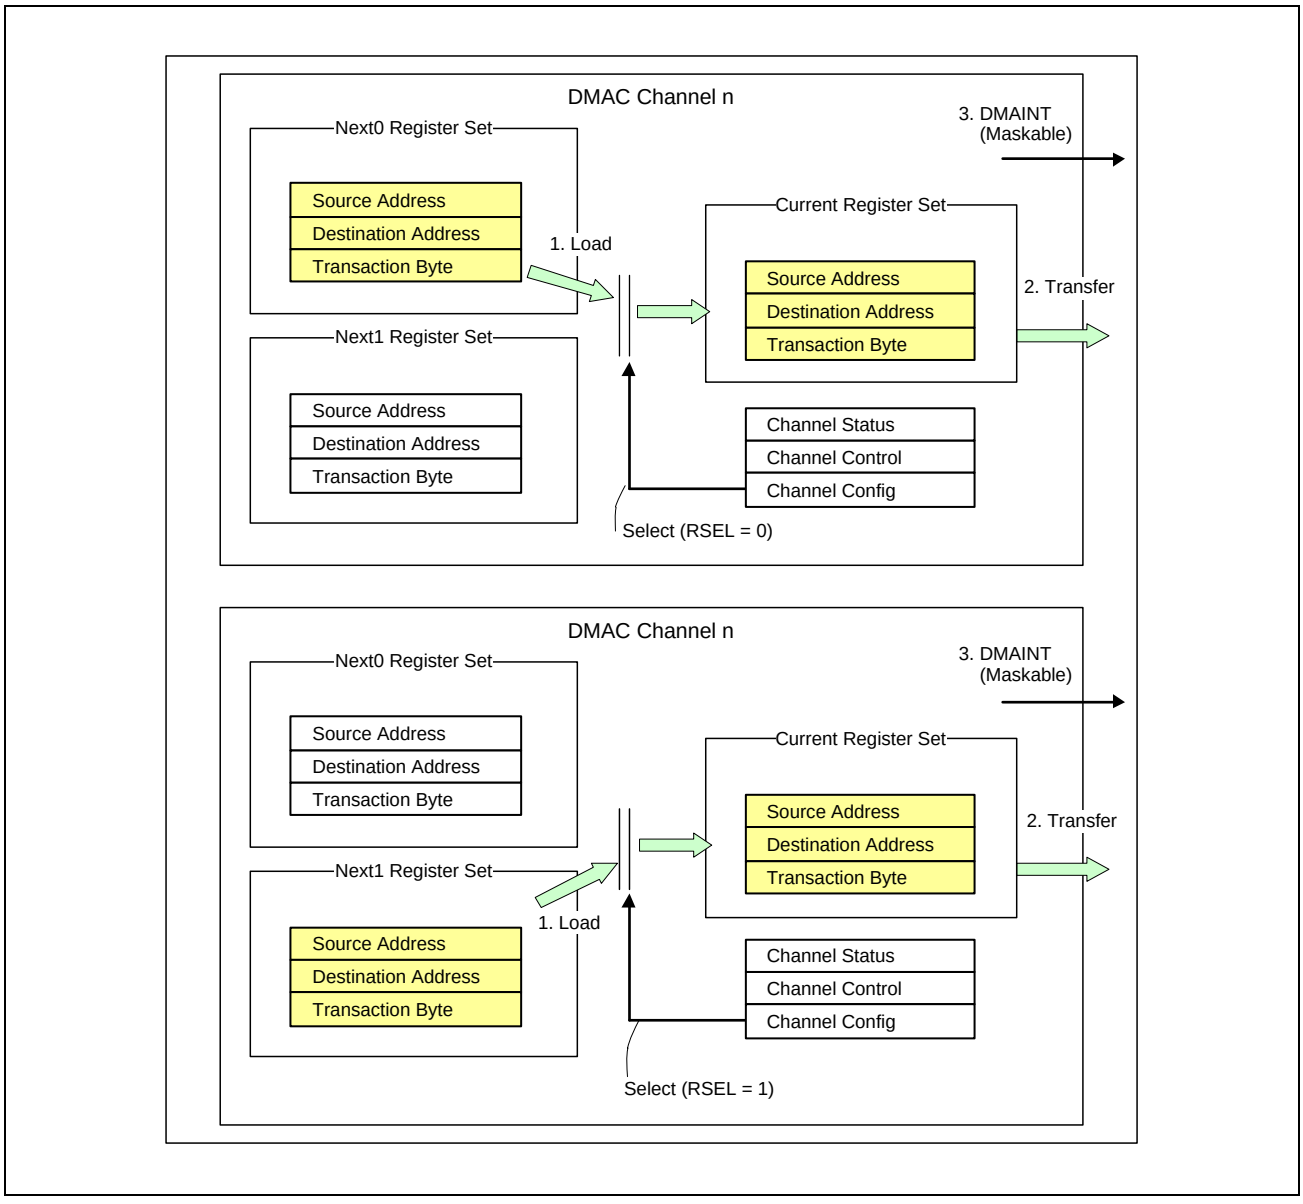

Figure 32B.14 Overview of Normal Behavior of Register Mode

The upper part of the above figure indicates a case when Next0 Register Set is processed. The lower part of the above figure indicates a case when Next1 Register Set is processed.

(a) Operation flow of register mode

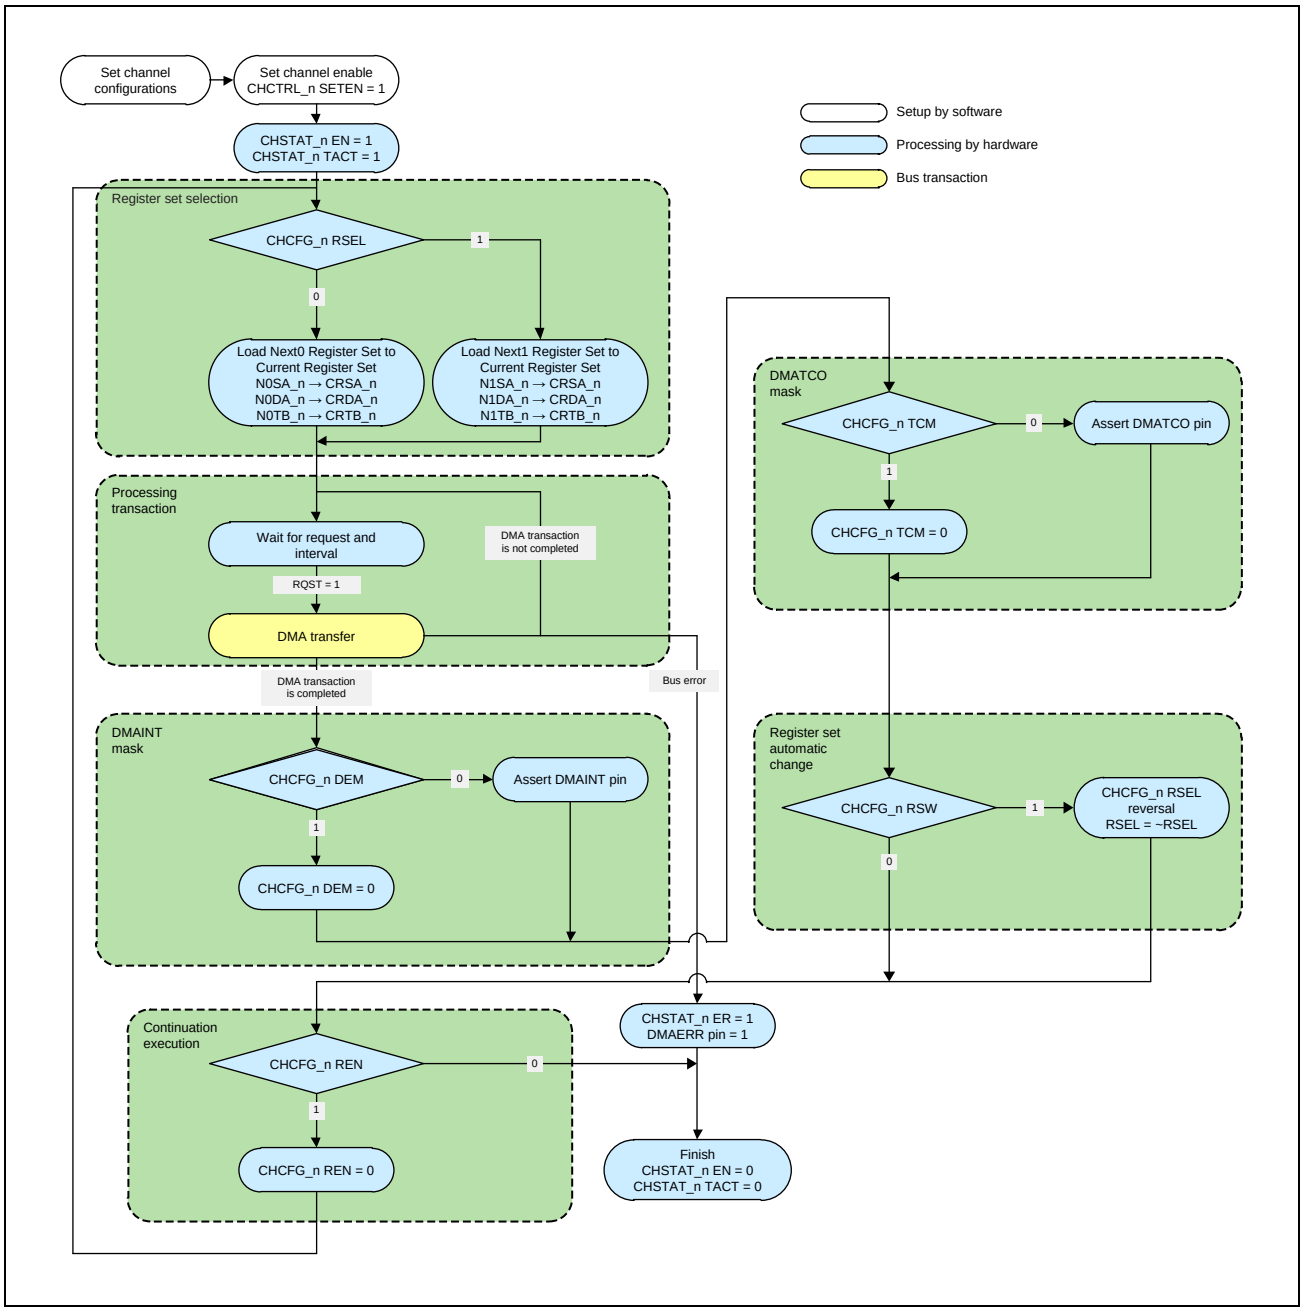

Figure 32B.15 Register Mode Operation Flow

Description of the register mode operation flow:

1. Channel setting
   The Next0 Register Set or Next1 Register Set register is set (transfer-destination address, transfer-source address, and total number of bytes to be transferred). In addition, the FIFO channel, volume of transfer data, and other items are set for USB control that is used for the Channel Register Set register.
   No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.
   (see **Section 32B.9.13, DMA Transfer**).

2. Register set selection
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits in the CHSTAT_n register are set to 1. As a result, the values set by the Next Register Set register selected by the RSEL bit in the CHCFG_n register are loaded to the Current Register Set register.

3. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, **Section 32B.9.13, DMA Transfer**.

4. The USBFDMAmn masking
   The USBFDMAmn interrupt is masked depending on the value of the DEM bit in the CHCFG_n register. If DEM = 1, the USBFDMAmn interrupt is masked, and the DEM bit is automatically cleared to 0.

5. DMATC masking
   DMATC from DMAC control to USB control is masked depending on the value of the TCM bit in the CHCFG_n register. If TCM = 1, DMATC is masked, and the TCM bit is automatically cleared to 0.

6. Automatic register set switchover
   Whether the current Next register set is to be switched to the other Next register set is determined by the value of the RSW bit in the CHCFG_n register.

7. Continuation of execution
   Whether to continue DMA transfer is determined by the value of the REN bit in the CHCFG_n register. If REN = 0, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC operation stops. If REN = 1, DMAC operation continues, and the REN bit is automatically cleared to 0.

(b) Register mode setting

- Register mode setting

  The register set to be processed is selected.

Table 32B.37 Register Mode Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Processes Next0 Register Set.
	1	Processes Next1 Register Set.

- USBFDMAmn masking

  The USBFDMAmn interrupt can be masked.

Table 32B.38 USBFDMAmn Mask Setting

DEM (CHCFG_n)	Description
0	Asserts the USBFDMAmn interrupt when the DMA transaction is completed.
1	Does not assert the USBFDMAmn interrupt even when the DMA transaction is completed. After the DMA transaction is completed, the DEM bit is cleared to 0.

- DMATC mask setting

  DMATC from DMAC control to USB control can be masked.

Table 32B.39 DMATC Mask Setting

DEM (CHCFG_n)	Description
0	Asserts DMATC when the DMA transaction is completed.
1	Does not assert DMATC even when the DMA transaction is completed. After the DMA transaction is completed, the TCM bit is cleared to 0.

- Automatic transaction execution for a register set

  After a DMA transaction finishes, another DMA transaction can be executed.

Table 32B.40 Automatic Execution Setting for a Register Set

REN (CHCFG_n)	Behavior	Remarks
0	The EN bit is cleared and DMA operation is terminated when the DMA transaction for the register set that is set by RSEL finishes.	Use this setting to execute a DMA transaction only once.
1	After a DMA transaction finishes, DMA transfer of the contents of the next register set continues. The REN bit is cleared to 0 when continuous transfer is successful.	Use this setting to continue processing of register set contents.

- Automatic register set switchover setting

  After a DMA transaction finishes, the next register set to be processed can be switched.

Table 32B.41 Automatic Execution Setting for a Register Set

RSW (CHCFG_n)	Behavior	Remarks
0	The register set is not switched when a DMA transaction finishes.	Use this setting to use only one register set.
1	When REN = 1 and a DMA transaction finishes, the RSEL setting is automatically reversed to select the other register set.	Use this setting to switch the register set.

(c) Example of setting the register mode

- Example of setting the register mode when using only the Next0 register set

Table 32B.42 Register Mode Setting Example

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0	0	0	0	0	0
(register mode)	(Next0)	(not masked)	(not masked)	(not switched)	(continuous execution disabled)

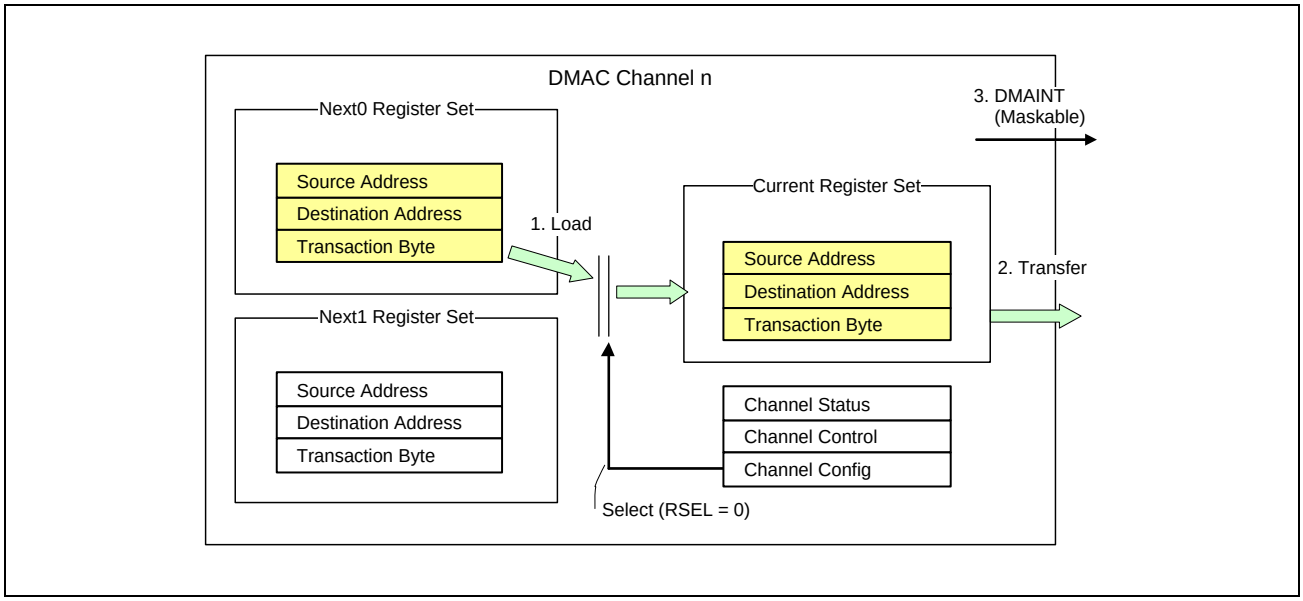

Figure 32B.16 Register Mode Setting Example 1

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
4. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
5. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Example of setting the register mode when using two register sets continuously

Table 32B.43 Automatic Register Set processing Setting

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	TCM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	1 (masked)	0 (not masked)	1 (switched)	1 (continuous execution enabled)

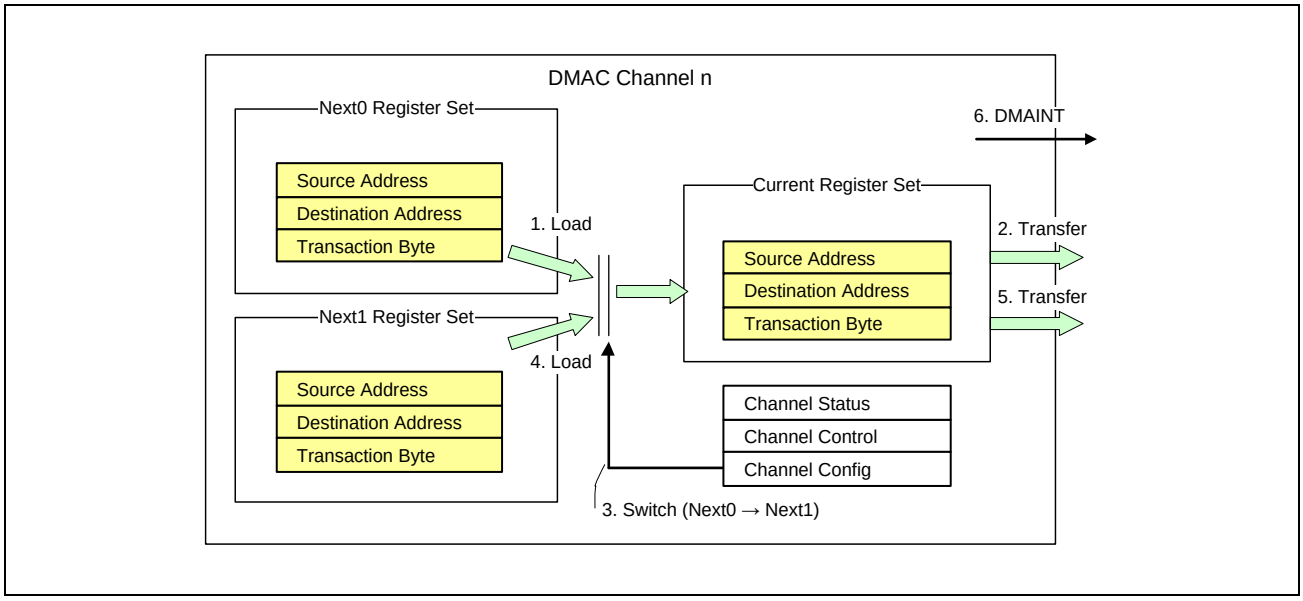

Figure 32B.17 Register Mode Setting Example 2

1. By writing 1 to the SETEN bit in the CHCTRL_n register, the EN bit in the CHSTAT_n register is set to 1. As a result, the contents of Next0 Register Set are loaded to Current Register Set.
2. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
3. Because the DEM bit in the CHCFG_n register is 1, the USBFDMAmn interrupt is not asserted after the DMA transaction finishes.
4. Because the REN bit in the CHCFG_n register is 1, operation continues. The REN bit is automatically cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the next register set to be processed is switched (RSEL = 0 to 1).
6. The contents of Next1 Register Set are loaded to Current Register Set.
7. A DMA transaction is executed based on the values of Current Register Set and Channel Register Set.
8. Because the DEM bit in the CHCFG_n register is 0, the USBFDMAmn interrupt is asserted after the DMA transaction finishes.
9. Because the TCM bit in the CHCFG_n register is 0, DMATC is asserted after the DMA transaction finishes.
10. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

(2) Link mode

In link mode, this module reads the value set in a descriptor placed in an external storage area to execute a DMA transaction. In DMAC, there are Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers for each channel. The Next Link Address (NXLA_n) register is used to set the address of the descriptor to be read the next time. The Current Link Address (CRLA_n) register is used to display the descriptor address for the current DMA transaction.

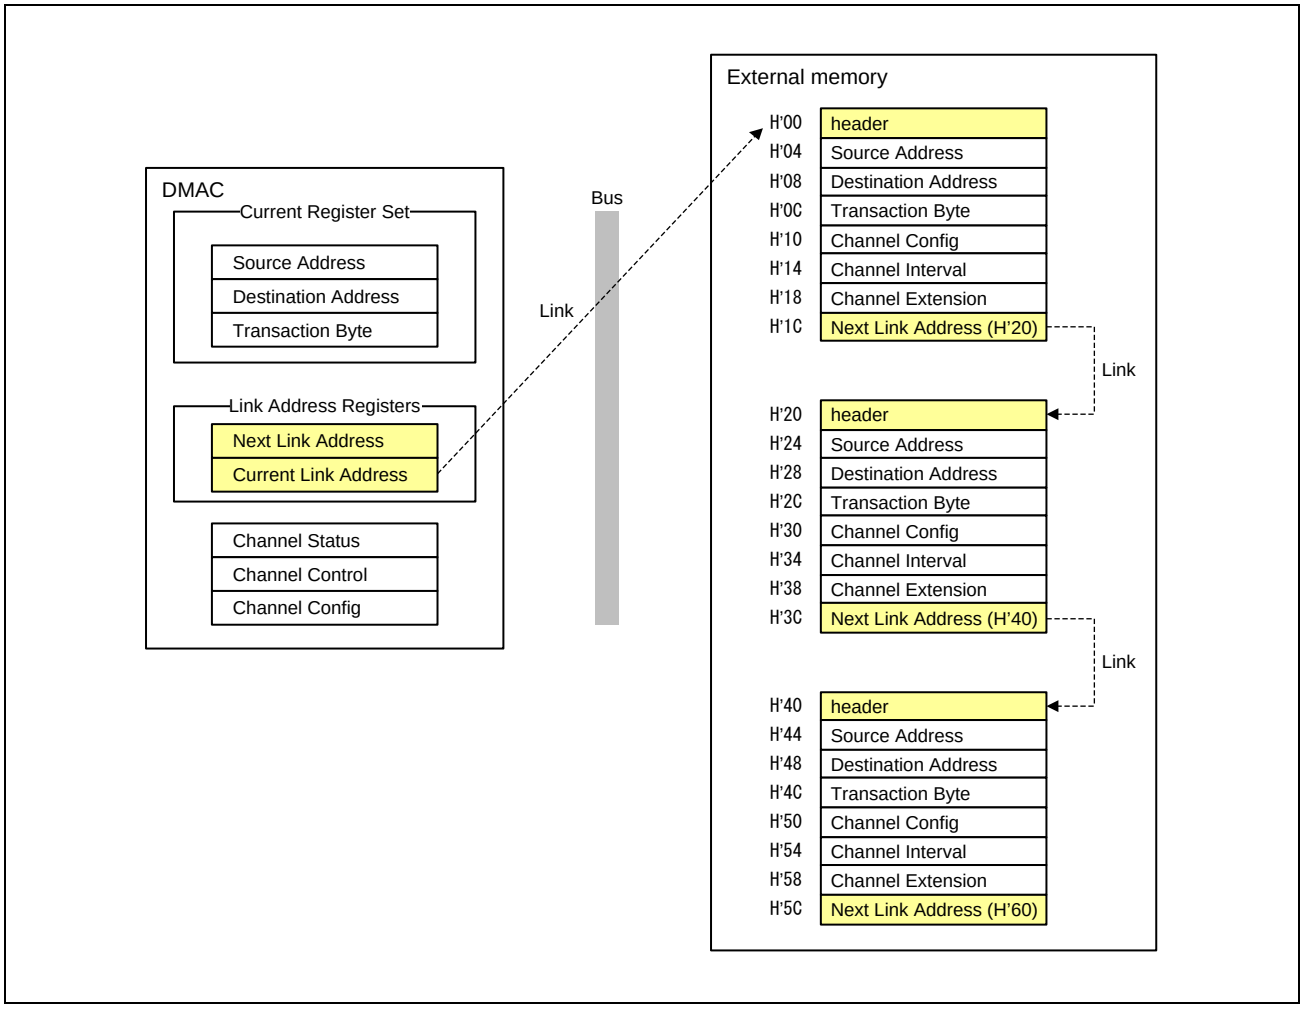

Figure 32B.18 Overview of Link Mode

(a) Operation flow of link mode

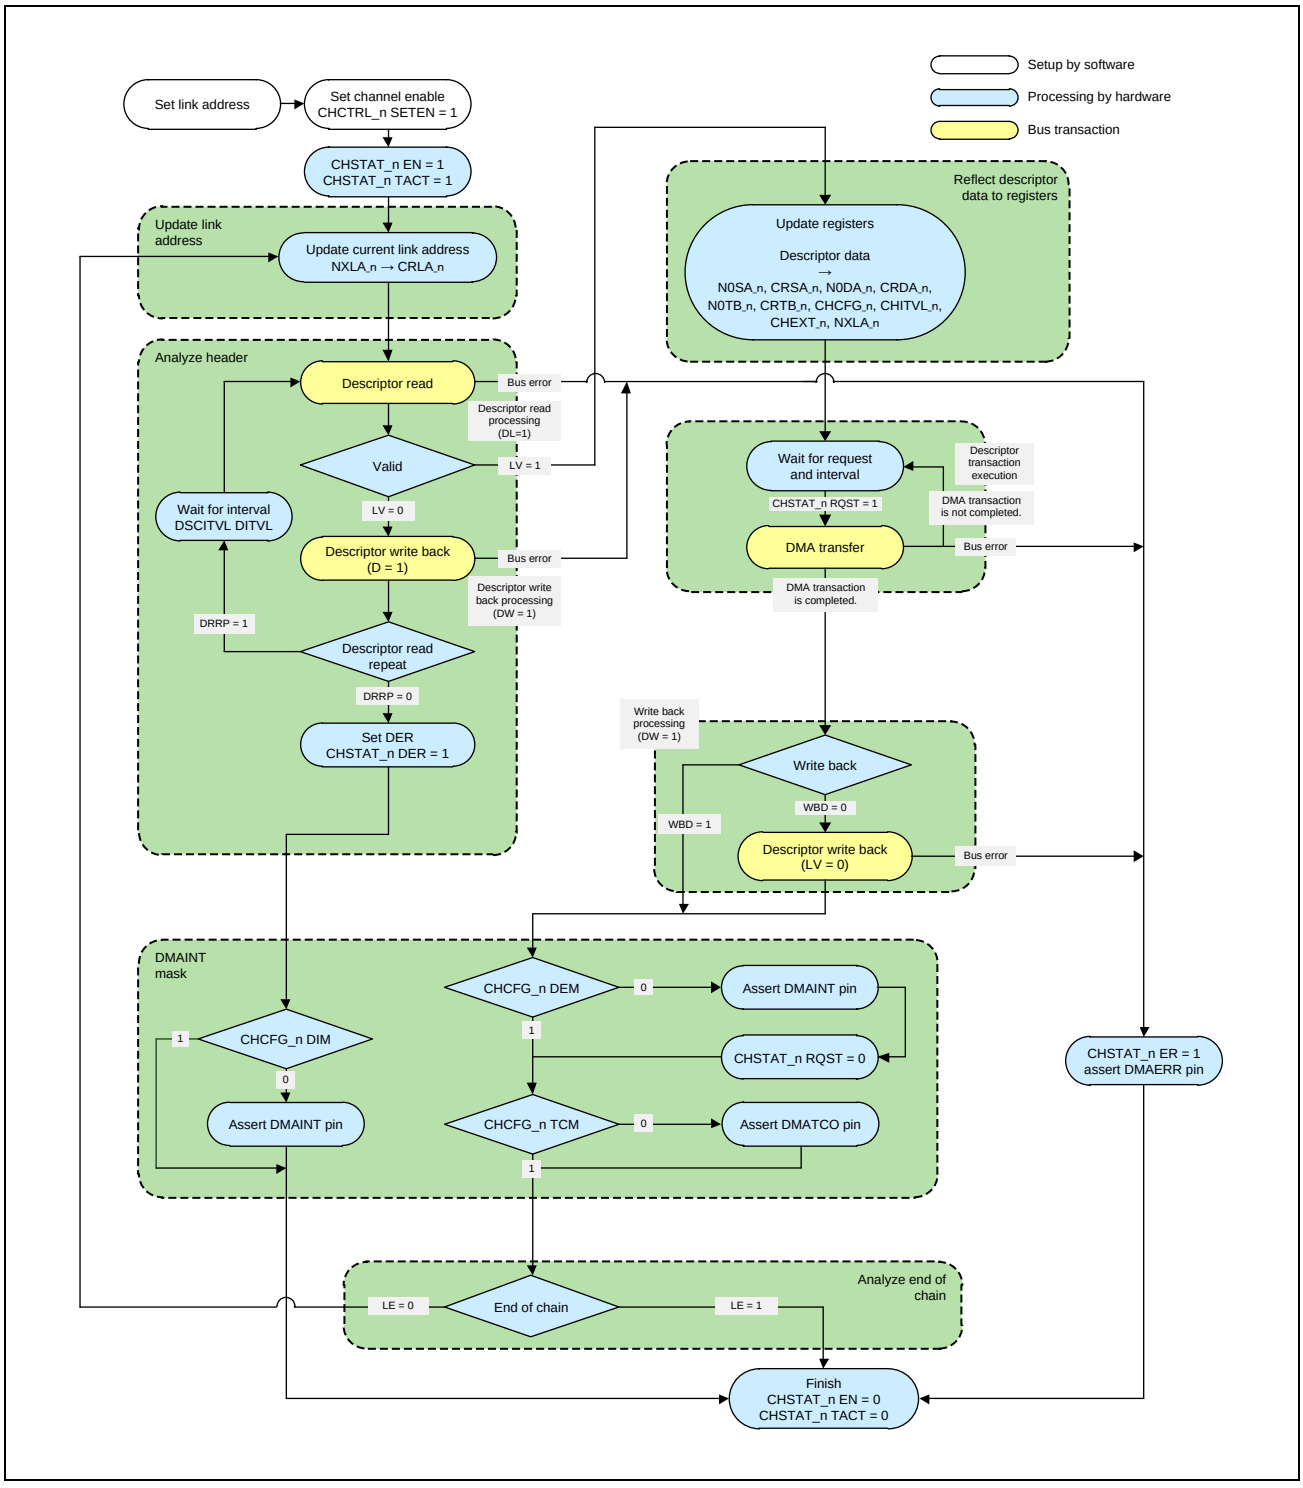

Figure 32B.19 Link Mode Operation Flow

Description of the link mode operation flow:

1. Channel setting
   The beginning address of the link destination is set in the NXLA_n register.

2. Link address updating
   If 1 is written to the SETEN bit in the CHCTRL_n register, the EN and TACT bits of the CHSTAT_n register are set to 1. As a result, the address set in the NXLA_n register is loaded to the CRLA_n register.

3. Descriptor reading and header judgment
   A read of the descriptor starts, and DMAC checks the contents of header. If LV = 0, this module writes 1 back to the D bit of header. After that, if the DRRP bit in the CHCFG_n register is 1, this module waits for the time intervals set by the DSCITVL register, and then reads the same descriptor again. If DRRP = 0, the DER bit in the CHSTAT_n register is set to 1, and this module is placed in the end state (both EN and TACT bits in the CHSTAT_n register are 0). At this time, if the DIM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

4. Descriptor setting
   If LV = 1, the data read from the descriptor is loaded to Current Register Set and Channel Register Set. In addition, the next link target is loaded to the NXLA_n register.

5. DMA transaction
   A DMA transaction is executed based on the values that are set. For details about transfer, see **Section 32B.9.13, DMA Transfer**.

6. Header write-back
   If WBD of header is 0, DMAC writes LV = 0 to the header area.

7. USBFDMAmn masking
   If the DEM bit in the CHCFG_n register is 0, this module asserts the USBFDMAmn interrupt.

8. DMATC masking
   If the TCM bit in the CHCFG_n register is 0, this module asserts DMATC.

9. Link end judgment
   If LE of header is 1, the EN and TACT bits in the CHSTAT_n register are cleared to 0, and DMAC terminates operation. If LE is 0, this module updates Current Register Set, and then restarts reading the next descriptor.

(b) Register setting

- Link mode setting

  To use link mode, set the DMS bit in the CHCFG_n register to 1.

Table 32B.44 Link Mode Setting

DMS (CHCFG_n)	Description
1	This module operates in link mode. The setting of this bit cannot be changed by using a descriptor.

- Link address setting

  The Next Link Address (NXLA_n) and Current Link Address (CRLA_n) registers are used to indicate a link target. Before starting link mode, set the link target in the NXLA_n register.
  After reading a descriptor, this module updates the NXLA_n register to the next link. Note that the CRLA_n register indicates the address of the link target that is being executed.

Table 32B.45 Link Address Register Set

Register	Description
Next Link Address Register (NXLA_n)	This register is used to set and display the next link target. Before starting link mode, set the address of the link target in this register.
Current Link Address Register (CRLA_n)	This register is used to display the link target that is being executed. This is a read-only register.

(c) Descriptor setting

DMAC supports multiple descriptor formats.

A switchover between formats is specified by using the DSCFM field of bits [31:28] of the 1st word (header) of the descriptor.

The following table shows the relationship between DSCFM values and descriptor formats.

Table 32B.46 Descriptor Formats

DSCFM	Descriptor Size	Next Link Address	Channel Extension	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	header
3	4 words	✓	— (reload)	— (reload)	— (reload)	— (header)	✓	✓	✓ (with STS)
1	8 words	✓	✓	✓	✓	✓	✓	✓	✓ (no STS)
Other than the above	If DSCFM is set to a value that is not 1 or 3, operation cannot be guaranteed. Make sure that DSCFM is set to 1 or 3.								

Table 32B.47 Explanation of the Marks in **Table 32B.46**

Field	Mark	Description	Remarks
Header	✓ (with STS)	The STS field of bits [15:0] in the header is valid. The value set in the STS field is used as the total number of transfer bytes (Transaction Size).	—
	✓ (no STS)	The STS field of bits [15:0] in the header is invalid. The value of "Transaction Size" in the descriptor is used as the total number of bytes.	
Source Address	✓	Specify the source address.	—
Destination Address	✓	Specify the destination address.	—
Transaction Size	✓	Specify the transaction size.	—
	— (header)	Omit the transaction size. The value set in the STS field is used as the total number of transfer bytes (Transaction Size)	Because the STS field is of 16 bits, a maximum of 65,535 bytes can be set.
Channel Config Channel Interval Channel Extension	✓	Specify Channel Config, Channel Interval, and Channel Extension.	—
	— (reload)	Omit Channel Config, Channel Interval, and Channel Extension. The previous settings (the values of the CHCFG_n, CHITVL_n, and CHEXT_n registers of the last time) are inherited.	—
Next Link Address	✓	Specify the next descriptor address (Next Link Address) to be read after DMA transfer of the descriptor.	—

DMAC sequentially interprets data read from descriptors. If the number of words specified for DSCFM is less than 8, place the data of descriptors that are indicated by "✓" in **Table 32B.46** on memory.

No software settings are required in OUT transfer (reception in peripheral mode) or in IN transfer (transmission in peripheral mode) because the hardware sets the transfer source or destination address according to the setting of the CURPIPE bits in the DxFIFOSEL register.

Table 32B.48 Example of Placing Descriptors

	Address							
DSCFM	Link Address + H'1C	Link Address + H'18	Link Address + H'14	Link Address + H'10	Link Address + H'0C	Link Address + H'08	Link Address + H'04	Link Address + H'00
H'3	—	—	—	—	Next Link Address	Destination Address	Source Address	header
H'1	Next Link Address	Extension	Interval	Config	Transaction Byte	Destination Address	Source Address	header

- header

The header area provides the descriptor status and other information as shown below.

DMAC reads this area before DMA transfer in link mode starts. After a DMA transaction terminates, DMAC writes the transfer status back to this area.

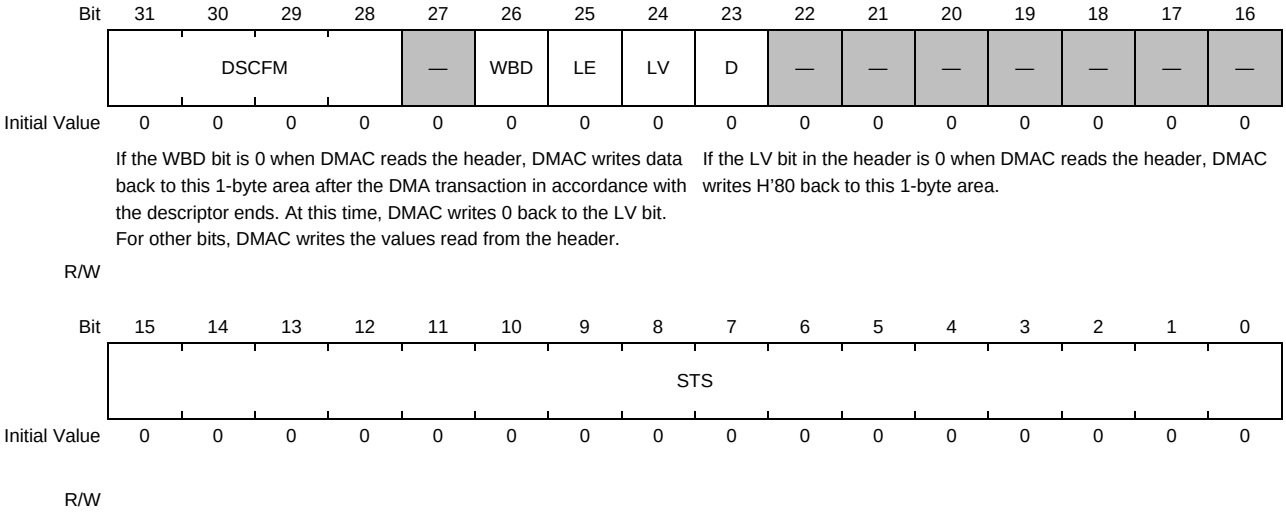

Figure 32B.20 Header Area

Table 32B.49 Header Area (1/2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	DSCFM			Descriptor Format Specifies the descriptor format (length and combination of descriptors). For details see **Table 32B.46**.
27	—			Reserved area. Set 0.
26	WBD			Wrazite Back Disable Masks a write-back operation for the LV bit. If this bit is 1, DMAC does not perform a write-back operation. 0: Writes 0 back to the LV bit. 1: Does not perform a write-back operation for the LV bit.
25	LE			Link End Indicates that the link will end with the DMA transaction for this descriptor. Set this bit to 1 to indicate the end of link. 0: The link continues. 1: The link ends.

Table 32B.49 Header Area (2/2)

Bit	Bit Name	Initial Value	R/W	Description
24	LV			Link Valid Indicates that this descriptor is valid. If WBD = 0, after DMAC executes the DMA transaction written in the descriptor, DMAC writes 0 to this bit. When header is set, set 1 to this bit. 0: This descriptor is invalid. 1: This descriptor is enable.
23	D			Descriptor Error Indicates a descriptor access error. If LV is 0 when the descriptor is read, DMAC writes 1 back to this bit. 0: A descriptor error has not occurred. 1: LV was 0 when the descriptor was read.
22 to 16	—			Reserved area. Set 0.
15 to 0	STS			Short Transaction Size If DSCFM is 3, the transaction size is set (in bytes). The maximum number of transfer bytes that can be set is 65,535. If DSCFM is 3, Do not set 0 for STS. If 0 is set, operation cannot be guaranteed.

If descriptors are added sequentially while DMAC is operating, the access that the CPU sets 0 to the LV bit and the access that DMAC writes 1 back to the D bit might contend with each other. If this contention occurs, prior-written data is overwritten by latter-written data.

To prevent this problem from occurring, DMAC performs a write-back operation for the D bit in a byte-write manner. Therefore, the CPU must also set LV to 1 in a byte-write manner. Because the byte lanes for the D and LV bits are different, by writing data to different areas, occurrence of this problem can be prevented.

- Settings of descriptors other than header

  The specifications of data of the descriptors other than header are the same as the specifications of internal registers.

- Settings specified when descriptors are accessed

  The MHPROT pin output can be set for the LWPR and LDPR fields of the DCTRL register when descriptors are accessed. Set it according to the access target in which descriptors are deployed.

- Descriptor areas and DMA transfer areas

  The following provides an overview of the descriptor areas and DMA transfer areas that are accessed by DMAC.

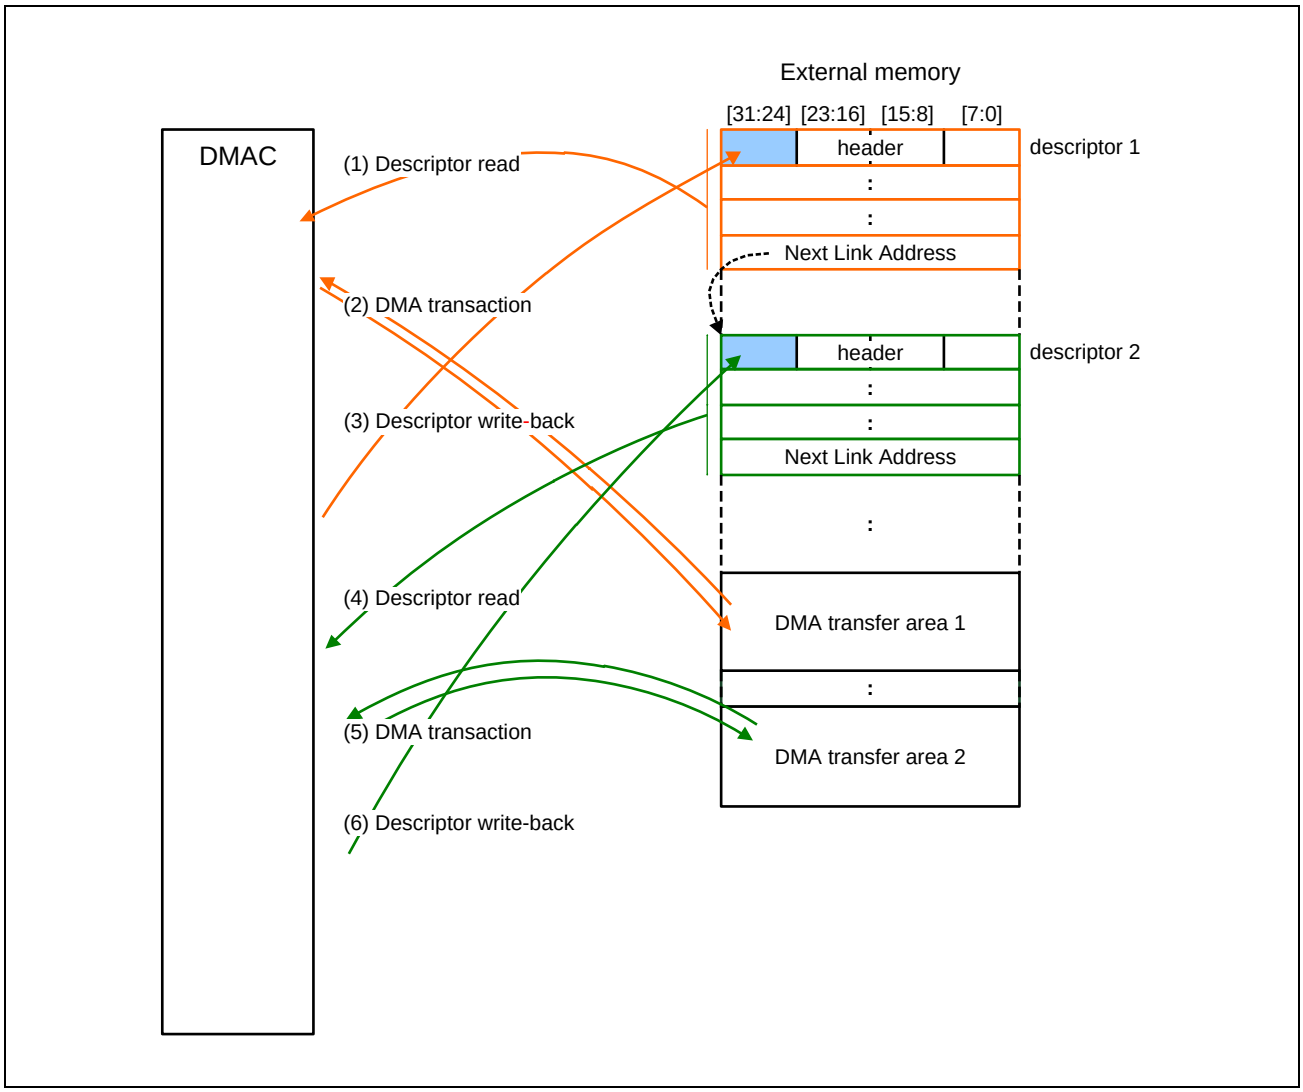

Figure 32B.21 Overview of Descriptor Areas and DMA Transfer Areas

(1) Descriptor read
DMAC loads a value from the internal NXLA_n register to the CRLA_n register, and then reads a descriptor from the external memory space indicated by the CRLA_n register (descriptor 1).

(2) DMA transfer
If the LV bit of the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(3) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 1. For the LV field, 0 is written back. For other fields, the values read in (1) are written back on a byte-size basis.

(4) Descriptor read
If the value of the LE bit in the header descriptor that was read previously (in (1)) is 0, DMAC reads the next descriptor from the address (descriptor2) indicated by Next Link Address in the current descriptor.

(5) DMA transfer
If the LV bit in the header descriptor is 1, DMAC performs a DMA transfer in accordance with the descriptor information.

(6) Descriptor write-back
After performing a DMA transfer of data by the number of bytes that are set, if the WBD bit in header is 0, DMAC performs write-back for bits [31:24] in header of Descriptor 2. For the LV field, 0 is written back. For other fields, the values read in (4) are written back on a byte-size basis.

(Steps (4) to (6) are repeated.)

If LE = 1 and WBD = 0 in header, DMAC performs a DMA transfer with the descriptor settings, writes 0 back to the LV bit in header, and then terminates processing.

If LE = 1 and WBD = 1 in header, DMAC performs a DMA transfer with the descriptor settings, and then terminates processing (without performing write-back).

If LV = 0 in header, DMAC writes 1 back to the D bit in header, and then, if the DRRP bit in the CHCFG_n register is 1, DMAC waits for the number of intervals specified by the DITVL field of the DSCITVL_n register, and then reads the descriptor again. If DRRP = 0, DMAC terminates processing.

- Notes on descriptors
  - In link mode, settings can be changed by reading descriptors. However, it is impossible to synchronize the setting change times and hardware requests. Therefore, to use hardware requests, before setting the SETEN bit in the CHCTRL_n register, set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register. Note that these setting bits must not be changed in descriptors.
  - Descriptors cannot be used to change the DMS field in the CHCFG_n register (DMAC is always placed in link mode). Although descriptors can be used to change the settings of the REN, RSW, and RSEL fields in the CHCFG_n register, changes of those fields do not affect operation.
  - The descriptor can be initialized by overwriting the memory area corresponding to the descriptor you intend to initialize while the DMAC is not operating. The DMAC determines whether or not the descriptor is valid by referring to the DSCFM field and LV bit in the header. Accordingly, set the areas in memory corresponding to the DSCFM field and LV bit to 1 or 3, and to 1, respectively, before enabling DMAC operation.
  - To set the next descriptor on memory while DMAC is operating, make sure that 1 is written to the LV bit after the descriptors subsequent to header (Source Address, Destination Address, ..., Next Link Address) are set. If this is not performed and descriptor setting by the CPU and descriptor reading by DMAC contend, DMAC performs a DMA transfer using the previous values of those descriptors (Source Address, Destination Address, ..., Next Link Address).
  - To leave the write-back information for the D bit of header, make sure that 1 is written to the LV bit of header in a byte-access manner.

(d) Link configuration example

In link mode, descriptors can be configured as shown below.

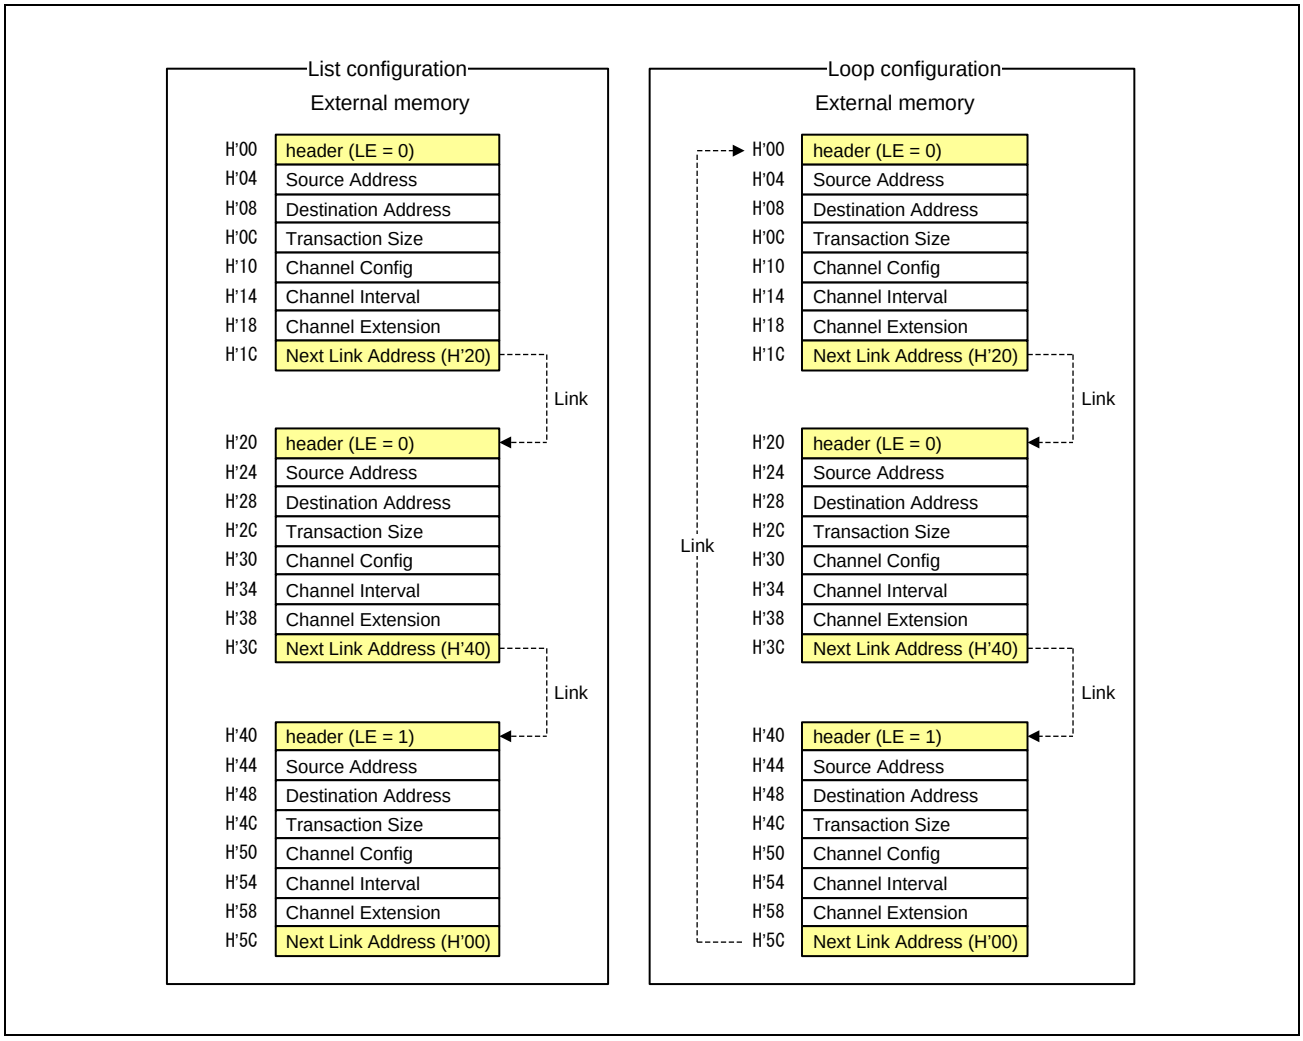

Figure 32B.22 Link Mode Configuration Example

- List configuration

  The link ends by setting 1 for the LE bit in the header of the last descriptor.

- Loop configuration

  A loop of descriptors can be created by setting the link target of the last descriptor to the address of the first descriptor. To end the loop, change the value of the LE bit of header to 1 or use the transfer interrupt procedure.

32B.9.12.2 Write only mode

Write-only mode is enabled by setting 1 for the WONLY bit in the CHCFG_n register.

Table 32B.50 Write-Only Mode Setting

WONLY (CHCFG)	Mode	Description
0	Normal mode	A DMA transfer is performed using the values set in Next Register Set.
1	Write-only mode	A DMA write transfer is performed without performing a DMA read transfer.

In write-only mode, no DMA read transfer is performed (note that descriptors are read in the same way as in normal mode). In register mode, the values set in the NxSA_n register (if RSEL = 0, x = 0; if RSEL = 1, x = 1) are used as write data. In link mode, the values of the SA fields of descriptors are used as write data.

Use this mode to, for example, initialize the memory area.

32B.9.13 DMA Transfer

This chapter describes the basic operation of DMA transfer.

32B.9.13.1 Transfer modes

DMAC supports only single transfer mode.

Upon receiving a DMA transfer request from USB control, DMAC executes a single DMA transfer on the side (source or destination) indicated by the REQD bit in the CHCFG_n register. DMAC then asserts internal DMA permission from internal USB control to DMAC control. DMAC performs a single transfer each time a transfer is received. DMAC continues this operation by the transfer size loaded to the CRTB_n register (arbitration between channels is performed for each DMA transfer).

The timing of internal DMA permission from internal USB control to DMAC control differs depending on the setting of the REQD bit in the CHCFG_n register and the setting of the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register). For details, see **Section 32B.9.13.7, Operational difference depending on the transfer size**.

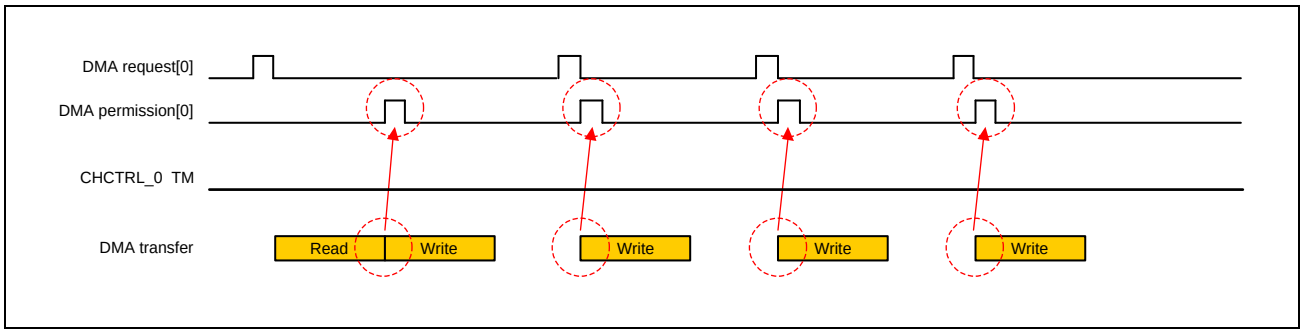

Figure 32B.23 Single Transfer Mode (REQD = 1, SDS > DDS)

32B.9.13.2 DMA channel priority control

DMAC supports fixed-priority mode and round-robin mode as methods of arbitration between channels. The mode is selected by using the PR bit in the DCTRL register. If the PR bit is 0, fixed-priority mode is selected. If the PR bit is 1, round-robin mode is selected.

Table 32B.51 Priority Control Setting

Mode	PR (DCTRL)	Description	Remarks
Fixed-priority	0	Controls requests based on fixed priority (CH0 > CH1 > ...).	Use this mode if channels have priority.
Round-robin	1	Controls requests in a round-robin manner.	Use this mode to execute requests equally.

(1) Fixed-priority mode

In fixed-priority mode, a fixed priority level is assigned to each channel as shown below.

(High) CH0 > CH1 (Low)

If DMA transfer requests simultaneously occur over multiple channels, the DMA transfer over the channel whose number is smallest is performed first.

The transfer over channel 0 is performed first. However, while a transfer switches to another transfer over channel 0, a transfer over the channel with the next highest priority level is performed in order to increase the bus usage rate.

(2) Round-Robin Mode

In round-robin mode, each time a transfer over a channel is received, the priority level of the channel that was used for the previous transfer is changed to the lowest level.

In the status immediately after the mode is reset, channels are assigned priority levels in the same way as fixed-priority mode as shown below.

(High) CH0 > CH1 (Low)

In this status, if a transfer request for DMA channel 0 does not occur and a transfer request for DMA channel 1 occurs, the transfer over DMA channel 1 is performed. When the transfer finishes, the channel priority is changed as follows.

(High) CH1 > CH0 (Low)

The following shows an example of DMA transfer in round-robin mode.

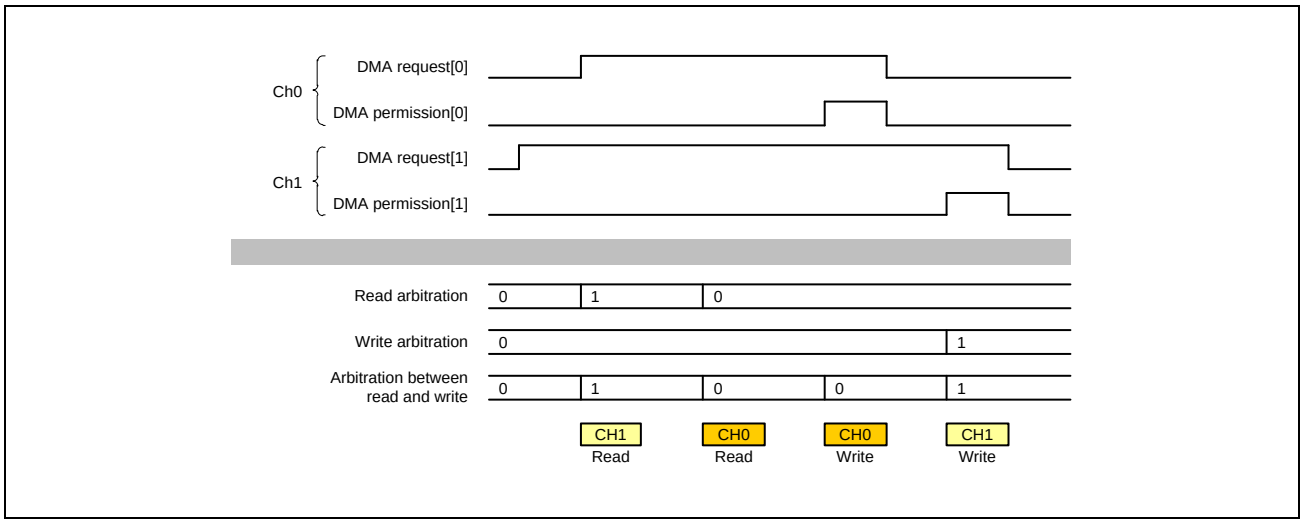

Figure 32B.24 Example of Operation in Round-Robin Mode (with 4 channels, REQD = 1)

DMAC internally performs arbitration between read channels and arbitration between write channels, further performs arbitration between the arbitration results, and then issues bus access.

32B.9.13.3 Forced sweeping request

When a forced sweeping request is entered, DMAC transfers the data that is left untransferred in the buffer to the destination address. After the sweep processing finishes, DMAC continues DMA transfer.

The following provides notes on forced sweeping requests:

(1) If a forced sweeping request and a transfer request from USB control contend, DMAC performs forced sweeping first, and then performs a DMA transfer.

(2) If the USB-control-side system is the destination (REQD bit in the CHCFG_n register is 1) register REQD = 1, buffer overflow or another error might occur on the destination unit because data is transferred although no DMA transfer request is made on the USB control side. Therefore, the specifications physically prohibit DMAC from using forced sweeping if REQD = 1.

(3) The difference from ordinary sweeping mode described in **Section 32B.9.13.8(3)(b), Transfer suspension (buffer sweeping enabled: SBE = 1)** (EN is cleared by setting 1 for the SBE bit in the CHCFG_n register) is as follows: DMAC stops operation after writing data in the buffer in ordinary sweeping mode, whereas DMAC can continue DMA transfer after sweeping the buffer in forced sweeping mode.

(1) Forced software sweeping request

The SETSSWPRQ bit in the CHCTRL_n register determines whether software-based forced sweeping requests can be used. To perform a forced sweeping request, write 1 to the SETSSWPRQ bit. DMAC then outputs the data in the buffer to the destination.

32B.9.13.4 DMA transfer completion interrupt (USBFDMAmn)

USBFDMAmn (m, n = 0, 1) is an interrupt signal that indicates termination of a DMA transaction.

If a transfer for the total number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response, the END bit in the CHSTAT_n register is set to 1. At this time, if the DEM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn (m, n = 0, 1) interrupt.
(If a write-back operation is performed in link mode, the interrupt is generated after the write-back operation finishes.)

In link mode, when the DRRP bit in the CHCFG_n register is 0, if the LV bit of the header of the descriptor that is read is 0, the DER bit in the CHSTAT_n register is set to 1. At this time, if the DIM bit in the CHCFG_n register is 0, DMAC generates a USBFDMAmn interrupt.

Use this signal to detect a transfer completion interrupt performed by the interrupt controller.

Table 32B.52 USBFDMAmn Assertion Conditions

Cause	Condition	INT_DMA[n] mask signal
DMA transaction ended	A transfer of data by the number of transfer bytes loaded to the CRTB_n register is completed by an OKAY response (if a write-back operation is performed in link mode, after the operation finishes)	DEM bit in the CHCFG_n register
Descriptor was invalid	LV of header of the descriptor that is read is 0 when DRRP and DIM in the CHCFG_n register are both 0 in link mode	DIM bit in the CHCFG_n register

32B.9.13.5 DMA error interrupt (USBFDMAERRm)

If an error response is received for DMA transfer or descriptor access, this module stops transfer, assuming that an error occurred. When an error response is received, the EN bit in the CHSTAT_n register for channel n that is being used for transfer is cleared to 0, and the ER bit is set to 1 (n = 1, 0). Also, the USBFDMAERRm interrupt is asserted.

The USBFDMAERRm signal cannot be masked.

For a sequence of transfers for which an error occurred, data integrity cannot be guaranteed. Always use the following procedure to restart the transfer sequence from the beginning.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Reset each register.

32B.9.13.6 Interval Count Function

The execution interval of a DMA transfer can be adjusted by using the ITVL field in the CHITVL_n register. This function prevents DMAC from continuously occupying the bus. If this function is enabled, DMAC does not perform a DMA transfer for the next request until the counter value becomes 0.

The following shows an operation example.

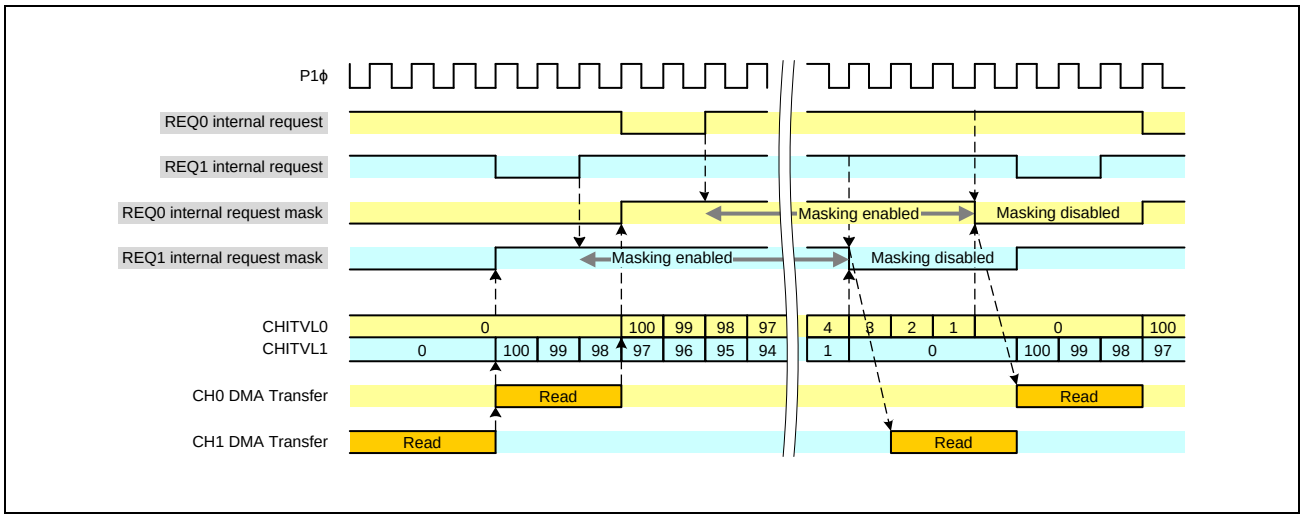

Figure 32B.25 Example of Counting Intervals (REQD = 0, SDS < DDS)

An interval is inserted after a transfer is performed on the side specified by the REQD bit in the CHCFG_n register. The following shows how the REQD, SDS, and DDS values of the CHCFG_n register are related with the interval.

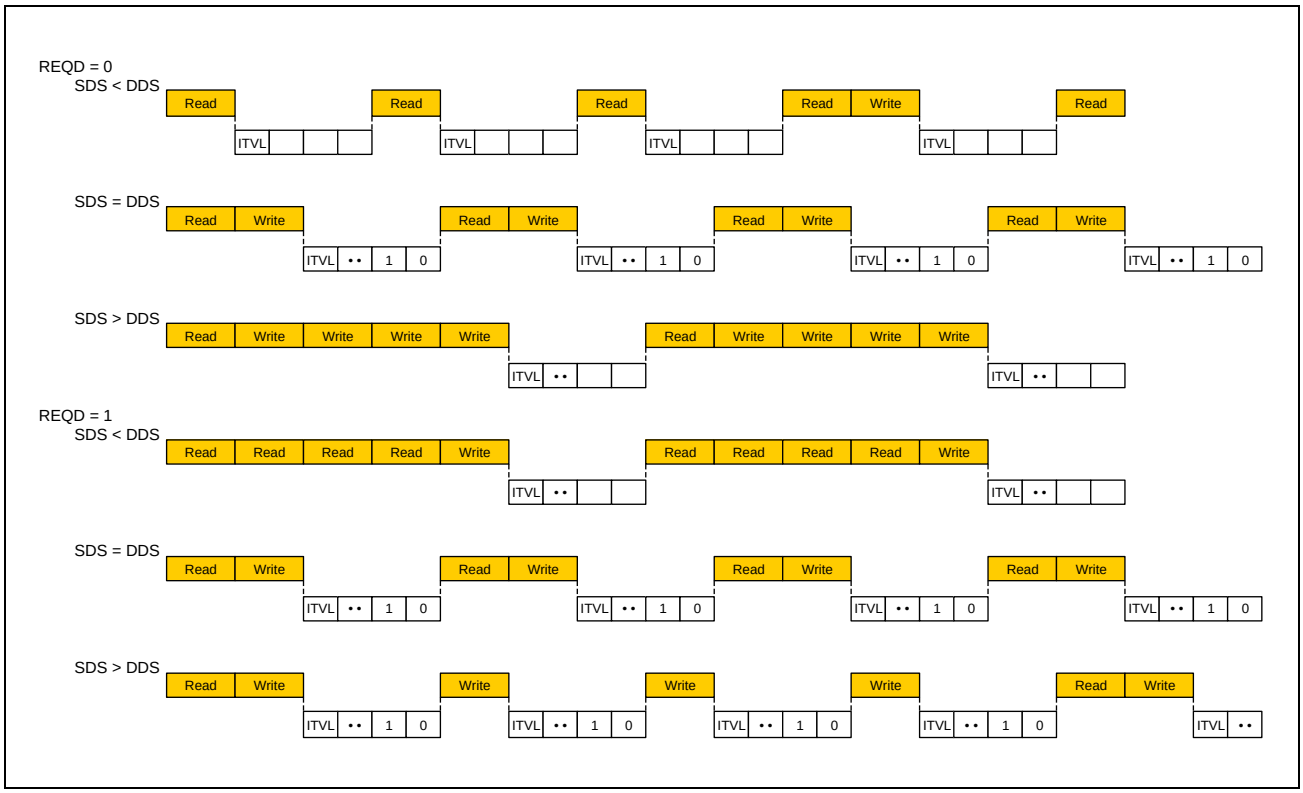

Figure 32B.26 DMA Transfer Settings and Interval Count

32B.9.13.7 Operational difference depending on the transfer size

(1) If the transfer size on the source side is smaller

When reading of as much data as the destination data size finishes, a write to the destination starts.

The following figure is an example of the timing chart in the case where the source is an 8-bit field and the destination is a 32-bit field (SDS = 0 and DDS = 2 in the CHCFG_n register) (when the rising edge is detected).

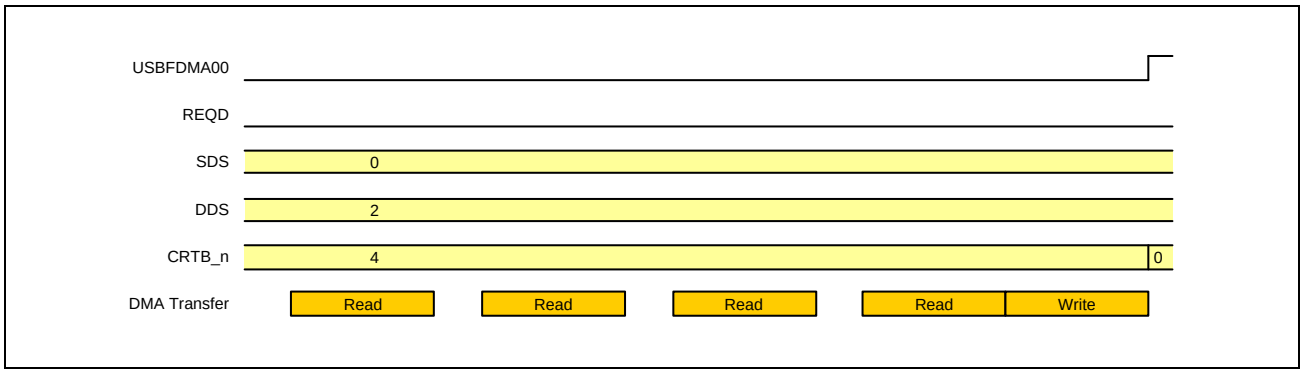

Figure 32B.27 Example of Timing Chart in the Case Where the Source is Smaller
(LVL = 0, HIEN = 1, REQD = 0, and SDS < DDS)

(2) If the transfer size on the destination side is smaller

Because the source side is larger than the destination side, two or more destination write operations occur for one source read operation. The following is an example of the timing chart in the case where the source is a 64-bit field and the destination is a 16-bit field (SDS = 3 and DDS = 1 in the CHCFG_n register) (when the rising edge is detected).

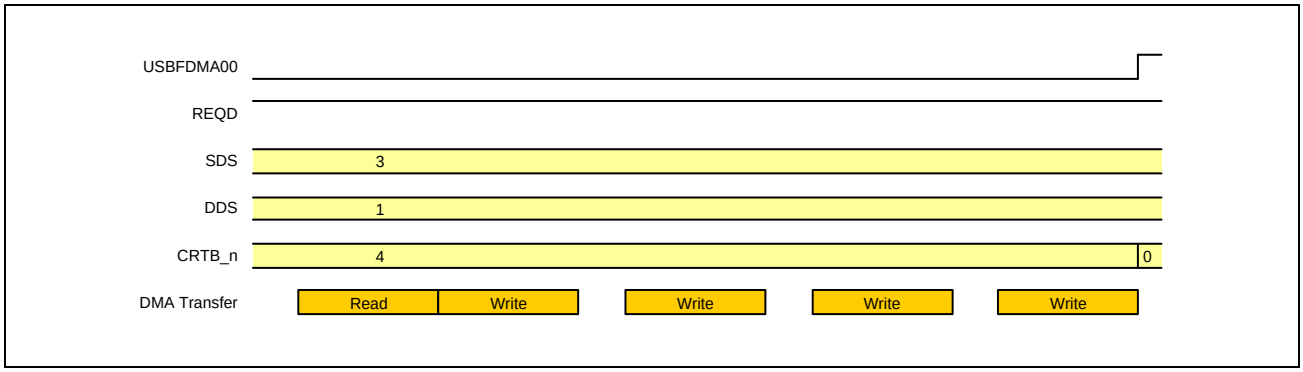

Figure 32B.28 Example of Timing Chart in the Case Where the Destination Is Smaller
(LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in the CHCFG_n Register)

(3) If the Source and Destination Transfer Sizes Are the Same

Each time a DMA transfer request is detected, a source read operation and a destination write operation occur.

The following is an example of the timing chart in the case where the source and destination are 8-bit fields (SDS = 0 and DDS = 0 in the CHCFG_n register) (when the rising edge is detected).

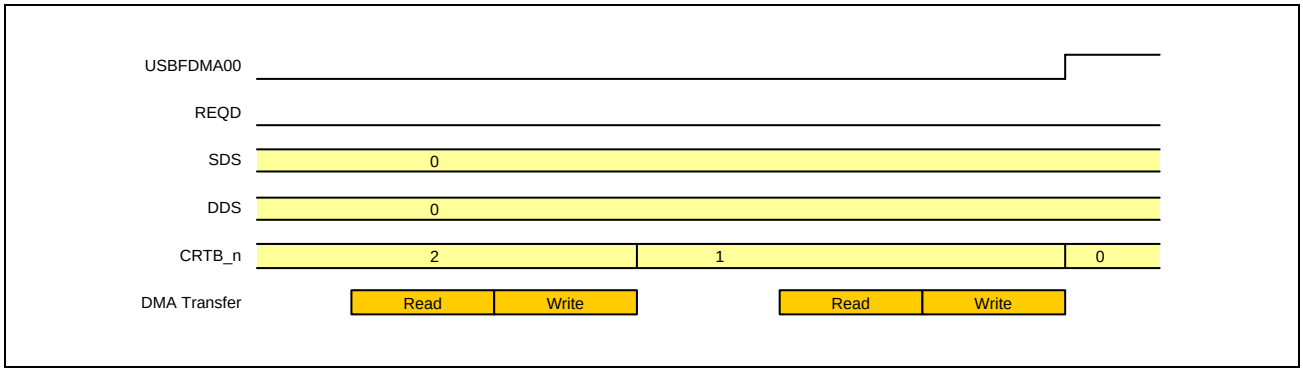

Figure 32B.29 Example of Timing Chart in the Case where the Source and Destination Sizes are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in the CHCFG_n Register)

32B.9.13.8 Transfer state

The CHSTAT_n register indicates the transfer state of a channel.

(1) Transfer state

The TACT bit in the CHSTAT_n register indicates that channel n is operating. When 1 is written to the SETEN bit in the CHCTRL_n register, the TACT bit is set to 1. The TACT bit continues to be 1 while DMAC is accessing a descriptor or waiting for a DMA request.

The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details about the conditions in which the EN bit is cleared, see **Section 32B.4.1, Current Source Address Register**) and the DMA transfer ends.

If the EN bit is not cleared when the DMA transaction ends (for example, when the REN bit of the CHCFG_n register is 1 in register mode or when DMAC accesses the next descriptor in link mode), the TACT bit is not cleared.

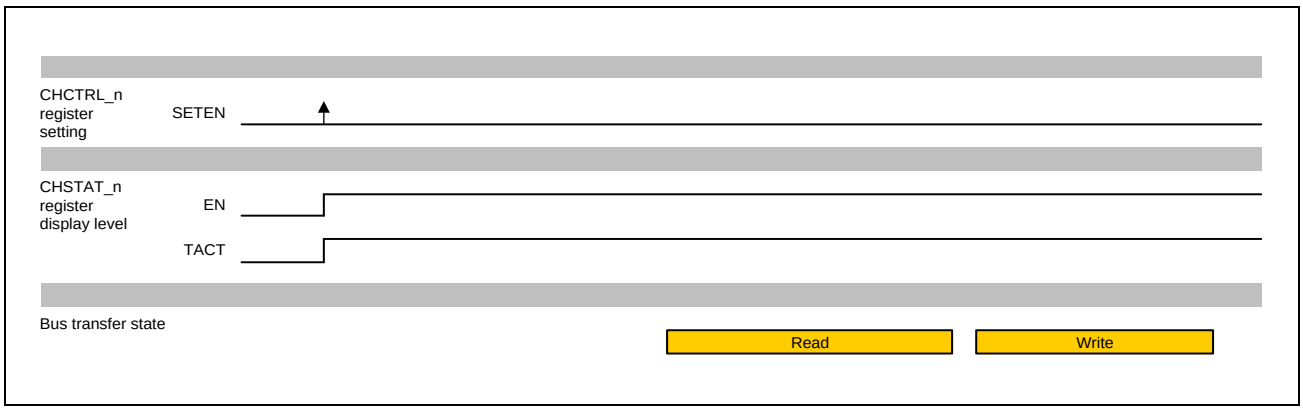

Figure 32B.30 DMAC State Example 1 (Hardware Request)

(2) Suspension

The SETSUS bit in the CHCTRL_n register can be used to suspend a DMA transfer. If suspension of a DMA transfer is attempted when a bus cycle is running, the DMA transfer is suspended after the bus cycle finishes. The suspended transfer can be resumed by writing 1 to the CLRSUS bit in the CHCTRL_n register.

To check whether a DMA transfer is suspended, after setting the SETSUS bit in the CHCTRL_n register, check the SUS bit in the CHSTAT_n register or the SUS bit for the relevant channel in the DSTAT_SUS register. If The SUS bit is 1, the DMA transfer is currently suspended.

(3) Transfer suspension

By writing 1 to the CLREN bit in the CHCTRL_n register during a DMA transaction, the DMA transaction of the channel can be suspended. As the post-processing for suspension, the SBE bit in the CHCFG_n register can be used to select whether to sweep the data remaining in the buffer when the transaction is suspended. The default is SBE = 0 (do not sweep remaining data).

If the sweep mode is enabled and a transfer is suspended by setting 1 for the CLREN bit in the CHCTRL_n register, DMAC sweeps any data remaining in the buffer and stops operation.

(a) Transfer suspension (buffer sweeping disabled: SBE = 0)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer and then stops. The timing of stoppage depends on the value set for the REQD bit. After DMAC stops, write 1 to the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

If DMA transfer is suspended before it is completed, the USBFDMAmn interrupt is not asserted.

If the REQD bit in the CHCFG_n register is 0, DMAC stops when the next read operation is completed. However, if data that can be written exists in the buffer, DMAC writes the data and then stops.

If the REQD bit in the CHCFG_n register is 1, DMAC stops when the next read operation is completed.

(b) Transfer suspension (buffer sweeping enabled: SBE = 1)

If 1 is written to the CLREN bit in the CHCTRL_n register during DMA transfer, DMAC suspends DMA transfer. If the REQD bit in the CHCFG_n register is 0, DMAC sweeps (writes) the already read data, and then stops DMA transfer. If the REQD bit is 1, sweep mode cannot be used physically.

After DMAC stops, set the SWRST bit in the CHCTRL_n register to clear the internal status of DMAC, and then specify the next transfer settings.

Complete deactivation of the channel can be confirmed when the value of the TACT bit in the CHSTAT_n register changes from 1 to 0.

(c) How to confirm deactivation of the channel

Even when the EN bit of the CHSTAT_n register is cleared to 0 by writing 1 to the CLREN bit in the CHCTRL_n register, if a transfer has already been executed over the bus, DMAC cannot immediately stop. To check whether DMAC has stopped completely, check the EN and TACT bits in the CHSTAT_n register. If both bits are 0, DMAC has stopped completely.

(d) Procedure for suspending transfer

To suspend transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. If the SBE bit in the CHCFG_n register is 0, DMAC stops according to the value of the REQD bit in the CHCFG_n register. If the SBE bit is 1, DMAC is placed in sweep mode.
3. Read the CHSTAT_n register to check whether the TACT bit is 0. If the TACT bit is 0, DMAC has stopped completely. If the TACT bit is 1, continue polling until the bit changes to 0.
4. To perform the next DMA transfer after it is suspended, make sure that the SWRST (software reset) bit in the CHCTRL_n register is turned on before the next DMA transfer starts.

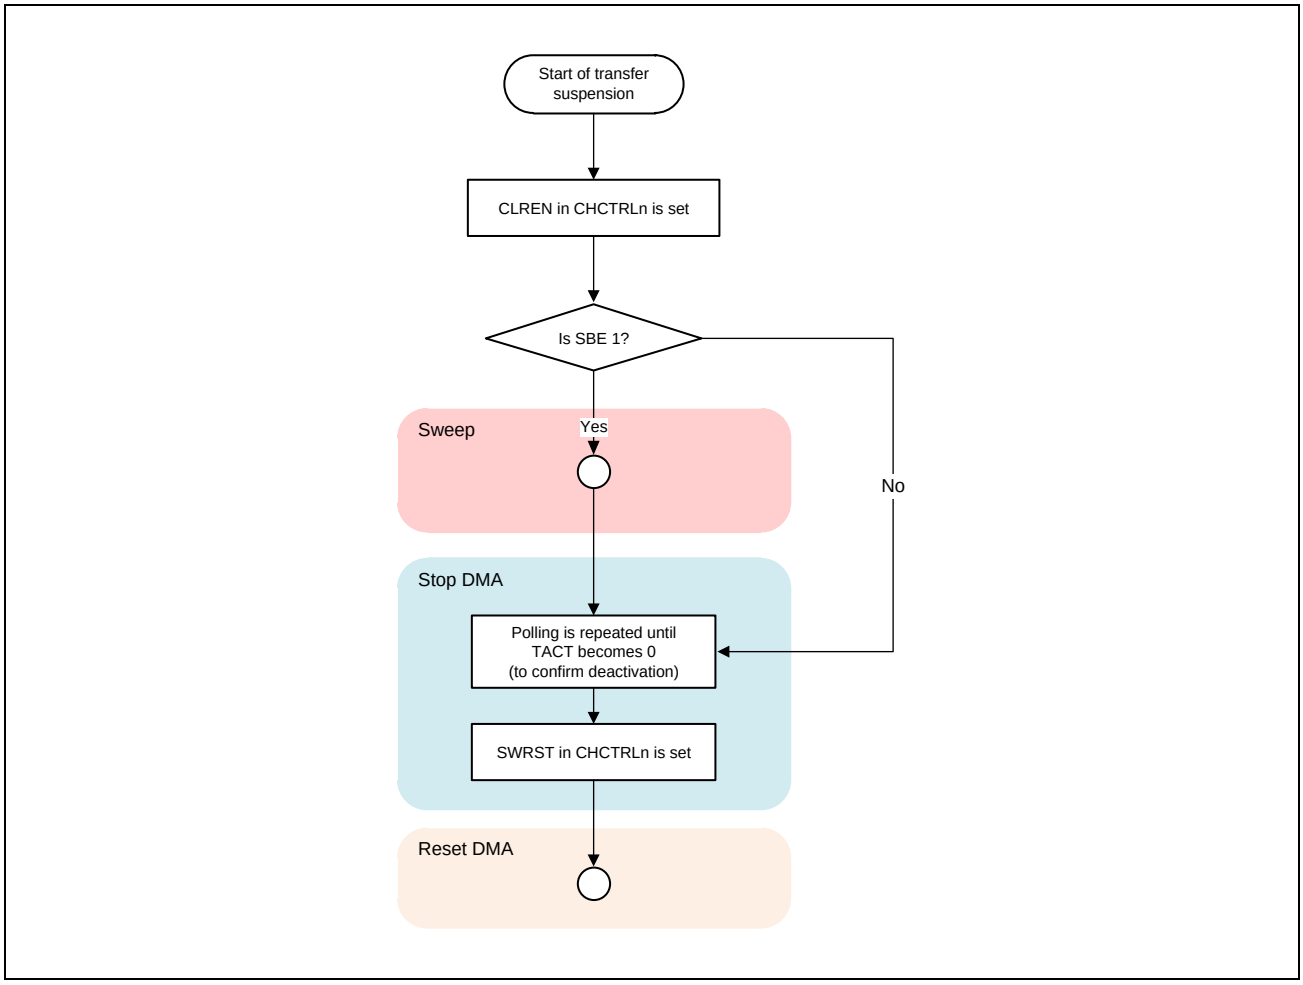

Figure 32B.31 Transfer Suspension Flowchart

32B.9.14 Access Type

32B.9.14.1 DMA master transfer combination list

(1) Read access

The following describes characteristics of the issuance type for DMA read access.

- An access is performed for a beat align space whose size is set by SDS[2:0] in the CHCFG_n register, including the source address indicated in the CRSA_n register. A beat unaligned transfer for the bus is not performed. An excess area is sometimes read depending on CRSA_n or SKIP settings. In this case, the necessary data is imported into the buffer from the read data.
- The size and burst length are determined based on the value set in the SDS[2:0] field.
  If the value set in the SDS[2:0] field is equal to or less than the bus width
  Size: Value set in SDS[2:0]
  Burst type: SINGLE
  If the value set in the SDS[2:0] field is larger than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = SDS[2:0] value/bus width)

The following indicates the access types for the bus.

Table 32B.53 DMA Read Transfer Combination List

SDS	Source Address	AHB transfer					
		First transfer			Second transfer		
		Address	Data Size	Burst Type	Address	Data Size	Burst Type
0 (8 bits)	-	addr	8	SINGLE			
1 (16 bits)	2 byte align	{addr[31:1], 0b}	16	SINGLE			
	2 byte unalign				{addr[31:1], 0b} + H'2	16	SINGLE
2 (32 bits)	4 byte align	{addr[31:2], 00b}	32	SINGLE			
	4 byte unalign				{addr[31:2], 00b} + H'4	32	SINGLE
4 (128 bits)	16 byte align	{addr[31:4], H'0}	32	INCR4			
	16 byte unalign				{addr[31:4], H'0} + H'10	32	INCR4
5 (256 bits)	32 byte align	{addr[31:5], H'00}	32	INCR8			
	32 byte unalign				{addr[31:5], H'00} + H'20	32	INCR8
6 (512 bits)	64 byte align	{addr[31:6], H'00}	32	INCR16			
	64 byte unalign				{addr[31:6], H'00} + H'40	32	INCR16

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

The following describes characteristics of the issuance type for DMA write access.

- An access is performed from the destination address indicated by the CRDA_n register to the beat align boundary whose size is set by DDS[2:0] in the CHCFG_n register.
- The size and burst length are determined based on the value set in the DDS[2:0] field.
  If the value set in the DDS[2:0] field is equal to or less than the bus width
  Size: Value set in DDS[2:0]
  Burst type: SINGLE
  If the value set in the DDS[2:0] field is greater than the bus width
  Size: Bus width
  Burst type: Fixed-length burst (burst length = DDS[2:0] value/bus width)
- In write access, only the specified space is accessed. In the following cases, the combination of values smaller than the value set in the DDS[2:0] field is used for access.
  - The destination address is beat-unaligned for the value set in the DDS[2:0] field.
  - An access specified in the DDS field will be across the SKIP boundary.
  - The size specified in the DDS[2:0] field is too large for the number of remaining bytes to be transferred.

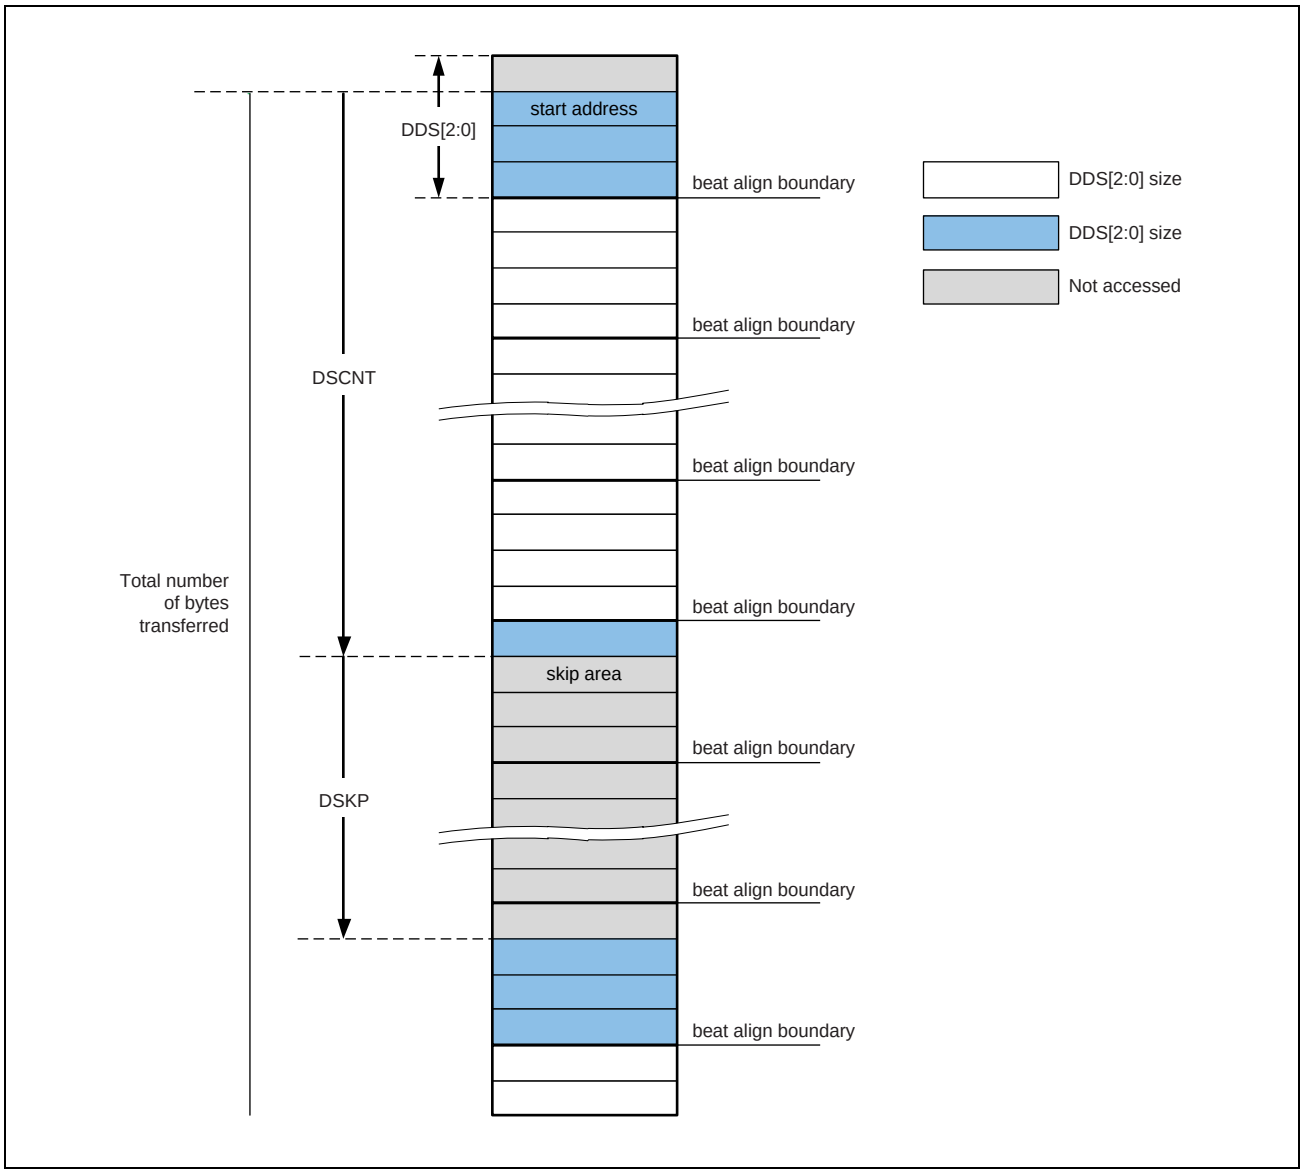

Figure 32B.32 Example of DMA Write Access Space and Access Types

The following shows the access types for the bus in the case of beat-aligned.

Table 32B.54 DMA Write Transfer Combination List

	AHB transfer		
	First transfer		
DDS[2:0]	Address	Data Size	Burst Type
0 (8 bits)	addr	8	SINGLE
1 (16 bits)	{addr[31:1], 0b}	16	SINGLE
2 (32 bits)	{addr[31:2], 00b}	32	SINGLE
4 (128 bits)	{addr[31:4], H'0}	32	INCR4
5 (256 bits)	{addr[31:5], H'00}	32	INCR8
6 (512 bits)	{addr[31:6], H'00}	32	INCR16

32B.9.14.2 DMA master descriptor combination list

(1) Read access

The following describes characteristics of a descriptor access.

- Accesses are performed for 8-word beat align space including the LINK address (the address indicated in the CRLA_n register). A beat unaligned transfer is not performed.
- The size and burst length set by INCR8 are used.
- The descriptor format (DSCFM) of the read header is analyzed, and then the descriptor data is set in an internal register.
- If the descriptor extends over the 8-word boundary, an additional read is performed on the succeeding eight words.

The following indicates the types of access to the bus.

Table 32B.55 Descriptor Read Transfer Combination List

Descriptor Format	Address	AHB Transfer					
		First Transfer			Second Transfer		
	addr[4:0]	Address	Size	Burst	Address	Size	Burst
4 words	H'00	{addr[31:4], 0000b}	32	INCR8			
	H'04						
	H'08						
	H'0C						
	H'10						
	H'14				{addr[31:4], 0000b} + H'20	32	INCR8
	H'18						
	H'1C						
8 words	H'00						
	H'04				{addr[31:4], 0000b} + H'20	32	INCR8
	H'08						
	H'0C						
	H'10						
	H'14						
	H'18						
	H'1C						

Note: If EBT is detected in the middle of burst, 32-bit INCR burst is used to transfer the remaining data.

(2) Write access

Use single transfer as the issuance type for writing data back to a descriptor. The following indicates the types of access to the bus.

Table 32B.56 Descriptor Write Transfer Combination List

Type	AHB transfer		
	Address	Size	Burst
Write-back in normal mode	{addr[31:2], 00b} + H'3	8	SINGLE
Write-back in the case of an error	{addr[31:2], 00b} + H'2	8	SINGLE

32B.9.15 Arbitration between DMACs

Arbitration between internal DMACs is performed in round-robin mode.

In round-robin mode, the highest priority is given to the DMAC whose DMAC number is the DMC number being used for transfer + 1. Immediately after a reset, DMAC0 has the highest priority.

Table 32B.57 Priority of a transfer request for DMACs that are performing transfer

	Next DMAC	
Current DMAC	DMAC0	DMAC1
DMAC0	2	1
DMAC1	1	2

Note: Priority: 1 (high), 2 (low)

32B.9.16 Notes

32B.9.16.1 Access

During read access, a beat align area is accessed by one transfer. Therefore, if beat unaligned is set, the beat align area including the specified area is accessed.

For example, if the Source Address is H'0000_1038 and SDS is 5 (256-bit), read starts from area H'0000_1020, not from address H'0000_1038. At this time, if the area from H'0000_1020 to H'0000_1037 contains a register whose value changes by read, the operation might be disrupted.

To prevent problems, use the beat align setting to access a register whose value changes by read access or access to an area adjacent to FIFO.

32B.9.16.2 Level Interrupt bit

This is a DMA interrupt output enable bit. Always set this bit to 1 irrespective of whether peripheral module interrupt USBFDMAmn (m, n = 0, 1) or USBFDMAERRm (m = 0, 1) is used.

To use peripheral module interrupt USBFDMAmn or USBFDMAERRm, set this bit to 1, and then set up the interrupt controller.

33. LCDC

33.1 Overview

This chapter describes the features of the LCDC unit of this LSI.

This unit is LCD controller, it is composed of Frame Compression Processor (FCPVD), Video Signal Processor (VSPD), and Display Unit (DU)

33.1.1 Features

The following is key features of this unit.

- FCPVD
  - Support out-of-order for the whole outstanding transactions
  - Read linear addressing image data
  - Read display list data
  - Write image data
- VSPD
  - Supports various data formats and conversion
    - Supports YCbCr444/422/420, RGB, α RGB, α plane
    - Color space conversion and changes to the number of colors by dithering
    - Color keying
    - Supports combination between pixel alpha and global alpha
    - Supports generating pre multiplied alpha
  - Video processing
    - Blending of two picture layers and raster operations (ROPs)
    - Clipping
    - 1D look up table
    - Vertical flipping in case of output to memory
  - Direct connection to display module
    - Supporting 1920 pixels in horizontal direction
    - Writing back image data which is transferred to Display Unit (DU) to memory
- DU
  - Supporting Display Parallel Interface (DPI)
  - Display timing master
    - Generating video timings (Front porch, Back porch, Sync active, Active video area)
    - Selecting the polarity of output DCLK, HSYNC, VSYNC, and DE
  - Supporting Progressive (Non-interlace)
  - Not supports Interlace

- Input data format (from VSPD): RGB888, RGB666 (not supports dithering of RGB565)
- Output data format: same as Input data format
- Supporting WXGA (1280 pixels x 800 lines) for Parallel Output

33.1.2 Block Diagram

Figure 33.1 shows a block diagram.

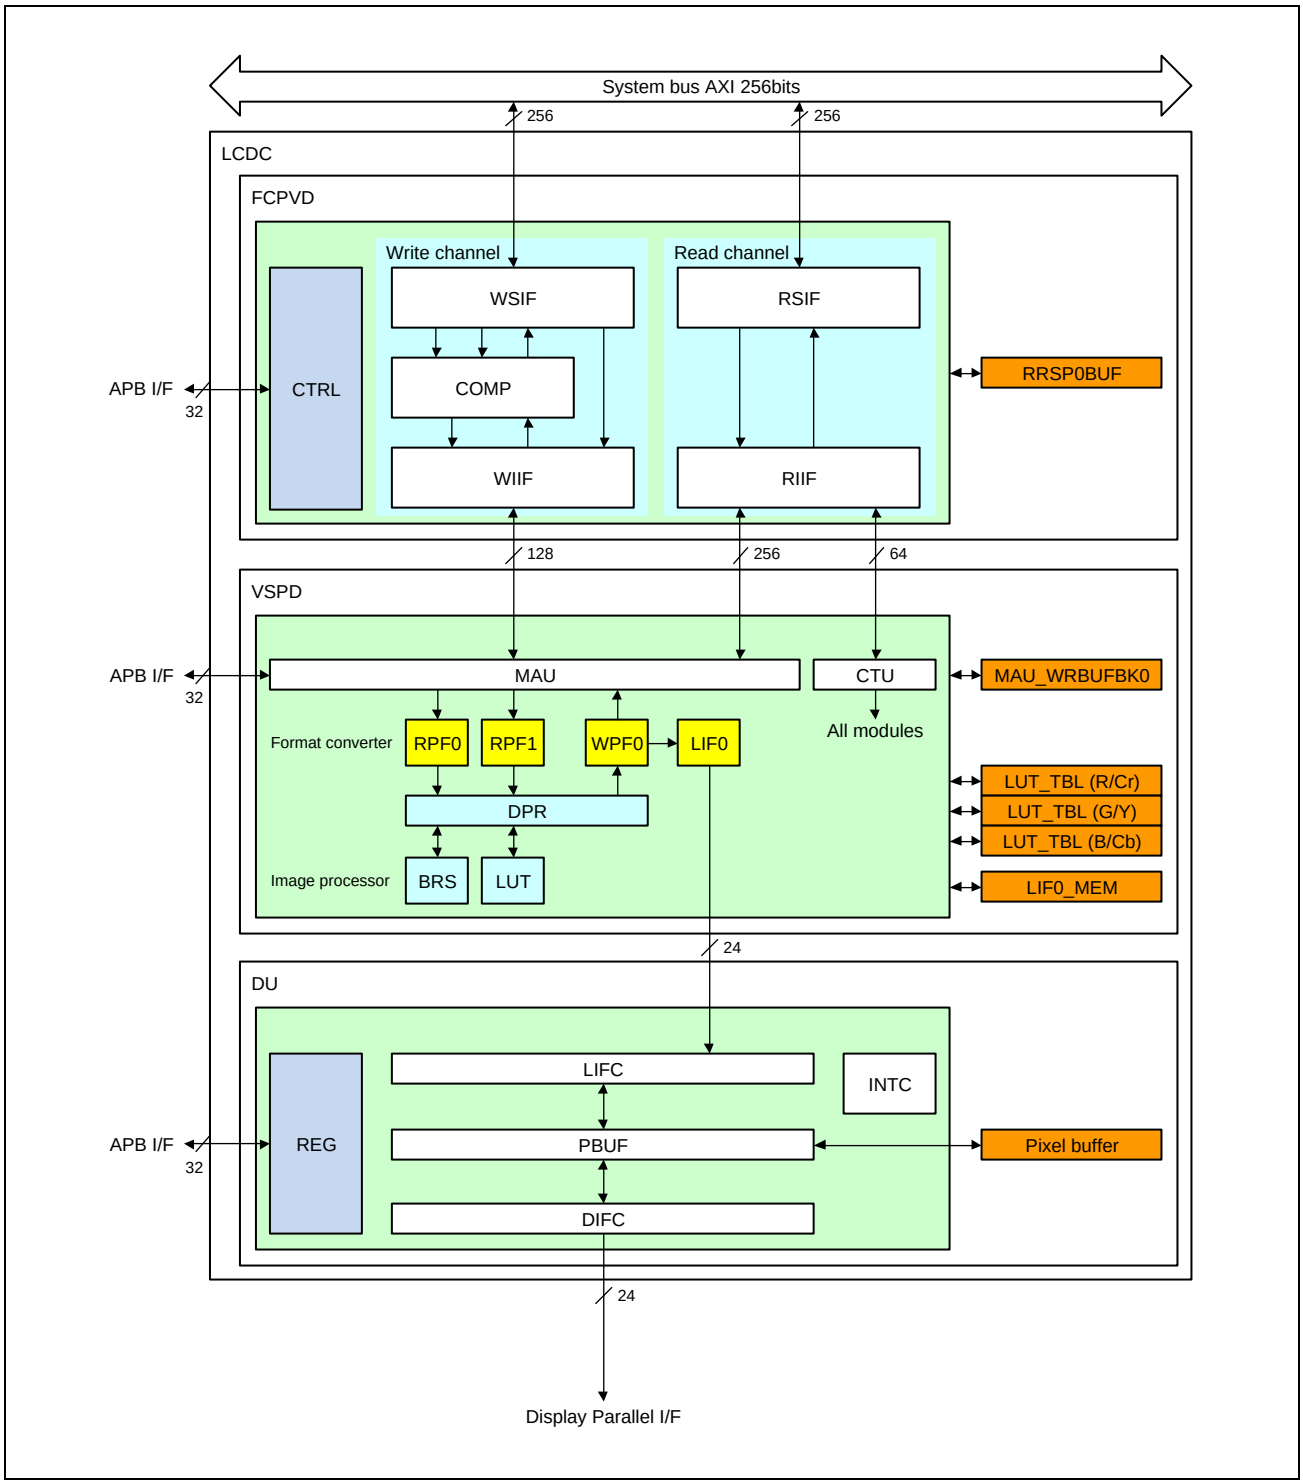

Figure 33.1 Block Diagram

33.1.2.1 FCPVD

FCPVD has the following sub modules.

Table 33.1 Sub modules in FCPVD

Abbreviation	Description
CTRL	FCPVD controller
WIIF	VSPD write channel interface
WSIF	System AXI write channel interface
RIIF	VSPD read channel interface
RSIF	System AXI read channel interface
COMP	Display Parallel Interface pixel data output

33.1.2.2 VSPD

VSPD has the following sub modules.

(1) Memory Access Unit (MAU)

The VSPD applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSPD necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSPD.

(2) Command Transfer Unit (CTU)

The VSPD can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

(3) Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. **Figure 33.2** show the processing flow in the RPF.

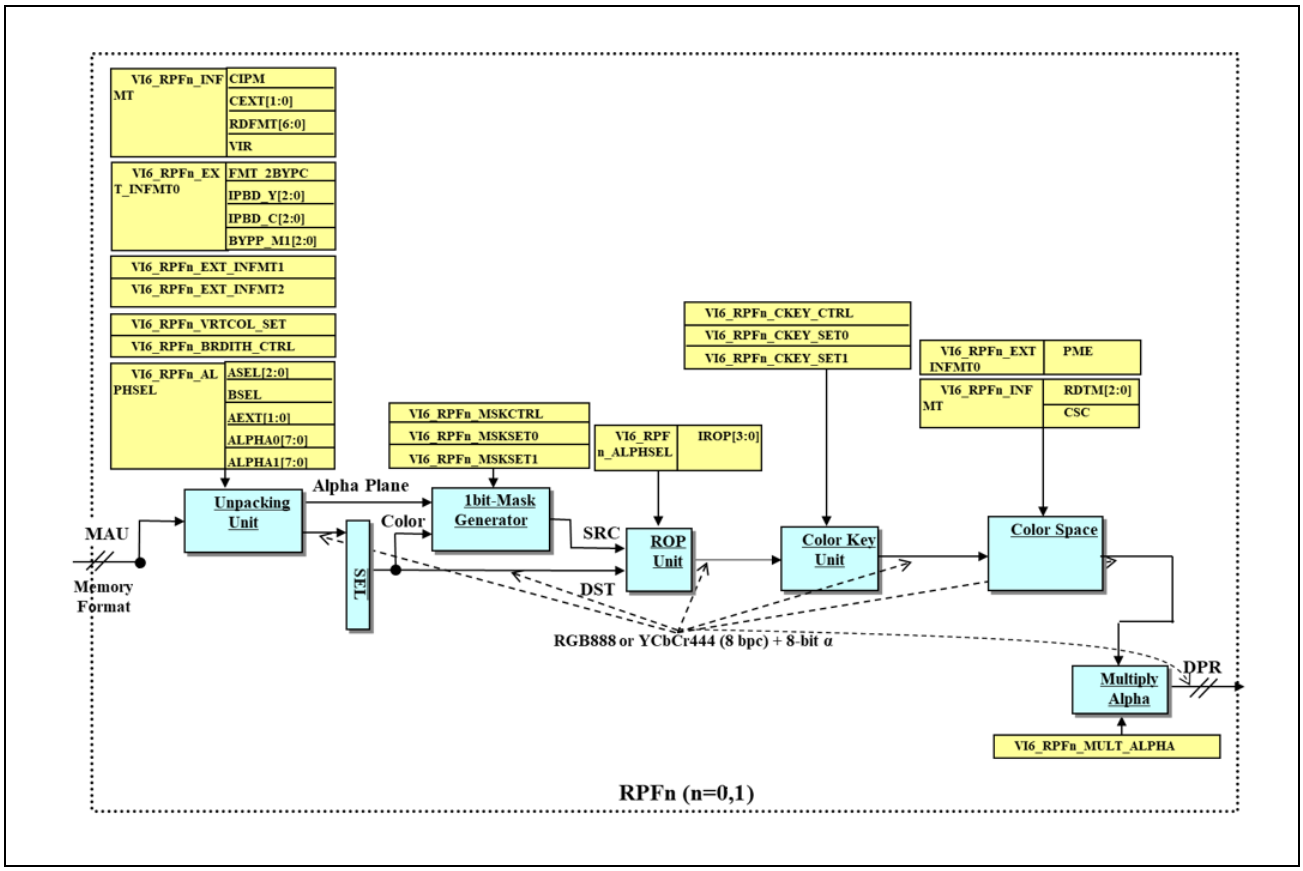

Figure 33.2 RPF Processing Flow

The input format unpacking unit expand the image data input from the MAU into the image format for internal processing (YCbCr444 8bpc or RGB888 8bpc), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSPD provides maximum two RPF modules (RPF0 to RPF1).

(4) Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRS or LUT), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

(5) Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

The LUT supports local area processing for Y component. The LUT can apply 1D look up table for Y component per area where a image is divided into multiple area specified by registers and command list.

(6) Blend ROP Sub Unit (BRS)

The BRS is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRS has two blend/ROP operation units (blend/ROP unit m, m = A to B), a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

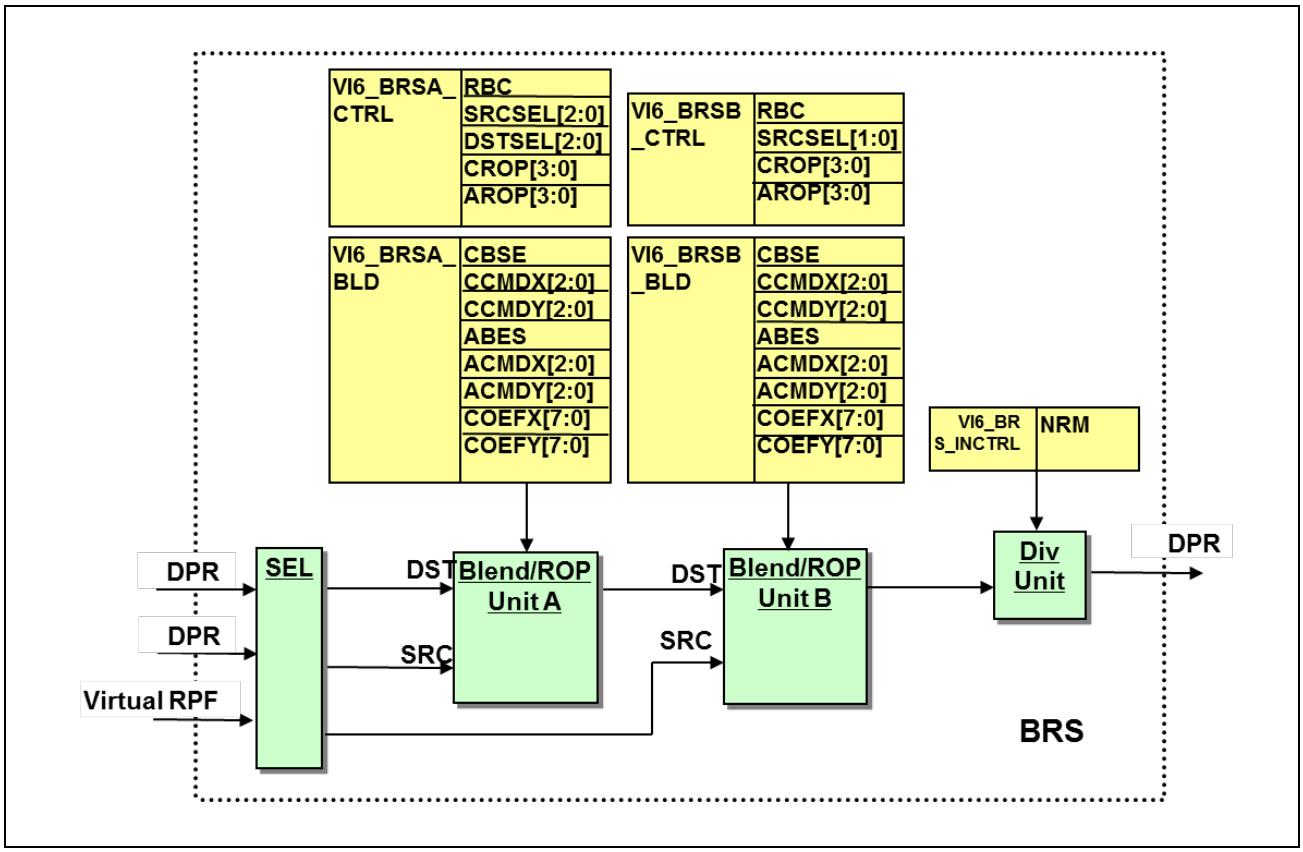

Figure 33.3 BRS Processing Flow

Each of the two blend-ROP operation units (blend/ROP unit m) receives the output from the SEL or blend/ROP Unit m, and executes blending or raster operation (ROP) of images.

The divider for normalization (div unit) divides the pixel value by the α value.

(7) Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8-bitα) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSPD image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

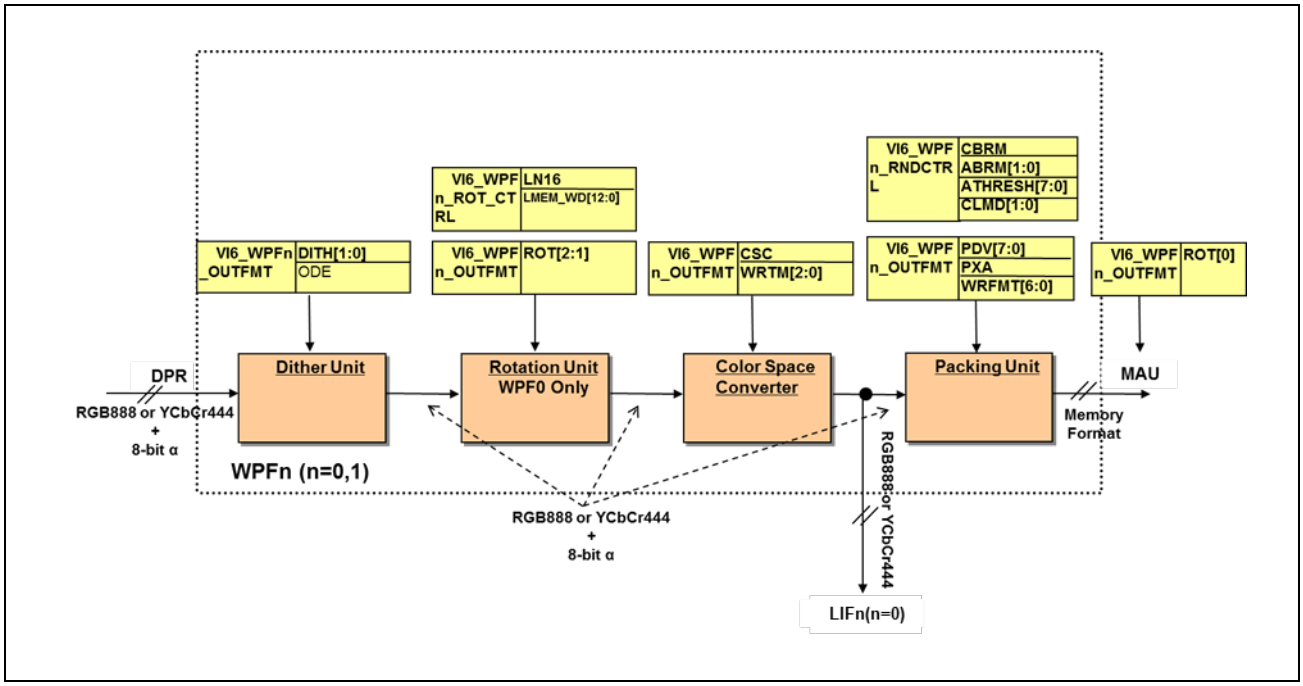

Figure 33.4 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSPD provides one WPF (WPF0). The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

(8) Display Unit InterFace (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIFn (n = 0) module is connected to WPFn (n = 0), and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in **Figure 33.30**.

(9) Detail Function

Table 33.2 Detail Function of VSPD (1/5)

• Image Data Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
		Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in **Table 33.39**
Tile transfer mode			Supported by RPF0 to RPF1
YCbCr memory storage format			Interleaved, planar, or semi-planar
• Display list/Extended Display List Transfer Function			
Bus interface	Protocol		AXI 256 bits through FCPVD
	Data alignment	Conversion method	Byte, Word, LW data swapping
			Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	—	Not available

Table 33.2 Detail Function of VSPD (2/5)

• Read Pixel Formatter (RPF)			
Number of channels			Two channels (RPF0 to RPF1)
Input color bit-depth		Color	2 to 8bit
		Alpha	1/2/4/8 bit
Operation bit-depth		Color	8bit
		Alpha	8bit
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555 α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4 (8bpc) Planar/Semi planar/Interleaved YCbCr4:2:2 (8bpc) Planar/Semi planar/Interleaved YCbCr4:2:0 (8 bpc) Planar/Semi planar/Interleaved α plane (8 bpp, 1 bpp)
		Maximum size	1920 × 1080 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **Section 33.5.3**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **Section 33.5.3**.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB or Y (8 bpc)
		Replaced data	αRGB or αYCbCr (8 bpc for R, G, B, Y, Cb, Cr, α)
		Comparison Mode	Matched color mode
		Input source	RPF0 to RPF1
	Transparent color	Compared data	RGB or Y (8 bpc)
		Replaced data	α 8bpp
		Comparison Mode	Matched color mode, Luma threshold mode
		Input source	RPF0 to RPF1
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF1. Note that 1-bpp α is converted to αRGB or αYCbCr4:4:4. (8 bpc)
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 2^n-1) to BT601 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) RGB (0, 2^n-1) to BT709 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) RGB (0, 2^n-1) to BT601 (0, 2^n-1) RGB (2^{n-4}, 235*2^{n-8}) to BT709 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) (n = 8)
		Target of conversion	RPF0 to RPF1
	YCbCr to RGB	Conversion expression	BT.601 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) to RGB (0, 2^n-1) BT.709 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) to RGB (0, 2^n-1) BT.601 (0, 2^n-1) to RGB (0, 2^n-1) BT.709 (2^{n-4}, 235*2^{n-8}/240*2^{n-8}) to RGB (2^{n-4}, 235*2^{n-8}) (n = 8)
		Target of conversion	RPF0 to RPF1

Table 33.2 Detail Function of VSPD (3/5)

• Read Pixel Formatter (RPF)			
Changing number of colors	Bit extension	Extended bits	Input bitdepth (2bpc to 6bpc) to operation bitdepth 8bpc
		Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Bit reduction method	Padded with 0. Copied from the most significant bits.
		Target of conversion	RPF0 to RPF1
	YCbCr444 generation	Vertical	CbCr copying
		Horizontal	copying or interpolation.
α bit count conversion	Bit extension	Extended bits	Input bitdepth 1bpc to operation bitdepth 8bpc
		Method	Padded with 0. Copied from the most significant bits.
Multiply-alpha function	Fade-alpha		RPF0 to RPF1 Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		RPF0 to RPF1
Virtual display	RPF0 to RPF1	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 1920 × 1080 pixels Minimum: 4 × 4 pixels

Table 33.2 Detail Function of VSPD (4/5)

• Write Pixel Formatter (WPF)			
Number of channels			One channel (WPF0)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	1920 × 1080 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to **Section 33.5.4**.
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to **Section 33.5.4**.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

Table 33.2 Detail Function of VSPD (5/5)

• Image Compositing			
α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Layer A: Upper layer Layer B: Lower layer	xA + yB, xA - yB Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 - α for layer A), (α for layer B), (1 - α for layer B)
	Output α value selection	RGB	Fixed α value, x (α for layer A) + y (α for layer B), x (α for layer A) – y (α for layer B) Coefficients x and y should be selected from the following. Fixed α value, (α for layer A), (1 - α for layer A), (α for layer B), (1 - α for layer B)
	Blending layers	Number of layers	Two layers selected from RPF0 to RPF1 and video processing function output, and virtual RPF; three layers in total
		Order of layers	The order of three layers selected from RPF0 to RPF1, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF1
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF1, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF1, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
• Color Adjustment Function			
1D-LUT	LUT configuration	Independent R/Y, G/Cb, and B/Cr. 256 entries each	
Direct connection to Display module			
Display I/F	Destination		DU
	Direct connection		Can transfer data without going through external memory to DU
Line padding	Padding cycles		1 to 32 cycles
	Padding pattern		Arbitrarily setting up to 32 cycles

33.1.2.3 DU

DU has the following sub modules.

(1) REG

The REG controls registers for DU. The DU has APB4 interface, its transaction is transfer with no wait states.

(2) LIFC

The LIFC is the interface block from/to VSPD. The LIFC receives image data from VSPD, sends to PBUF in a pixel unit. The LIFC continues to receive the image data from VSPD unless FIFO will be full.

(3) PBUF

The PBUF is the asynchronous FIFO which convert clock domain of image data from System Bus Clock to Video Clock. The PBUF watches over FIFO underflow.

(4) DIFC

The DIFC is the display timing master. The DIFC controls the polarity and the timing of the control signals (DISP_CLK, DISP_HSYNC, DISP_VSYNC, and DISP_DE). Controlable timings are the followings.

- Hfront: Horizontal front porch (pixels)
- Hback: Horizontal back porch (pixels)
- Hsync: Horizontal sync active (pixels)
- Hactive: Horizontal active area (pixels)
- Vfront: Vertical front porch (lines)
- Vback: Vertical back porch (lines)
- Vsync: Vertical sync active (lines)
- Vactive: Vertical active area (lines)

(5) INTC

The INTC generates the interrupt when PBUF will detect FIFO underflow. The interrupt is level signal.

33.1.3 External Pins

Table 33.3 shows the pin configuration.

Table 33.3 LCDC Display Parallel Interface (DPI) External Pins

Pin Name	Input/Output	Function
DISP_CLK	Output	Display Parallel Interface pixel clock
DISP_HSYNC	Output	Display Parallel Interface Horizontal sync pulse
DISP_VSYNC	Output	Display Parallel Interface Vertical sync pulse
DISP_DE	Output	Display Parallel Interface data enable
DISP_DATA0	Output	Display Parallel Interface pixel data output Red0
DISP_DATA1	Output	Display Parallel Interface pixel data output Red1
DISP_DATA2	Output	Display Parallel Interface pixel data output Red2
DISP_DATA3	Output	Display Parallel Interface pixel data output Red3
DISP_DATA4	Output	Display Parallel Interface pixel data output Red4
DISP_DATA5	Output	Display Parallel Interface pixel data output Red5
DISP_DATA6	Output	Display Parallel Interface pixel data output Red6
DISP_DATA7	Output	Display Parallel Interface pixel data output Red7
DISP_DATA8	Output	Display Parallel Interface pixel data output Green0
DISP_DATA9	Output	Display Parallel Interface pixel data output Green1
DISP_DATA10	Output	Display Parallel Interface pixel data output Green2
DISP_DATA11	Output	Display Parallel Interface pixel data output Green3
DISP_DATA12	Output	Display Parallel Interface pixel data output Green4
DISP_DATA13	Output	Display Parallel Interface pixel data output Green5
DISP_DATA14	Output	Display Parallel Interface pixel data output Green6
DISP_DATA15	Output	Display Parallel Interface pixel data output Green7
DISP_DATA16	Output	Display Parallel Interface pixel data output Blue0
DISP_DATA17	Output	Display Parallel Interface pixel data output Blue1
DISP_DATA18	Output	Display Parallel Interface pixel data output Blue2
DISP_DATA19	Output	Display Parallel Interface pixel data output Blue3
DISP_DATA20	Output	Display Parallel Interface pixel data output Blue4
DISP_DATA21	Output	Display Parallel Interface pixel data output Blue5
DISP_DATA22	Output	Display Parallel Interface pixel data output Blue6
DISP_DATA23	Output	Display Parallel Interface pixel data output Blue7

33.1.4 Clock and Interrupt signal

The following clocks are supplied to the LCDC.

Table 33.4 Clock List

Clock Name	Clock Symbol	Description	Frequency (MHz)
LCDC_CLK_A	M0ϕ	AXI clock. This clock should be a synchronous clock of LCDC_CLK_P	200
LCDC_CLK_P	ZTϕ	APB clock. This clock should be a synchronous clock of LCDC_CLK_A	100
LCDC_CLK_D	M3ϕ	Video clock. The duty of this clock is 50% when the display parallel interface	up to 148.5

The LCDC transmits the following interrupt signals to the interrupt controller.

Table 33.5 Interrupt List

Signal Name	Interrupt Condition	Interrupt Source Register
VSPD_INT	Frame End	VI6_WPF0_IRQ_STA.FRE
	Display List Frame End	VI6_WPF0_IRQ_STA.DFE
	DU Connection UnderRun Error	VI6_WPF0_IRQ_STA.UND
DU_INT	RBUF FIFO Underflow	DU_MSR0.ST_PB_RUF

Note: Refer to **Section 33.3.2.4(13)**. WPFn Interrupt Status Registers and **Section 33.3.3.1**. DU Module Control Register 0 for details.

33.2 Register Configuration

33.2.1 FCPVD Register Configuration

The FCPVD contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

Never access the registers when the FCPVD is in the module standby mode (with the operation clock placed in hold status).

Base Address: H'0_1088_0000 (Cortex-A55 Address Space)

Table 33.6 FCPVD Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
FCPVD version control register	FCP_VCR	R	H'0000 0109	H'0000	32
FCPVD configuration register 0	FCP_CFG0	R/W	H'0000 0000	H'0004	32
FCP reset register	FCP_RST	R/W	H'0000 0000	H'0010	32
FCP status register	FCP_STA	R	H'0000 0000	H'0018	32

33.2.2 VCPD Register Configuration

Base Address: H'0_1087_0000 (Cortex-A55 Address Space)

Lowercase "n" in a register name or a offset address indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.

Table 33.7 VCPD Register Configuration (1/3)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
VSPD Start Registers 0	VI6_CMD0	R/W*1	H'0000 0000	H'0000	32
Clock Control Register0	VI6_CLK_CTRL0	R/W	H'0000 0000	H'0010	32
Clock Control Register1	VI6_CLK_CTRL1	R/W	H'0000 0000	H'0014	32
Dynamic Clock Stop Control Register	VI6_CLK_DCSWT	R/W	H'0000 0000	H'0018	32

LUT table	VI6_LUT_TBL_0 To VI6_LUT_TBL_255	R/W	Undefined	H'7000 To H'73fc	32

Note 1. Read only bits or write only bits or read/write bits are mixed in the registers.

33.2.3 DU Register Configuration

The DU contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits), word (16 bits), and byte (8 bits) in the registers. Therefore, read-modify-write is needed to change partial bits not more than 8 bits in 32 bits register.

Never access the registers when the DU is in the module standby mode (with the operation clock placed in hold status).

Base Address: H'0_1089_0000 (Cortex-A55 Address Space)

Table 33.8 DU Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

33.3 Register Descriptions

33.3.1 FCPVD Registers

33.3.1.1 FCPVD version Control Register (FCP_VCR)

FCP_VCR is the version control register of the FCPVD. The value read is fixed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATEGORY								REVISION							
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	1	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 8	CATEGORY	H'01	R	FCP use case category.
7 to 0	REVISION	H'09	R	Version of LSI product H'09: FCP revision is this LSI.

33.3.1.2 FCPVD Configuration Register 0 (FCP_CFG0)

FCP_CFG0 specifies the configuration of the FCPVD.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCPVSEL	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	FCPVSEL	0	R/W	FCPVD Mode Select This bit specifies the FCPVD processing mode. 0: FCPVD 1: Reserved This bit must not be changed during operation of the FCPVD.
0	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

33.3.1.3 FCP Reset Register (FCP_RST)

FCP_RST controls the FCPVD reset operation. The reset operation of the FCPVD highly depends on the reset sequence of the connected VSPD. For detailed information, refer to **Section 33.4.1** and **Section 33.4.2**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MODRST	—	—	—	SOFTRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	MODRST	0	R/W	FCPVD MODule ReSeT This reset stops the FCPVD module immediately regardless of the bus transaction state. To operate the FCPVD after this reset, reconfigure all FCPVD registers. After the active period of MODRST is finished, it is switched back to 0 automatically. 0: NOP 1: Forcibly terminate the FCPVD operation. *Note*: Do not set both MODRST and SOFTRST bit to 1.
3 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SOFTRST	0	R/W	FCPVD SOFT ReSeT This reset stops the FCPVD module after finishing active bus transaction. To operate the FCPVD after this reset, reconfigure all FCPVD registers. After the active period of SOFTRST is finished, it is switched back to 0 automatically. 0: NOP 1: Terminates the FCPVD operation. *Note*: Do not set both MODRST and SOFTRST bit to 1.

33.3.1.4 FCP Status Register (FCP_STA)

FCP_STA indicates the FCPVD status.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ACT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ACT	0	R	FCPVD Active Flag 0: Indicates the FCPVD is not active. 1: Indicates the FCPVD is active.

33.3.2 VCPD Registers

33.3.2.1 Notational Conventions for Registers and Bit Fields

This section uses the following notational conventions for the VSPD registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase “n” in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For RPFn, and WPFn, when the range of value n is not defined, RPFn (n = 0, 1), WPFn (n = 0) are assumed.
4. In each subsection for register description in **Section 33.3.2**, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

33.3.2.2 Register Classification

The VSPD registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSPD, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from **Section 33.3.2.4**.

1. General control registers (VI6_CMDn (n = 0, 1), VI6_SRESET, VI6_STATUS, VI6_WPFn_IRQ_* (n = 0))
2. Display list control registers (VI6_DL_*)
3. RPF control registers (VI6_RPFn_* (n = 0, 1))
4. WPF control registers (VI6_WPFn_* (n = 0))
5. DPR control registers (VI6_DPR_*)
6. LUT control register (VI6_LUT_CTRL)
7. BRS control registers (VI6_BRS_*)
8. LIFn control registers (VI6_LIFn_* (n = 0))

The VSPD has two RPF channels and the register configuration is the same for all of RPFn (n = 0, 1). However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all WPFn (n = 0), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers.

For each register address, refer to **Table 33.7**.

33.3.2.3 Restrictions on Access to Registers and Lookup Tables

The VSPD has control registers and lookup tables. All VSPD registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSPD will not operate correctly.

1. For the read-only bits and reserved bits in all VSPD registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in **Table 33.7** are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMDn, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDRn, VI6_DL_BODY_SIZE0, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to **Section 33.4.4**.
4. There are three types about General control registers (**Section 33.3.2.4**) and Display List Control Registers (**Section 33.3.2.5**) as below.
   - Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   - Common setting of WPF0 (ex. VI6_DL_CTRL.AR_WAIT [15:0])

Table 33.9 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n = 0, 1)	VI6_RPFn_*
WPFn (n = 0)	VI6_WPFn_*
DPR	VI6_DPR_*
LUT	VI6_LUT_CTRL
BRS	VI6_BRS_*
LIFn (n = 0)	VI6_LIFn_*

33.3.2.4 General Control Registers

(1) VSPD Start Registers n (VI6_CMDn: n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	UPDHDR	—	—	—	STRCMD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	UPDHDR	0	R/W	Reserved state of updating Display List Header (DLH) address. UPDHDR can be negated by software reset (VI6_SRESET.SRSTn). [Write] 0: NOP 1: Don't set 1 to this bit [Read] 0: Not reserved to update DLH address. 1: Reserved to update DLH address. Set 0 to this bit when STRCMD bit is set to 1.
3 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STRCMD	0	R/W	Start reservation of WPF VI6_CMDn.STRCMD controls WPFn. Writing 1 to this bit starts WPFn in VSPD. Set this bit for activation only after all register settings in each output channel have been completed. If WPFn is idle, WPFn starts right after this bit is set to 1. If WPFn is active, writing 1 to this bit reserves starting WPFn operation. Wait to set 1 to VI6_CMDn.STRCMD until this bit is read as 0. VI6_CMDn.STRCMD can be negated by software reset (VI6_SRESET.SRSTn). [Write] 0: Start reservation of WPFn is canceled. 1: Start reservation of WPFn is set. [Read] 0: Starting VSPD is not reserved. 1: Starting VSPD is reserved.

The basic concept of image processing operation started by activating the VSPD is shown in **Figure 33.5**. The actual data input/output is executed by the MAU, which is the bus interface module, as described in **Section 33.1.2**, but conceptually the RPF works as the data entry point to the VSPD and the WPF works as the data exit point. To process images through the VSPD, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to **Section 33.3.2.7(1)**). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSPD between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to **Section 33.3.2.8**).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSPD through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSPD.

There are two types of data path configuration in the VSPD; one is “a single input module to a single output module” as shown in **Figure 33.5 (A)**, and the other is “multiple input modules to a single output module” as shown in **Figure 33.5 (B)**.

Figure 33.5 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR.

Figure 33.5 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR.

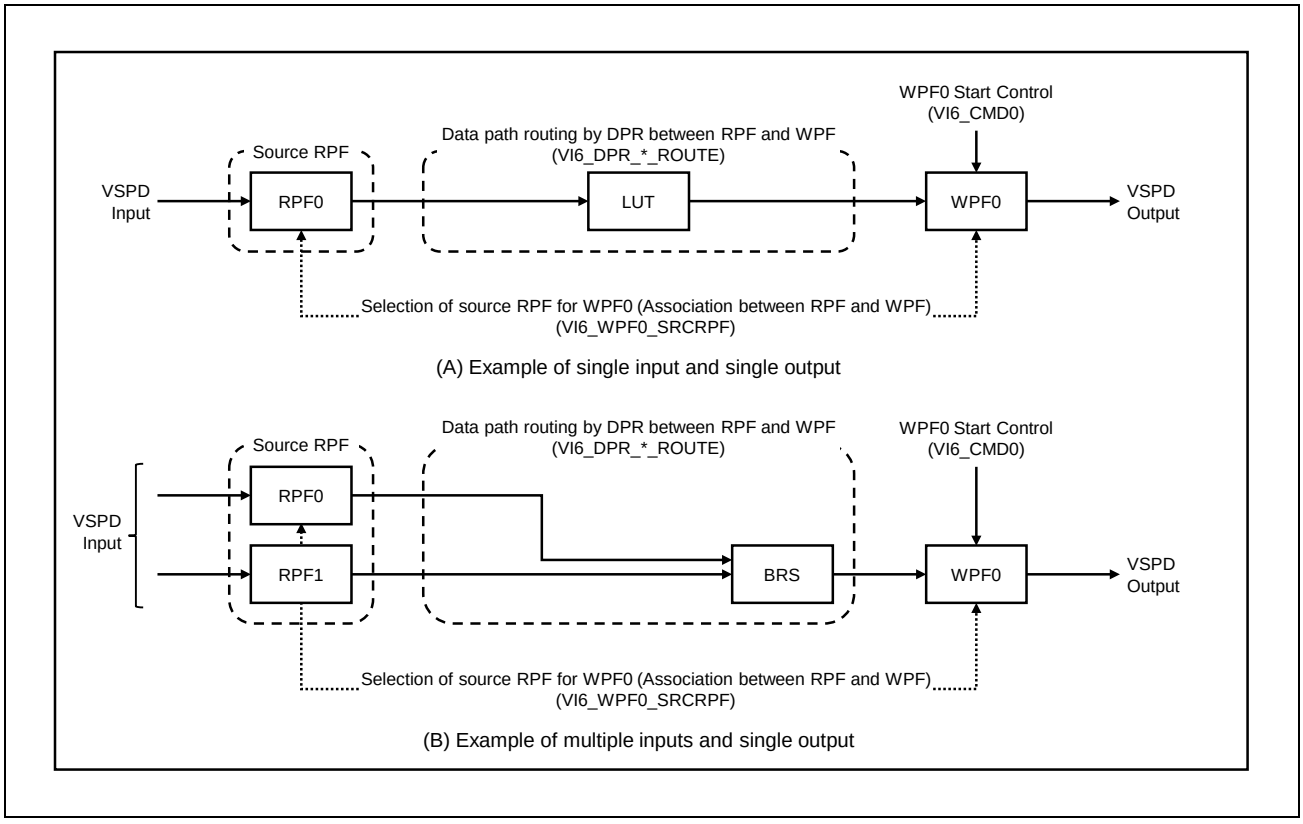

Figure 33.5 Basic Concept of VSPD Startup

(2) Clock Control Register 0 (VI6_CLK_CTRL0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	GCS0	—	—	—	—	—	—	—	—	—	—	—	GCS1
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	GCS2				—	—	—	GCS3				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	GCS0	0	R/W	Clock Control Setting0
27 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	GCS1	0	R/W	Clock Control Setting1
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	GCS2	0	R/W	Clock Control Setting2
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	GCS3	0	R/W	Clock Control Setting3

VSPD can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’0000 0000
- VI6_CLK_CTRL1 = H’0000 0000
- VI6_CLK_DCSWT = H’0000 0808
- VI6_CLK_DCSM0 = H’0000 0000
- VI6_CLK_DCSM1 = H’0000 0000

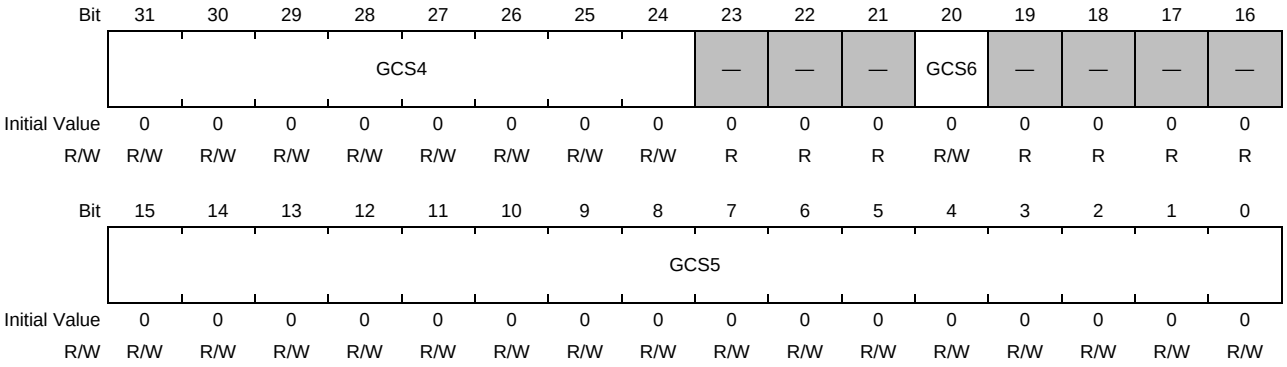
To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’1001 0F1F
- VI6_CLK_CTRL1 = H’FF10 FFFF
- VI6_CLK_DCSWT = H’0033 0808
- VI6_CLK_DCSM0 = H’1FFF 0F1F
- VI6_CLK_DCSM1 = H’FF10 FFFF

When the clock gating is enabled, the supply of the clock signal is stopped for the module which is not operated. If the bit field of this register is changed from 0 to 1, the supply of the clock signal for the module is immediately started. If

the bit field of the register is changed from 1 to 0, the clock supply is immediately stopped. Therefore, please do not change this register field from 1 to 0 in operation because the VSPD may be stalled.

(3) Clock Control Register 1 (VI6_CLK_CTRL1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GCS4	0	R/W	Clock Control Setting4
23 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	GCS6	0	R/W	Clock Control Setting6
19 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	GCS5	0	R/W	Clock Control Setting5

See **Section 33.3.2.4(2)** for detail.

(4) Dynamic Clock Stop Control Register (VI6_CLK_DCSWT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	DCC0		—	—	DCC1	DCC2
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

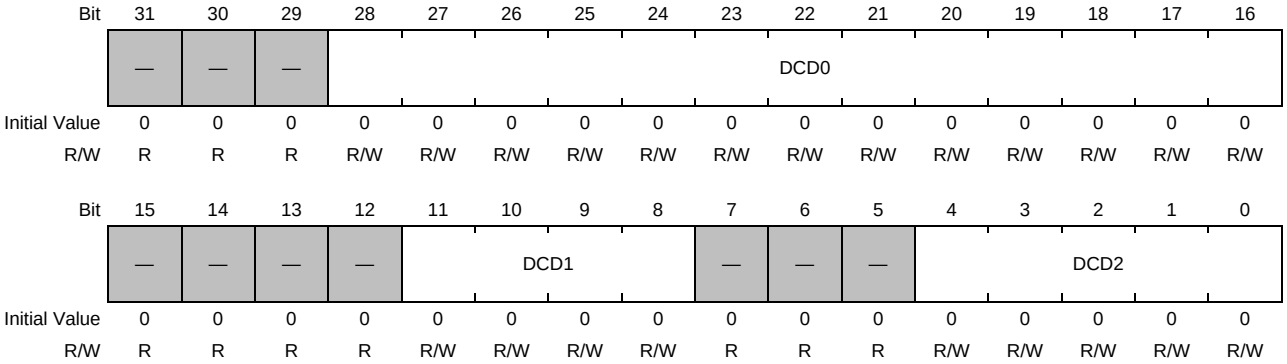
Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21, 20	DCC0	0	R/W	Dynamic Clock Control Setting0
19, 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	DCC1	0	R/W	Dynamic Clock Control Setting1
16	DCC2	0	R/W	Dynamic Clock Control Setting2
15 to 8	CSTPW[7:0]	0	R/W	Dynamic Clock Stop Control 1 Always specify 8.
7 to 0	CSTRW[7:0]	0	R/W	Dynamic Clock Stop Control 2 Always specify 8.

See **Section 33.3.2.4(2)** for detail.

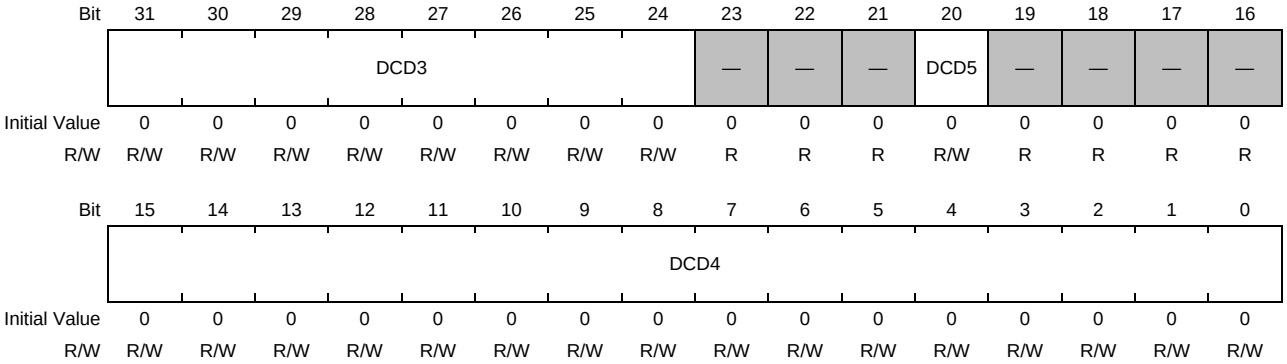
(5) Dynamic Clock Stop Disable Register 0 (VI6_CLK_DCSM0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	DCD0	0	R/W	Dynamic Clock Stop Disable Setting0
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	DCD1	0	R/W	Dynamic Clock Stop Disable Setting1
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	DCD2	0	R/W	Dynamic Clock Stop Disable Setting2

See **Section 33.3.2.4(2)** for detail.

(6) Dynamic Clock Stop Disable Register 1 (VI6_CLK_DCSM1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DCD3	0	R/W	Dynamic Clock Stop Disable Setting3
23 to 21	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	DCD5	0	R/W	Dynamic Clock Stop Disable Setting5
19 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	DCD4	0	R/W	Dynamic Clock Stop Disable Setting4

See **Section 33.3.2.4(2)** for detail.

(7) Software Reset Register (VI6_SRESET)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

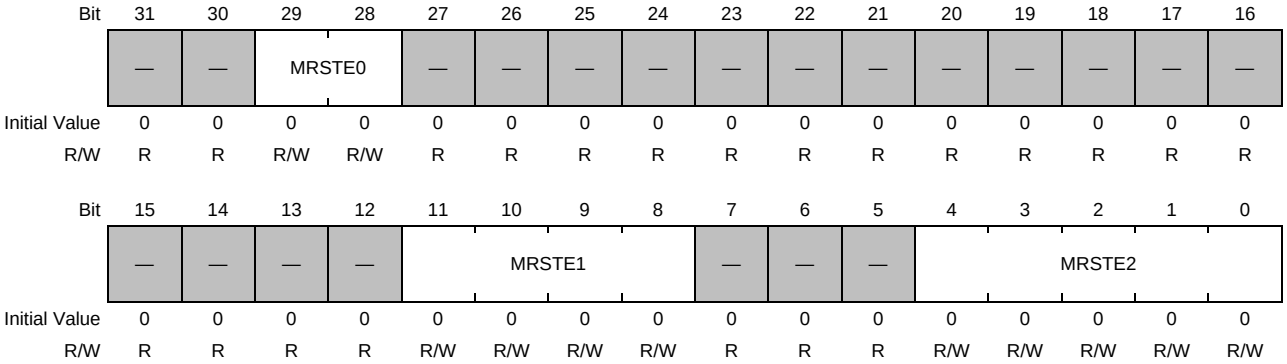
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	SRST0	0	R/W	WPFn Software Reset (SRSTn, n = 0) Writing 1 to this bit aborts the current processing in WPFn (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPFn_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0. 0: NOP 1: WPFn software reset*1

Note 1. Applying a software reset to each WPF has the following restrictions.

1. A software reset can be applied to only one of WPF0 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSPD may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSPD completes operation.
4. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.
5. When software reset is issued to VSPD, issue software reset to also FCPVD. See **Figure 33.41** for VSPD software reset sequence.

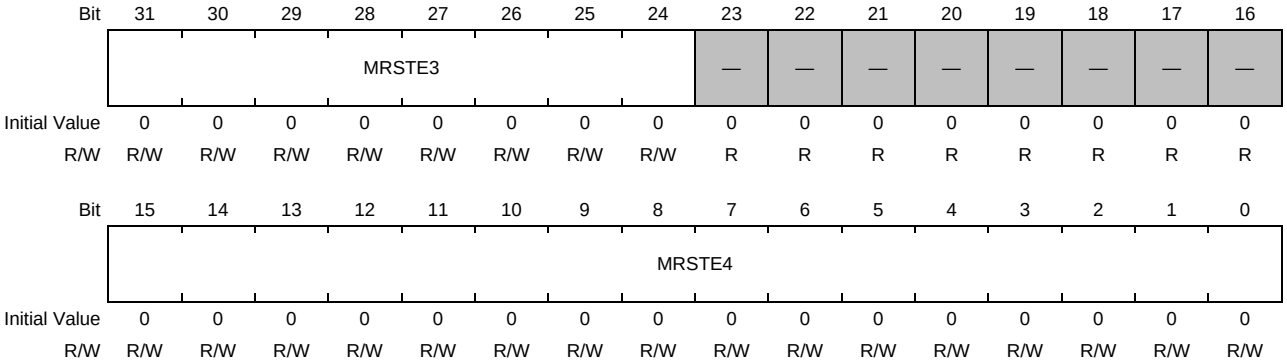
(8) Module Reset Enable Register 0 (VI6_MRESET_ENB0)



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29, 28	MRSTE0	0	R/W	Module Reset Enable 0
27 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	MRSTE1	0	R/W	Module Reset Enable 1
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4 to 0	MRSTE2	0	R/W	Module Reset Enable 2

This register is for purpose of h/w debugging.

(9) Module Reset Enable Register 1 (VI6_MRESET_ENB1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MRSTE3	0	R/W	Module Reset Enable 3
23 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	MRSTE4	0	R/W	Module Reset Enable 4

This register is for purpose of h/w debugging.

(10) Module Reset Issuing Register (VI6_MRESET)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	MRST	0	R/W	Module Reset Assertion

This register is for purpose of h/w debugging.

(11) Operating Status Register (VI6_STATUS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	FLDST0	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SYS0_ACT	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	FLDST0	0	R	Field status of previous frame of WPF0. 0: Previous finished frame is TOP field. 1: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
27 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SYS0_ACT	0	R	WPFn Operating Status (SYSn_ACT, n=0) Each bit indicates the operating or stopped state of control channel n (WPFn). 0: WPFn is stopped. 1: WPFn is operating.
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(12) WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFEE	FREE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UNDE	0	R/W	Interrupt Enable for WPFn (n = 0) Underrun in case of DU connection.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DFEE	0	R/W	Interrupt Enable for WPFn (n = 0) Display List Frame End
0	FREE	0	R/W	Interrupt Enable for WPFn (n = 0) Frame End

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

(13) WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFE	FRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	UND	0	R/W	Interrupt Status and Clear for WPFn (n = 0) Underrun in case of DU connection. This interrupt source bit is set to 1 when data underrun occurs in case of DU connection. Timing that this bit is set to 1 is at end of 1 frame.
15 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DFE	0	R/W	Interrupt Status and Clear for WPFn (n = 0) Display List Frame End This interrupt source bit is set to 1 when VSPD completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to **Section 33.4.4**). When display lists are not used, this bit is not used. In this case, clear VI6_WPFn_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

Bit	Bit Name	Initial Value	R/W	Description
0	FRE	0	R/W	Interrupt Status and Clear for WPFn (n = 0) Frame End This interrupt source bit is set to 1 when VSPD completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed. The interrupt status is set to 1 by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSPD is processing. c) One frame's data from DU is displayed while VSPD couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSPD. Whether to output a VSPD interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSPD does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

(14) Display-n Interrupt Enable Register (VI6_DISPn_IRQ_ENB: n = 0)

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DSTE	—	—	MAEE	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	DSTE	0	R/W	Interrupt Enable for Display Start
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	MAEE	0	R/W	Interrupt Enable for Display Read Data End
4 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(15) Display-n Interrupt Status Register (VI6_DISPn_IRQ_STA: n = 0)

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DST	—	—	MAE	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	DST	0	R/W	Interrupt Enable for Display Start
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	MAE	0	R/W	Interrupt Enable for Display Read Data End
4 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

33.3.2.5 Display List Control Registers

(1) Display List Control Register (VI6_DL_CTRL)

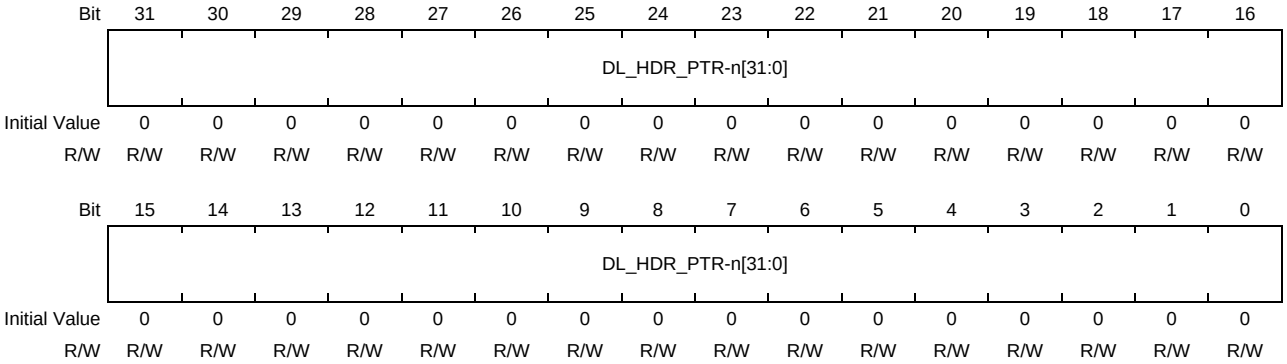
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DC2	—	—	—	DC1	—	—	—	DLE1	RLM0	CFM0	NH0	DLE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT [15:0]	All 0	R/W	Display List Control Setting Always specify 256.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	DC2	0	R/W	This bit doesn't affect anything to VSPD (NOP)
11 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	DC1	0	R/W	This bit doesn't affect anything to VSPD (NOP)
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	DLE1	0	R/W	This bit doesn't affect anything to VSPD (NOP)
3	RLM0	0	R/W	Loading two plane Registers Mode for WPF0. 0: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.
2	CFM0	0	R/W	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started

Bit	Bit Name	Initial Value	R/W	Description
1	NH0	0	R/W	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSPD is stopped. And also make sure the following before starting VSPD. – Header Address (VI6_DL_HDR_ADDR0) – Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0: Use Display List Header (Normal DL Mode) 1: Don't use Display List Header (Header-less Mode) *Note 1.* Only WPF0 supports header-less display list. WPF1 work as the normal display list mode even if the WPF0 is set to header-less display list mode. *Note 2.* When DLE0 bit is 0, set 0 to NH0 bit.
0	DLE0	0	R/W	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in **Section 33.3.2.3**. 0: The display list function is disabled 1: The display list function is enabled

(2) Display List-n Header Address Register (VI6_DL_HDR_ADDRn: n = 0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-n[31:0]	All 0	R/W	Display List-n Header Address These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPFn is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. A value from H'0000 0000 to H'FFFF FFF0 can be specified.

(3) Display List-n Data Swapping Register (VI6_DL_SWAPn: n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IND	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	LWS	WDS	BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	IND	0	R/W	Enabling independent swap setting per WPF. This bit is available only for VI6_DL_SWAP1. This bit is reserved for VI6_DL_SWAP0. 0: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP0. 1: Display list swap for WPF1 is specified by LWS, WDS and BTS in VI6_DL_SWAP1
30 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	LWS	0	R/W	Display List Data Swapping in long word Units The effect of this bit setting is defined in **Table 33.10**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	WDS	0	R/W	Display List Data Swapping in Word Units The effect of this bit setting is defined in **Table 33.10**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	BTS	0	R/W	Display List Data Swapping in Byte Units The effect of this bit setting is defined in **Table 33.10**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 33.10 shows the data order before and after swapping according to the long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 33.35**, set 111b to {LWS, WDS, BTS}. If data order is not the same as the definition, change data order within 8byte unit by these bits as shown in **Table 33.10**.

Table 33.10 Changing data order according to display list swap register

Data order in memory											
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7	*_LWS	*_WDS	*_BTS
Data	0	1	2	3	4	5	6	7	1	1	1
	1	0	3	2	5	4	7	6	1	1	0
	2	3	0	1	6	7	4	5	1	0	1
	3	2	1	0	7	6	5	4	1	0	0
	4	5	6	7	0	1	2	3	0	1	1
	5	4	7	6	1	0	3	2	0	1	0
	6	7	4	5	2	3	0	1	0	0	1
	7	6	5	4	3	2	1	0	0	0	0

Data order defined in **Table 33.35**								
Byte address	8n+0	8n+1	8n+2	8n+3	8n+4	8n+5	8n+6	8n+7
Data	0	1	2	3	4	5	6	7

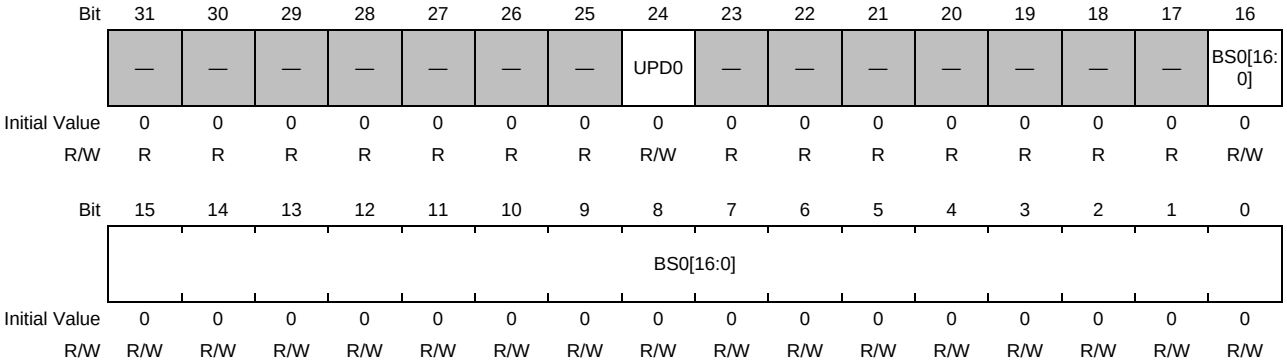
(4) Extended Display List-n Control Register (VI6_DL_EXT_CTRLn: n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NWE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POLINT						—	—	DLPRI	EXPRI	—	—	—	EXT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	NWE	0	R/W	No Wait for Polling When this bit is set to 1, the polling condition for extended display lists is always assumed to be true.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	POLINT	All 0	R/W	Extended Display List Command Control Always specify 2.
7, 6	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5	DLPRI	0	R/W	Display List Control 0 Always specify 1.
4	EXPRI	0	R/W	Display List Control 1 Always specify 0.
3 to 1	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	EXT	0	R/W	Extended Display List for WPFn Enables or disables the extended display list function. When extended display lists are used, the display list header size is 96 bytes; when they are not used, the header size is 80 bytes. 0: No extended display lists are used 1: Extended display lists are used [Note] When using extended display lists, be sure to also use normal display list mode (VI6_DL_CTRL.DLEn); executing only extended display lists is not possible. When the header-less display list mode is activated, this bit should be set to 0. The extended display list cannot be used with the header-less display list mode. Extended Display List is available only for VSPD/LIF0 or VSPDL/LIFn (n = 0, 1) to realized AUTO-FLD or AUTO-DISP.

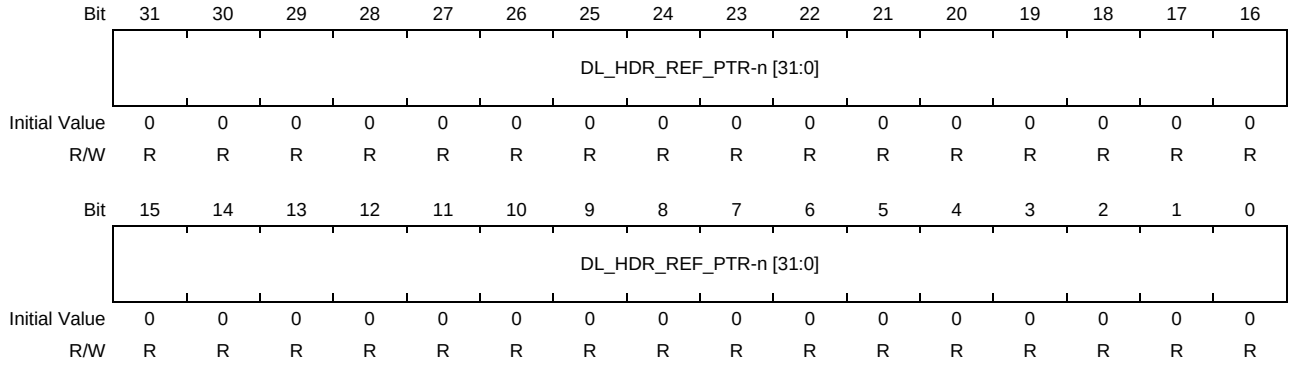
(5) Display List Body Size Register-n (VI6_DL_BODY_SIZEn: n = 0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	UPD0	0	R/W	Update Flag This bit controls the download of the display list at the next downloading timing in case that the header-less display list mode is used. Set 1 to this bit when display list need to be downloaded for next frame. This bit is automatically cleared to 0 after VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) is downloaded in H/W side. When this bit is set to 1, the value of VI6_DL_HDR_ADDRn and VI6_DL_BODY_SIZEn.BS0 (n = 0) should not be changed. 0: Updating display list for the next frame is not reserved 1: Updating display list for the next frame is reserved
23 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16 to 0	BS0[16:0]	0	R/W	Header-less Display List Body Size (WPFn, n = 0) These bits are used for specifying the body size of the display list in case of header-less display list mode. The unit of the size is byte. The value should be set in multiples of 8.

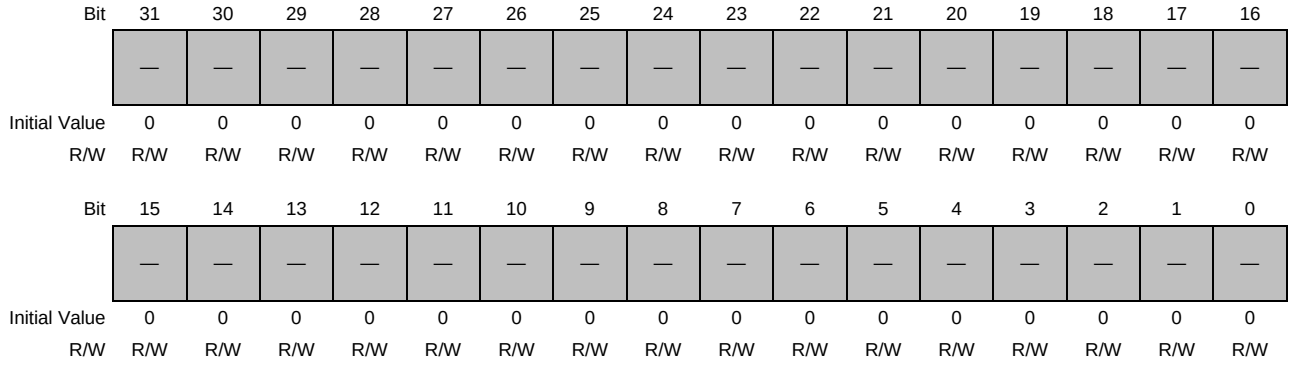
See **Section 33.4.8.2** for detail.

(6) Display List-n Header Reference Address Register (VI6_DL_HDR_REF_ADDRn: n = 0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_PTR-n [31:0]	All 0	R	Display List-n reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDRn for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSPD -H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDRn is read out.

(7) Display List-0 Wake Up Counter Register (VI6_DL_WUPCNT0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

33.3.2.6 RPF Control Registers

(1) RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	BHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	BHSIZE[12:0]	All 0	R/W	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1920 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	BVSIZE[12:0]	All 0	R/W	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 1080 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 33.6 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSPD.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

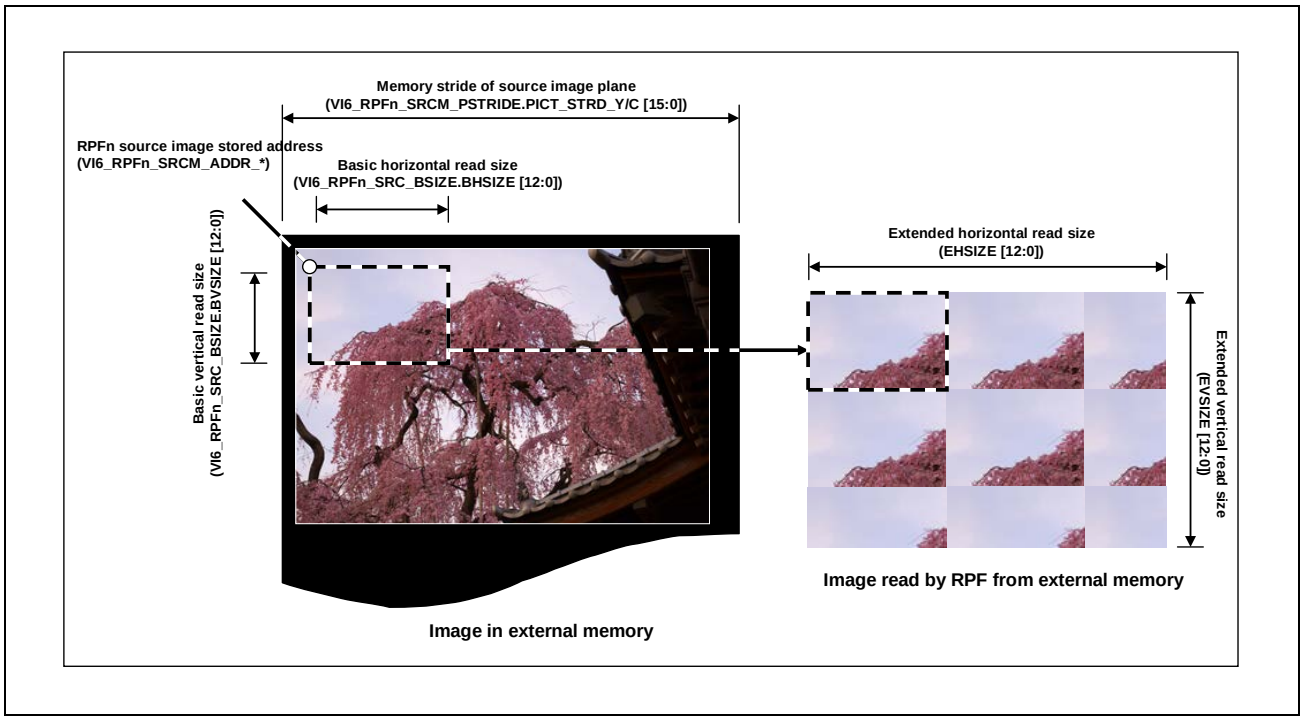


Figure 33.6 Relationship between Basic Read Size and Extended Read Size

(2) RPFn Extended Read Size Registers (VI6_RPFn_SRC_ESIZE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	EHSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EVSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	BHSIZE[12:0]	All 0	R/W	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 33.6**, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1920 can be specified.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	EVSIZE[12:0]	All 0	R/W	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in **Figure 33.6**, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 1080 can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in **Section 33.3.2.8** and later sections are all applied to the image in the extended read size shown on the right side in **Figure 33.6**.

(3) RPFn Input Format Registers (VI6_RPFn_INFMT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VIR	—	—	—	—	—	—	—	—	—	—	—	CIPM
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W

	SPYCS	SPUVS	CEXT[1:0]		RDTM[2:0]			CSC	—	RDFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	VIR	0	R/W	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSPD. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in **Section 33.3.2.6(11)** can be used. 0: RPFn uses general input. 1: RPFn uses virtual input.
27 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	CIPM	0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSPD in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in **Figure 33.7** for internal processing. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47). When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H'41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H'42). When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CEXT[1:0]	All 0	R/W	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from **Table 33.12** through the RDFMT bits, VSPD internally extends each color component to 8 bits before using the data. These bits select this extension method. 00b: Lower-order bits of color data are extended with 0. 01b: Upper-order bits of color data are copied to the lower -order bits. 10b: Lower-order bits of color data are extended with 0. The maximum value is limited to H'FF. 11b: Setting prohibited
11 to 9	RDTM[2:0]	All 0	R/W	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. 0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting.*1 When using the virtual input (VIR = 1), specify 0. 0: Color space conversion is disabled. 1: Color space conversion is enabled.
7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 0	RDFMT[6:0]	All 0	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in **Table 33.12**, **Table 33.13**, and **Table 33.14**. When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE.

Note 1. Note on color space settings

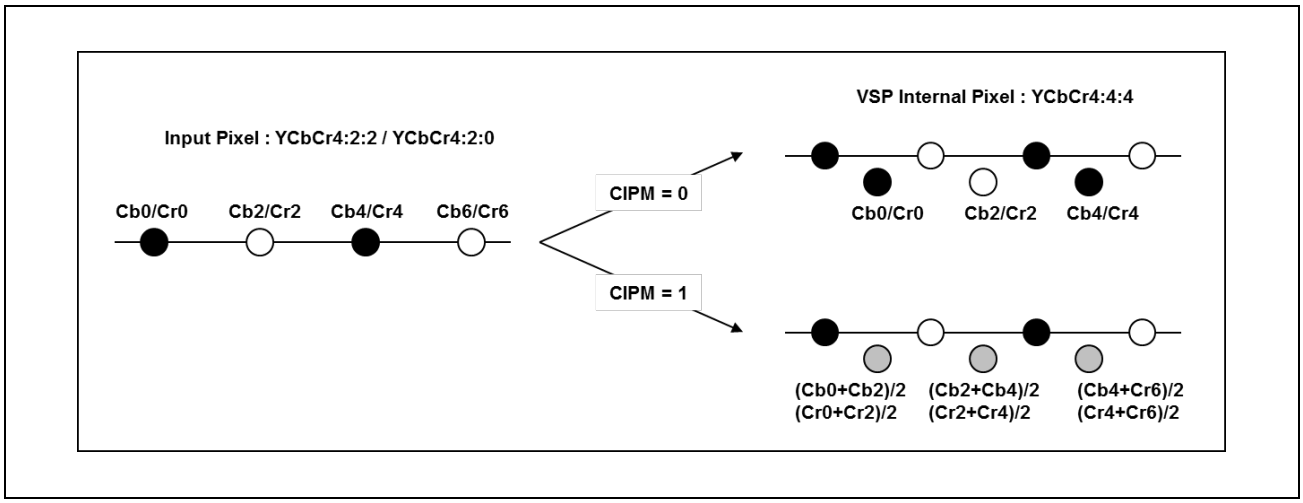

Figure 33.7 Chrominance Interpolation Methods Selectable through CIPM Setting

The color space for the image output from the RPF to VSPD internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (**Table 33.11**). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSPD internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSPD internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 33.11 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(H'00 to H'3F)*1	Disabled	(0) *1	RGB
		Enabled	(1) *1	YCbCr
YCbCr	(H'40 to H'7F)*1	Disabled	(0) *1	YCbCr
		Enabled	(1) *1	RGB

Note 1. Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in **Table 33.11**, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

Figure 33.8 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSPD internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in **Table 33.11** and **Figure 33.8**. The user should first determine whether the image processing in the VSPD is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the

RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSPD depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in **Figure 33.8.** The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in **Figure 33.8.**, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

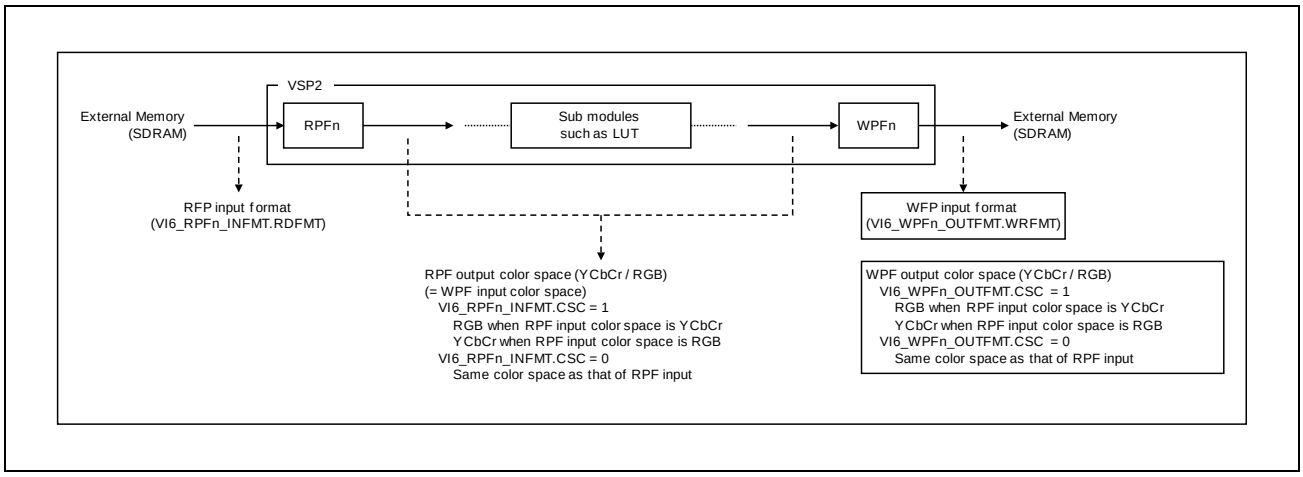

Figure 33.8 Relationship between Input/output Format and Color Space

Table 33.12 Packed Formats for RPF Input

RDFMT[6:0]	Bit per pixel	Phase	upper row - address / bottom row - bit field

31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	A_LLS	0	R/W	α Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
10	A_LWS	0	R/W	α Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
9	A_WDS	0	R/W	α Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in Word (16-bit) units is disabled 1: Data swapping in Word (16-bit) units is enabled
8	A_BTS	0	R/W	α Plane Data Swapping in Byte Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in Byte (8-bit) units is disabled 1: Data swapping in Byte (8-bit) units is enabled
7 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	P_LLS	0	R/W	Picture Plane Data Swapping in LONG LWORD Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
2	P_LWS	0	R/W	Picture Plane Data Swapping in long word Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

Bit	Bit Name	Initial Value	R/W	Description
1	P_WDS	0	R/W	Picture Plane Data Swapping in Word Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in Word (16-bit) units is disabled 1: Data swapping in Word (16-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.
0	P_BTS	0	R/W	Picture Plane Data Swapping in Byte Units The effect of this bit setting is defined in **Table 33.15**. 0: Data swapping in Byte (8-bit) units is disabled 1: Data swapping in Byte (8-bit) units is enabled This register is available for only Luma plane (Y) in the case input data format is YUV Planar or Semi-Planar and input bit-depth is 2bypc (IPBD_Y != 0 or IPBD_C != 0), and available for both Luma plane (Y) and Chroma plane (CbCr/U/V) in other cases.

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 33.15 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as **Table 33.12** for RGB format and **Figure 33.9** to **Figure 33.12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 33.15**.

Table 33.15 Changing data order according to swap register

Data order in memory

R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VCOORD[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 1919 can be specified.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 1079 can be specified.

Figure 33.13 shows an example of RPF1 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to **Section 33.3.2.7(1)**.

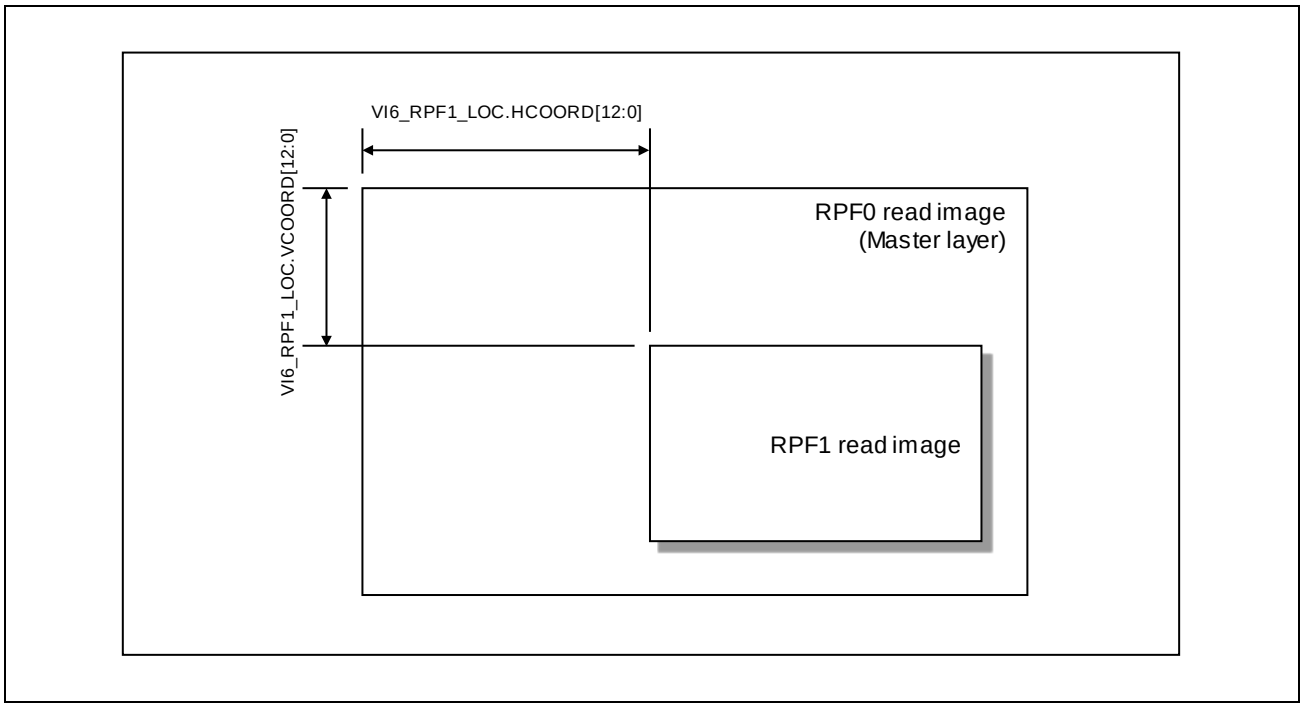

Figure 33.13 RPF1 Offsets from Master Layer

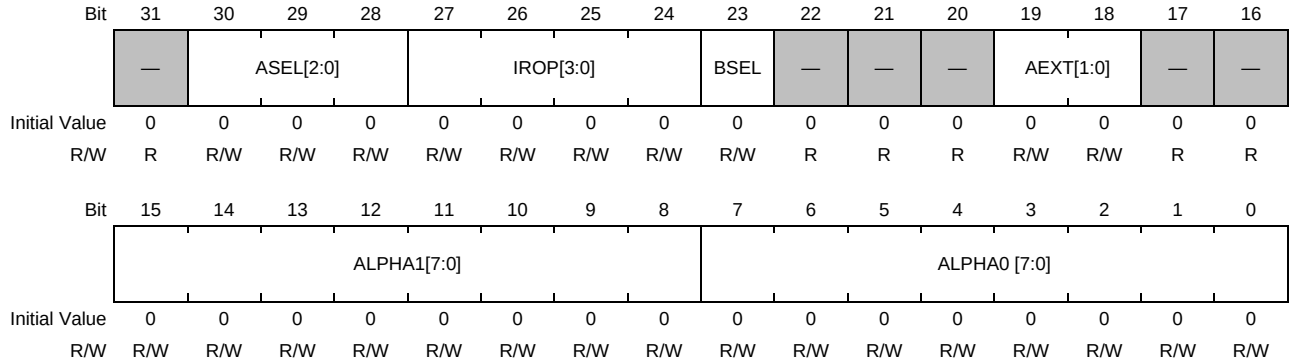
(6) RPFn α Plane Selection Control Registers (VI6_RPFn_ALPH_SEL)



Bit	Bit Name	Initial Value	R/W	Description
31	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
30 to 28	ASEL[2:0]	All 0	R/W	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSPD assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in **Figure 33.14** and then output to the subsequent modules. The output α value is used, for example, for blending in the BRS. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in **Figure 33.14**. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4. 0: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 1: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in **Figure 33.14** without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 2: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in **Figure 33.14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. 3: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in **Figure 33.14** according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. 4: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. 5 to 7: Setting prohibited.

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	IROP [3:0]	All 0	R/W	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in **Figure 33.14**. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to 0000b. 0000b: NOP(D) 0001b: AND(S & D) 0010b: AND_REVERSE(S & ~D) 0011b: COPY(S) 0100b: AND_INVERTED(~S & D) 0101b: CLEAR(0) 0110b: XOR(S ^ D) 0111b: OR(S | D) 1000b: NOR(~(S | D)) 1001b: EQUIV(~(S ^ D)) 1010b: INVERT(~D) 1011b: OR_REVERSE(S | ~D) 1100b: COPY_INVERTED(~S) 1101b: OR_INVERTED(~S | D) 1110b: NAND(~(S & D)) 1111b: SET(all 1)
23	BSEL	0	R/W	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in **Figure 33.14**. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect. 0: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to 1b; when the value is 0, it is converted to 0b. 1: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 18	AEXT[1:0]	All 0	R/W	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. 00b: The lower-order bits of α value are extended with 0. 01b: The upper-order bits of α value are copied to the lower-order bits. 10b: The lower-order bits of α value are extended with 0. The maximum value is limited to H'FF. 11b: Setting prohibited
17, 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	ALPHA1[7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 33.14** is 1b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.
7 to 0	ALPHA0 [7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in **Figure 33.14** is 0b. This setting is valid when the ASEL bits are set to 010b or 011b. A value from 0 to 255 can be specified.

Figure 33.14 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

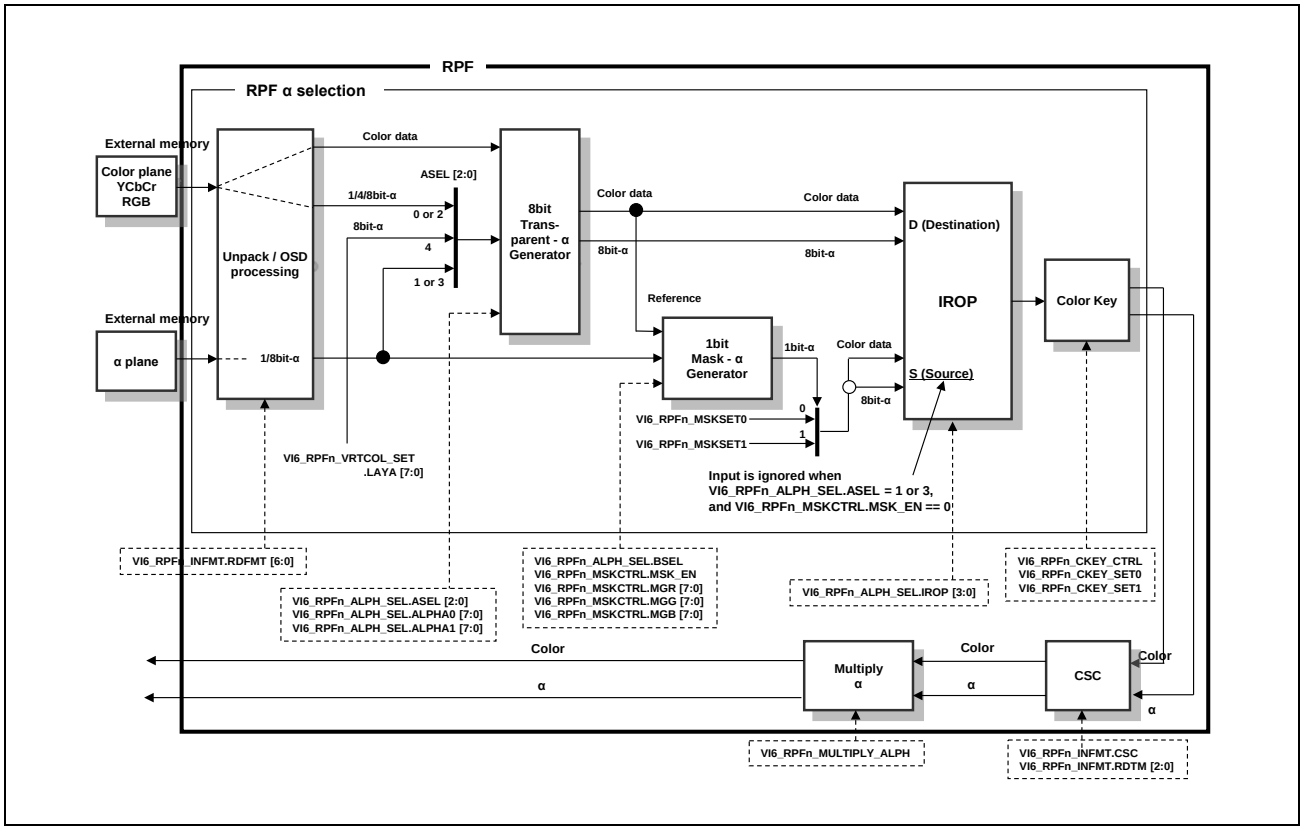


Figure 33.14 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in **Figure 33.14**. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of 0b is generated; if the value is not 0, a 1-bit α value of 1b is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is 0b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is 1b, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in **Figure 33.14**, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to **Section 33.3.2.6(8)**), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit:

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in **Table 33.16**. Where the source input state is indicated as “Valid” in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 33.16 Source Input State in IROP Operation Unit

VI6_RPFn_ALPH_SEL.ASEL[2:0]		VI6_RPFn_MSKCTRL.MSK_EN		
		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
000b	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
001b	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
010b	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
011b	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
100b	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

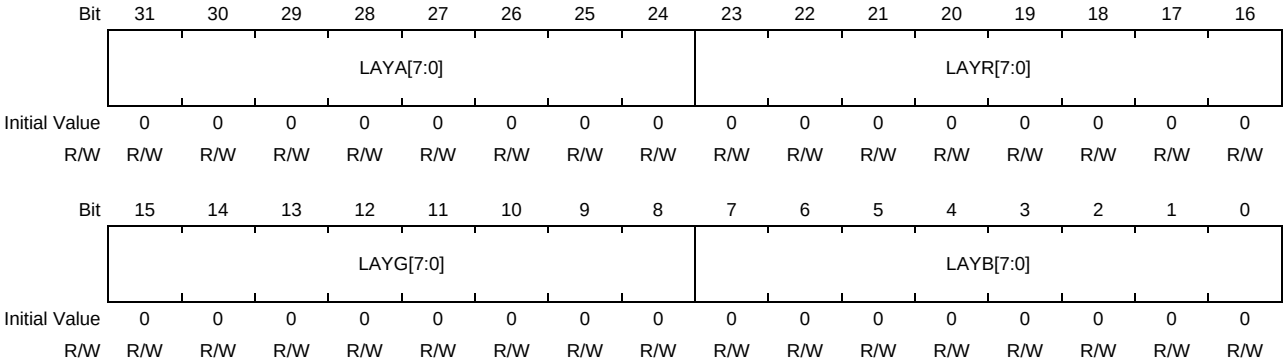
For the handling of the α values shown in **Figure 33.14** and **Table 33.16**, the relationship between the RPF input format and RPF output α value is shown in **Table 33.17**. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

Table 33.17 α Value Selected and Output according to ASEL Bits in Each Input Format

ASEL Setting		α Value Output for Each Input Format	
		RGB	YCbCr
000b	(8-, 4-, or 1-bit packed α is input)	1- ,4-, or 8-bit pixel α	H’FF*1
001b	(8-bit plane α is input)	8-bit α plane	8-bit α plane
010b	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	H’FF*1
011b	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
100b	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting	

Note 1. Fixed value H’FF is output because packed α is not included in YCbCr.

(7) RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA[7:0]	All 0	R/W	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR[7:0]	All 0	R/W	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG[7:0]	All 0	R/W	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB[7:0]	All 0	R/W	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

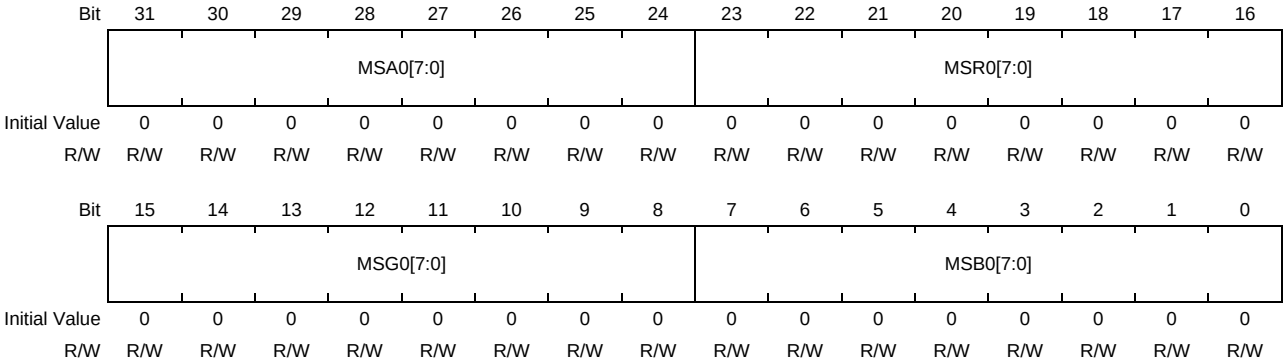
(8) RPFn Mask Control Registers (VI6_RPFn_MSKCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	MSK_EN	MGR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG[7:0]								MGB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

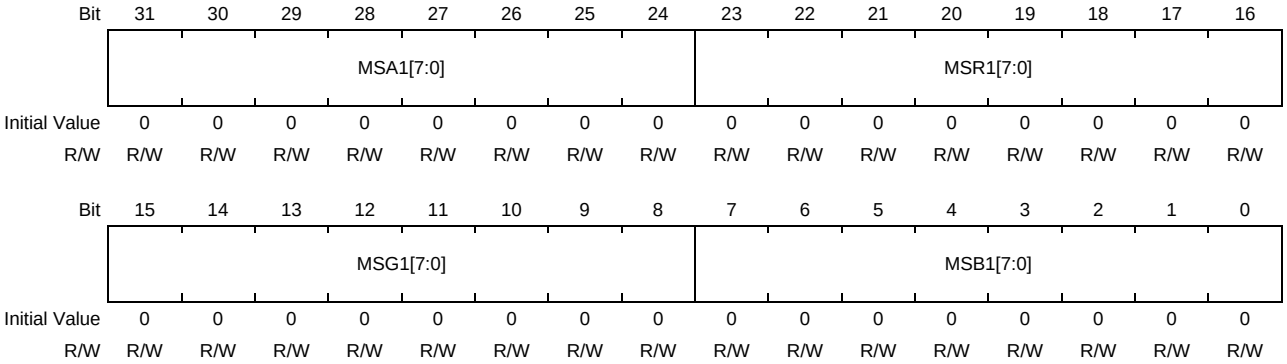
Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	MSK_EN	0	R/W	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in **Figure 33.14**. 0: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is H'00; otherwise, the 1-bit mask value is 1. 1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0.
23 to 16	MGR[7:0]	All 0	R/W	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG[7:0]	All 0	R/W	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.
7 to 0	MGB[7:0]	All 0	R/W	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

(9) RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0[7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**). A value from 0 to 255 can be specified.
23 to 16	MSR0[7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0[7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0[7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(10) RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1[7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (**Figure 33.14**).
23 to 16	MSR1[7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1[7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1[7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (**Figure 33.14**). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

(11) RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

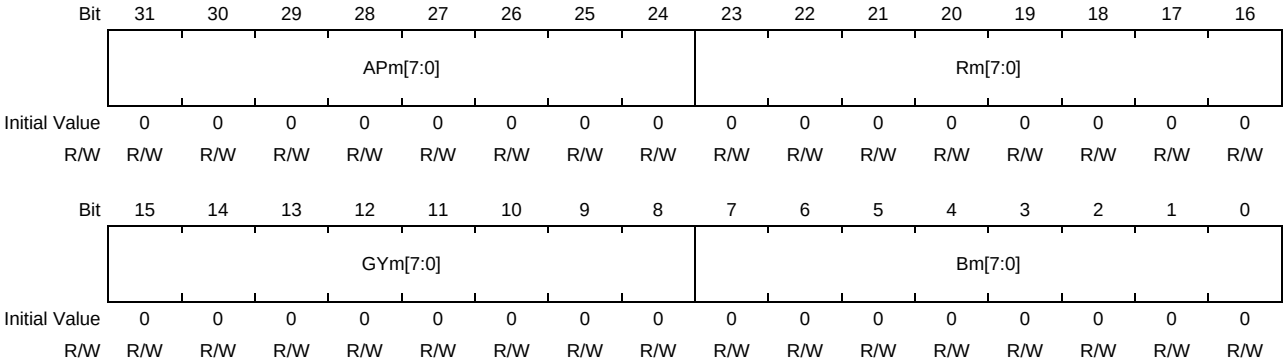
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LTH	—	—	—	CV	—	—	SAPE1	SAPE0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	LTH	0	R/W	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Luma threshold mode is disabled (Matched color mode) 1: Luma threshold mode is enabled
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CV	0	R/W	Color Replacement Control This bit controls the color replacement function in the color keying module shown in **Figure 33.2**. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Color replacement function is disabled (transparent color mode). 1: Color replacement function is enabled.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
1	SAPE1	0	R/W	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Comparison color data setting 1 is disabled. 1: Comparison color data setting 1 is enabled.
0	SAPE0	0	R/W	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0. 0: Comparison color data setting 0 is disabled. 1: Comparison color data setting 0 is enabled.

(12) RPFn Color Keying Color Setting Registers-m (VI6_RPFn_CKEY_SETm : m = 0, 1)

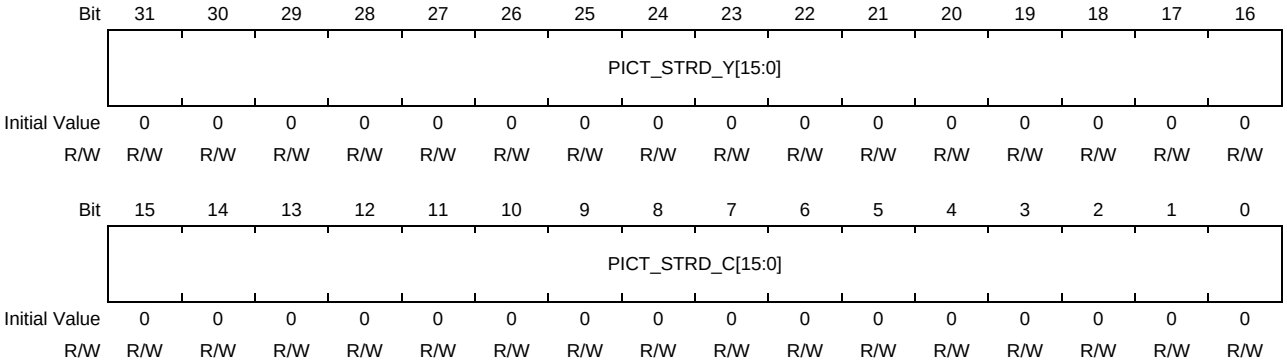


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	APm[7:0]	All 0	R/W	α Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. ● In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. ● In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm[7:0]	All 0	R/W	R*1/Cr Component Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. ● In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. ● In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
15 to 8	GYm[7:0]	All 0	R/W	G*1/Y Component Data in Color Keying Color Information-m ● In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. ● In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. ● In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	Bm[7:0]	All 0	R/W	B*1/Cb Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note 1. When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

(13) RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings.
15 to 0	PICT_STRD_C[15:0]	All 0	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in **Figure 33.15**. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in **Figure 33.15**. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to **Sction 33.3.2.6(6)**.

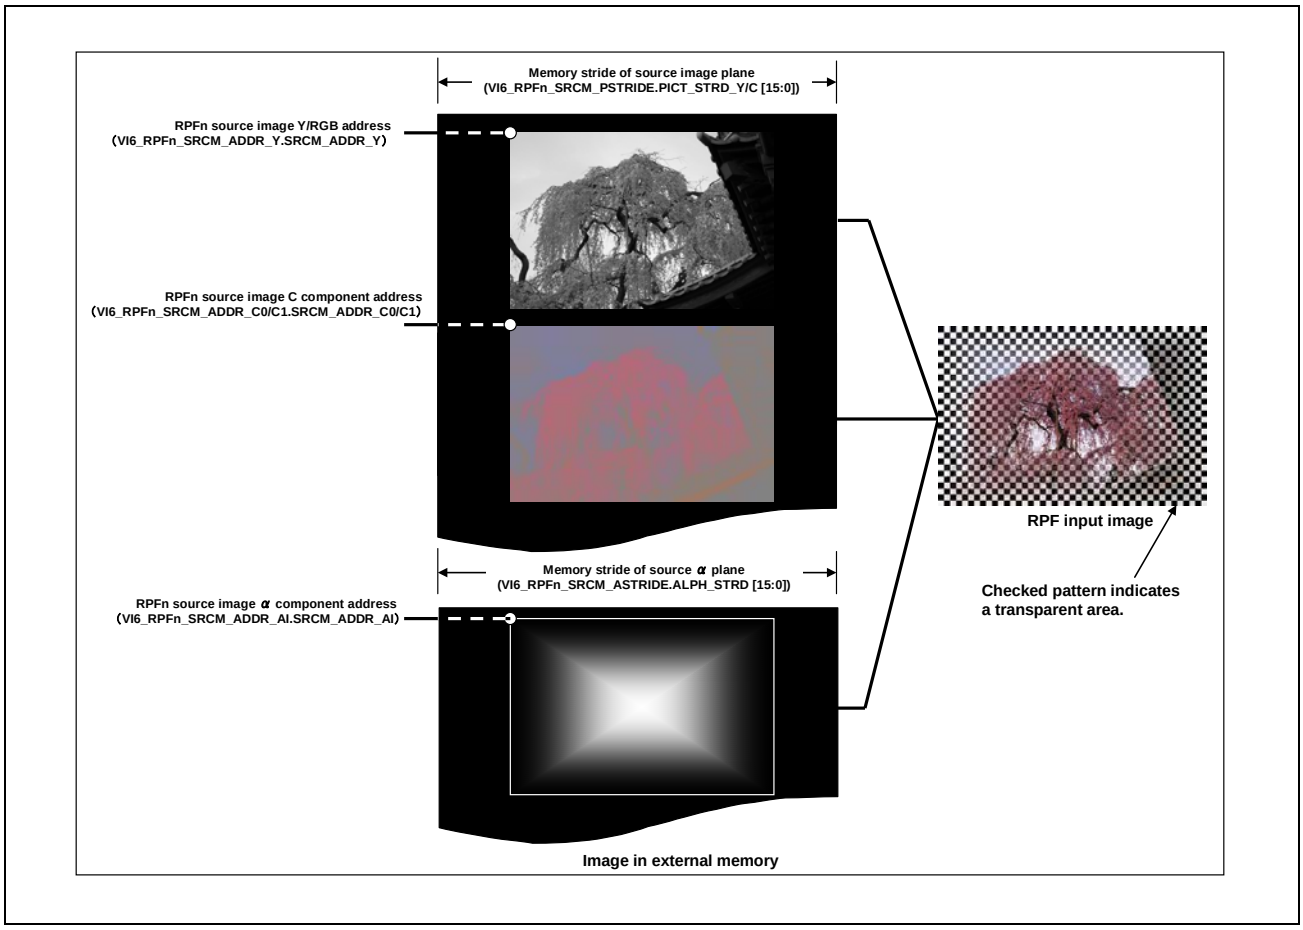


Figure 33.15 Reading an Image from RPFn Source Area

(14) RPFn Source α Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ALPH_STRD[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	ALPH_STRD [15:0]	All 0	R/W	Memory Stride of Source α Plane These bits specify in 1-byte units the memory stride of the source α plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to **Figure 33.15** for settings.

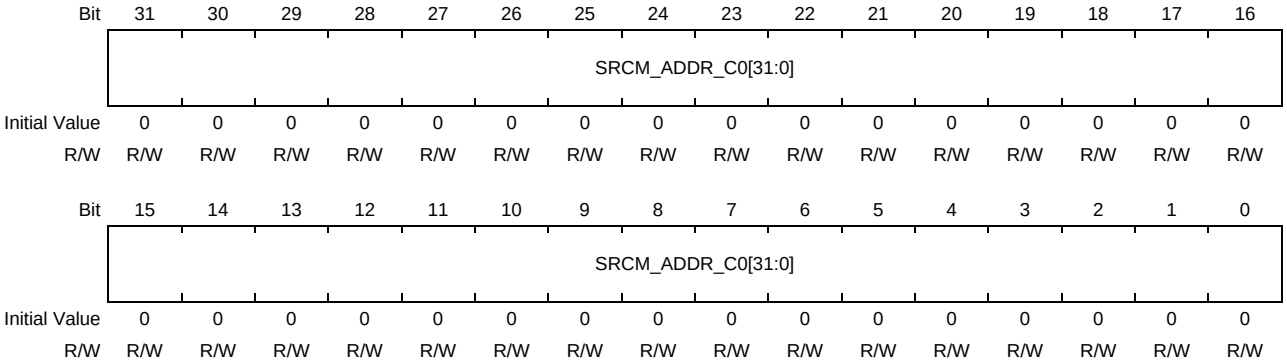
(15) RPFn Source Y/RGB Address Registers (VI6_RPFn_SRCM_ADDR_Y)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_Y[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCM_ADDR_Y[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

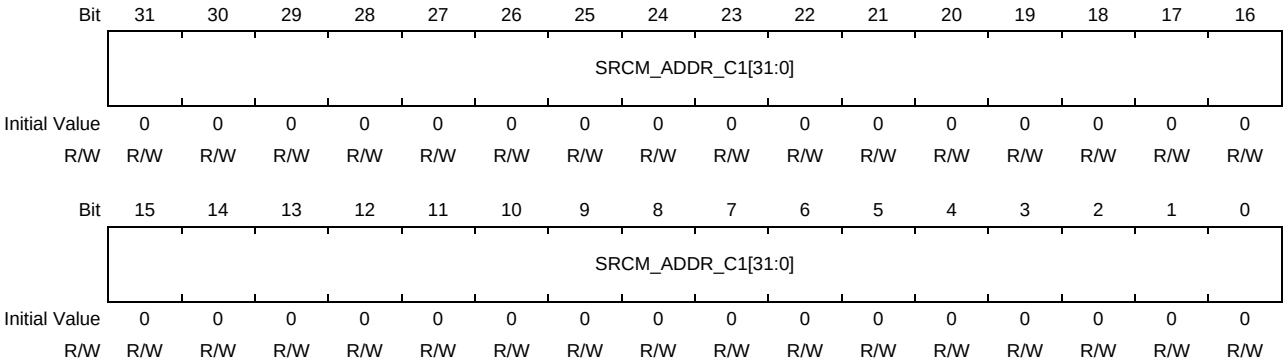
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR _Y[31:0]	All 0	R/W	Source Image Y/RGB Plane Storing Address These bits specify in 1-byte units the start address of the source image Y plane and packed RGB plane read by the RPFn. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(16) RPFn Source Chroma Address Registers 0 (VI6_RPFn_SRCM_ADDR_C0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C0[31:0]	All 0	R/W	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Figure 33.15** or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(17) RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_C1[31:0]	All 0	R/W	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in **Figure 33.15** is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(18) RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCM_ADDR_AI[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCM_ADDR_AI[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ADDR_AI[31:0]	All 0	R/W	Source Image α Plane Storing Address These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.15** in **Section 33.3.2.6(13)** for settings.

(19) RPFn Bus Access Control Registers (VI6_RPFn_BAC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	B512
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	B512	0	R/W	Burst access in 512 pixels' enable 0: burst access in 256 pixels 1: burst access in 512 pixels Always set 0 to this bit
15 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(20) RPFn Multiple Alpha Control (VI6_RPFn_MULT_ALPH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	A_MMD	—	—	P_MMD[1:0]		ALPHA_RATIO[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12	A_MMD	0	R/W	0: Alpha data go through multiply-alpha unit. 1: Multiply-alpha unit multiplies alpha data by specified alpha (ALPHA_RATIO[7:0]). When output format from CSC unit is YCbCr, set 0 to this bit.
11, 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	P_MMD[1:0]	All 0	R/W	0: Image data go through multiply-alpha unit. 1: Multiply-alpha unit multiplies image data by specified alpha (ALPHA_RATIO[7:0]). 2: Multiply-alpha unit multiplies image data by alpha data. 3: Multiply-alpha unit multiplies image data by alpha data and specified alpha (ALPHA_RATIO[7:0]). When output format from CSC unit is YCbCr, set 0 to this bit.
7 to 0	ALPHA_RATIO[7:0]	All 0	R/W	Multiply alpha value

ALPin: Input Alpha data to Multiply-alpha unit

PIXin(R): Input R data to Multiply-alpha unit

PIXin(G): Input G data to Multiply-alpha unit

PIXin(B): Input B data to Multiply-alpha unit

ALPout: Output Alpha data from Multiply-alpha unit

PIXout(R): Output R data from Multiply-alpha

PIXout(G): Output G data from Multiply-alpha

PIXout(B): Output B data from Multiply-alpha

Table 33.18 Expression of output alpha data from Multiply-alpha unit

A_MMD	ALPHA_RATIO[7:0]	Expression
0	Don't care	ALPout = ALPin
1	Not 255	ALPout = ALPin * ALPHA_RATIO / 256
	255	ALPout = ALPin

Table 33.19 Expression of output pixel data from Multiply-alpha unit

P_MMD[1:0]	ALPHA_RATIO[7:0]	ALPin	Expression
0	Don't care	Don't care	PIXout(R) = PIXin(R) PIXout(G) = PIXin(G) PIXout(B) = PIXin(B)
1	Not 255	Don't care	PIXout(R) = PIXin(R) * ALPHA_RATIO / 256 PIXout(G) = PIXin(G) * ALPHA_RATIO / 256 PIXout(B) = PIXin(B) * ALPHA_RATIO / 256
	255	Don't care	PIXout(R) = PIXin(R) PIXout(G) = PIXin(G) PIXout(B) = PIXin(B)
2	Don't care	Not 255	PIXout(R) = PIXin(R) * ALPin / 256 PIXout(G) = PIXin(G) * ALPin / 256 PIXout(B) = PIXin(B) * ALPin / 256

33.3.2.7 WPF Control Registers

(1) WPFn-Source-RPF Registers (VI6_WPFn_SRCRPF)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	VIR_ACT2[1:0]		—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RPF1_ACT[1:0]		RPF0_ACT[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	VIR_ACT2 [1:0]	All 0	R/W	Virtual RPF Start Enable in BRS These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. **Section 33.3.2.10(1) BRS Input Control Register (VI6_BRS_INCTRL)** **Section 33.3.2.10(2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)** **Section 33.3.2.10(3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)** **Section 33.3.2.10(4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)** Note that the virtual RPF is in the BRS as shown in **Figure 33.28** and there are no register bits for DPR setting related to the virtual RPF. 0: The virtual RPF in the BRS is not started. 1: The virtual RPF in the BRS is started as a sublayer source RPF for the WPFn. 2: The virtual RPF in the BRS is started as the master-layer source RPF for the WPFn. 3: Setting prohibited
23 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3, 2	RPF1_ACT [1:0]	All 0	R/W	RPFn Start Enable (RPFn_ACT, n = 0 to 1) These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPFn (n = 0), set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to D'63. 0: RPFn is not started. 1: RPFn is started as a sublayer source RPF for the WPFn. 2: RPFn is started as the master-layer source RPF for the WPFn. 3: Setting prohibited
1, 0	RPF0_ACT [1:0]	All 0	R/W	

When the WPFn is started through the VSPD start register n (VI6_CMDn: n = 0), the RPF and virtual RPF in the BRS specified as the source RPF in this register are also started to supply data to the VSPD internal modules.

Note the following when specifying the source RPF.

(1) When blending or ROP operation is applied to multiple images through the BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs.

Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = H’00000015) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = H’0000025A) (such settings are prohibited).

(2) When the BRS is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

(2) WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HCEN	—	—	—	—	HCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	HCEN	0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPFn input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	HCL_OFST [7:0]	All 0	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (**Figure 33.16**). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	HCL_SIZE [12:0]	All 0	R/W	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored. A value from 1 to 1920 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly. (Note) When the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

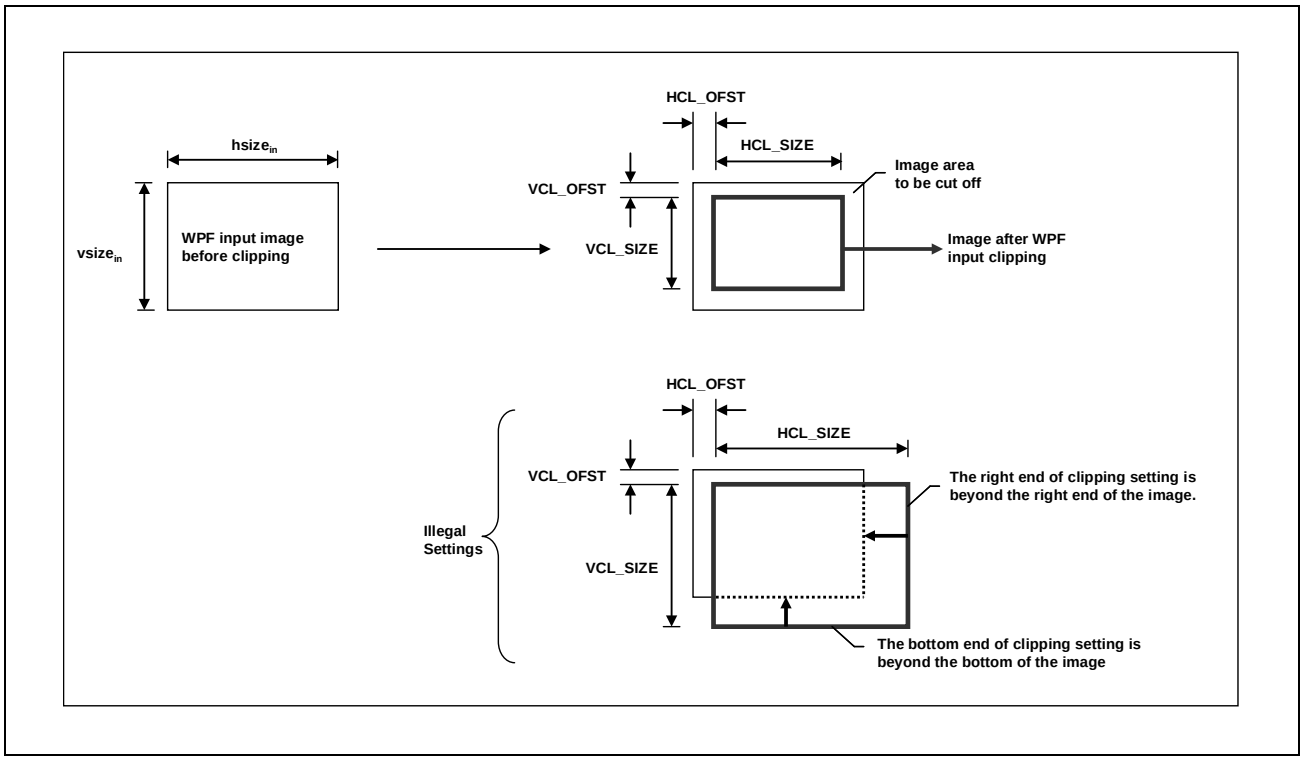

Figure 33.16 Image Clipping in WPF Input Section

(3) WPFn Vertical Input Size Clipping Registers (VI6_WPFn_VSZCLIP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VCEN	—	—	—	—	VCL_OFST[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VCL_SIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	VCEN	0	R/W	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPFn input image. 0: Vertical size clipping is disabled 1: Vertical size clipping is enabled
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	VCL_OFST [7:0]	All 0	R/W	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (**Figure 33.16**). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VCL_SIZE [12:0]	All 0	R/W	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPFn input image are discarded. When the VCEN bit is 0, this setting is ignored. A value from 1 to 1080 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in **Figure 33.16** is made, VSPD does not operate correctly. (Note) When the WPFn output format is YCbCr4:2:0, specify an even value in these bits.

(4) WPFn Output Format Registers (VI6_WPFn_OUTFMT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PDV [7:0]								PXA	ODE	—	—	—	ROT[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPYCS	SPUVS	DITH[1:0]		WRTM[2:0]			CSC	—	WRFMT[6:0]						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PDV [7:0]	All 0	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in **Table 33.20**. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	0	R/W	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in **Table 33.21**. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in **Table 33.20** are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to **Figure 33.17** and the description of VI6_WPFn_RNDCTRL.ABRM. 0: The value specified in the PDV bits is stored in the PAD shown in **Table 33.20**. 1: The α value output from DPR in pixel units is stored in the PAD shown in **Table 33.20**.
22	ODE	0	R/W	Ordered Dither (mode A) Enable/Disable 0: Ordered dither (mode A) is disabled. 1: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
21 to 19	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	ROT[2:0]	All 0	R/W	Rotation Processing Select These bits select the flipping processing to be applied to the WPFn output image. **Figure 33.18** shows the correspondence between the original image and the flipping result according to each setting. 0: No flipping 1: Vertical flipping Note that the destination address setting should be changed according to the setting of these bits. For details, refer to **Section 33.3.2.7(9)**. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to ROT[2:0].

Bit	Bit Name	Initial Value	R/W	Description
15	SPYCS	0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	SPUVS	0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
13, 12	DITH[1:0]	All 0	R/W	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. 0: Dithering (mode B) is disabled 3: Dithering (mode B) is enabled 1, 2: Setting prohibited When ODE bit in the register is 1, set this bit to 0.
11 to 9	WRTM[2:0]	All 0	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] 1: BT.601 YCbCr [0,255] ↔ RGB [0,255] 2: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] 3: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] 4 to 7: Setting prohibited
8	CSC	0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in **Section 33.3.2.6(3)**, RPFn Input Format Registers (VI6_RPFn_INFMT). 0: Color space is not converted. 1: Color space is converted.
7	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	WRFMT[6:0]	All 0	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPFn to the external memory from among those listed in **Table 33.20** and **Table 33.21**. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF -> DPR -> target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. [Note 2] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in **Figure 33.19**). [Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

Table 33.21 Packed YCbCr Formats for WPF Output

WRFMT[6:0]	Packed YCbCr Output Format	Reference
H'40	YCbCr4:4:4 semi-planar	**Figure 33.9***4
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	**Figure 33.10***4
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved *5	
H'4A	YCbCr4:4:4 planar	**Figure 33.11***4
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, I420)	
H'4D to H'7F	Reserved	—

Note 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.

Note 2. When the output format is YUY2, set SPYCS (bit 15) to 1.

Note 3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.

Note 4. **Figure 33.12** shows the definition of memory address for each pixel in **Figure 33.9** to **Figure 33.11**.

Note 5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to **Figure 33.9**, **Figure 33.10**, **Figure 33.11**, **Figure 33.12**. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures)	→	(Corresponding WPF registers)
VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y	→	VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y
VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0	→	VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0
VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1	→	VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

(5) WPFn Data Swapping Registers (VI6_WPFn_DSWAP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	P_LLS	P_LWS	P_WDS	P_BTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	P_LLS	0	R/W	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	0	R/W	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	0	R/W	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	0	R/W	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to **Table 33.15**. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 33.15 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in **Table 33.20** for RGB format and **Figure 33.9** to **Figure 33.12** for YCbCr format, set 1111b to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in **Table 33.15**.

(6) WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	ABRM[1:0]		ATHRESH[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	CBRM	0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in **Table 33.20** and the target bit fields are not 8 bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
27, 26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25, 24	ABRM[1:0]	All 0	R/W	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in **Table 33.20** and the target bit field is four bits or one bit. A value of 10b can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. 00b: Bit count conversion: The lower-order bits are truncated 01b: Bit count conversion: Rounding (rounding off) 10b: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) 11b: Setting prohibited
23 to 16	ATHRESH [7:0]	All 0	R/W	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to 10b. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13, 12	CLMD[1:0]	All 0	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. 00b: Output value is not clipped (0-255) 01b: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) 10b: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) 11b: Setting prohibited
11 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(7) WPFn Destination Y Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_Y)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PICT_STRD_Y[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**. A value from H'0000 to H'FFFF can be specified.

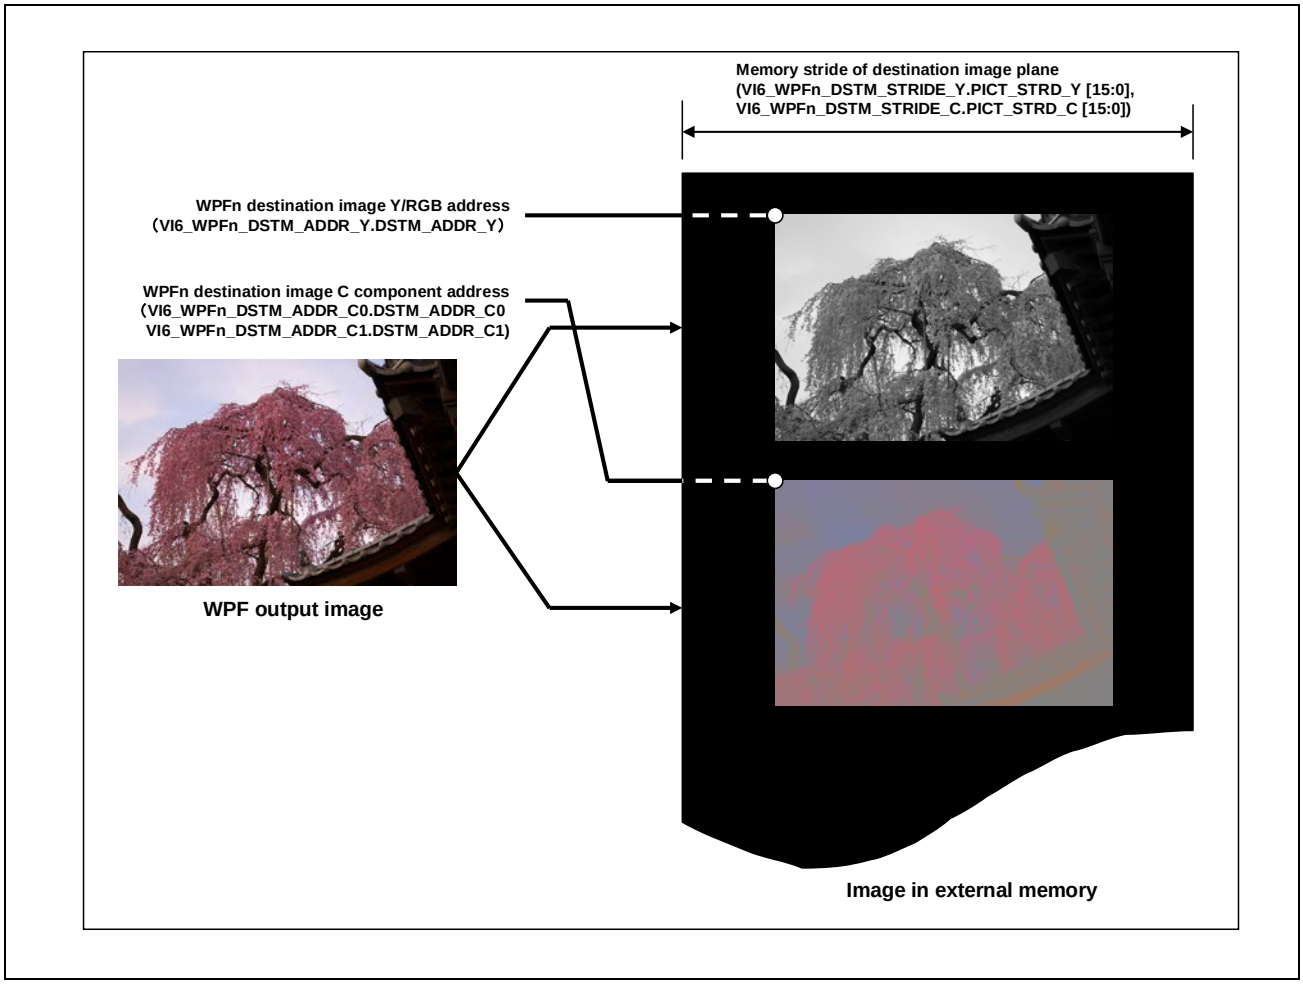

Figure 33.20 Writing Image Data to Destination Area in WPFn

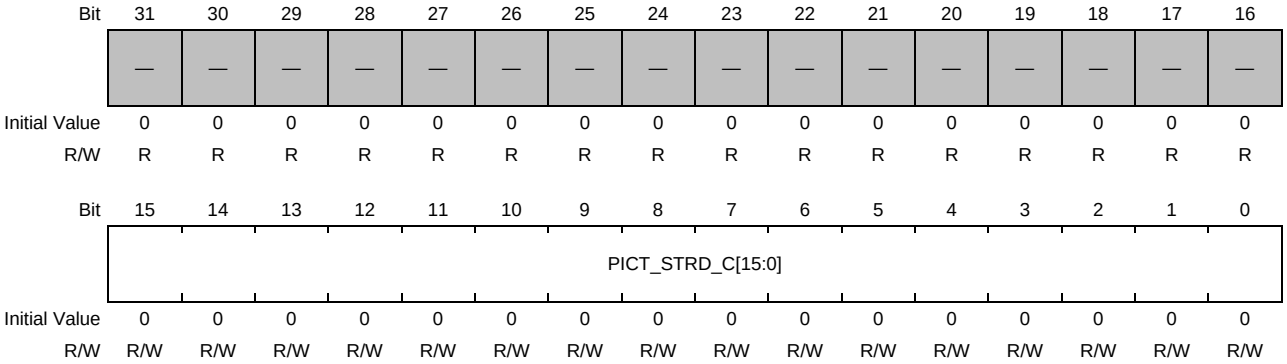
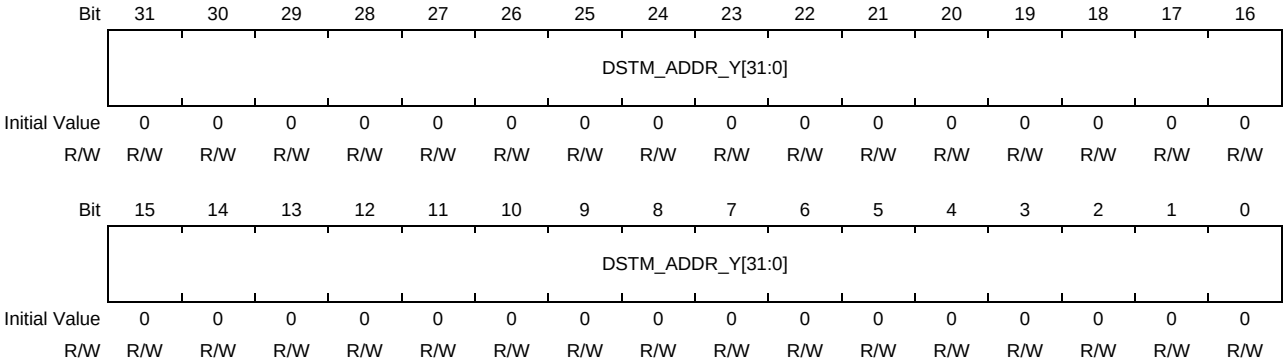
(8) WPFn Destination C Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_C)



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	PICT_STRD_Y[15:0]	All 0	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in **Figure 33.20**. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0000 to H'FFFF can be specified.

(9) WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_Y[31:0]	All 0	R/W	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later. A value from H'0000 0000 to H'FFFF FFFF can be specified.

[Destination Address Specification Method]

When flipping is not used, the start address of a frame (address FHA shown in **Figure 33.21**) should be specified as the destination address. When flipping is used, the destination address is not the frame start address (FHA); one of addresses A0 and A2 shown in **Figure 33.21** should be selected according to the combination of desired flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A0 and A2, let the horizontal size of the output image be H, the vertical size of the output image be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in **Figure 33.21**. Calculate the destination address (one of A0 and A2) using the formula shown in **Table 33.22** and specify it in the destination address storing register.

The values of variables L in **Table 33.22** depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to **Table 33.23** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or **Table 33.24** when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

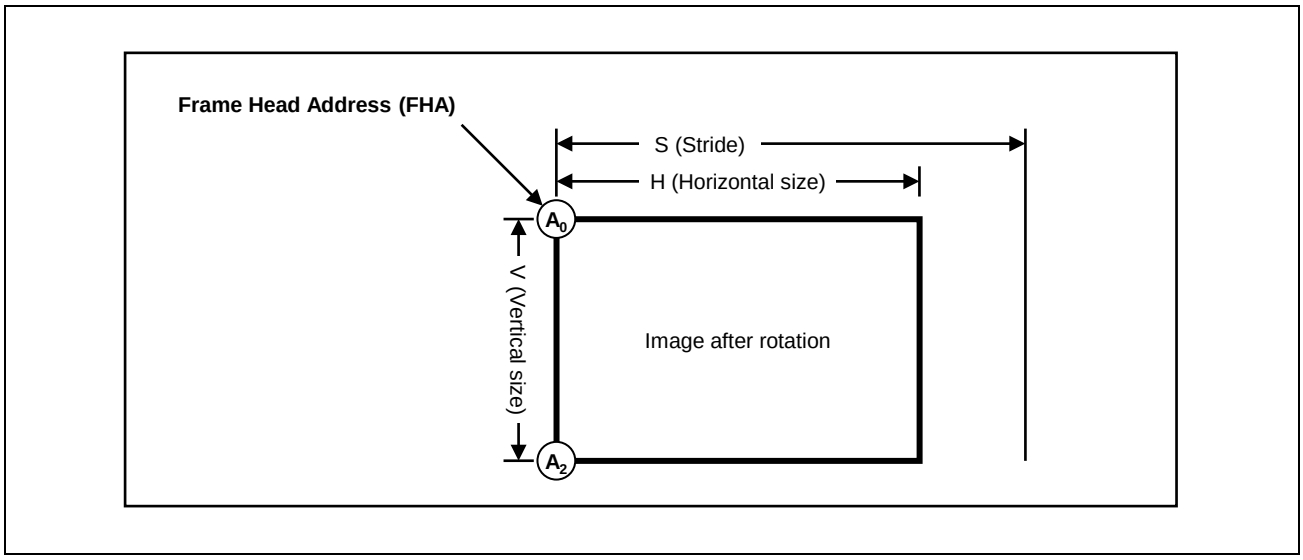


Figure 33.21 Location of Destination Address to be Specified for Flipping

Table 33.22 Destination Address A_0, A_1, A_2, and A3 Calculation Formulas

VI6_WPFn_OUTFMT.ROT Setting	Formula for Calculating Address to be Set in VI6_WPFn_DSTM_ADDR_Y, VI6_WPFn_DSTM_ADDR_C0, and VI6_WPFn_DSTM_ADDR_C1
0	A_0 = FHA
1	A_2 = FHA + (V×L – 1) × S

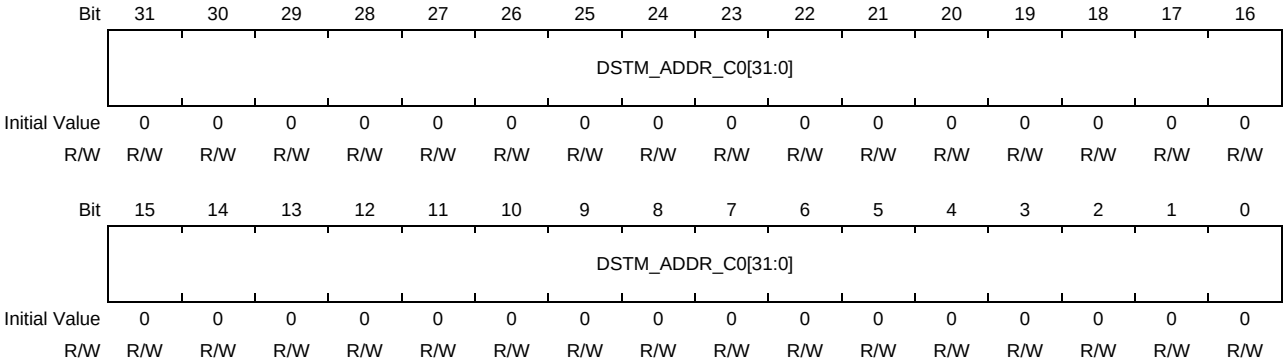
Table 33.23 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for RGB and Luminance Y Address Calculation)

VI6_WPFn_OUTFMT.WRFMT	L
73	0.5
0 to 2, 4 to 35, 64 to 66, 70 to 72, or 74 to 76	1

Table 33.24 Value of L according to VI6_WPFn_OUTFMT.WRFMT Setting (for Chrominance C0 and C1 Address Calculation)

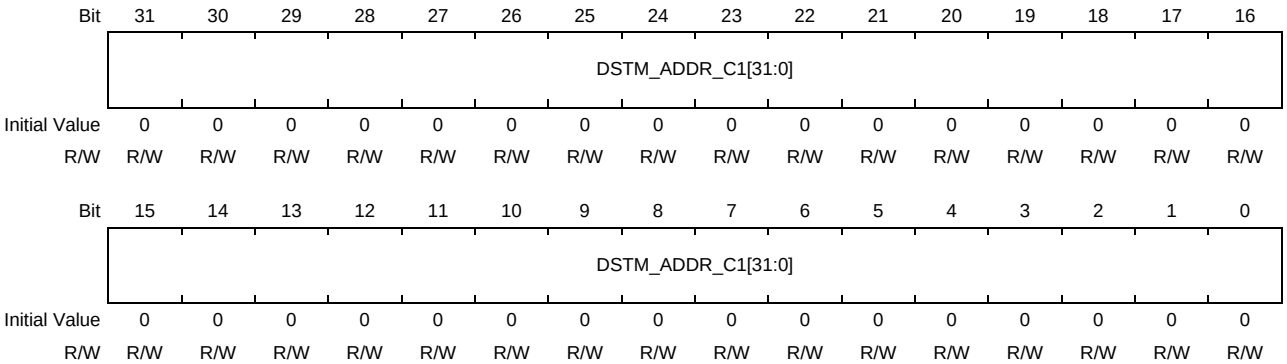
VI6_WPFn_OUTFMT.WRFMT	L
70 to 73	Not defined
66, 76	0.5
64 to 65, 74 to 75	1

(10) WPFn Destination Chroma Address Registers 0 (VI6_WPFn_DSTM_ADDR_C0)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C0[31:0]	All 0	R/W	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPFn. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in **Table 33.21** or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.21** in **Section 33.3.2.7(10)** for settings.

(11) WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ADDR_C1[31:0]	All 0	R/W	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPFn outputs images to the external memory in YCbCr planar format shown in **Table 33.21**. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from H'0000 0000 to H'FFFF FFFF can be specified. Refer to **Figure 33.21** in **Section 33.3.2.7(10)** for settings.

(12) WPFn LIF Write Back Control Registers (VI6_WPFn_WRBCK_CTRL: n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WBMD[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1, 0	WBMD[1:0]	All 0	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIFn_CTRL.LIF_EN bit is set to 1. 0: Write Back Disabled 1: Write Back Enabled

33.3.2.8 DPR Control Registers

(1) Concept of DPR Settings

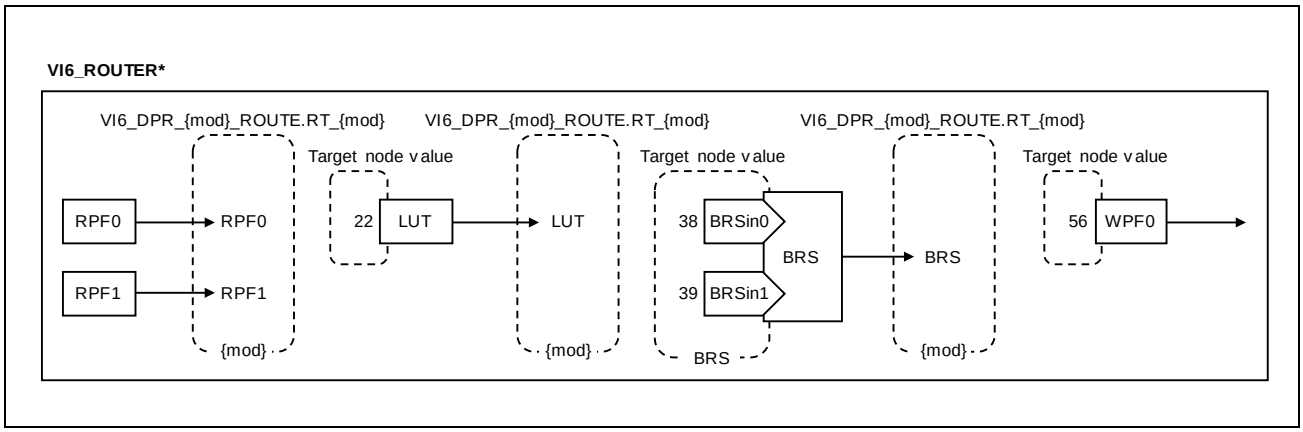


Figure 33.22 Node Register Names and Target Node Values on Data Path Router

In the VSPD internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in **Figure 33.22** to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed.

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value. Note: VI6_DPR_{mod}_ROUTE.RT are not implemented in VSPD which doesn't have {mod}. See **Figure 33.1** whether VSPD has {mod} or not.
2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF1 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.
4. Desired modules can be connected between each RPF and BRS input port, but all RPFs specified as the sources for a BRS input port should have the same target WPF.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRS input ports are the same.
6. Do not connect the output of any module as the input to the same module (in the BRS case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in **Figure 33.22** is assigned in one RPF to WPF path, it cannot be used in another RPF to WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when BRS is used.
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 1

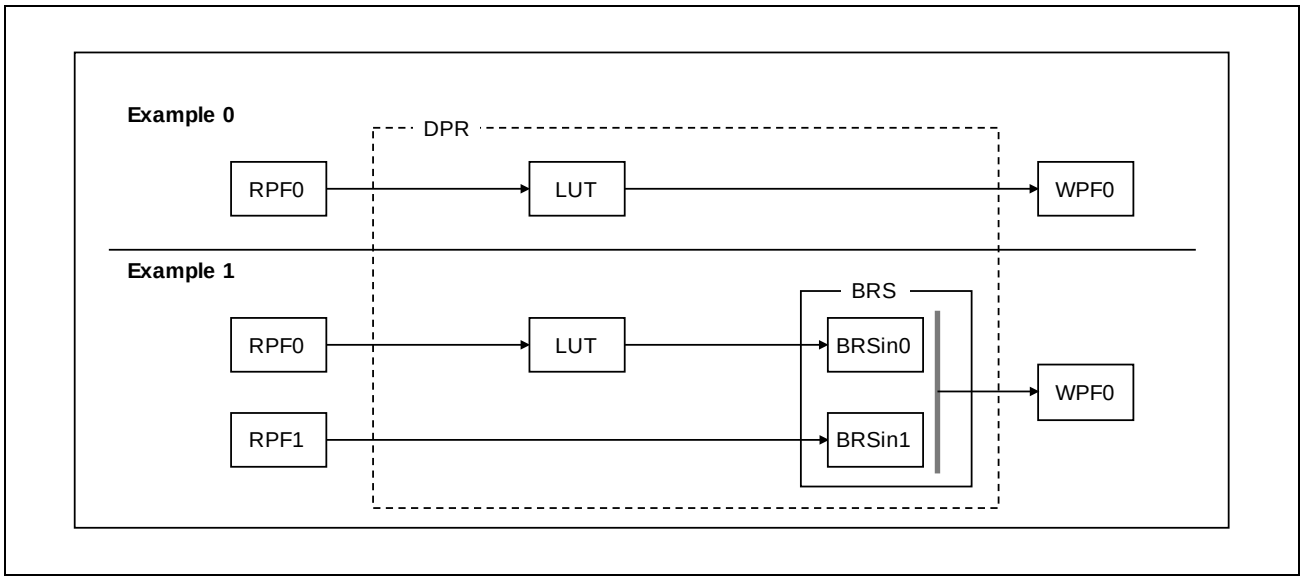

Figure 33.23 Examples of Internal Data Path Routing

Figure 33.23 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF1 are the source RPFs). Each example has the configuration shown in **Figure 33.23**. Example 0 performs LUT (e.g. γ correction) processing. Example 1 performs LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 (RPF1). The VI6_ DPR_*_ROUTE settings for these examples are shown in **Table 33.25**. The bit fields for the modules that are not used in the examples should be set to 63.

Table 33.25 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in **Figure 33.23**. Although both examples show in **Figure 33.23** include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

Table 33.25 Examples of Internal Data Path Routing

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63	(UNUSED)
	VI6_DPR_LUT_ROUTE.RT	56	(To WPF0)
	VI6_DPR_ILV_BRS_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	22	(To LUT)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	39	(To BRSin1)
	VI6_DPR_LUT_ROUTE.RT	38	(To BRSin0)
	VI6_DPR_ILV_BRS_ROUTE.RT	56	(To WPF0)

(2) RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n = 0, 1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RT_RPFn[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RT_RPFn [5:0]	All 0	R/W	RPFn Target Node Value These bits specify the target node value for RPFn. When using RPFn, refer to **Figure 33.22** for settings. When RPFn is not started through the VI6_WPFn_SRCRPF setting, specify 63.

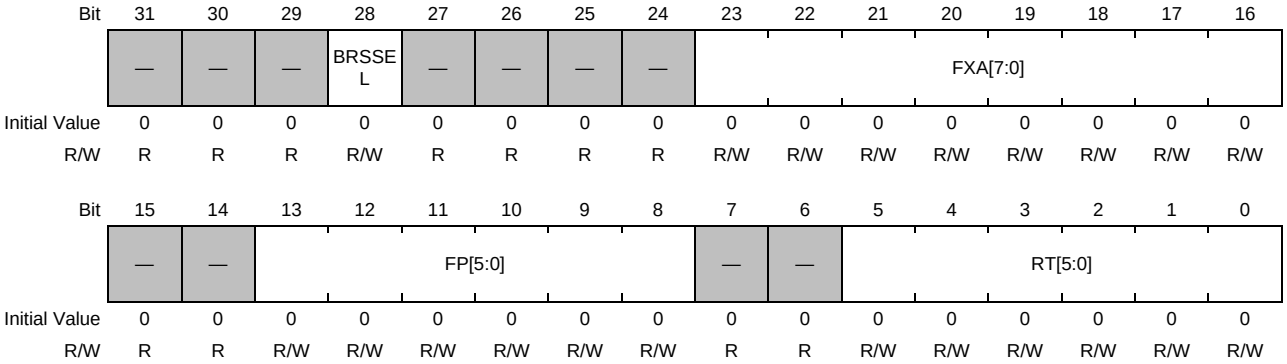
(3) WPFn Timing Control Register (VI6_DPR_WPFn_FPORCH : n = 0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	FP_WPFn[5:0]						—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	FP_WPFn [5:0]	All 0	R/W	WPFn Internal Operation Timing Setting Specify 5.
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

(4) {mod} Routing Register (VI6_DPR_{mod}_ROUTE : {mod}=ILV_BRS, LUT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	BRSSEL	0	R/W	This bit is valid only for VI6_DPR_ILV_BRS_ROUTE. Always specify 1.
27 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	FXA[7:0]	All 0	R/W	Fixed α Output Value for {mod} The {mod} does not support input/output of the α value. The α value input to the {LUT} is discarded, and the fixed α value specified in these bits is always output from the {LUT}. A value from 0 to 255 can be specified. These bits are valid for LUT module. For BRS module, these bits are reserved.
15, 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 8	FP[5:0]	All 0	R/W	{mod} Internal Operation Timing Setting Specify 0.
7, 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RT[5:0]	All 0	R/W	{mod}Target Node Value These bits specify the target node value for the {mod}. When using the {mod}, refer to **Figure 33.22** for settings. When not using the {mod}, specify 63.

33.3.2.9 LUT Control Register

(1) LUT Control Register (VI6_LUT_CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUT_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	LUT_EN	0	R/W	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to **Section 33.4.7.1**. 0: 1D-LUT function is disabled 1: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in **Figure 33.24**, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in **Figure 33.25**, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. **Figure 33.25** shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in **Figure 33.26**, the input bits are reversed. This has the effect of negative-positive flipping. In **Figure 33.27**, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

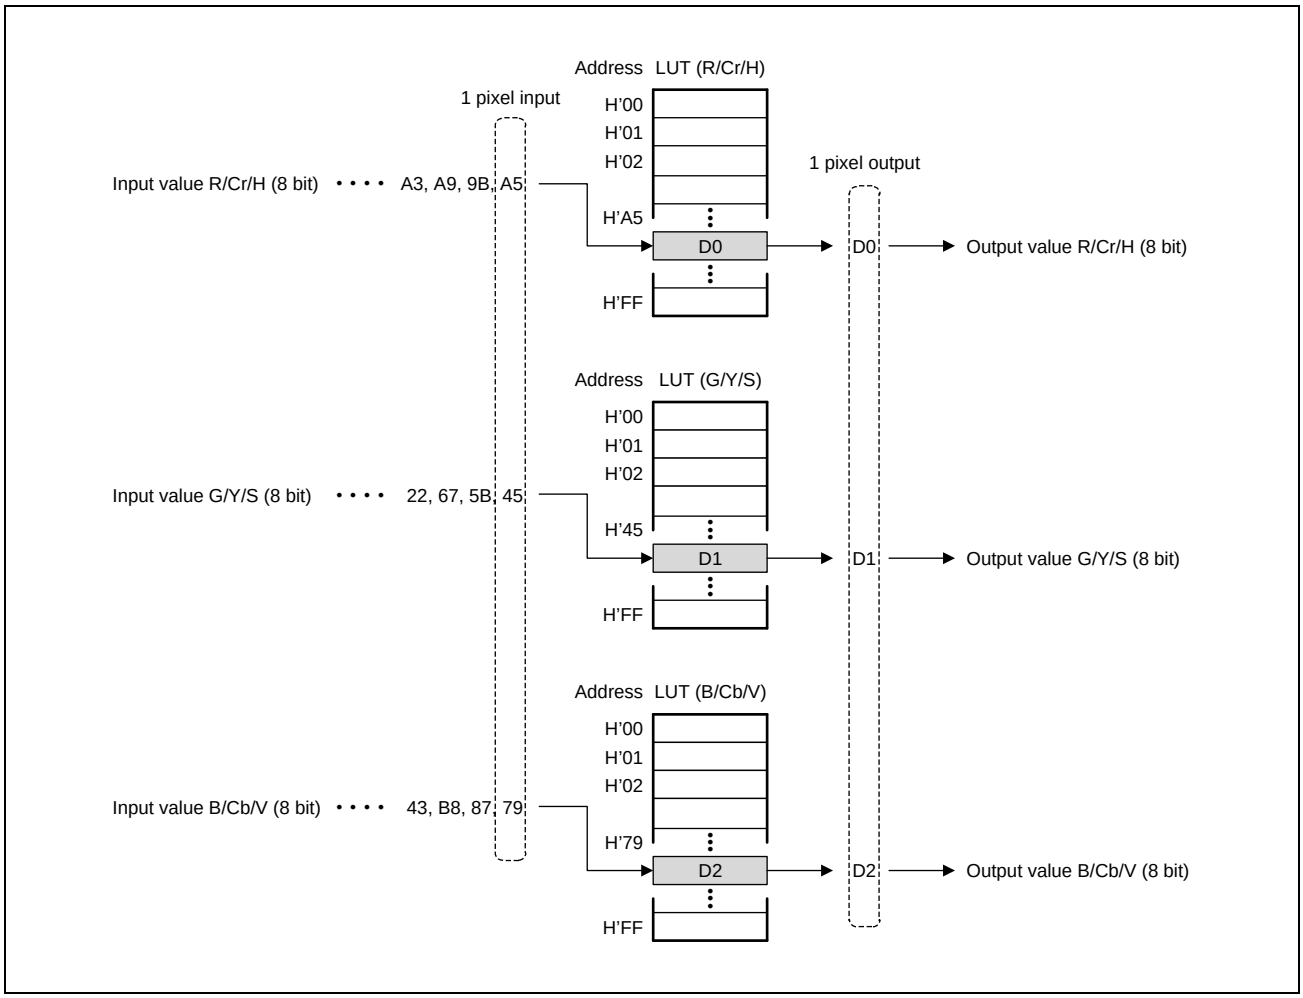


Figure 33.24 Relationship between Input and Output for 1D-LUT Table

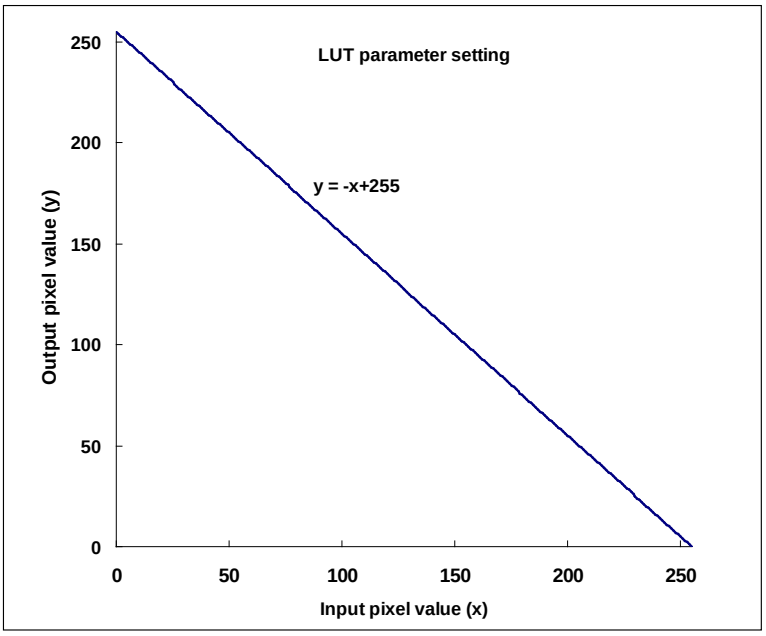

Figure 33.26 Setting Example of Negative-Positive Conversion

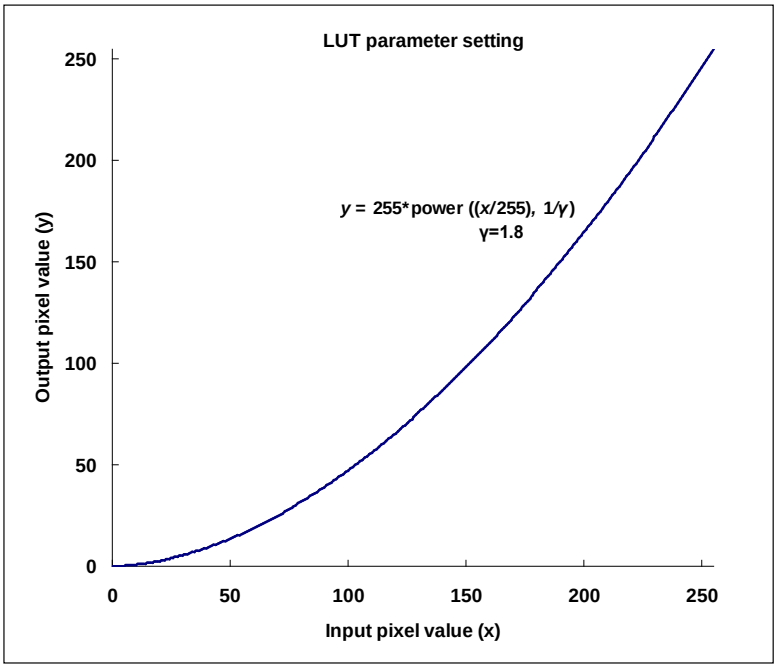

Figure 33.27 Setting Example of γ Correction

33.3.2.10 BRS Control Registers

(1) BRS Input Control Register (VI6_BRS_INCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	NRM	—	—	—	—	—	—	—	—	—	—	D1ON	D0ON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ODE1	DITH1[2:0]			ODE0	DITH0 [2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	NRM	0	R/W	Color Data Normalization Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in **Figure 33.28**) does not divide the color value by α 1: Divider (DIV unit in **Figure 33.28**) divides the color value by α
27 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	D1ON	0	R/W	Ordered dither (mode B) Enable of BRS Input 1 Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in **Figure 33.28**). 0: Dithering (mode B) of BRSin1 is disabled 1: Dithering (mode B) of BRSin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	0	R/W	Ordered dither (mode B) Enable of BRS Input 0 Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in **Figure 33.28**). 0: Dithering (mode B) of BRSin0 is disabled 1: Dithering (mode B) of BRSin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	ODE1	0	R/W	Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin1 is disabled. 1: Ordered dither (mode A) of BRSin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	DITH1[2:0]	All 0	R/W	Dithering of CH1 Input to BRS These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. 0: Dithering of BRSin1 input image is disabled 1: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors) 2: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors) 3: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors) 4: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors) 5: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors) 6, 7: Setting prohibited
3	ODE0	0	R/W	Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin0 is disabled. 1: Ordered dither (mode A) of BRSin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1. When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	All 0	R/W	Dithering of CH0 Input to BRS These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively.

Figure 33.28 shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in **Figure 33.22**, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the “virtual RPF” because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see **Section 33.3.2.10(4)**.

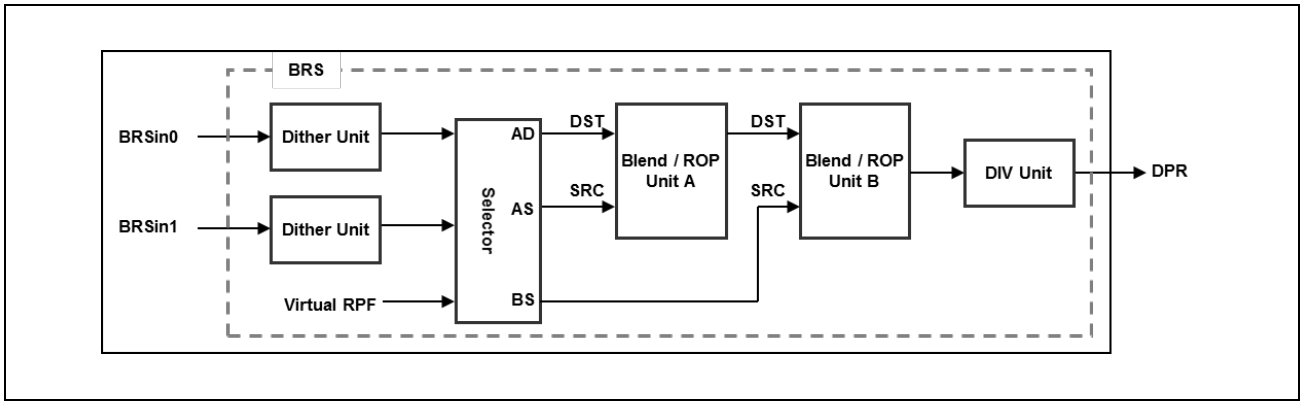

Figure 33.28 BRS Configuration

The selector in **Figure 33.28** is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in **Figure 33.28** or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in **Table 33.26**.

Table 33.26 Correspondence between Selector Output Destinations and Register Bits for BRS

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRSA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRSA_CTRL.SRCSEL
BS	Blending/ROP unit B - SRC	VI6_BRSB_CTRL.SRCSEL

(2) Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)

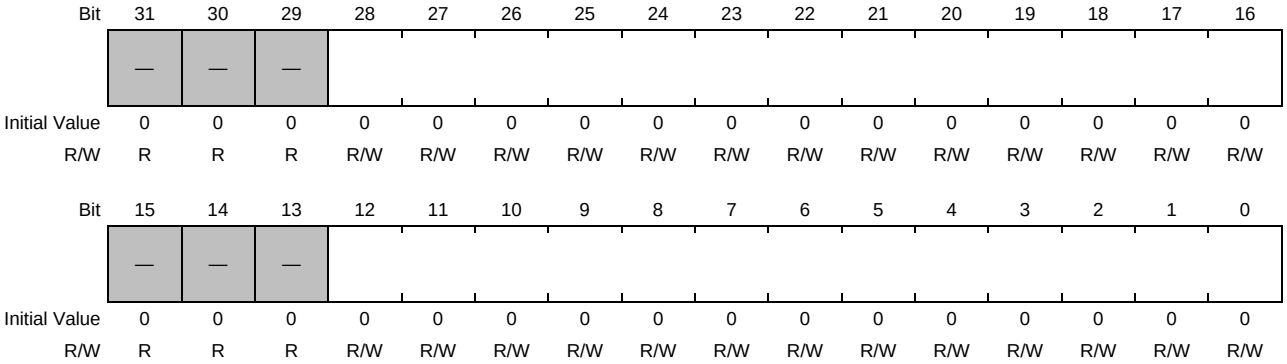
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VIR_HSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VIR_VSIZE[12:0]												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VIR_HSIZE [12:0]	All 0	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1920 can be specified.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VIR_VSIZE [12:0]	All 0	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in **Figure 33.28**. A value from 1 to 1080 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

(3) Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1919 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 1079 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.

(4) Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COL_A[7:0]								COL_RCR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COL_GY[7:0]								COL_BCB[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A[7:0]	All 0	R/W	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	All 0	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY[7:0]	All 0	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	All 0	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRS is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

[Case 1: When an input other than the virtual RPF is used]

When the source RPF is connected to any one of the BRS input ports (BRSin0 to BRSin1) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRS inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of “all BRS inputs must have the same color space”, as described in **Section 33.3.2.8(1)** or **Section 33.3.2.10(1)**.

[Case 2: When only the virtual RPF is used]

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRS, as shown in **Figure 33.29**. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRS is determined by the WPF setting.

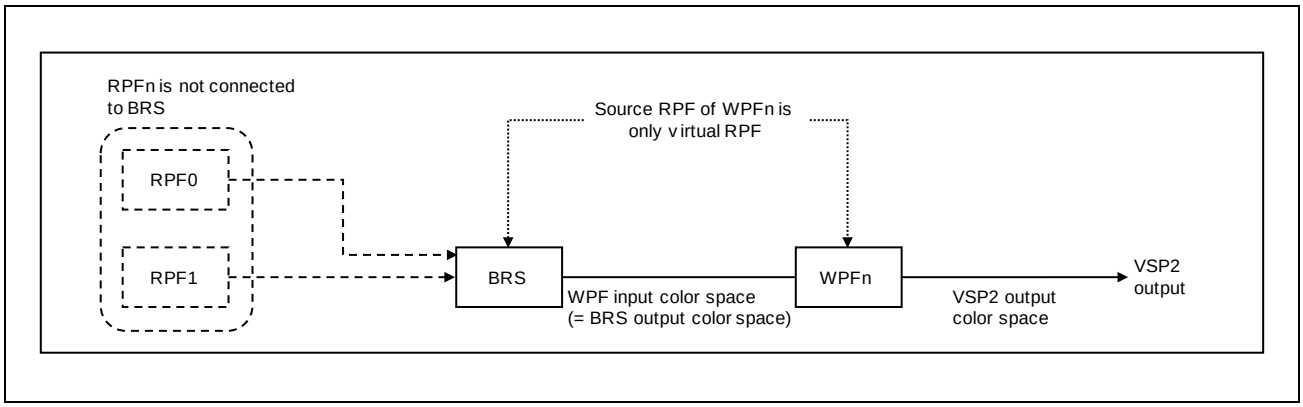


Figure 33.29 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 33.29, the output color space of the VSPD (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRS output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRU output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRU output color space) are the opposite. This relationship is summarized in **Table 33.27**.

The color space for the virtual RPF's color information should be set in this register according to the “BRS output color space” shown in **Table 33.27**.

Table 33.27 Relationship between WPF Output Color Space and BRS Output Color Space

VI6_WPFn_OUTFMT Register Bit Settings				BRU Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT		CSC		
0	(WPF output is RGB)	0	(YCbCr to RGB conversion is disabled)	RGB
0	(WPF output is RGB)	1	(YCbCr to RGB conversion is enabled)	YCbCr
1	(WPF output is YCbCr)	0	(RGB to YCbCr conversion is disabled)	YCbCr
1	(WPF output is YCbCr)	1	(RGB to YCbCr conversion is enabled)	RGB

(5) BRS Control Registers (VI6_BRSm_CTRL: m = A, B)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RBC	—	—	—	—	—	—	—	—	DSTSEL[2:0]			—	SRCSEL[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	LBA2[11:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

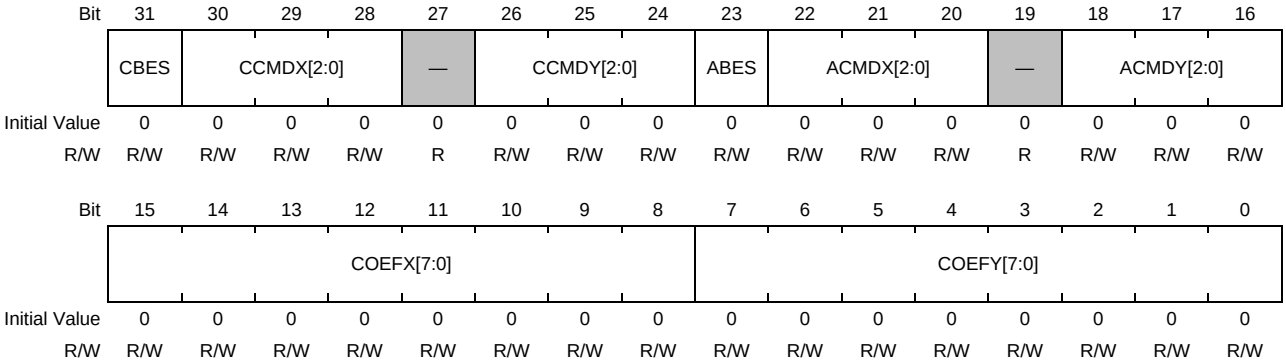
Bit	Bit Name	Initial Value	R/W	Description
31	RBC	0	R/W	Operation Type of Blending/ROP Unit m (m = A, B) Specifies the operation type for blending/ROP unit m (m = A, B) shown in **Figure 33.28**. 0: ROP (raster operation) 1: Blending operation
30 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22 to 20	DSTSEL[2:0]	All 0	R/W	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in **Figure 33.28**. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to DST 001b: BRS input 1 (BRSin1) is input to DST 100b: Virtual RPF is input to DST 010b, 011b, 101b to 111b: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit B is reserved. The write value should always be 0.
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	SRCSEL[2:0]	All 0	R/W	Input Selection for SRC Side of Blending/ROP Unit m (m = A, B) These bits select the input for the SRC side of blending/ROP unit m (m = A, B) shown in **Figure 33.28**.These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. 000b: BRS input 0 (BRSin0) is input to SRC 001b: BRS input 1 (BRSin1) is input to SRC 100b: Virtual RPF is input to SRC 010b, 011b, 101b to 111b: Setting prohibited [Note] The SRCSEL bits for blending/ROP unit B are reserved. The write value should always be 0.
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	CROP[3:0]	All 0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.28**.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	AROP[3:0]	All 0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from **Table 33.28**.

Table 33.28 ROP Operator of Blending/ROP Unit m (m = A, B)

Opcode	Operator
0000b	NOP(D)
0001b	AND(S & D)
0010b	AND_REVERSE(S & ~D)
0011b	COPY(S)
0100b	AND_INVERTED(~S & D)
0101b	CLEAR(0)
0110b	XOR(S ^ D)
0111b	OR(S | D)
1000b	NOR(~(S | D))
1001b	EQUIV(~(S ^ D))
1010b	INVERT(~D)
1011b	OR_REVERSE(S | ~D)
1100b	COPY_INVERTED(~S)
1101b	OR_INVERTED(~S | D)
1110b	NAND(~(S & D))
1111b	SET(all1)

(6) BRS Blend Control Registers (VI6_BRSm_BLD: m = A, B)



Bit	Bit Name	Initial Value	R/W	Description
31	CBES	0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: CCMDX * (DST color data) + CCMDY * (SRC color data) 1: CCMDX * (DST color data) - CCMDY * (SRC color data)
30 to 28	CCMDX[2:0]	All 0	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient X 001b: 255 - (DST α data) is used as blending coefficient X 010b: SRC α data is used as blending coefficient X 011b: 255 - (SRC α data) is used as blending coefficient X 100b: Fixed α value 0 (COEFX setting)
27	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 24	CCMDY[2:0]	All 0	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. 000b: DST α data is used as blending coefficient Y 001b: 255 - (DST α data) is used as blending coefficient Y 010b: SRC α data is used as blending coefficient Y 011b: 255 - (SRC α data) is used as blending coefficient Y 100b: Fixed α value 1 (COEFY setting) When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.
23	ABES	0	R/W	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B, C, D, E). α creation coefficients are specified by the ACMDX and ACMDY bits. 0: ACMDX * (DST α data) + ACMDY * (SRC α data) 1: ACMDX * (DST α data) - ACMDY * (SRC α data)
22 to 20	ACMDX[2:0]	All 0	R/W	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient X) = (DST α data) 001b: (α creation coefficient X) = 255 - (DST α data) 010b: (α creation coefficient X) = (SRC α data) 011b: (α creation coefficient X) = 255 - (SRC α data) 100b: (α creation coefficient X) = Fixed α value 0 (COEFX setting) 101b to 111b: Setting prohibited
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	ACMDY[2:0]	All 0	R/W	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. 000b: (α creation coefficient Y) = (DST α data) 001b: (α creation coefficient Y) = 255 - (DST α data) 010b: (α creation coefficient Y) = (SRC α data) 011b: (α creation coefficient Y) = 255 - (SRC α data) 100b: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) 101b to 111b: Setting prohibited
15 to 8	COEFX[7:0]	All 0	R/W	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to 100b. A value from H'00 to H'FF can be specified.
7 to 0	COEFY[7:0]	All 0	R/W	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to 100b. A value from H'00 to H'FF can be specified.

33.3.2.11 LIF Control Registers

(1) LIFn Control Register (VI6_LIFn_CTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	OBTH [11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	PADL	—	—	—	CFMT	—	—	REQSEL	LIF_EN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	OBTH [11:0]	0	R/W	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1.
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	PADL	0	R/W	Enable/Disable of padding with dummy lines to output-image to the DU. [LIF0 only] Enables or disables of padding with dummy lines to output-image to the DU. 0: Padding with dummy lines to output image to DU is disabled. 1: Padding with dummy lines to output image to DU is enabled.
7 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	CFMT	0	R/W	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0. 0: YCbCr444 or RGB Format 1: YCbCr422 Format [Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in **Figure 33.30**.
3, 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	REQSEL	0	R/W	External Display Module Selection 0: This value is setting prohibited when 1 is set to LIF_EN 1: DU is selected as the destination external display module.
0	LIF_EN	0	R/W	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to the external display module (DU). 0: Data output to the external display module is disabled. 1: Data output to the external display module is enabled.

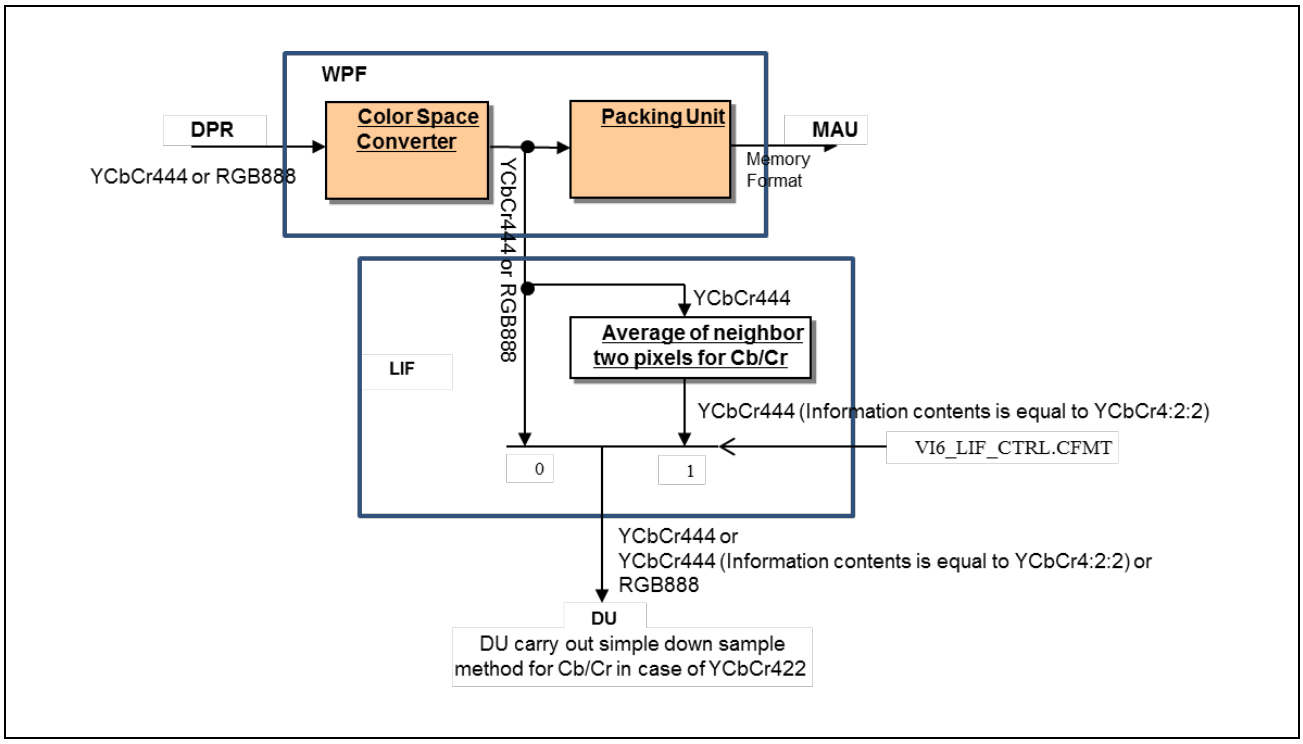


Figure 33.30 Data flow between LIF and DU

(2) LIFn Clock Stop Buffer Control Register (VI6_LIFn_CSBTH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	HBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LBTH[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	HBTH[11:0]	0	R/W	Buffer Threshold for Start Ready Notification to Display Module Always specify 1500, when LIF_EN is set to 1.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LBTH[11:0]	0	R/W	Buffer Threshold for Clock Start in Dynamic Clock Control Set LBTH[11:0] = 0 (fixed value)

(3) LIF0 Buffer Attribute Register (VI6_LIF0_LBA)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LBA0	—	—	—	LBA1[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LBA2[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LBA0	0	R/W	LIF Buffer Attribute Register0 Always specify 1, when LIF_EN is set to 1
30 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	LBA1[11:0]	0	R/W	LIF Buffer Attribute Register1 Always specify 1536, when LIF_EN is set to 1
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LBA2[11:0]	0	R	LIF Buffer Attribute Register2 These bits are internal status for purpose of h/w debugging.

(4) LIF0 Padding Line Cycle Register (VI6_LIF0_PADLN_CYC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	PADLN_CYC[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	PADLN_CYC [5:0]	0	R/W	Cycle of padding pattern. These bits specify the minimum number of cycles of the padding pattern of valid lines and dummy lines. For example, if PADLN_CYC[5:0] is 4, lower 4 bits of PADLN_PATTERN[3:0] indicates padding pattern. A value from 1 to 32 can be specified.

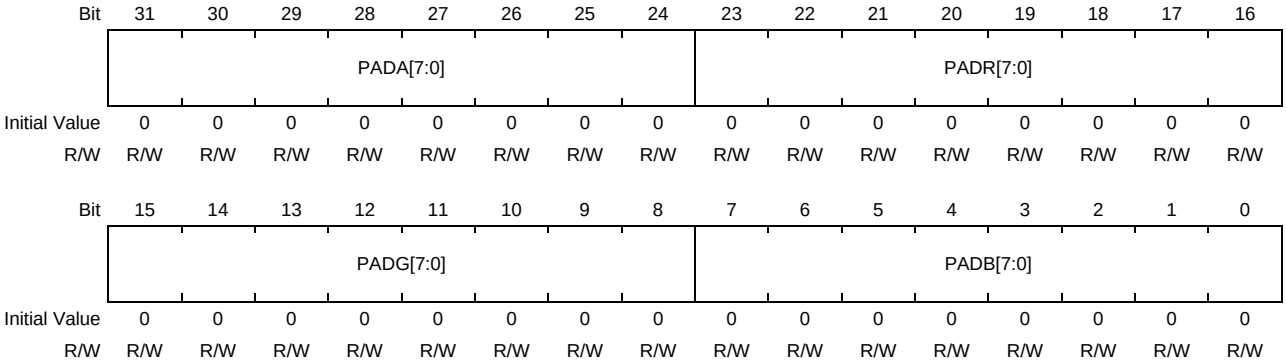
(5) LIF0 Padding Line Pattern Register (VI6_LIF0_PADLN_PT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PADLN_PATTERN[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PADLN_PATTERN[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PADLN_PAT TERN[31:0]	0	R/W	Pattern of padding with dummy lines These bits specify the padding pattern of valid lines and dummy lines. In each bit, 0b indicates an active line, 1b indicates a dummy line. It starts from the lower bit (Bit 0). First line should be valid line (Always set 0 to PADLN_PATTERN[0]).

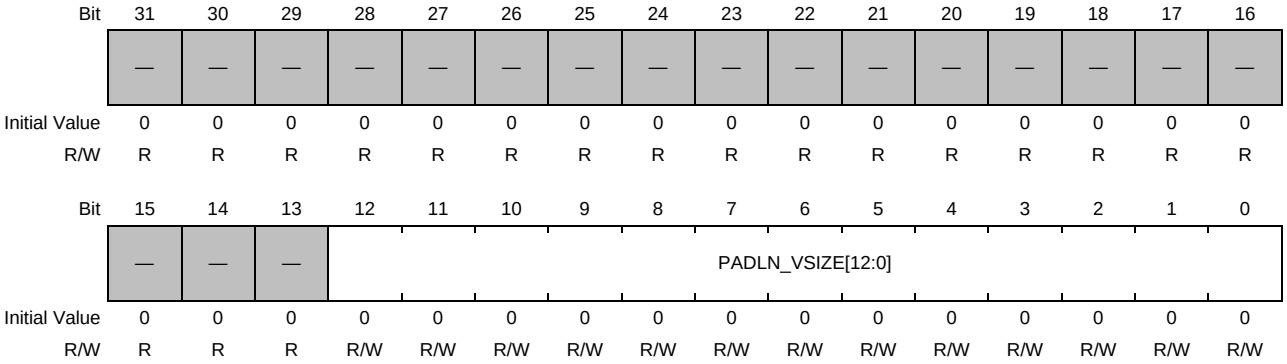
(6) LIF0 Padding Line Value Register (VI6_LIF0_PADLN_VAL)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PADA[7:0]	0	R/W	Padding data of EDC code for dummy line.
23 to 16	PADR[7:0]	0	R/W	Padding data of R/Cr for dummy line.
15 to 8	PADG[7:0]	0	R/W	Padding data of G/Y for dummy line.
7 to 0	PADB[7:0]	0	R/W	Padding data of B/Cb for dummy line.

Note: Set H'24FFFFFF to the register, when output format is YUV422. Set H'2EFFFFFF to the register in other case.

(7) LIF0 Padding Line Size Register (VI6_LIF0_PADLN_SIZE)



Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	PADLN_VSIZE[12:0]	0	R/W	Vertical Size of LIF output in case of enabling Padding line When VI6_LIF0_CTRL.PADL is 1, dummy lines are included in the output data from LIF, so set the LIF output VSIZE including dummy lines to these bits. If the number of output lines does not reach the value of PADLN_VSIZE [12:0] even if all valid lines are output according to padding pattern, dummy lines are inserted until the number of output lines reaches PADLN_VSIZE [12:0]. • Output vsize of LIF is same with input vsize to LIF when VI6_LIF0_CTRL.PADL is 0 • Output vsize of LIF is PADLN_VSIZE [12:0] when VI6_LIF0_CTRL.PADL is 1

33.3.3 DU Registers

33.3.3.1 DU Module Control Register 0 (DU_MCR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PB_CLR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DI_EN	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved
16	PB_CLR	0	R/W	Clear PBUF pointers. This parameter must be changed while VSPD is not running and DU_MSR0.ST_DIF_BSY is “0”. Writing “1”. to this parameter starts clearing the PBUF pointers. After clearing the PBUF pointers is completed, DU_MSR0.ST_PB_WINIT and DU_MSR0.ST_PB_RINIT are read as “1”, this parameter must be written back to “0”.
15 to 9	—	All 0	R	Reserved
8	DI_EN	0	R/W	Display enable. 1: Enable 0: Disable
7 to 0	—	All 0	R	Reserved

33.3.3.2 DU Module Status Register 0 (DU_MSR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	ST_PB_RINIT	ST_PB_RUF	ST_PB_REMPTY	—	ST_PB_WINIT	—	ST_PB_WFULL
Initial Value	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ST_DI_BSY	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
22	ST_PB_RINIT	1	R	PBUF FIFO read pointer cleared status. 1: Cleared (initial value) 0: Not cleared
21	ST_PB_RUF	0	R	PBUF read underflow status. This parameter clears when PBUF pointers are cleared. 1: Occur PBUF underflow 0: Not occur PBUF underflow
20	ST_PB_REMPTY	1	R	PBUF read empty status. 1: Empty 0: Not empty
19	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	ST_PB_WINIT	1	R	PBUF FIFO write pointer cleared status. 1: Cleared (initial value) 0: Not cleared
17	—	0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	ST_PB_WFULL	0	R	PBUF write full status. 1: Full 0: Not full
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	ST_DI_BSY	0	R	Display I/F status. 1: Busy 0: Idle
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

33.3.3.3 DU Module Status Register 1 (DU_MSR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	UF_VACT												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	UF_HACT												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	UF_VACT	H'0000	R	Vactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from VACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	UF_HACT	H'0000	R	Hactive counter when the PBUF underflow occurs. This parameter is value latched the down counter starting from HACTIVE. This parameter is cleared when DU_MSR0.ST_PB_RUF is cleared.

33.3.3.4 DU Interrupt Mask Register 0 (DU_IMR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IM_PB_RUF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	IM_PB_RUF	0	R/W	Mask PBUF read underflow interrupt. 1: Mask interrupt 0: Not mask interrupt

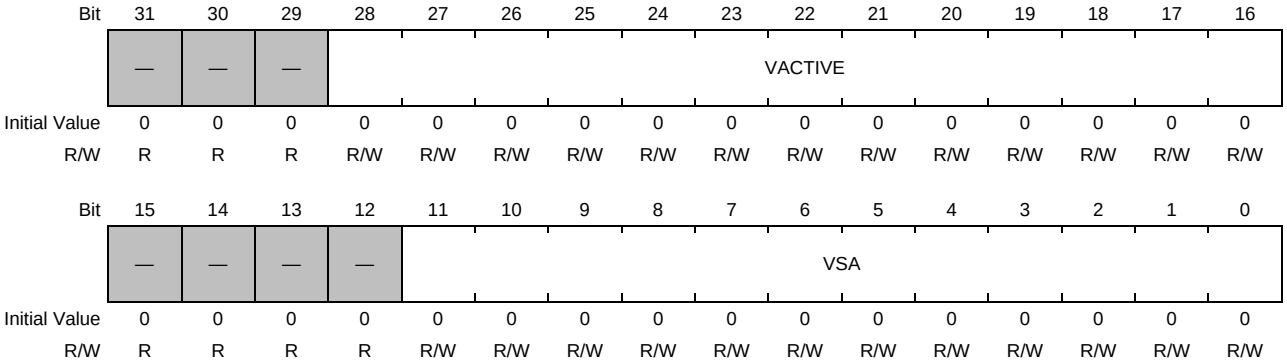
33.3.3.5 DU Display I/F Timing Register 0 (DU_DITR0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSPOL	VSPOL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DEMD		—	—	—	—	—	—	—	DPI_CLKMD
Initial Value	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	HSPOL	1	R/W	hsync polarity. 1: High active 0: Low active
16	VSPOL	1	R/W	vsync polarity. 1: High active 0: Low active
15 to 10	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9, 8	DEMD	11b	R/W	de output mode. 00: Fixed to Low 01: Reserved 10: Reserved 11: Data enable (High active)
7 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	DPI_CLKMD	0	R/W	Display parallel interface clock mode. 0: Through output 1: Inversion output

33.3.3.6 DU Display I/F Timing Register 1 (DU_DITR1)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VACTIVE	H'0000	R/W	The number of lines in the Vactive period. This parameter should be more than 0.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VSA	H'000	R/W	The number of lines in the Vsync period. This parameter should be 0 or more, and DU_DITR1.VSA + DU_DITR2.VBP should be more than 0. If set 0, Vsync is not asserted to DU_DITR0.VSPOL.

Figure 33.31 shows the relationship between the parameters and the video output timings.

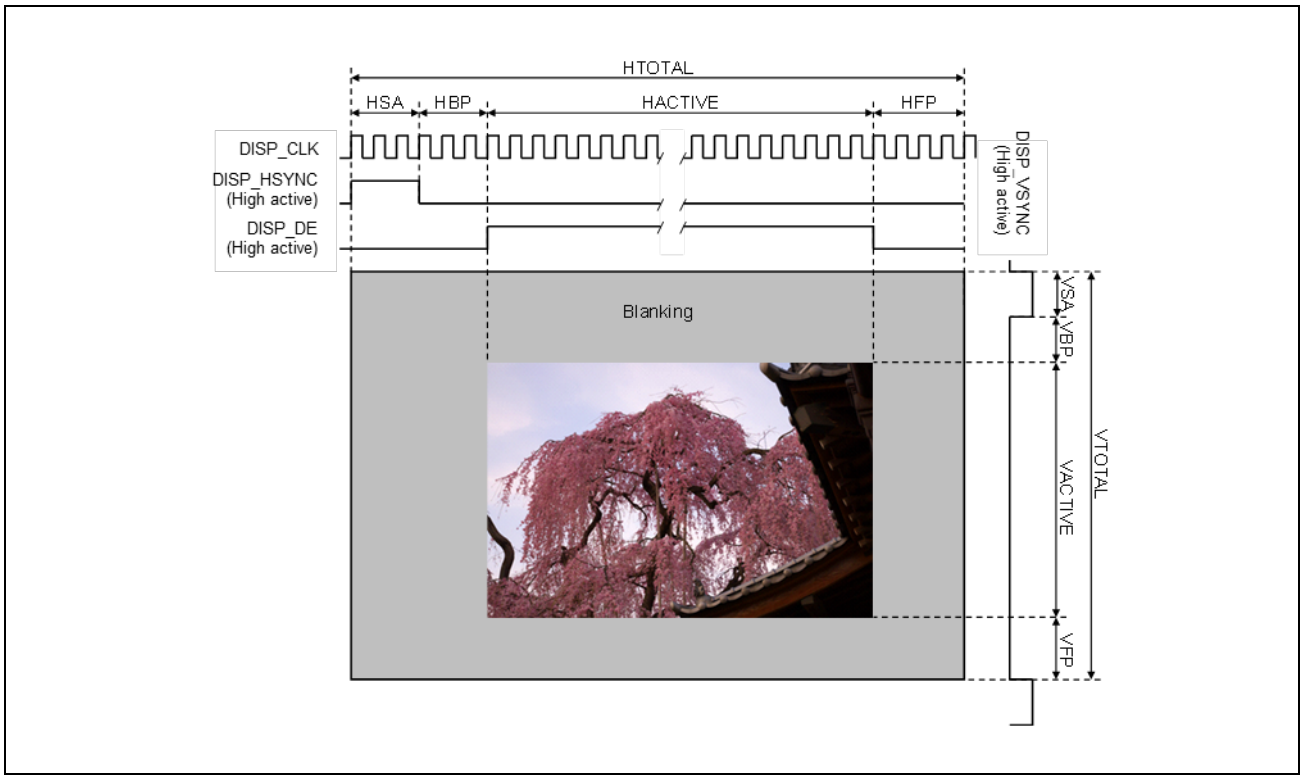


Figure 33.31 Video output timings

33.3.3.7 DU Display I/F Timing Register 2 (DU_DITR2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	VFP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VBP												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	VFP	H'0000	R/W	The number of lines in the Vfront period. This parameter should be 0 or more.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	VBP	H'0000	R/W	The number of lines in the Vback period. This parameter should be 0 or more, and DU_DITR1.VSA + DU_DITR2.VBP should be more than 0.

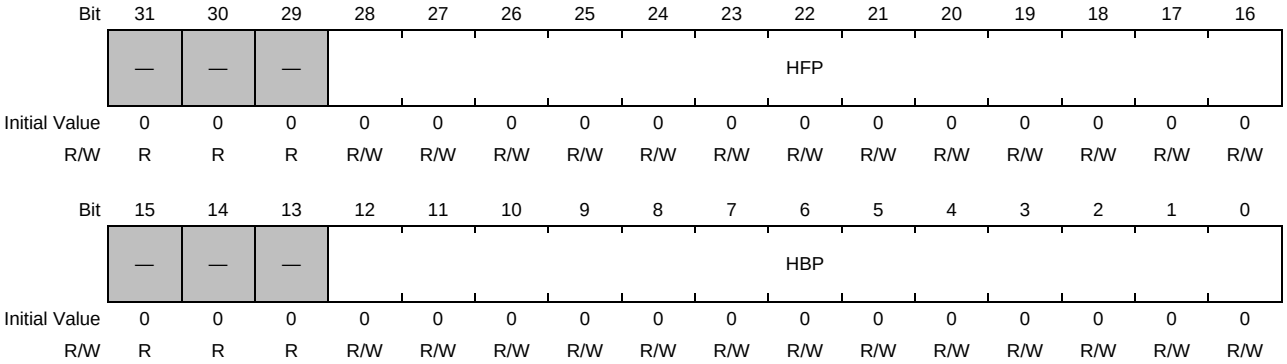
33.3.3.8 DU Display I/F Timing Register 3 (DU_DITR3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	HACTIVE												
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HSA											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HACTIVE	H'0000	R/W	The number of cycles (pixels) in the Hactive period. This parameter should be more than 0.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	HSA	H'000	R/W	The number of cycles in the Hsync period. This parameter should be 0 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP + DU_DITR5.HSFT (=Hblank) should be 3 or more. If set 0, Hsync is not asserted to DU_DITR0.HSPOL.

33.3.3.9 DU Display I/F Timing Register 4 (DU_DITR4)



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	HFP	H'0000	R/W	The number of cycles in the Hfront period. This parameter should be 1 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP + DU_DITR5.HSFT (=Hblank) should be 3 or more.
15 to 13	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	HBP	H'0000	R/W	The number of cycles in the Hback period. This parameter should be 0 or more, and DU_DITR3.HSA + DU_DITR4.HBP + DU_DITR4.HFP + DU_DITR5.HSFT (=Hblank) should be 3 or more.

33.3.3.10 DU Display I/F Timing Register 5 (DU_DITR5)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
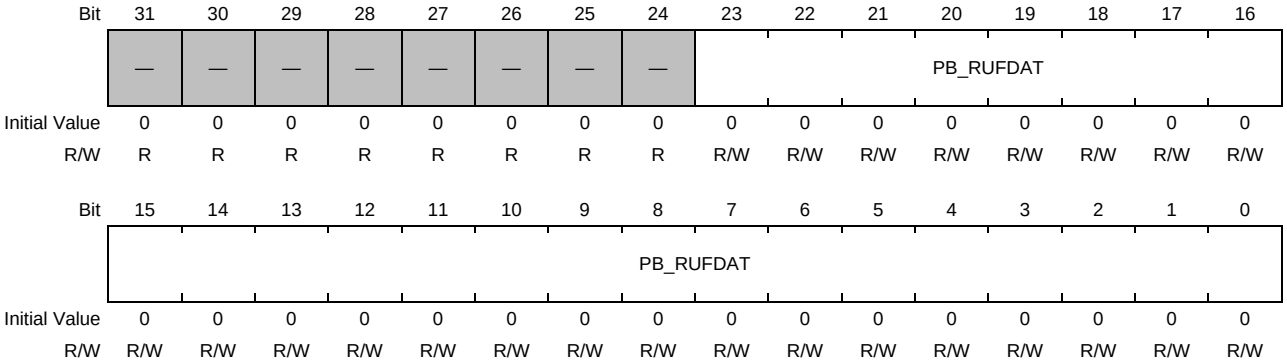
31 to 1	—	H'0000_0000	R	Reserved When read, the initial value is read. The written value will be ignored.
0	PB_RUFOP	0	R/W	Specify behavior when the PBUF underflow occurs. 0: Continue outputting invalid data 1: Output DU_PBCR2.PB_RUFDAT

33.3.3.14 DU PBUF Control Register 2 (DU_PBCR2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'00	R	Reserved When read, the initial value is read. The written value will be ignored.
23 to 0	PB_RUFDAT	H'00_0000	R/W	Read data when the PBUF underflow occurs.

33.4 Operation

33.4.1 Operation Control Setting

(a) FCPVD initialization

FCPVD must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don’t need to be set for every image process.

- Set 0 to FCP_CFG0.FCPVSEL to enable configuration of FCPVD.

(b) To start image process

FCPVD registers do not need to be set when starting an image process. Therefore, refer the **Section 33.4.4** for the guidance of starting an image process.

(c) To stop image process immediately

Do following steps to stop immediately an image process

1. Set value 1 to DU register DU_MCR0.DI_EN so that DU can stop to output.
2. Set value 1 to VSPD register VI6_WPF0_IRQ_ENB.FREE so that frame end interruption can be issued.
3. Set value 1 to VSPD register VI6_SRESET.SRST0. VSPD will invoke termination process immediately.
4. Wait frame end interruption from VSPD or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPD has finished its processing.
5. Set value 1 to FCPVD register FCP_RST.SOFTRST. FCPVD will invoke termination process immediately.
6. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPVD has finished its processing.
7. Wait until ST_DI_BSY bit of the DU register DU_MSR0 become 0. After it occurs, DU has stopped outputting.

With this procedure, VSPD can stop its process quickly, but the output frame of the last frame is corrupted.

33.4.2 Reset Operation

FCPVD reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPVD operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPVD logic immediately.

33.4.2.1 Software Reset

1) Activate software reset sequence

Set FCP_RST.SOFTRST to the value 1.

2) Confirm software reset sequence finished:

FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

33.4.2.2 Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of LCDC.

33.4.3 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set H'0000 0808 to VI6_CLK_DCSWT

[2] Always set D'256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set D'2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set D'1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set D'0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set H'0000 0500 toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[7] Always set D'1500 to VI6_LIF0_CTRL.OBTH [11:0] in case of using LIF (VI6_LIF0_CTRL.LIF_EN = 1).

[8] Always set H'8600 0000 to VI6_LIF0_LBA in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[9] Always set D'1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[10] Always set D'0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

33.4.4 Concept of VSPD Operation Starting and Stopping

The VSPD provides one channel of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0, which are output modules of the VSPD. Use the start registers shown in **Table 33.29** to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in **Table 33.29**; clearing a source register cancels the corresponding interrupt signal. Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. **Figure 33.33** shows these operation timings.

Table 33.29 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT

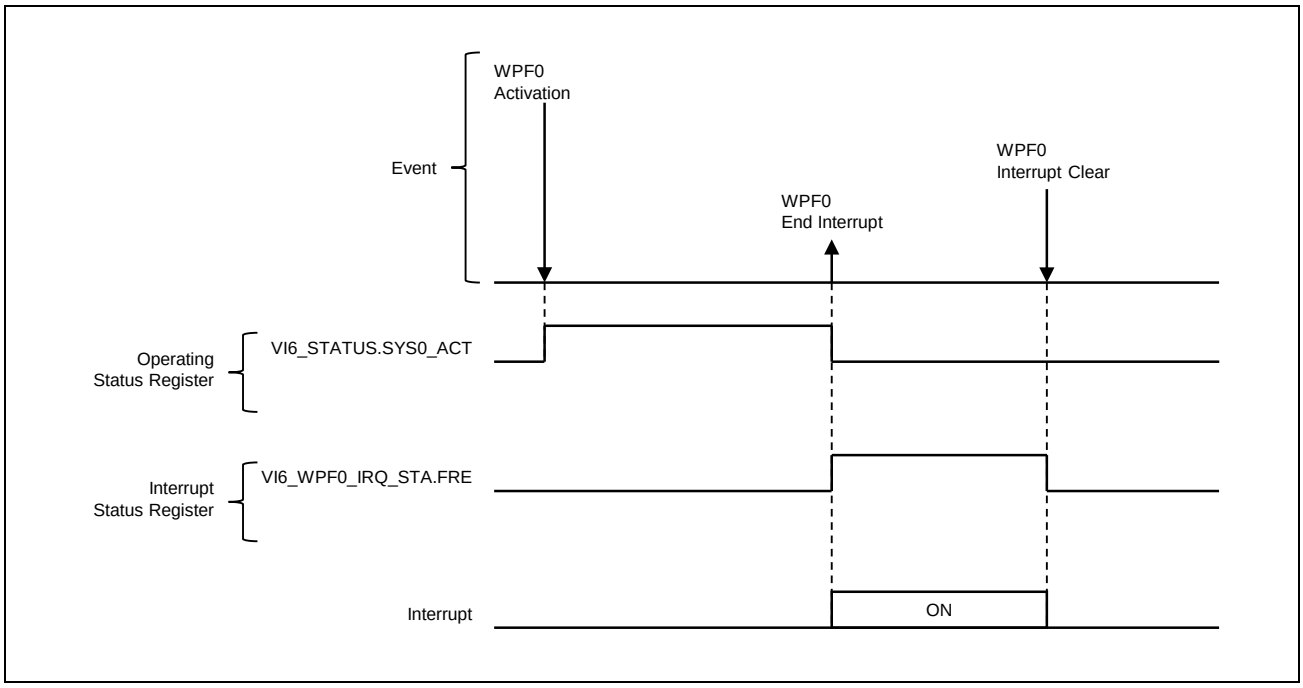


Figure 33.33 VSPD Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSPD internal modules. As described in **Section 33.3.2**, the VSPD has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRS is WPF0, the BRS operating state is the same as that of WPF0; that is, the BRS operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in **Table 33.29** and the status change timing is shown as VI6_STATUS. SYS0_ACT in **Figure 33.33**. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSPD will hang.

Figure 33.34 shows relation between start reservation and operating status. When start is reserved while VSPD is operating, the reservation is accepted after VSPD status is moved from “operating” into “idle” as shown in **Figure 33.34**.

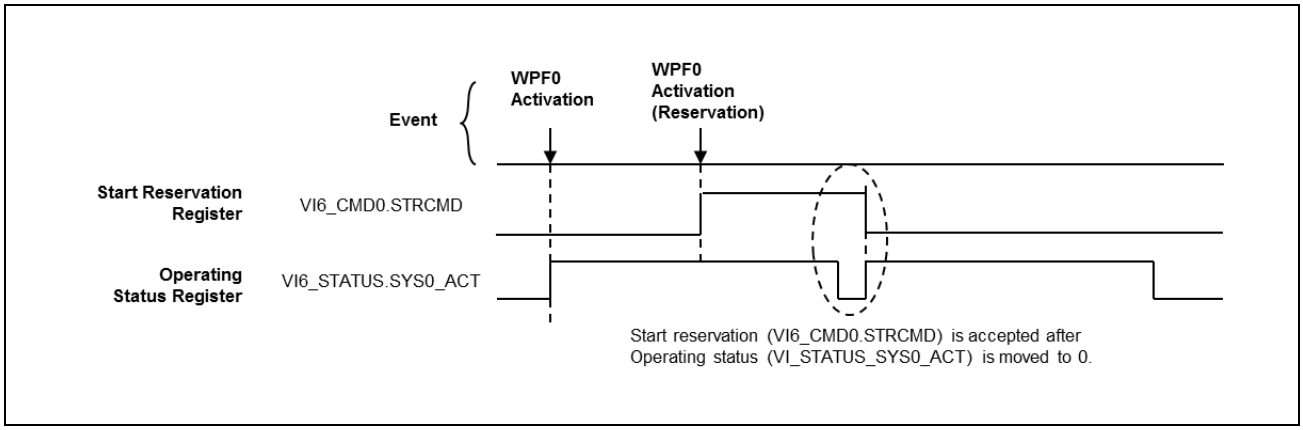

Figure 33.34 VSPD Start reservation and Operating status

33.4.5 Display List

33.4.5.1 Functional Description

The VSPD provides the display list function. As a display list, the VSPD automatically downloads the register settings except for the control registers (**Sections 33.3.2.4** and **Section 33.3.2.5**) from external memory and stores the settings in the VSPD registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSPD processing are prepared in advance in external memory such as SDRAM.

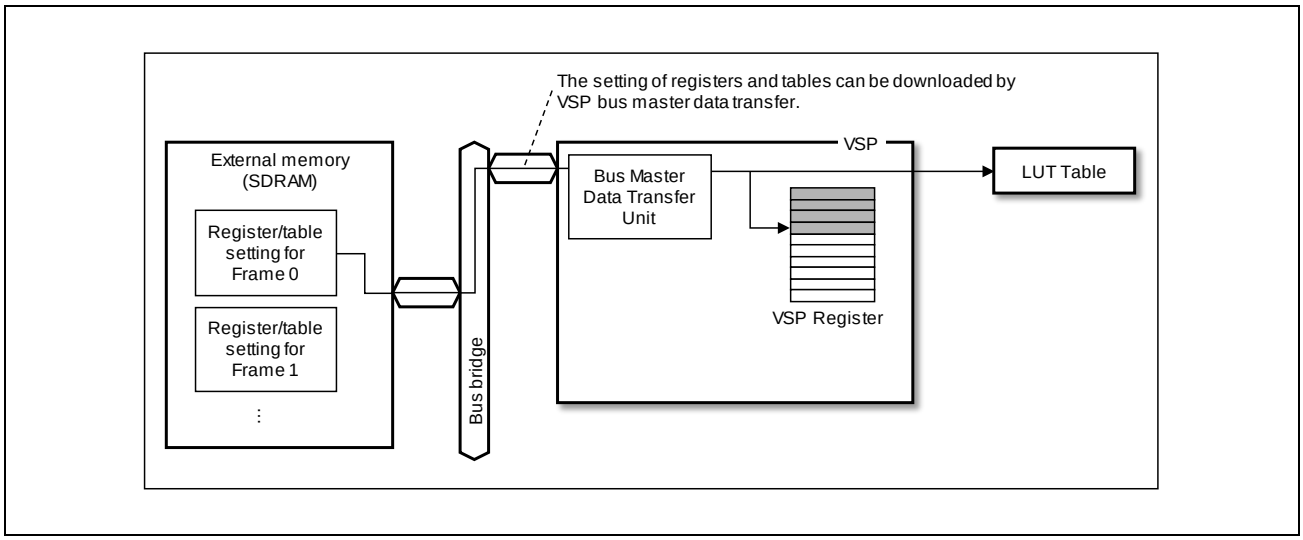

Figure 33.35 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in **Section 33.3.2.5**. The register settings or various types of information should be stored in external memory in the format described in **Section 33.4.5.2**. **Figure 33.36** shows the difference between VSPD operation through normal register settings and through display lists.

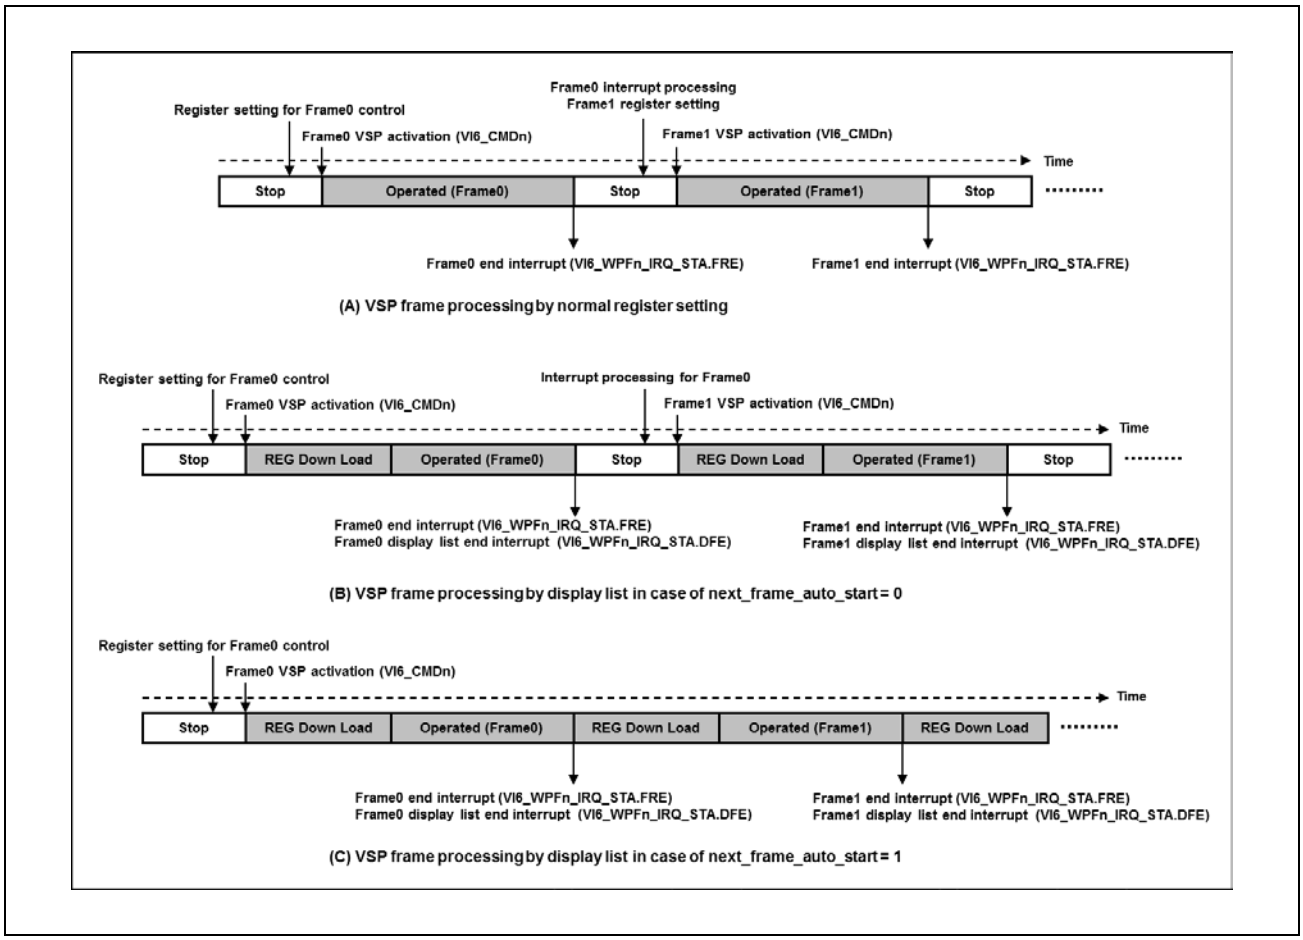

Figure 33.36 Comparison of VSPD Operation between Normal Register Settings and Display Lists

As shown in **Figure 33.36** (A), in the VSPD processing through normal register settings, all registers should be set up before the VSPD is started for each frame. After the VSPD processing is completed, the VSPD outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSPD automatically downloads register settings from external memory as shown in **Figure 33.36** (B) and (C), which reduces the load on the CPU between frames.

Figure 33.36 (B) shows the display list usage where the VSPD stops at the end of every frame; only the VSPD start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSPD is large. In the case shown in **Figure 33.36** (C), as soon as the frame processing ends, the VSPD automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 33.30 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 33.30 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

33.4.5.2 Normal Display List Mode

The VSPD display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. **Figure 33.37** shows the display list structure.

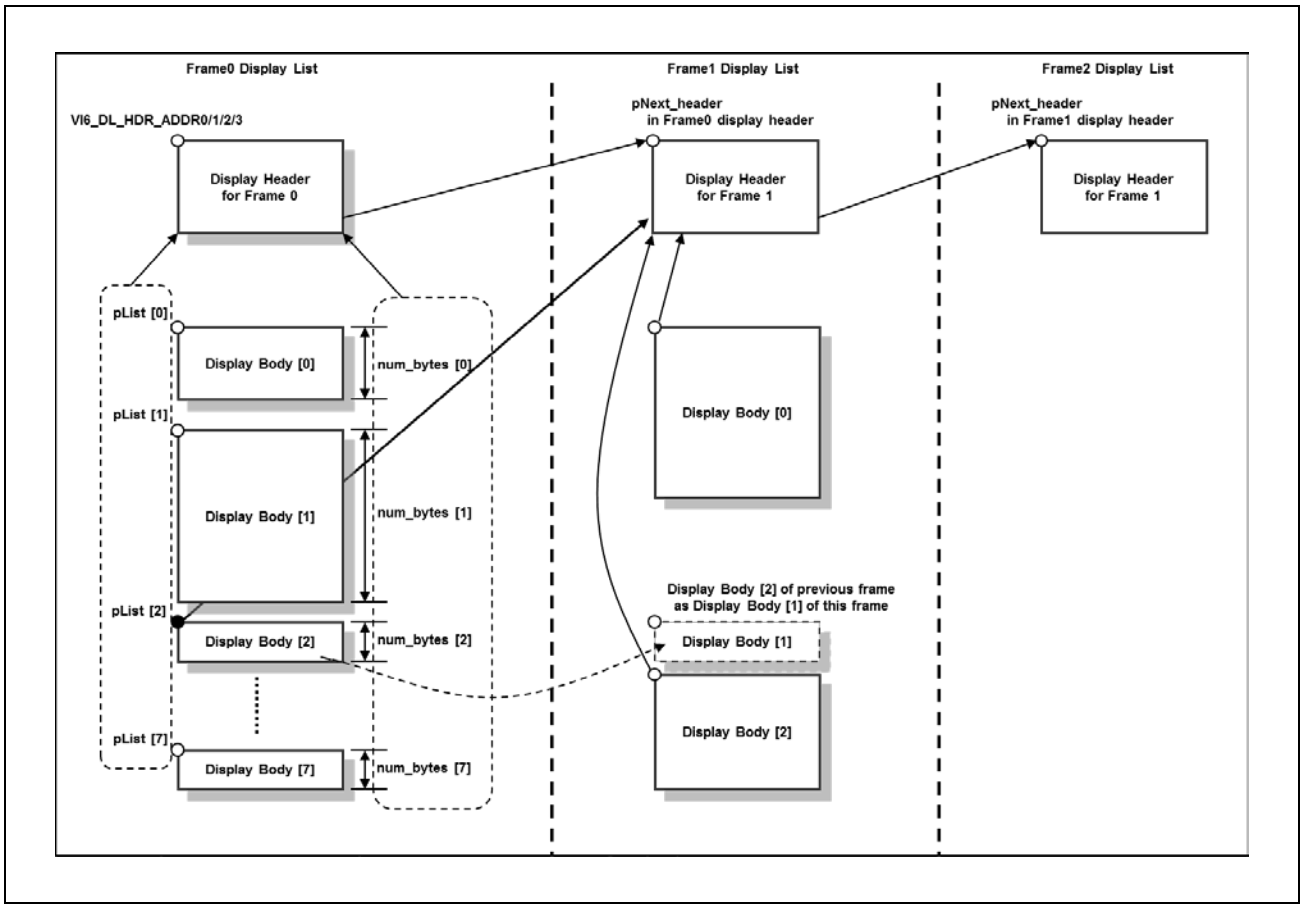

Figure 33.37 Structure and Concept of VSPD Display List

A VSPD display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSPD analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSPD registers described in **Section 33.3.2.5**. When activated in a mode that uses display lists, the VSPD downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0 (number 0 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSPD becomes ready for frame image processing; the VSPD then starts the actual frame processing.

After processing of a frame ends, the VSPD proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in **Figure 33.36**. In one mode, the VSPD stops operation and waits for the next activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0 while the VSPD is stopped. When the VSPD is started after a correct value is specified, the VSPD starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSPD after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSPD downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSPD starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSPD continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, **Table 33.31** defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, **Table 33.32** defines the header section format of a display list and **Table 33.33** defines the body section format and **Table 33.34** defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. **Table 33.35** shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (see the **Section 33.3.2.5(3)**).

Table 33.31 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (I = 0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

wait_wup	1
zero_bits (3)	
ignore_upd_dl	1
zero_bits (2)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSPD keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
wait_wup	When this bit is 1, VSPD starts reading image data from external memory after WUP (Wake Up) signal from any channel of VIN asserts. This bit is available for WPF0.
ignore_upd_dl	If this bit is set to 1, new display list pointed by VI6_DL_HDR_ADDR0 is not downloaded in VSPD H/W for the next frame, even if S/W sets VI6_DL_HDR_ADDR0 during the frame. New display list is downloaded in VSPD H/W at next frame of the processing which this bit is 0. This bit is available for WPF0.
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSPD generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSPD starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSPD stops operation when one-frame processing by this display header ends. In this case, start the VSPD through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSPD executes the extended display list for frame preprocessing. The VSPD does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 33.33 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
{	
for (i =0; i<num_bytes; i+=8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. Note : Register space of VSPD is 32Kbyte (H'0000 - H'7FFC). So, set 0 to upper 17bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

33.4.5.3 Header-less Display List Mode

The header-less display list does not have the display header listed in **Table 33.32**, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the **Section 33.3.2.5(1)**) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

33.4.5.4 Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed.
2. Do not execute write access to the same LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSPD is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.36**.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in **Table 33.36**.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in **Section 33.3.2.3**.

6. Manipulation and setting of the registers described in **Section 33.3.2.4** and **Section 33.3.2.5** through a display list is prohibited.
7. The extended display list function enabled by VI6_DL_EXT_CTRL.EXT is to control the registers of the ICB connected with the VSPD. Do not use extended display lists for any other purpose.

33.4.6 Interrupt Processing

When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in WPF independently, the VSPD has the following registers to control interrupts in WPF.

WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0) (refer to **Section 33.3.2.4(12)**)

WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0) (refer to **Section 33.3.2.4(13)**)

CAUTION

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSPD.

33.4.7 Lookup Table Settings

33.4.7.1 LUT

For a single entry to the LUT space (see **Table 33.36**) of the VSPD, the LUT data is set by a write access in the format shown in **Figure 33.38**.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + H'7000 + 7 × 4 = (offset address) + H'701C.

Table 33.36 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in **Table 33.36** is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 33.36 LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_LUT_TBL	(offset address) + H'7000 to (offset address) + H'73FC	256	LUT

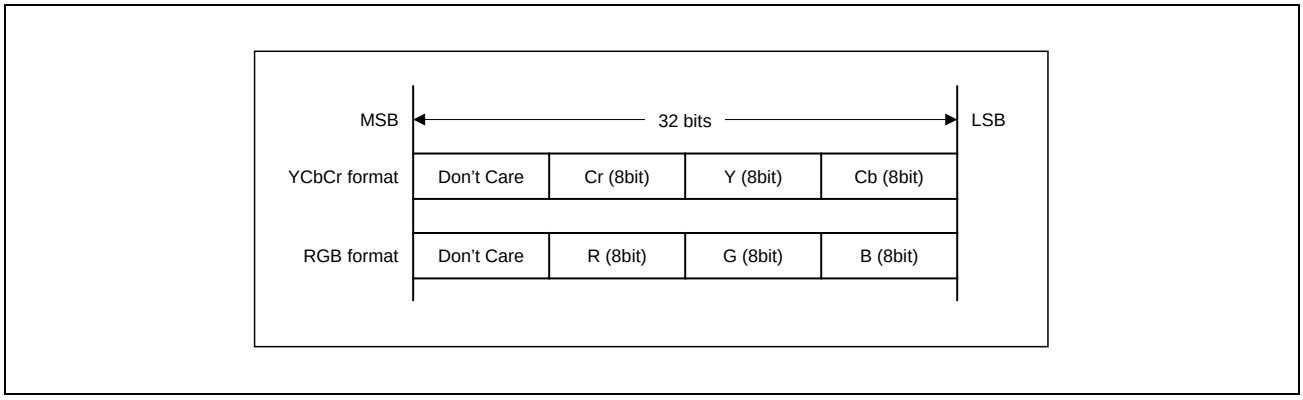

Figure 33.38 VI6_LUT_TBL Formats

33.4.8 Linked with DU

33.4.8.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD by using Normal Display List Mode. For details of Normal Display List Mode, refer to **Section 33.4.5.2**.

Figure 33.39 to **Figure 33.41** shows a procedure (register setting flow) to display image data to display panel.

Figure 33.39 shows setting flow to start VSPD/LIF0 linked with DU. **Figure 33.40** shows setting flow to update display image. **Figure 33.41** shows setting flow to stop VSPD/LIF0 linked with DU.

Using display list with enabling next_frame_auto_start shown in **Section 33.4.5** is required to take the flow from **Figure 33.39** to **Figure 33.41**.

NOTE

If display sync operation ([1-8] step in **Figure 33.39**) is set before activating the VSPD, invalid data is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

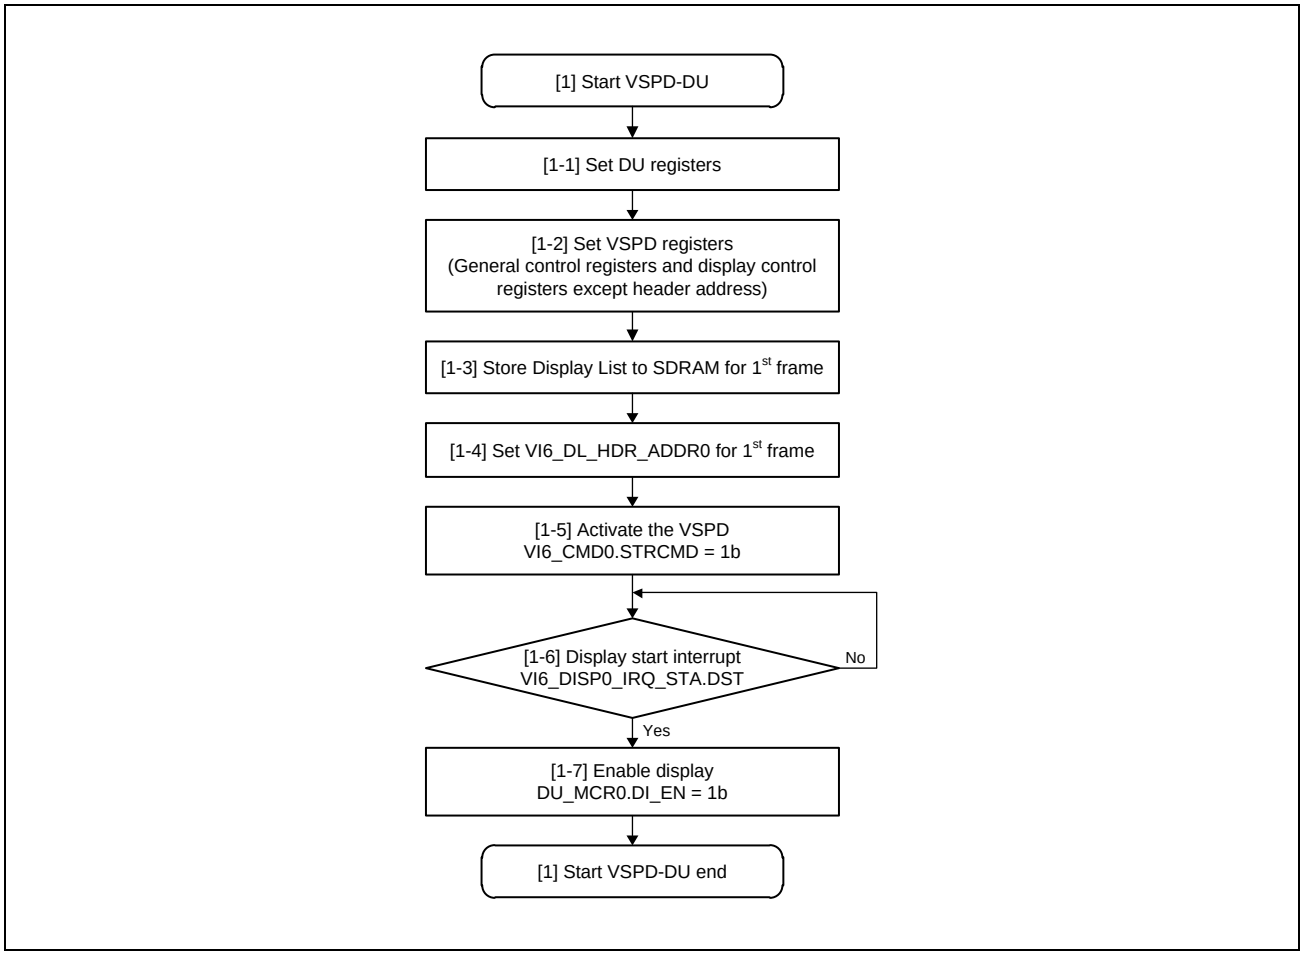

Figure 33.39 Setting flow to start VSPD linked with DU

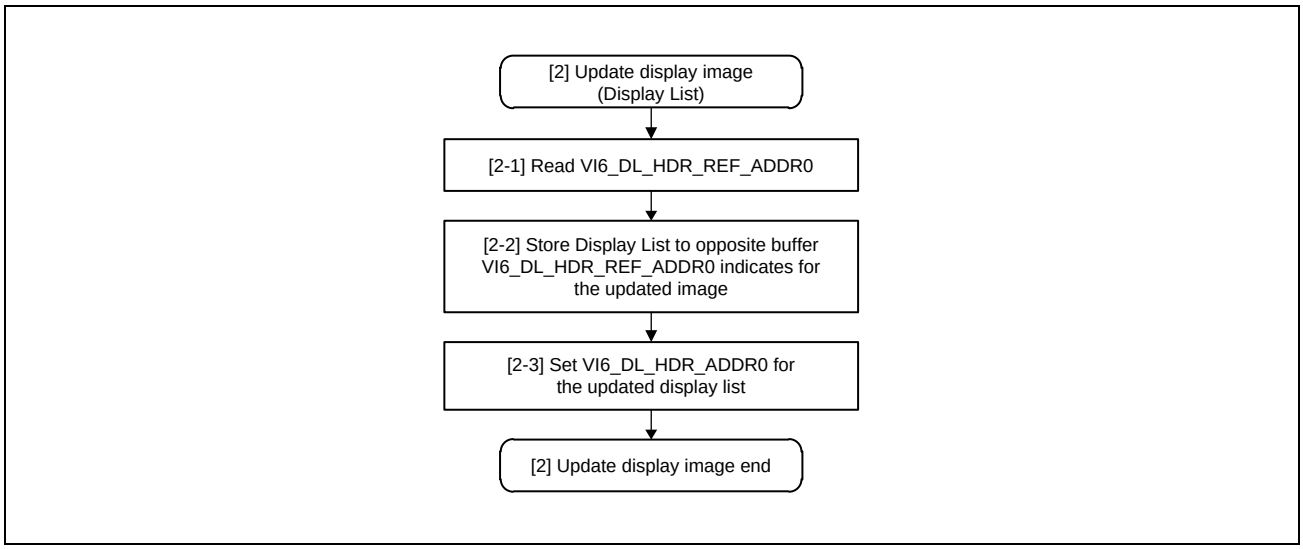

Figure 33.40 Setting flow to update display image

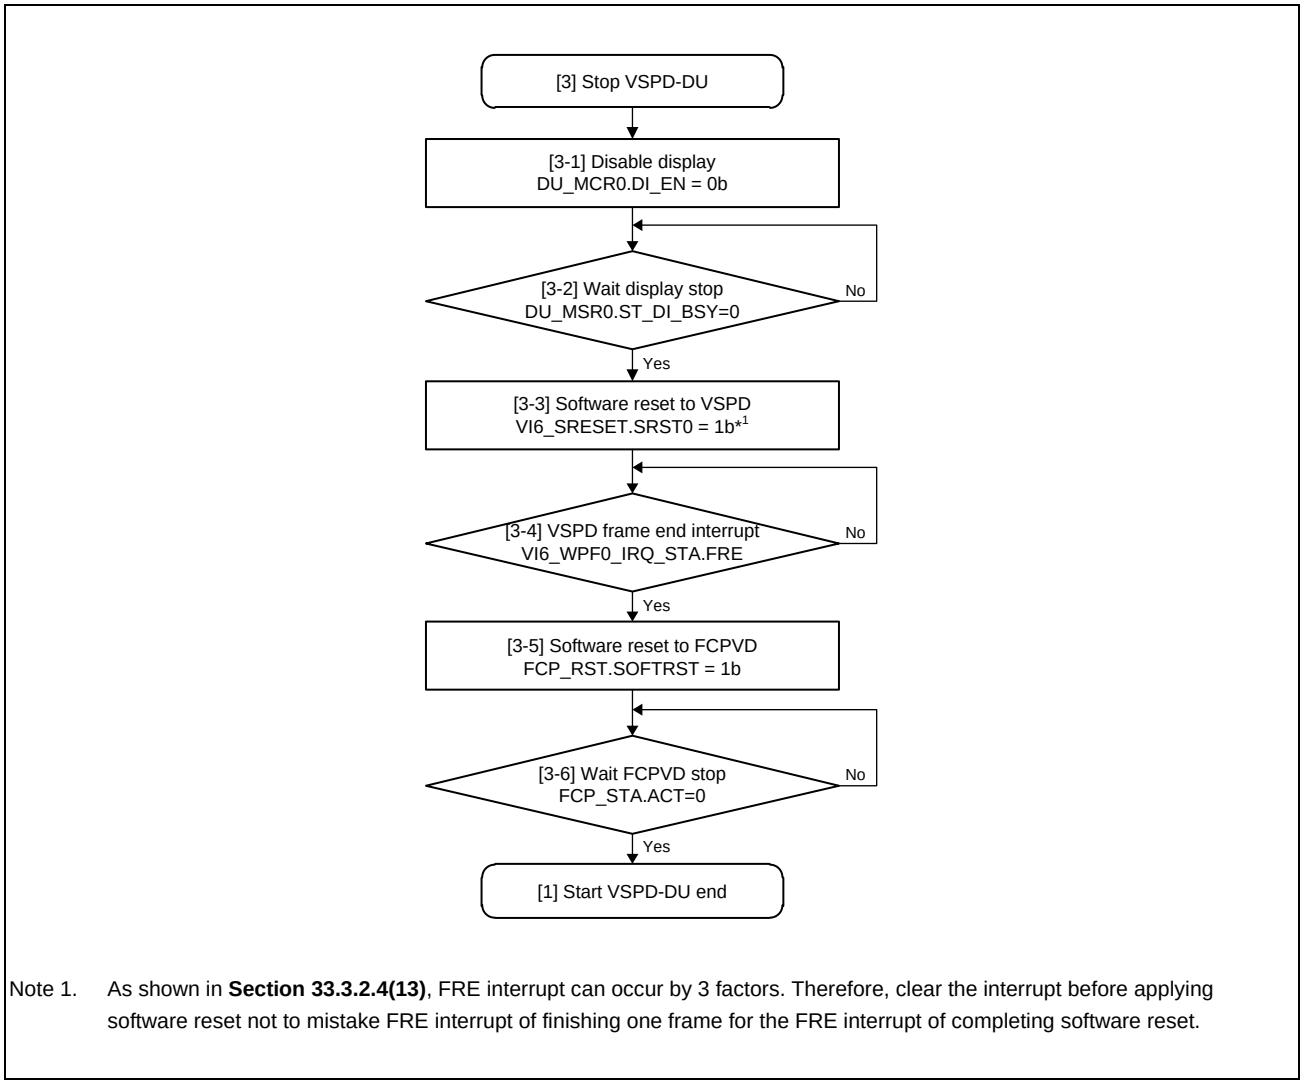

Note 1. As shown in **Section 33.3.2.4(13)**, FRE interrupt can occur by 3 factors. Therefore, clear the interrupt before applying software reset not to mistake FRE interrupt of finishing one frame for the FRE interrupt of completing software reset.

Figure 33.41 Setting flow to stop VSPD linked with DU

It is possible to update display list at any time (arbitrary timing) as shown in **Figure 33.40**. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSPD is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in **Section 33.3.2.5(6)**, when VSPD is reading display list from external memory (Period [A] in **Figure 33.42**), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSPD. When VSPD is not reading display list from external memory (Period [B] in **Figure 33.42**), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSPD at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSPD -H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSPD.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSPD reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to **Section 33.3.2.5(2)** and **Section 33.3.2.5(6)**.

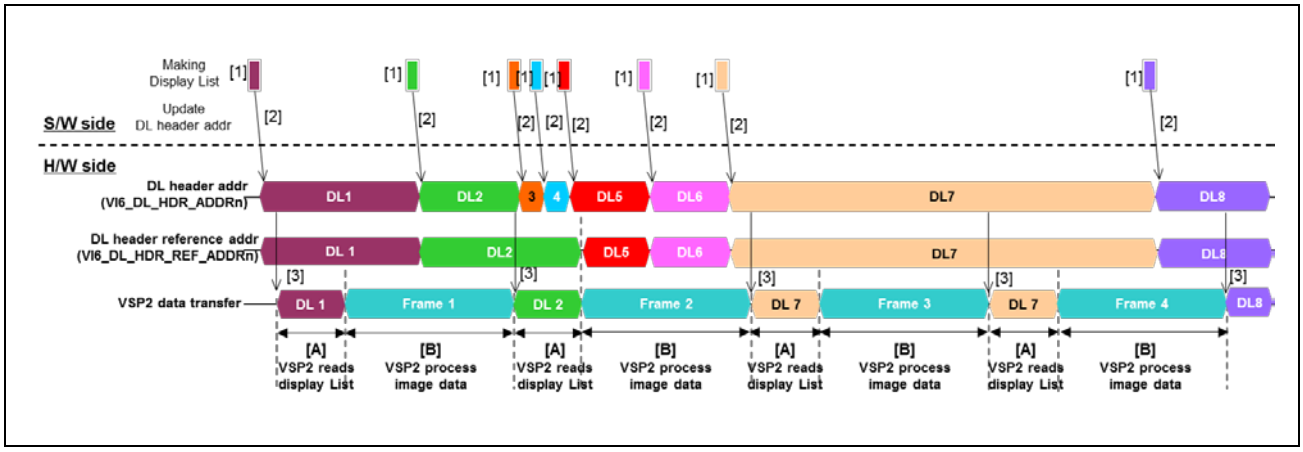

Figure 33.42 Updating display list at arbitrary timing

33.4.8.2 Controlling Two Register Planes Using Display Lists

This section shows operation flow of VSPD by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in **Section 33.4.8.1** except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in **Figure 33.39**. The procedure to update display list is different with Normal Display List Mode, and is described later. **Figure 33.43** shows the control of two register planes using header-less display lists (see **Section 33.4.5.3**) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.

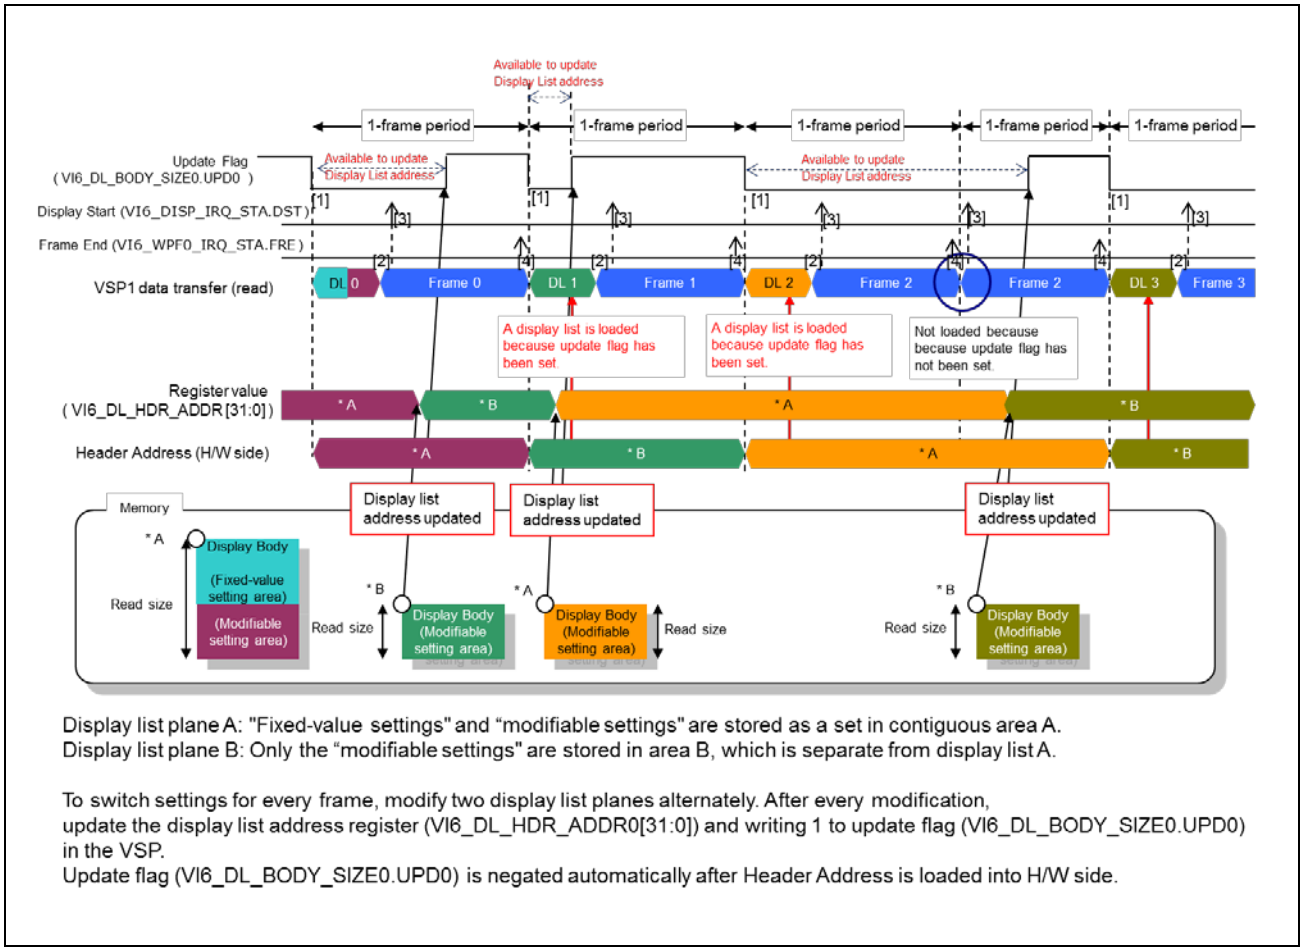

Figure 33.43 Controlling Two Register Planes Using a Display List

The VSPD downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSPD downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSPD -H/W Events mentioned as [1], [2], [3] and [4] in **Figure 33.43** are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSPD -H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from “[4] VI6_WPF0_IRQ_STA.FRE” to next “[3] VI6_DISP_IRQ_STA.DST”, because VSPD is reading the display list for the period.

33.5 Usage Note

33.5.1 Assignment in Memory Space

Make sure that VSPD memory space shall be mapped to Non-Cache region.

33.5.2 Limitations on Software Reset and Module Standby

Stop LCDC with the software reset sequence following to the guidance in the **Section 33.4.1**.

33.5.3 Input Image Size

Table 33.37 is a list of input size specifications.

Table 33.37 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restriction on Setting Unit
RPF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. *Note 2.* These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
LUT	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
BRS	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF	1 (horizontal) x 1 (vertical) pixel	1920 (horizontal) x 1080 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. *Note 1.* This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units.

Note 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 011b.

The most important restriction shown in **Table 33.37** is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in **Table 33.37**.

33.5.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in **Figure 33.1**, the data input to the VSPD is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. **Table 33.38** is a list of the processing that changes image size.

Table 33.38 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE x 2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE x 2 setting
LIF	Padding line	VI6_LIFn_CTRL	When padding with dummy lines is disabled, output size is same with Input size. When padding with dummy lines is enabled: Horizontal output size: input size Vertical output size: VI6_LIF0_PADLN_SIZE setting

Note 1. For details of each function, refer to the descriptions of the related registers.

Note 2. Refer to **Section 33.3.2.1** for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in **Table 33.38**. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSPD output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in **Table 33.38**, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in **Table 33.38**, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSPD output size for that WPFn path.

Figure 33.44 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

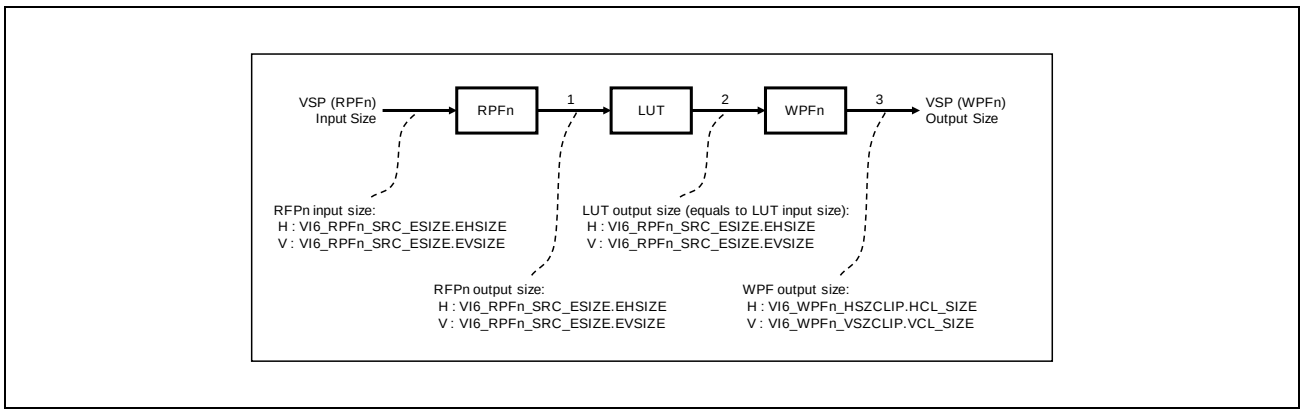

Figure 33.44 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSPD output image size determined as shown in the figure does not violate the restrictions shown in **Table 33.38**.

33.5.5 Restriction

When the data output from this unit is written back to the same memory area where the input data for this unit has been read, this unit has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in. Refer to the descriptions of the registers related to each restriction. In the table, RPFm indicates the RPFn that inputs the master layer, and WPFwb indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 33.39 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPFm input format and the WPFwb output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPFm source image storing address and the WPFwb destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPFm source picture memory stride and the WPFwb destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPFm and WPFwb data swapping settings should be the same.	VI6_WPFn_DSWAP
Restriction 2	The RPFm basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
	Color space conversion is prohibited in RPFm and WPFwb.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
Restriction 3*1	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note 1. Note: When the input format is not YCbCr4:2:0, restriction 3 in not applied.

35. Camera Data Receiving Unit (CRU)

The CRU consists of a MIPI CSI-2 block and an Image Processing block.

(1) MIPI CSI-2

This block can receive signals conforming to the MIPI CSI-2 standard, extracts video data from various packets, and sends them to Image Processing block in the subsequent stage.

(2) Image Processing

This block can receive video data received from MIPI CSI-2 block, and perform appropriate image processing for each. The image-processed data is temporarily stored in the FIFO and transferred to an external memory.

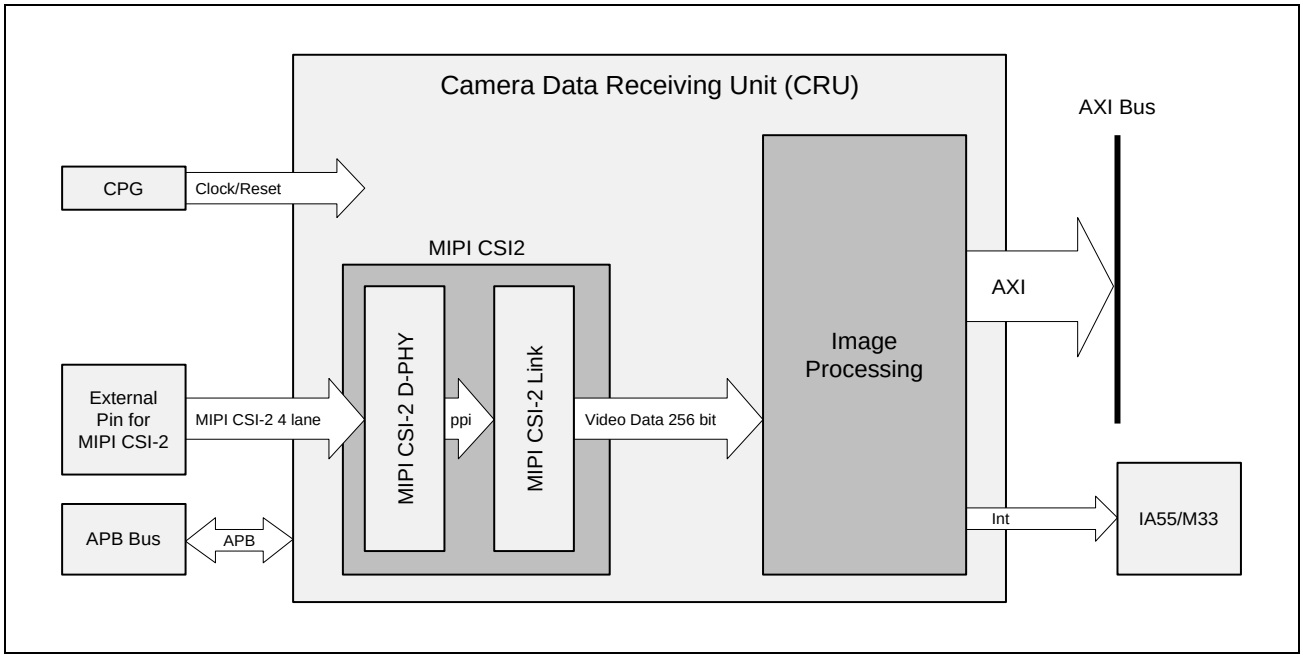

Figure 35.1 Block Diagram of CRU

35.1 MIPI CSI-2

35.1.1 Overview

The MIPI CSI-2 is an MIPI Camera Serial Interface 2 receiver module.

This module supports MIPI CSI-2 V2.1 and MIPI D-PHY V2.1 (80 Mbps ~ 1500 Mbps).

The image signal received by the MIPI-CSI2 is output to the image processing module.

35.1.2 Features

This module supports the following functions.

1) Input Image Size

- Maximum image size: 5 M pixels
- Minimum image size: QVGA (320 × 240) ＝ 76.8 K pixels
- Maximum number of valid pixels in the horizontal direction: 2800 pixels
- Maximum number of valid pixels in the vertical direction: 4095 lines

2) Compliant with Specification for Camera Serial Interface 2 (CSI-2)^{SM}

3) Support 1/2/4 lanes

4) Supported Input Data Format is described in **Table 35.10**.

5) Support Data De-Scrambling

6) Generic Short Packet FIFO with the depth of 16

7) Support Latency Reduction and Transport Efficiency (LRTE)

8) ECC 1bit error correction and 2bit error detection in packet header

9) CRC check for payload data

10) Support 4 Virtual Channel

11) Support Data Interleaving

- Data Type Interleaving
  - Packet Level Interleaved Data Transmission
  - Frame Level Interleaved Data Transmission
- Virtual Channel Identifier Interleaving

12) Receiver Error Detection and Report

- D-PHY Level Errors
- Packed Level Errors
- Protocol Decoding Level Errors

13) Skew Adjustment for D-PHY

14) MIPI CSI-2 Input Bandwidth Limitation

- CRU can receive signals which satisfied both of **Table 35.1** and **Table 35.2**.

15) Blanking period

- Minimum invalid period between horizontal lines: 412ns.

Table 35.1 Supported Image Format and Maximum Transfer Rate

Number of Lanes	Transfer Data Rate per Lane [M bps / Lane]		Total Transfer Data Rate [M bps]	
	MIN	MAX	MIN	MAX
1 lane	80	1500	80	1500
2 Lanes	80	1500	160	3000
4 Lanes	80	1500	320	6000

Table 35.2 Supported Image Format and Maximum Transfer Rate

No.	ICnMC.ICTHR	Input Image Format	MIPI CSI-2 Maximum Transfer Ratio [Mbps]
1	0	YCbCr/YUV422 8-bit	4256
2		YCbCr/YUV422 10-bit	5238
3		RGB565	4256
4		RGB666	4540
5		RGB888	6000
6		RAW8	2128
7		RAW10	2619
8		RAW12	3095
9		RAW14	3584
10		RAW16	4000
11		Others	2128
12	1	All Formats	6000

Initial Value	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	1b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	GSNM	H'10	R	Indicate the number of stages of the generic short packet FIFO (16 stages).
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	SDLN	H'4	R	Indicate the supported maximum number of data lanes. H'4: Operable with four lanes, two lanes or one lane.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	VER	H'0	R	Indicate the version of this core.

35.1.6.2 Module Control Register 0 (CSI2nMCT0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	LFSREN	ECCV13	—	—	—	—	RVMD	—	EDMD	ZLMD
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	RW	RW	R	R	R	RW	RW	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	VDLN			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	LFSREN	1b	RW	Enables or disables de-scrambling. 0b: Disables de-scrambling. 1b: Enables de-scrambling.
24	ECCV13	0b	RW	CSI-2 specification-compliant mode of ECC checking 0b: 26 bits to be checked for ECC 1b: 24 bits to be checked for ECC It is prohibited to set this bit to 1b when receiving four or more virtual channels.
23 to 21	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	RVMD	0b	RW	For a packet whose data type is H'38 to H'3F ("Reserved" in Table 10 Data Type Classes in the CSI-2 Specification), set the receive operation mode to 0. 0b: Discards the data (notifies an ErrID). 1b: Receives data as a long packet (outputs data to the image processing module when the corresponding bit in CSI2nDTEH is 1, or discards the data and notifies an ErrID when the corresponding bit in CSI2nDTEH is 0),
18	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	EDMD	0b	RW	Notifies ErrFrameData when an ECC 2-bit error or a packet of less than four bytes is received between FS and FE. 0b: Does not notify ErrFrameData. 1b: Notifies ErrFrameData.
16	ZLMD	0b	RW	Sets whether to output a long packet whose word count is 0 to the image processing module. Set this bit to 0. 0b: Output 1b: No output
15 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	VDLN	H'4	RW	Set the number of used data lanes. Change this field when CSI2nMCT3.RXEN = 0. A value equal to or less than the CSI2nMCG.SDLN value can be specified. H'1: Operation with one lane H'2: Operation with two lanes H'4: Operation with four lanes Others: Setting prohibited

35.1.6.3 Module Control Register 2 (CSI2nMCT2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FRRSKW								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	FRRCLK								
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24 to 16	FRRSKW	H'0	RW	Internal setting parameter Set the following value by using the ROUNDDOWN function that rounds down the decimal places. (ROUNDDOWN((3 * vclk frequency/hsclk1 frequency), 0) + 1) where vclk = 266 MHz, hsclk1 = transfer rate/8 Example: Set 7 when the vclk frequency is 266 MHz and the transfer rate is 1 Gbps. ROUNDDOWN((3 * 266/(1000/8)), 0) + 1 = 7
15 to 9	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8 to 0	FRRCLK	H'0	RW	Parameter for the IP to determine whether packets have been received if RxWordClkHS stops at the timing when the IP cannot recognize that RxValidHS is low. Set the following value by using the ROUNDDOWN function that rounds down the decimal places. (ROUNDDOWN((1.5 * vclk frequency/hsclk1 frequency), 0) + 1) where vclk = 266 MHz, hsclk1 = transfer rate/8 Example: Set 4 when the vclk frequency is 266 MHz and the transfer rate is 1 Gbps. ROUNDDOWN((1.5 * 266/(1000/8)), 0) + 1 = 4

35.1.6.4 Module Control Register 3 (CSI2nMCT3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RXEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	RXEN	0b	RW	Enables data reception in the PPI. The value of this register is reflected in ppi_dl[1:4]_enable and ppi_cl_enable for the lane(s) which is enabled by CSI2nMCT0.VDLN. 0b: Disables reception. 1b: Enables reception.

35.1.6.5 Reset Control Register (CSI2nRTCT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VSRST
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VSRST	0b	R0W	Writing 1 to this bit resets the internal LINK signal by a software reset.

35.1.6.6 Reset Status Register (CSI2nRTST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VSRSTS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VSRSTS	0b	R	Indicates the execution status of the software reset generated by CSI2nRTCT.VSRST. 0b: Not during a reset 1b: During a reset

35.1.6.7 EPD Option Control Register (CSI2nEPCT)

This register supports the TX_REG_CSI_EPD_EN_SSP register and the TX_REG_CSI_EPD_OP_SLP register that are defined in *Section 9.11.1.2.3, D-PHY EPD Specifications (for EPD Options 1 and 2)* in *the MIPI CSI-2 V2.1 Specification*.

Set the same value as the one set in this register in the CSI-2 transmitter.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EPDEN	SSP														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EPDOP	SLP														
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31	EPDEN	0b	RW	Enables the EPD. 0b: Disables the EPD. 1b: Enables the EPD.
30 to 16	SSP	H'0	RW	Specify the number of spacers inserted after a short packet. This field is valid when EPDEN = 1. The following shows the specifiable minimum number of spacers when EPDEN = 1. Setting a value less than the minimum value is prohibited.
15	EPDOP	0b	RW	Selects an EPD option. Set this bit to 1b. 0b: D-PHY EPD Option 1 (0 cannot be set when EPDEN = 1) 1b: D-PHY EPD Option 2
14 to 0	SLP	H'0	RW	Specify the number of spacers inserted after a long packet. This field is valid when EPDEN = 1. When EPDEN = 1, the minimum number of spacers is the value described in the SSP field. Setting a value less than the minimum value is prohibited.

EPDOP	Minimum number of spacers
1b	The larger value of the following two values: • Minimum number of spacers due to the D-PHY setting • Minimum number of spacers due to the number of used lanes

Minimum number of spacers due to the D-PHY setting:

The minimum value can be found by using the ROUNDUP function that rounds up the decimal places.

ROUNDUP((105/UI[ns] + 20) / 8), 0)

Minimum number of spacers due to the number of used lanes:

Number of used lanes	Minimum number of spacers
One lane	64
Two lanes	32
Four lanes	32

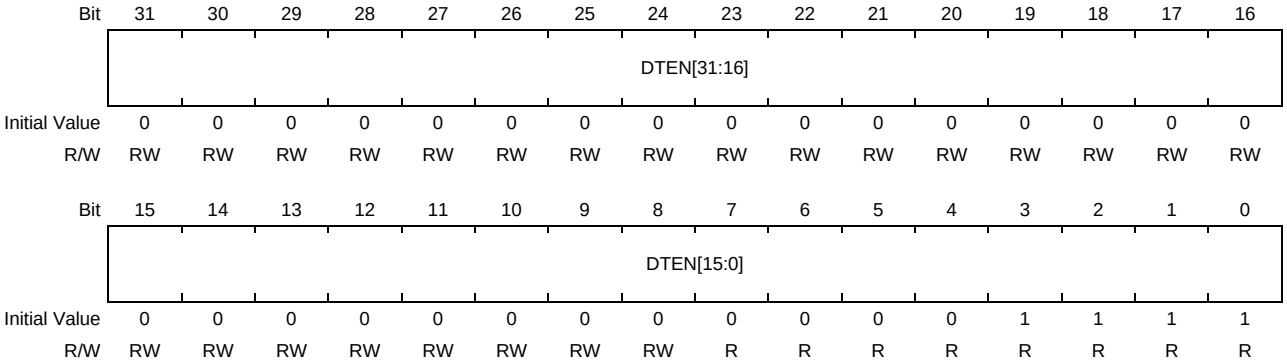
35.1.6.8 Module Interrupt Status Register (CSI2nMIST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	VC3S	VC2S	VC1S	VC0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	RXS	GSTS	PMS	—	—	—	—	DL3S	DL2S	DL1S	DL0S
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	VC3S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 3. Check the CSI2nVCST3 register for the details of the interrupt source.
18	VC2S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 2. Check the CSI2nVCST2 register for the details of the interrupt source.
17	VC1S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 1. Check the CSI2nVCST1 register for the details of the interrupt source.
16	VC0S	0b	R	When this bit is set to 1, there is an interrupt source regarding virtual channel 0. Check the CSI2nVCST0 register for the details of the interrupt source.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	RXS	0b	R	When this bit is set to 1, there is an interrupt source regarding the reception in general. Check the CSI2nRXST register for the details of the interrupt source.
9	GSTS	0b	R	When this bit is set to 1, there is an interrupt source regarding reception of generic short packets. Check the CSI2nGSST register for the details of the interrupt source.
8	PMS	0b	R	When this bit is set to 1, there is an interrupt source regarding the power management. Check the CSI2nPMST register for the details of the interrupt source.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	DL3S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 3. Check the CSI2nDLST3 register for the details of the interrupt source.
2	DL2S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 2. Check the CSI2nDLST2 register for the details of the interrupt source.
1	DL1S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 1. Check the CSI2nDLST1 register for the details of the interrupt source.
0	DL0S	0b	R	When this bit is set to 1, there is an interrupt source regarding data lane 0. Check the CSI2nDLST0 register for the details of the interrupt source.

35.1.6.9 Receive Data Type Enable Low Register (CSI2nDTEL)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DTEN[31:0]	H'0000_000F	RW/R	Receive data of a packet whose data type is one of the following. 0b: Does not receive data. 1b: Receives data. *Note*: After multiple data types are selected here, only one data type is selected by the INF[5:0] bits in the ICnMC register in the image processing module.

Bit	Data Type	Attribute	Comment
31	YUV422 10-bit	RW	When this bit is set to 1b, data is output to the image processing module.
30	YUV422 8-bit	RW	
29	YUV420 10-bit (Chroma Shifted Pixel Sampling)	RW	
28	YUV420 8-bit (Chroma Shifted Pixel Sampling)	RW	
27	Reserved	RW	
26	Legacy YUV420 8-bit	RW	
25	YUV420 10-bit	RW	
24	YUV420 8-bit	RW	
23	Reserved	RW	
22	Generic long packet data type 4	RW	
21	Generic long packet data type 3	RW	
20	Generic long packet data type 2	RW	
19	Generic long packet data type 1	RW	
18-16	Reserved (Embedded 8-bit non Image Data, etc.)	RW	Fixed to 0 since this function is not support.
15	Generic Short Packet Code 8	RW	Fixed to 1 for each bits.
14	Generic Short Packet Code 7	RW	When each bits are set to 1b and CSI2nGSCT.GFIF = 1, data is output to the generic short packet FIFO.
13	Generic Short Packet Code 6	RW	
12	Generic Short Packet Code 5	RW	
11	Generic Short Packet Code 4	RW	
10	Generic Short Packet Code 3	RW	
9	Generic Short Packet Code 2	RW	
8	Generic Short Packet Code 1	RW	
7-4	Reserved	R	Fixed to 0.
3-0	Reserved	R	Fixed to 1.

35.1.6.10 Receive Data Type Enable High Register (CSI2nDTEH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DTEN[63:48]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

7-5	Reserved	RW	
4	RGB888	RW	
3	RGB666	RW	
2	RGB565	RW	
1	RGB555	RW	
0	RGB444	RW	

35.1.6.11 Receive Status Register (CSI2nRXST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RACTDET	RACT
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FRM3	FRM2	FRM1	FRM0
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 18	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	RACTDET	0b	R	When this bit is set to 1, CSI2nRXST.RACT = 1 has been detected. Write 1 to CSI2nRXSC.RACTDETC to clear this bit.
16	RACT	0b	R	Indicates that this IP is receiving packets.
15 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	FRM3	0b	R	Indicates that frames on virtual channel = 3 are being processed.
2	FRM2	0b	R	Indicates that frames on virtual channel = 2 are being processed.
1	FRM1	0b	R	Indicates that frames on virtual channel = 1 are being processed.
0	FRM0	0b	R	Indicates that frames on virtual channel = 0 are being processed.

35.1.6.12 Receive Status Clear Register (CSI2nRXSC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RACTDETC	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R0W	R	R	R	R	R	R	R0W	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	ULP(N)	H'0	R	Indicates the RxUlpsEsc status of logical data lane (N).
23 to 20	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	RUL(N)	0b	R	When this bit is set to 1, logical data lane (N) has transitioned to the ULPS receive mode (RxUlpsEsc). Write 1 to CSI2nDLSC(N).RULC(N) to clear this bit.
16	EUL(N)	0b	R	When this bit is set to 1, logical data lane (N) has exited from the ULPS receive mode (RxUlpsEsc). Write 1 to CSI2nDLSC(N).EULC(N) to clear this bit.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	EES(N)	0b	R	When this bit is set to 1, an escape mode entry error (ErrESC) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).EESC(N) to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
2	ECT(N)	0b	R	When this bit is set to 1, a control error (ErrControl) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ECTC(N) to clear this bit.
1	ESS(N)	0b	R	When this bit is set to 1, an SoT synchronization error (ErrSotSyncHS) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ESSC(N) to clear this bit.
0	ESH(N)	0b	R	When this bit is set to 1, an SoT error (ErrSotHS) has occurred on logical data lane (N). Write 1 to CSI2nDLSC(N).ESHC(N) to clear this bit.

35.1.6.15 Data Lane (N) Status Clear Register (CSI2nDLSC(N))

(N) indicates a logical data lane number.

(N) = 0, 1, 2, or 3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored..
17	RULE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).RUL(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).RUL(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).RUL(N) = 1.
16	EULE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).EUL(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).EUL(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).EUL(N) = 1.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored..
9	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored..
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	EESE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).EES(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).EES(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).EES(N) = 1.
2	ECTE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ECT(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ECT(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ECT(N) = 1.
1	ESSE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ESS(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESS(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ESS(N) = 1.

Bit	Bit Name	Initial Value	R/W	Description
0	ESHE(N)	0b	RW	Enables interrupts generated by CSI2nDLST(N).ESH(N). 0b: Does not assert csi2_int_dl when CSI2nDLST(N).ESH(N) = 1. 1b: Asserts csi2_int_dl when CSI2nDLST(N).ESH(N) = 1.

35.1.6.17 Virtual Channel (M) Status Register (CSI2nVCST(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LER(M)	LSR(M)	FER(M)	FSR(M)	—	—	—	—	—	—	—	OVF(M)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	FRD(M)	FRS(M)	—	ECN(M)	ECC(M)	WCE(M)	IDE(M)	CRC(M)	ECD(M)	MLF(M)
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	LER(M)	0b	R	When this bit is set to 1, a packet whose data type is "Line End Code" has been received. Write 1 to CSI2nVCSC(M).LERC(M) to clear this bit.
26	LSR(M)	0b	R	When this bit is set to 1, a packet whose data type is "Line Start Code" has been received. Write 1 to CSI2nVCSC(M).LSRC(M) to clear this bit.
25	FER(M)	0b	R	When this bit is set to 1, a packet whose data type is "Frame End Code" has been received. Write 1 to CSI2nVCSC(M).FERC(M) to clear this bit.
24	FSR(M)	0b	R	When this bit is set to 1, a packet whose data type is "Frame Start Code" has been received. Write 1 to CSI2nVCSC(M).FSRC(M) to clear this bit.
23 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	OVF(M)	0b	R	When this bit is set to 1, the generic short packets on virtual channel M has been discarded due to an overflow of the generic short packet FIFO. Write 1 to CSI2nVCSC(M).OVFC(M) to clear this bit.
15 to 10	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	FRD(M)	0b	R	When this bit is set to 1, ErrFrameData has been detected. This bit is set to 1 if any of the following errors occurs between FS and FE: • ErrCRC • ErrWC • ECC 2-bit error (when CSI2nMCT0.EDMD = 1) • Reception of a packet of less than four bytes (when CSI2nMCT0.EDMD = 1) Note that this bit is set to 1 if Virtual Channel = M is between FS and FE because the virtual channel of a packet with an ECC 2-bit error or the virtual channel which received a packet of less than four bytes cannot be determined. Write 1 to CSI2nVCSC(M).FRDC(M) to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
8	FRS(M)	0b	R	When this bit is set to 1, ErrFrameSync has been detected. This bit is set to 1 if any of the following conditions occurs: • After an FS is received, another FS has been received on the same virtual channel without receiving an FE. • Although an FE is received, an FS has not been received on the same virtual channel. Write 1 to CSI2nVCSC(M).FRSC(M) to clear this bit.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	ECN(M)	0b	R	When this bit is set to 1, no error was found in the ECC check on the received packets. Write 1 to CSI2nVCSC(M).ECNC(M) to clear this bit.
5	ECC(M)	0b	R	When this bit is set to 1, a 1-bit error was found in the ECC check on the received packets and the error was corrected. Write 1 to CSI2nVCSC(M).ECCC(M) to clear this bit.
4	WCE(M)	0b	R	When this bit is set to 1, it was detected that the data payload length of the packet is shorter than the value indicated by WC. Write 1 to CSI2nVCSC(M).WCEC(M) to clear this bit.
3	IDE(M)	0b	R	When this bit is set to 1, an ErrID was detected and the packet was discarded. This bit is set to 1 if any of the following conditions occurs: • A packet which is defined as "Reserved" in chapter 9, Low Level Protocol in the CSI-2 Specification has been received. – A packet whose data type is H'04 to H'07 has been received. – A packet whose data type is H'38 to H'3F has been received when CSI2nMCT0.RVMD = 0. • A generic short packet (Data Type = H'08 to H'0F) for which the corresponding bit in CSI2nDTEL.DTEN is 0 has been received. • A long packet (Data Type = H'10 to H'3F) for which the corresponding bit in CSI2nDTEL(H).DTEN is 0 has been received. Write 1 to CSI2nVCSC(M).IDEC(M) to clear this bit. Note that this bit may be set to 1 if more spacers than the count specified in CSI2nEPCT.SSP/SLP are received when using EPD option 2.
2	CRC(M)	0b	R	When this bit is set to 1, a CRC error was detected in the received packet. Write 1 to CSI2nVCSC(M).CRCC(M) to clear this bit.
1	ECD(M)	0b	R	When this bit is set to 1, a 2-bit error was found in the ECC check on the received packets. Because the virtual channel of the packet with an error cannot be determined, the ECD(M) field is set to 1 for all virtual channels. To clear the ECD(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AECDC(M) for any virtual channel. To clear the ECD(M) field of virtual channel M, write 1 to CSI2nVCSC(M).ECDC(M).
0	MLF(M)	0b	R	When this bit is set to 1, a packet of less than 4 bytes has been received. Because the virtual channel of the packet with an error cannot be determined, the MLF(M) field is set to 1 for all virtual channels. To clear the MLF(M) field for all virtual channels, write 1 to CSI2nVCSC(M).AMLFC(M) for any virtual channel. To clear the MLF(M) field of virtual channel M, write 1 to CSI2nVCSC(M).MLFC(M).

35.1.6.18 Virtual Channel (M) Status Clear Register (CSI2nVCSC(M))

(M) indicates a virtual channel number.

(M) = 0, 1, 2, or 3

31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27	LERE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).LER(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).LER(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).LER(M) = 1.
26	LSRE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).LSR(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).LSR(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).LSR(M) = 1.
25	FERE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FER(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FER(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FER(M) = 1.
24	FSRE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FSR(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FSR(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FSR(M) = 1.
23 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	OVFE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).OVF(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).OVF(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).OVF(M) = 1.
15 to 10	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9	FRDE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FRD(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FRD(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FRD(M) = 1.
8	FRSE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).FRS(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).FRS(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).FRS(M) = 1.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6	ECNE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECN(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECN(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECN(M) = 1.

Bit	Bit Name	Initial Value	R/W	Description
5	ECCE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECC(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECC(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECC(M) = 1.
4	WCEE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).WCE(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).WCE(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).WCE(M) = 1.
3	IDEE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).IDE(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).IDE(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).IDE(M) = 1.
2	CRCE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).CRC(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).CRC(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).CRC(M) = 1.
1	ECDE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).ECD(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).ECD(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).ECD(M) = 1.
0	MLFE(M)	0b	RW	Enables interrupts generated by CSI2nVCST(M).MLF(M). 0b: Does not assert csi2_int_vc when CSI2nVCST(M).MLF(M) = 1. 1b: Asserts csi2_int_vc when CSI2nVCST(M).MLF(M) = 1.

35.1.6.20 Power Management Status Register (CSI2nPMST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	DLUL				—	—	—	—	DLSS			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLUL	CLSS	—	—	—	—	—	—	CUN	CUX	DUN	DUX	CSN	CSX	DSN	DSX
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	DLUL	H'0	R	Indicate the RxUlpsEsc status of a logical data lane. Bit 0: RxUlpsEsc of logical lane 0 Bit 1: RxUlpsEsc of logical lane 1 Bit 2: RxUlpsEsc of logical lane 2 Bit 3: RxUlpsEsc of logical lane 3
23 to 20	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	DLSS	H'0	R	Indicate the stop state of a logical data lane. Bit 0: Stop state of logical lane 0 Bit 1: Stop state of logical lane 1 Bit 2: Stop state of logical lane 2 Bit 3: Stop state of logical lane 3
15	CLUL	0b	R	Indicates the inverted state of RxUlpsClkNot of the PPI clock lane. 0b: Not in ULPS 1b: In ULPS
14	CLSS	0b	R	Indicates the stop state of the PPI clock lane. 0b: Not in the stop state 1b: In the stop state
13 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CUN	0b	R	When this bit is set to 1, the clock lane has transitioned to ULPS mode (inversion of RxUlpsClkNot). Write 1 to CSI2nPMSC.CUNC to clear this bit.
6	CUX	0b	R	When this bit is set to 1, the mode of the clock lane has changed from ULPS mode (inversion of RxUlpsClkNot) to non-ULPS mode. Write 1 to CSI2nPMSC.CUXC to clear this bit.
5	DUN	0b	R	When this bit is set to 1, all valid data lanes have transitioned to ULPS mode. Write 1 to CSI2nPMSC.DUNC to clear this bit.
4	DUX	0b	R	When this bit is set to 1, the mode of all valid data lanes has changed from ULPS mode to a different state. Write 1 to CSI2nPMSC.DUXC to clear this bit.
3	CSN	0b	R	When this bit is set to 1, the clock lane has transitioned to the stop state. Write 1 to CSI2nPMSC.CSNC to clear this bit.
2	CSX	0b	R	When this bit is set to 1, the state of the clock lane has changed form the stop state to a state different from the stop state. Write 1 to CSI2nPMSC.CSXC to clear this bit.

Bit	Bit Name	Initial Value	R/W	Description
1	DSN	0b	R	When this bit is set to 1, all valid data lanes have transitioned to the stop state. Write 1 to CSI2nPMSC.DSNC to clear this bit.
0	DSX	0b	R	When this bit is set to 1, the mode of all valid data lanes has changed from the stop state to a different state. Write 1 to CSI2nPMSC.DSXC to clear this bit.

35.1.6.21 Power Management Status Clear Register (CSI2nPMSC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	CUNE	0b	RW	Enables interrupts generated by CSI2nPMST.CUN. 0b: Does not assert csi2_int_pm when CSI2nPMST.CUN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CUN = 1.
6	CUXE	0b	RW	Enables interrupts generated by CSI2nPMST.CUX. 0b: Does not assert csi2_int_pm when CSI2nPMST.CUX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CUX = 1.
5	DUNE	0b	RW	Enables interrupts generated by CSI2nPMST.DUN. 0b: Does not assert csi2_int_pm when CSI2nPMST.DUN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DUN = 1.
4	DUXE	0b	RW	Enables interrupts generated by CSI2nPMST.DUX. 0b: Does not assert csi2_int_pm when CSI2nPMST.DUX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DUX = 1.
3	CSNE	0b	RW	Enables interrupts generated by CSI2nPMST.CSN. 0b: Does not assert csi2_int_pm when CSI2nPMST.CSN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CSN = 1.
2	CSXE	0b	RW	Enables interrupts generated by CSI2nPMST.CSX. 0b: Does not assert csi2_int_pm when CSI2nPMST.CSX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.CSX = 1.
1	DSNE	0b	RW	Enables interrupts generated by CSI2nPMST.DSN. 0b: Does not assert csi2_int_pm when CSI2nPMST.DSN = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DSN = 1.
0	DSXE	0b	RW	Enables interrupts generated by CSI2nPMST.DSX. 0b: Does not assert csi2_int_pm when CSI2nPMST.DSX = 1. 1b: Asserts csi2_int_pm when CSI2nPMST.DSX = 1.

35.1.6.23 Generic Short Packet Control Register (CSI2nGSCT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GFIF
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHTH						
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	GFIF	1b	RW	When this bit is set to 1, the received generic short packet is stored in the generic short packet FIFO (GS FIFO).
15 to 7	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 0	SHTH	H'0	RW	Asserts CSI2nGSST.GTH while the number of packets stored in the generic short packet FIFO equals or exceeds the value of this field + 1. Set this field to 15 or less when using CSI2nGSST.GTH. Set the default value when not using CSI2nGSST.GTH.

35.1.6.24 Generic Short Packet Status Register (CSI2nGSST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRDS	GCD
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNUM								—	—	—	GOV	—	—	GTH	GNE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
17	STRDS	0b	R	Indicates whether the received generic short packets can be stored in the generic short packet FIFO. 0b: Can be stored in the generic short packet FIFO. 1b: Cannot be stored in the generic short packet FIFO. This field indicates an inverted value of the store_en signal described in **Section 35.1.7.1** with a delay of internal latency. It may indicate the previous value depending on the signal change timing.
16	GCD	0b	R	When this bit is set to 1, the GS FIFO is being cleared by CSI2nGSCT.GFCLR.
15 to 8	PNUM	H'0	R	Indicate the number of packets stored in the generic short packet FIFO.
7 to 5	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GOV	0b	R	When this bit is set to 1, the generic short packet FIFO has overflowed. Write 1 to CSI2nGSSC.GOVC to clear this bit.
3 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	GTH	0b	R	When this bit is set to 1, the number of packets stored in the generic short packet FIFO equals or exceeds "CSI2nGSCT.SHTH + 1".
0	GNE	0b	R	When this bit is set to 1, the generic short packet FIFO is not empty.

35.1.6.25 Generic Short Packet Status Clear Register (CSI2nGSSC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GOVC	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R0W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GOVC	0b	R0W	Write 1 to this bit to clear CSI2nGSST.GOV. This bit cannot be modified to 0.
3 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

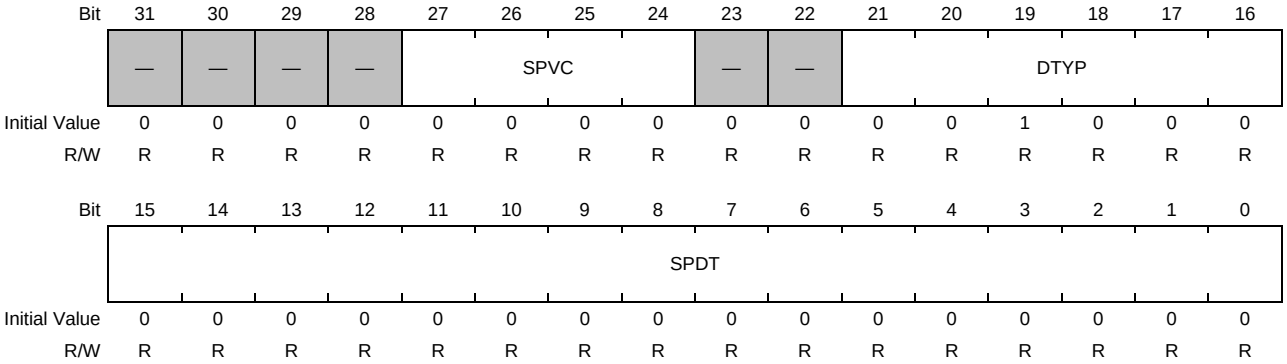
35.1.6.26 Generic Short Packet Interrupt Enable Register (CSI2nGSIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GOVE	—	—	GTHE	GNEE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GOVE	0b	RW	Enables interrupts generated by CSI2nGSST.GOV. 0b: Does not assert csi2_int_gst when CSI2nGSST.GOV = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GOV = 1.
3 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	GTHE	0b	RW	Enables interrupts generated by CSI2nGSST.GTH. 0b: Does not assert csi2_int_gst when CSI2nGSST.GTH = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GTH = 1.
0	GNEE	0b	RW	Enables interrupts generated by CSI2nGSST.GNE. 0b: Does not assert csi2_int_gst when CSI2nGSST.GNE = 1. 1b: Asserts csi2_int_gst when CSI2nGSST.GNE = 1.

35.1.6.27 Generic Short Packet Register (CSI2nGSHT)



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	SPVC	H'0	R	Indicate the virtual channel.
23 to 22	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 16	DTYP	H'8	R	Indicate the data type. H'08-H'0F
15 to 0	SPDT	H'0	R	Indicate 16-bit user-defined data.

35.1.6.28 Generic Short Packet Information Update Register (CSI2nGSIU)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R0W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GFCLR	—	—	—	—	—	—	—	FINC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	R	R	R0W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	GFEN	0b	R0W	Write 1 to this bit to re-enable storing generic short packets in the GS FIFO which has overflowed and been disabled. This bit cannot be modified to 0.
15 to 9	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	GFCLR	0b	RW	Clears the GS FIFO. Writing 1 to this bit requests the FIFO to be cleared. Writing 0 to this bit requests FIFO clearing to be canceled.
7 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FINC	0b	R0W	Write 1 to this bit to update the next packet with the data of the packet indicated in the CSI2nGSHT register. This bit cannot be modified to 0. Writing 1 to this bit while CSI2nGSST.PNUM = 0 is prohibited.

35.1.6.29 D-PHY Control Register 0 (CSIDPHYCTRL0)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EN_LDO1200	EN_BGR
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	RW	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15 to 9	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	—	0b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
7 to 3	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	—	1b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
18 to 16	—	000b	RW	Reserved When read, the initial value is read. When writing, be sure to write the initial value. Operation is not guaranteed if a value other than the initial value is written.
15	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 12	UTIL_DL3_SKW_ADJ	000b	RW	Data lane 3 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
11	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 8	UTIL_DL2_SKW_ADJ	000b	RW	Data lane 2 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	UTIL_DL1_SKW_ADJ	000b	RW	Data lane 1 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.
3	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	UTIL_DL0_SKW_ADJ	000b	RW	Data lane 0 skew adjustment function Set the recommended value 001b. If required, change the value referring to **Figure 35.3**.

The skew adjustment function adjusts the skew by using the circuit shown in **Figure 35.3**.

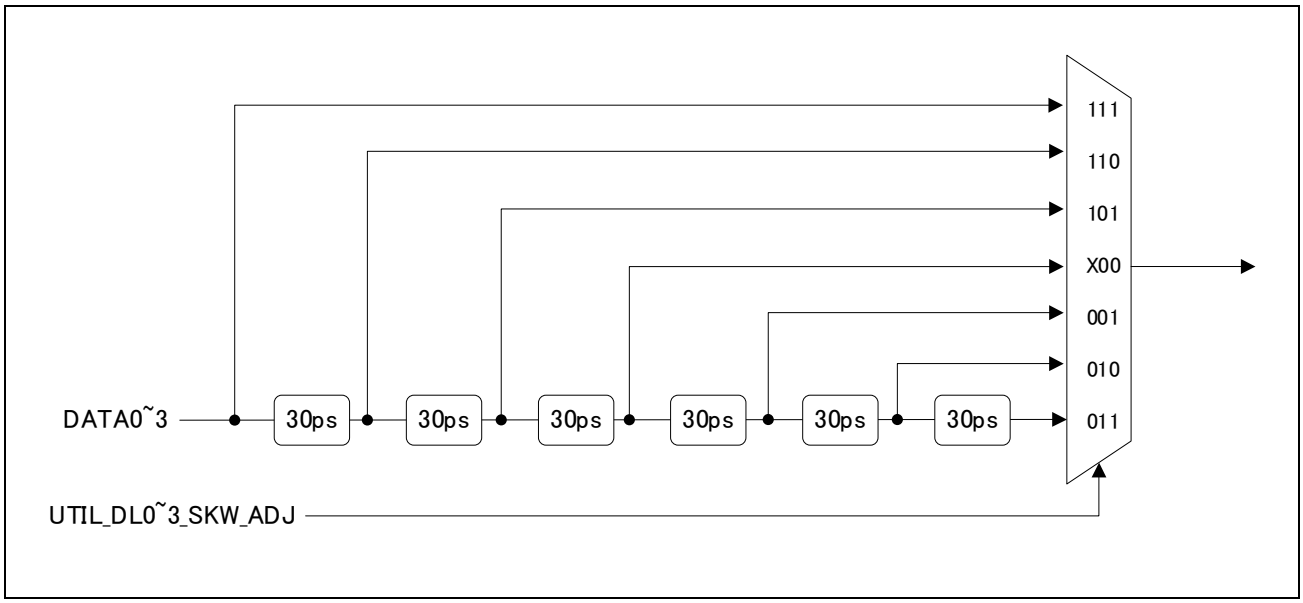

Figure 35.3 Skew Adjustment Circuit

35.1.7 Operation

35.1.7.1 Data Reception

(1) Common Between Short Packets and Long Packets

Figure 35.4 shows the flow when receiving a packet whose data type is A and virtual channel is M.

This flow is common between short packets and long packets.

Upon receiving a packet, the CRU checks the length of the received packet.

If the length of the received packet is less than the packet header length (4 bytes), a virtual channel cannot be determined, resulting in setting CSI2nVCST(M).MLF(M) to 1 for all virtual channels. In addition, this packet is discarded because it is invalid.

When the length of the received packet is 4 bytes or more, ECC checking is performed. The check results are indicated in the CSI2nVCST(M) register.

- 2-bit error: Because the virtual channel of the packet with an error cannot be determined, CSI2nVCST(M).ECD(M) is set to 1 for all virtual channels.
  In addition, the packet is discarded because error correction cannot be performed.
- 1-bit error: CSI2nVCST(M).ECC(M) is set to 1 for the relevant virtual channel.
  Error correction is performed because it is possible.
  No error: CSI2nVCST(M).ECN(M) is set to 1 for the relevant virtual channel.

If the ECC check results are “1-bit error” or “no error”, the data type field of the packet header is analyzed.

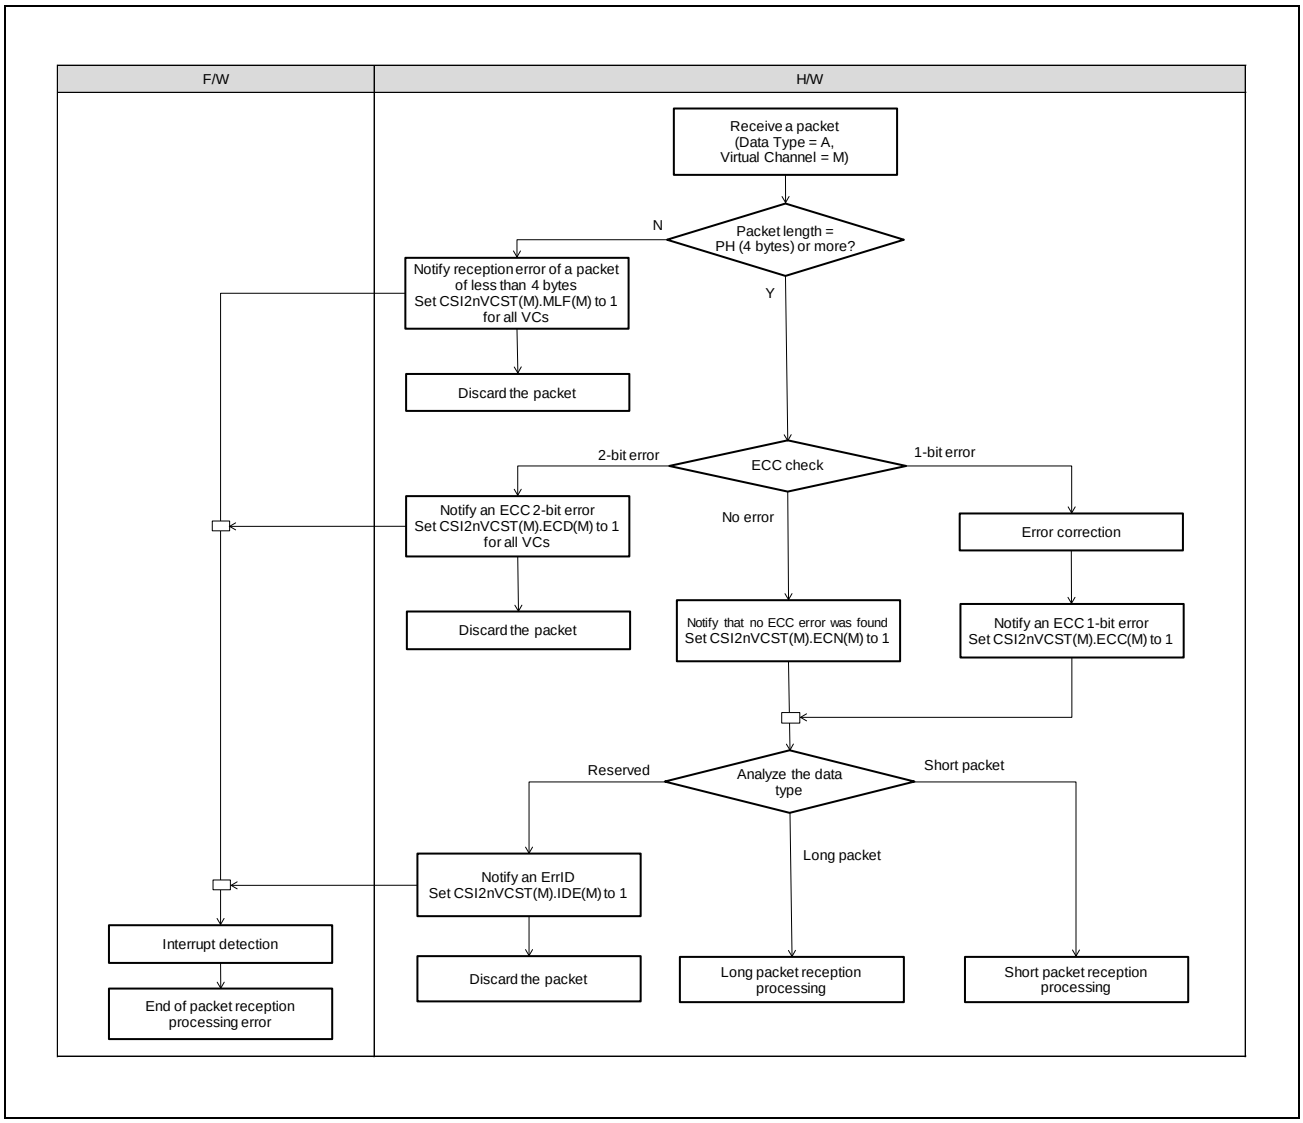

Figure 35.4 Packet Reception Processing

(2) Generic Short Packet Data Type Code

Figure 35.5 shows the flow when receiving a packet whose data type is generic short packet code 1 to 8 and virtual channel is M.

When the corresponding bit in CSI2nDTEL.DTEN is set to 0, CSI2nVCST(M).IDE(M)) is asserted and the packet is discarded.

When the corresponding bit in CSI2nDTEL.DTEN is set to 1 and CSI2nGSCT.GFIF is set to 1, the generic short packet is output to the generic short packet FIFO. For details on the operation when using the generic short packet FIFO, see the flow in **Figure 35.5**.

The initial value of internal signal store_en which is described in the flow is 1. When store_en is set to 1, packets can be stored in the generic short packet FIFO. When it is set to 0, packets cannot be stored in the generic short packet FIFO.

- store_en is set to 0 when the generic short packet FIFO has overflowed.
- store_en is set to 1 when 1 is written to CSI2nGSIU.GFEN.

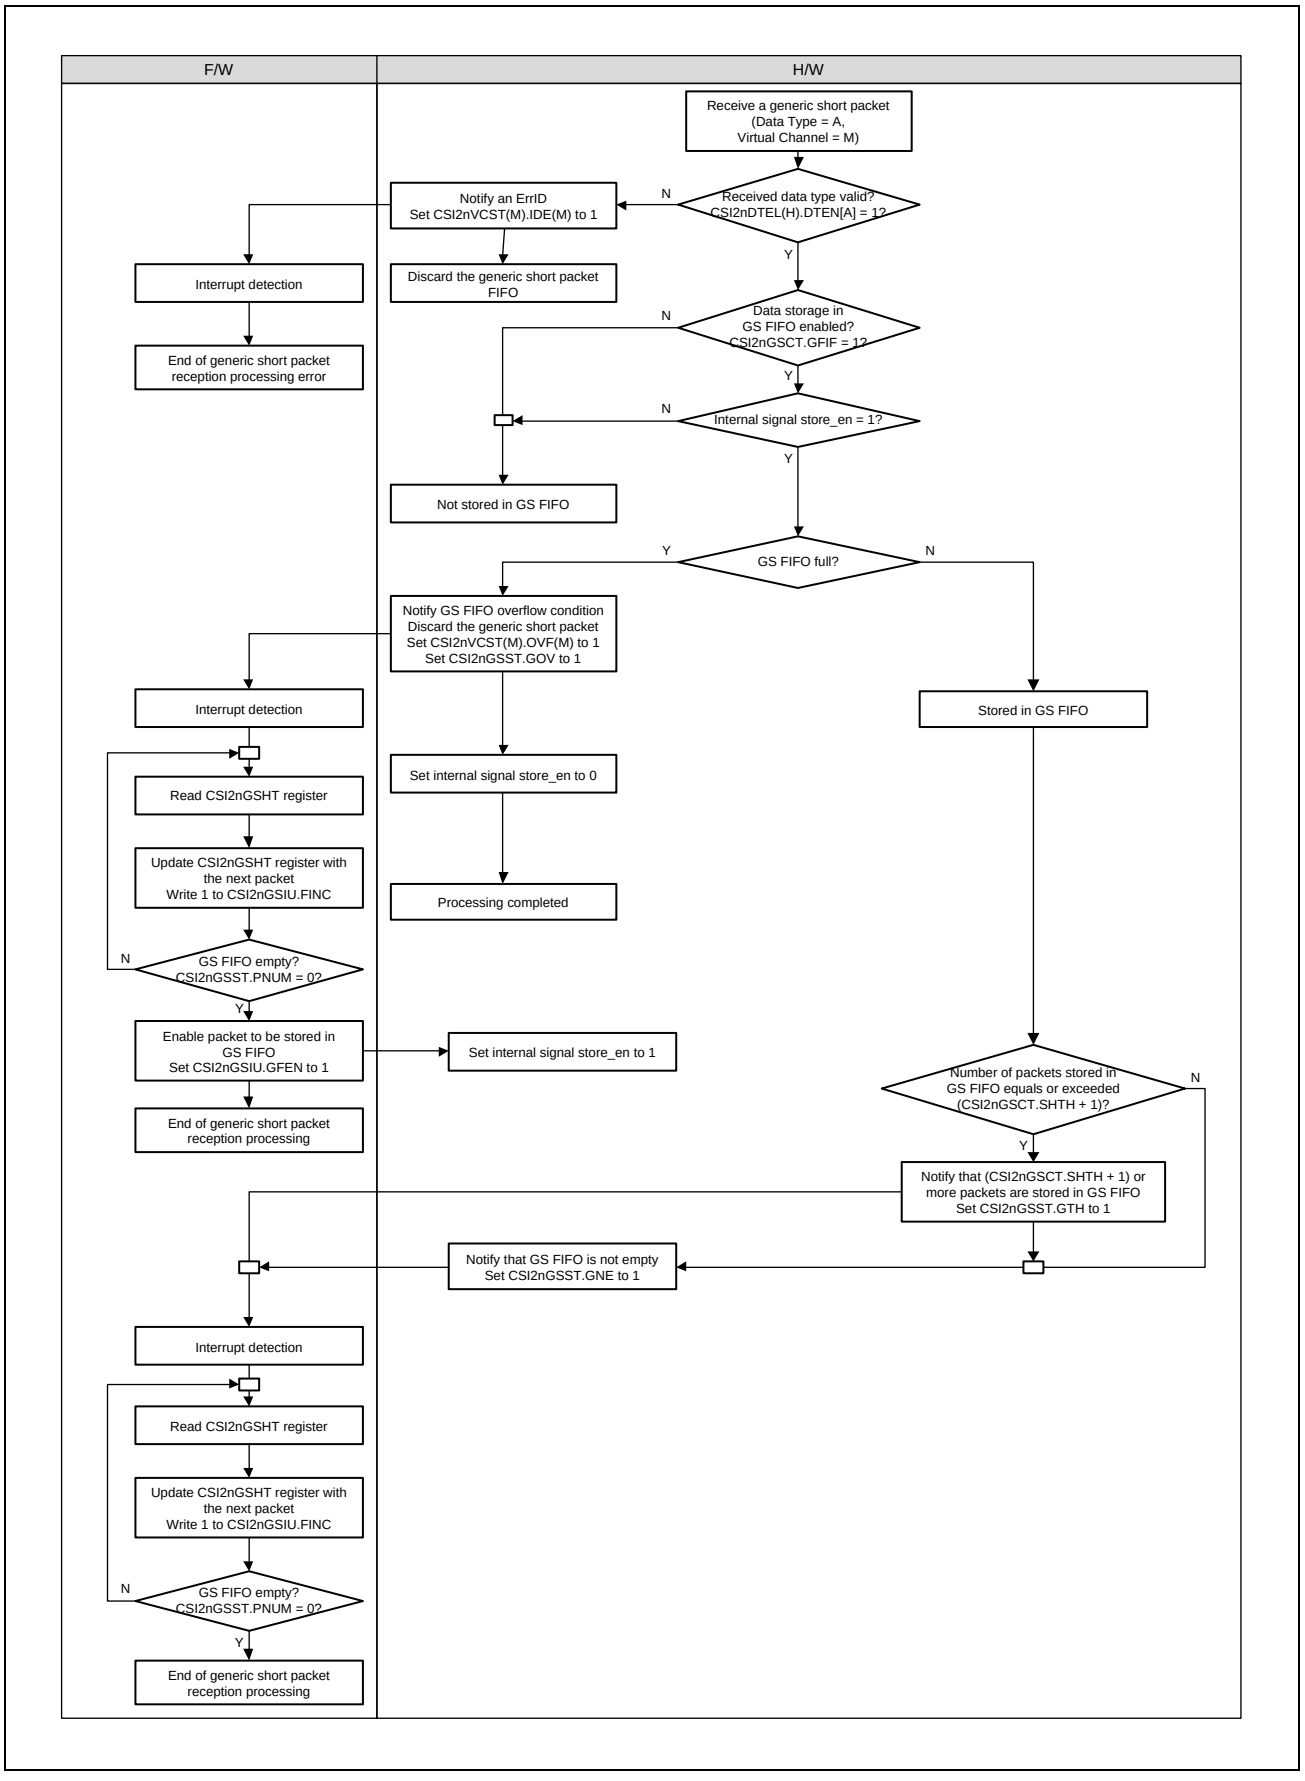

Figure 35.5 Generic Short Packet Receive Processing

(3) Clearing the Generic Short Packet FIFO

Figure 35.6 shows how the generic short packet FIFO is cleared.

Writing 1 to CSI2nGSIU.GFCLR starts clearing the generic short packet FIFO.

After requesting to clear the generic short packet FIFO, check if CSI2nGSST.GCD is set to 1 to make sure that the FIFO is cleared. Then, writing 0 to CSI2nGSIU.GFCLR cancels the request for clearing the generic short packet FIFO. Check if CSI2nGSST.GCD is set to 0 to make sure that the request for clearing the generic short packet FIFO is canceled.

When CSI2nMCG.GSNM is set to 0d, it is prohibited to clear the generic short packet FIFO.

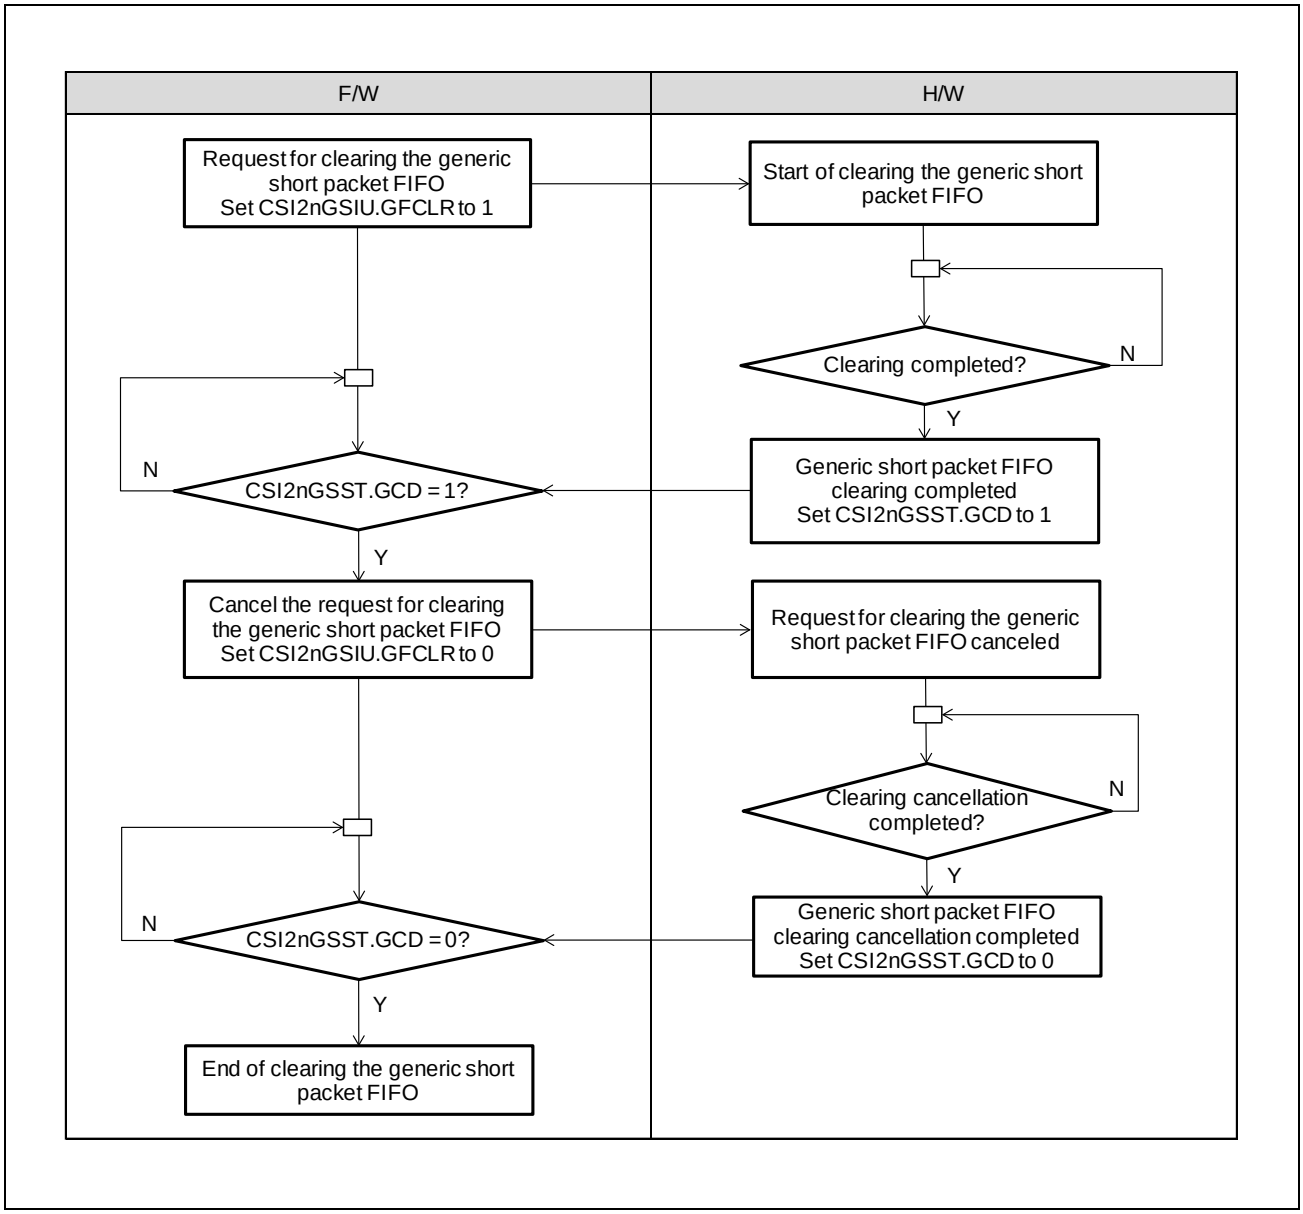

Figure 35.6 Clearing the Generic Short Packet FIFO

35.1.8 Interrupt

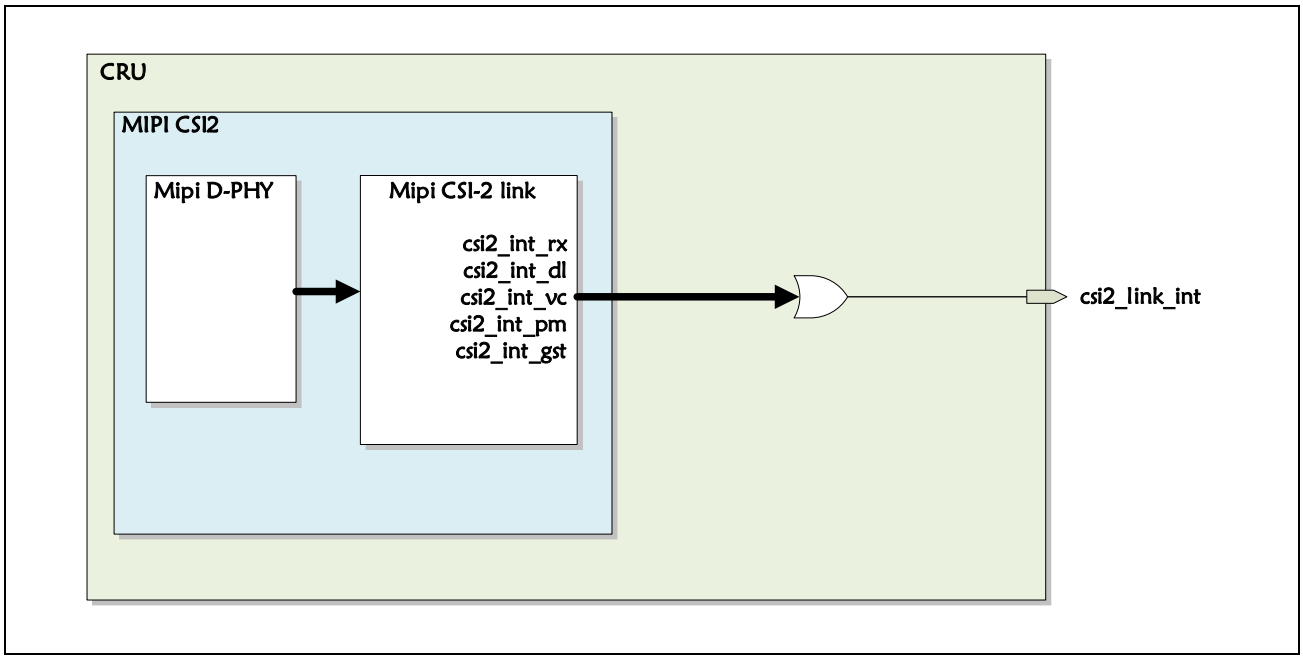

Figure 35.7 Interrupt Structure

Table 35.8 Interruption Status and Generation Condition (1/3)

Interrupt Status	Interrupt Source Register Field	Interrupt Enable Register Field	Generation Condition
CSI2nMIST.RXS	CSI2nRXST.RACTDET	CSI2nRXIE.RACTDETE	This IP received a packet.
CSI2nMIST.DLS0	CSI2nDLST0.ESH0	CSI2nDLIE0.ESHE0	ErrSotHS occurred on DL0.

	CSI2nGSST.GOV	CSI2nGSIE.GOVE	GS FIFO overflowed.

35.2 Image Processing

35.2.1 Overview

The image processing module is a data conversion module equipped with pixel color space conversion, LUT, pixel format conversion, etc. An MIPI CSI-2 (**Section 35.1**) input is provided as the image sensor interface. Either of the two inputs is selected and stored in the internal FIFO (RAM), and then the data is transferred to the external memory by using the internal AXI bus. The MIPI CSI-2 input processes only a single data type on one channel from virtual channels CH0 to CH3. Some parameters allow changes on a per-frame basis. If multiple virtual channels (with the same image size) are to be processed, channels are switched at the frame boundary by changing register settings.

35.2.1.1 Features

- The operating ranges are as follows:
  - Maximum number of valid pixels: QVGA (320 × 240) to 5 Mpixels
  - Range of valid pixels in the horizontal direction: 320 to 2800 pixels
  - Range of valid pixels in the vertical direction: 240 to 4095 lines
  - The maximum transfer rate is 4 Gbps for the MIPI CSI-2 input. Because the max. transfer rate depends on the input format, see **Section 35.1.2** for details.
- Input data format (type): See **Table 35.10**.
  - MIPI CSI-2 input: YUV, RGB, RAW, etc.
- Output data format (type): Only little endian is supported.
  - YCbCr422/YCbCr420, 8-bit multiplexed (Y, U/V order swapping supported)
  - YC separation from YCbCr422 (separated into Y and CbCr components)
  - Y component extraction from YCbCr422
  - U/V of the YUV422/YCbCr420 output is expressed in offset binary or two’s complement notation.
  - RGB-888 (24 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)
  - RAW8,10,12,14,16
- Color space conversion
  - YCbCr422 to RGB888
  - RGB888 to YCbCr422
- Image format conversion
  - YCbCr422 → YC separation (separated into Y and CbCr components)
  - YCbCr422 → Y component extraction
  - YCbCr422 → YCbCr420
  - RGB-888 → RGB-888 (32 bits/pixel)
  - RGB-888 → ARGB-8888 (32 bits/pixel): B First A Last format
  - RGB-888 → ARGB-8888 (32 bits/pixel): A First B Last format

  - RGB-565 → RGB-888 conversion (intermediate processing): Converted to RGB-888 except for the all-bypass setting (ICnMC.ICTHR = 1)
  - RGB-666 → RGB-888 conversion (intermediate processing): Converted to RGB-888 except for the all-bypass setting (ICnMC.ICTHR = 1)
- Conversion by using a lookup table (LUT)
- Data clipping (clipping YCbCr values below 16 and above 240)
- Image clipping
- Frame subsampling
- Bypassing each function (function bypassed)
- Pattern generator (for debugging)
  - Output Y, U, V register values.
- FIFO:
  - For image data: 8 K bytes
- AXI master: One channel
- APB slave: Only 32-bit access is supported.

35.2.1.2 Block Diagram

Below figure shows a block diagram of the image processing module.

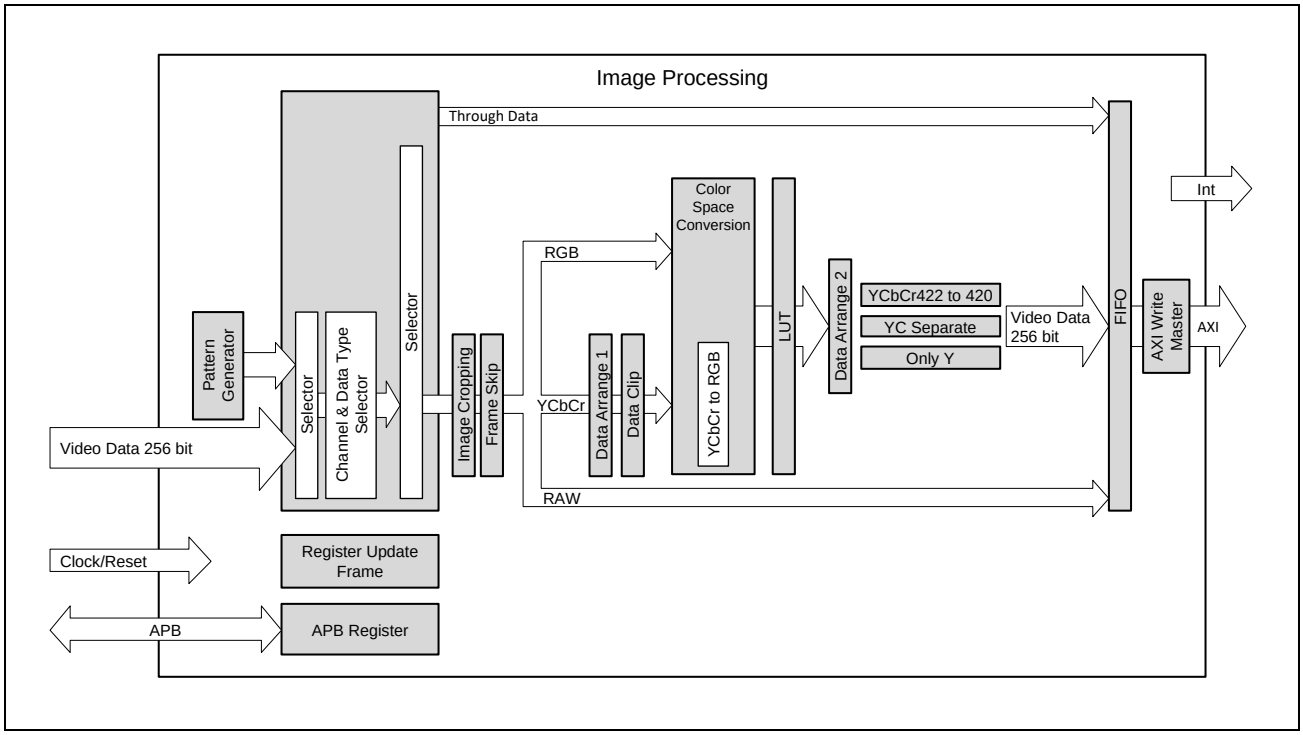

Figure 35.8 Block Diagram of the Image Processing Module

35.2.2 Register Configuration

The following shows the base address of this module.

Module Name	Address
Image Processing	H'0_1083_0000 (Cortex-A55 Address Space)

The register values at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization. For the changing flows, see **Section 35.3.4.1**, **Section 35.3.4.2**.

Table 35.9 Register Configuration of the Image Processing Module (1/4)

Register Name	Register Symbol Name	Address	R/W	Initial Value
Common

35.2.3 Register Descriptions

Access the following registers only in units of 32 bits.

35.2.3.1 CRU Control Register (CRUnCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VINSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VINSEL	0b	RW	Video data input switch setting 0b: MIPI I/F 1b: Setting Prohibited

35.2.3.2 CRU Interrupt Enable Register (CRUnIE)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	WIE	SIE	EFE	SFE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FEOVWE	DECEE	SLVEE	FOE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 21	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	WIE	0b	RW	Work count value error interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
18	SIE	0b	RW	Scan line interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
17	EFE	0b	RW	Frame end interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
16	SFE	0b	RW	Frame start interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	FEOVWE	0b	RW	FrameEndOverWrite (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
2	DECEE	0b	RW	DECERR (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
1	SLVEE	0b	RW	SLVERR (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.
0	FOE	0b	RW	FIFO overflow (image-related) interrupt control 0b: No interrupts are generated. 1b: Interrupts are generated.

35.2.3.3 CRU Interrupt Status Register (CRUnINTS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	WIS	SIS	EFS	SFS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FEOVWS	DECES	SLVES	FOS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 21	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	WIS	0b	RW	Word count value error interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
18	SIS	0b	RW	Scan line interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
17	EFS	0b	RW	Frame end interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
16	SFS	0b	RW	Frame start interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 8	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3	FEOVWS	0b	RW	FrameEndOverWrite (image-related) interrupt status An error occurs if the end of the next frame is received while processing a frame end. Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
2	DECES	0b	RW	DECERR (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
1	SLVES	0b	RW	SLVERR (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated
0	FOS	0b	RW	FIFO overflow (image-related) interrupt status Write 0: Invalid, 1: Clears the interrupt & status Read 0: No interrupts generated, 1: Interrupts generated

35.2.3.4 CRU Reset Register (CRUnRST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VRESETN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	VRESETN	0b	RW	0b: Resets the image processing module. 1b: Releases the image processing module from the reset state.

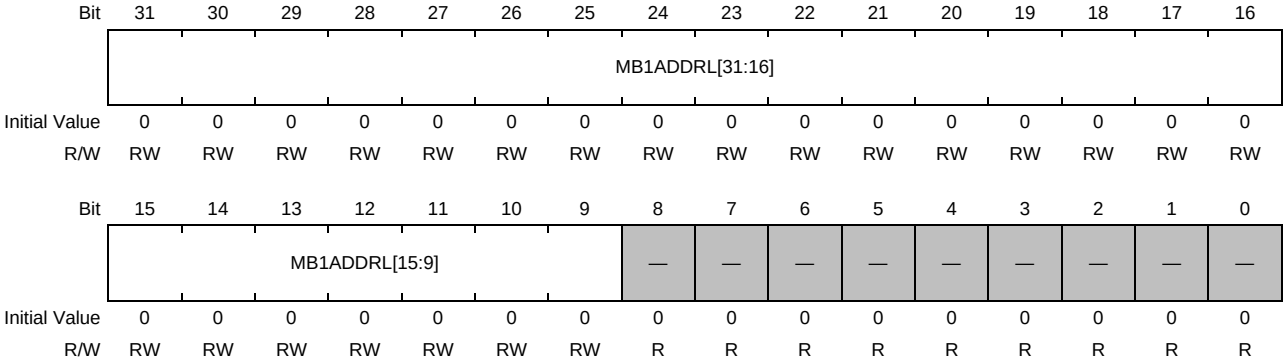
35.2.3.5 CRU General Read/Write Register (CRUnCOM)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	COMMON[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	COMMON[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

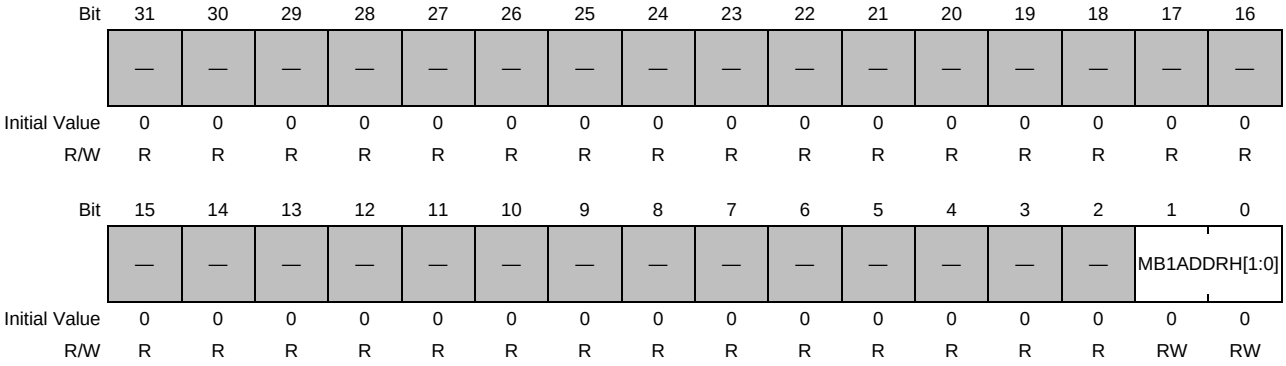
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	COMMON [31:0]	H'0	RW	General register

35.2.3.6 Memory Bank 1 Base Address (Lower) Register for CRU Image Data (AMnMB1ADDRL)



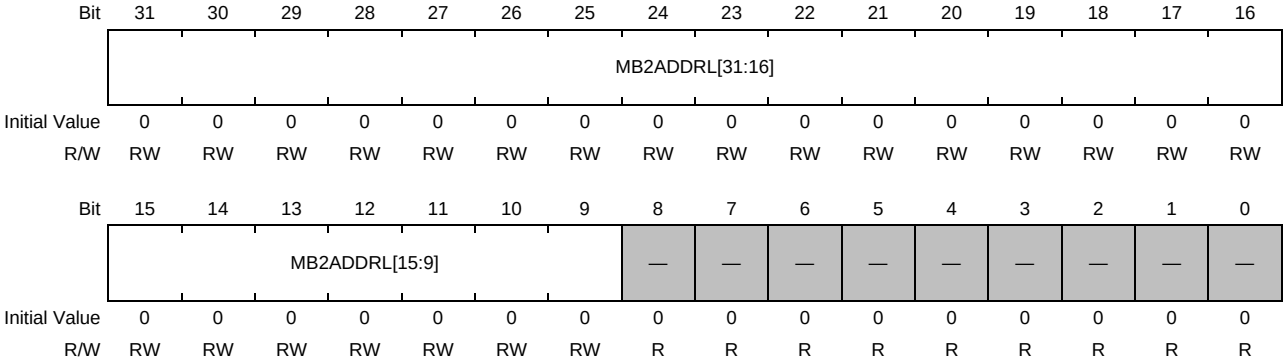
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB1ADDRL [31:9]	H'0	RW	Image data transfer destination base address 1 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.7 Memory Bank 1 Base Address (Higher) Register for CRU Image Data (AMnMB1ADDRH)



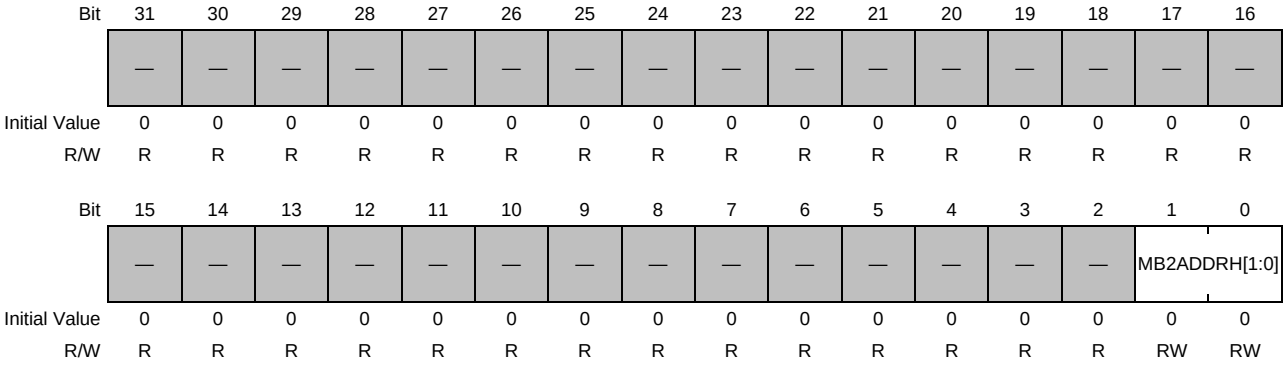
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB1ADDRH [1:0]	H'0	RW	Image data transfer destination base address 1 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.8 Memory Bank 2 Base Address (Lower) Register for CRU Image Data (AMnMB2ADDRL)



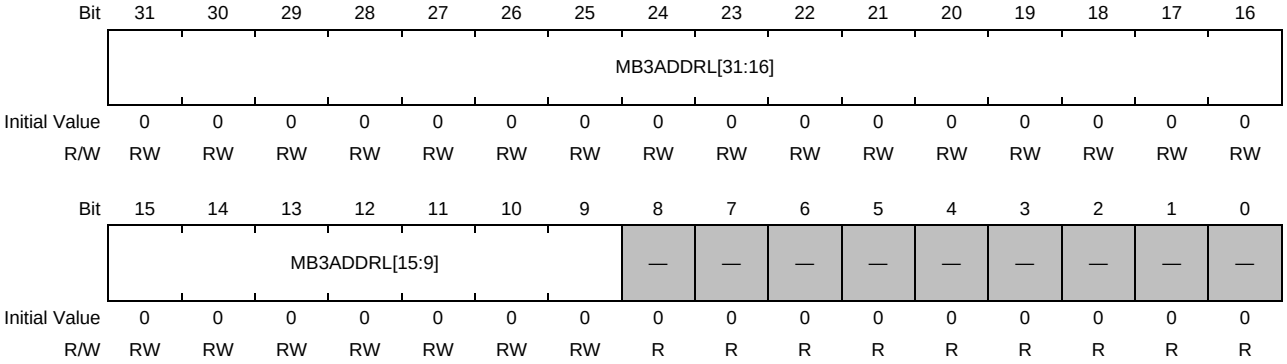
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB2ADDRL [31:9]	H'0	RW	Image data transfer destination base address 2 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.9 Memory Bank 2 Base Address (Higher) Register for CRU Image Data (AMnMB2ADDRH)



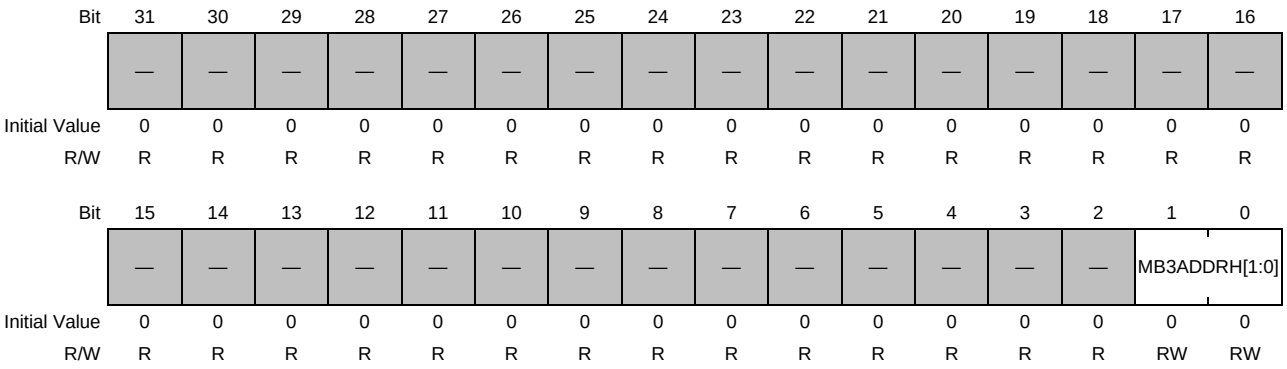
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB2ADDRH [1:0]	H'0	RW	Image data transfer destination base address 2 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.10 Memory Bank 3 Base Address (Lower) Register for CRU Image Data (AMnMB3ADDRL)



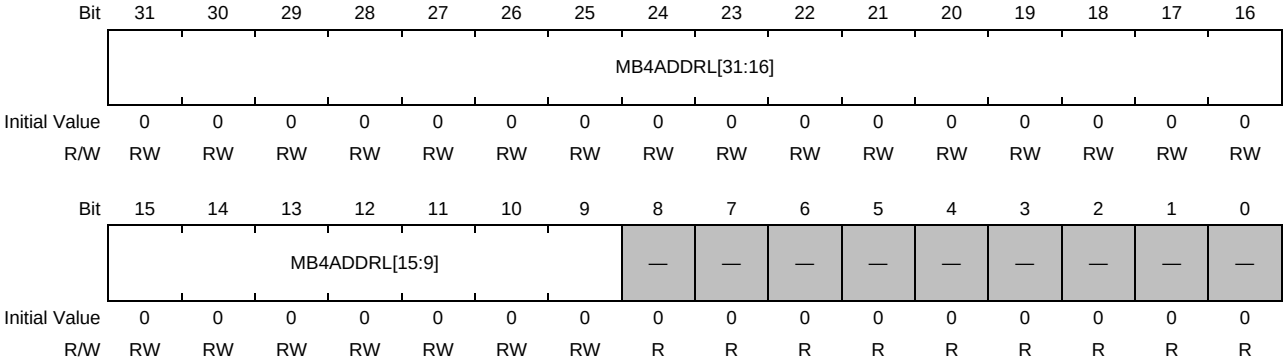
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB3ADDRL [31:9]	H'0	RW	Image data transfer destination base address 3 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.11 Memory Bank 3 Base Address (Higher) Register for CRU Image Data (AMnMB3ADDRH)



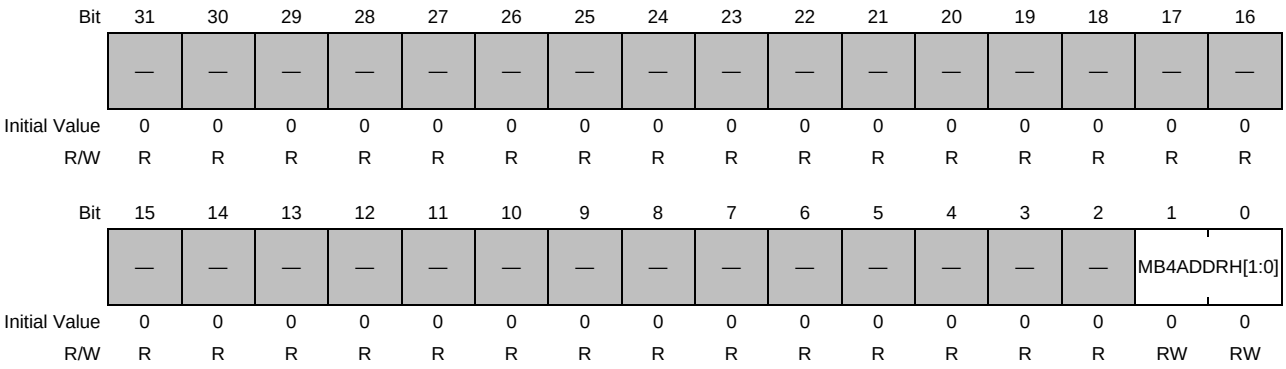
Bit	Bit Name	Initial Value	R/W	Description
31 to2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB3ADDRH [1:0]	H'0	RW	Image data transfer destination base address 3 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.12 Memory Bank 4 Base Address (Lower) Register for CRU Image Data (AMnMB4ADDRL)



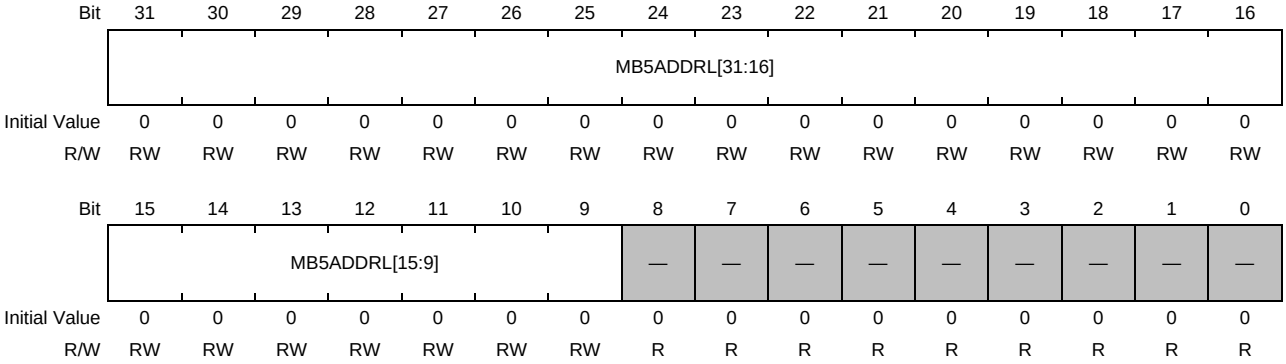
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB4ADDRL [31:9]	H'0	RW	Image data transfer destination base address 4 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.13 Memory Bank 4 Base Address (Higher) Register for CRU Image Data (AMnMB4ADDRH)



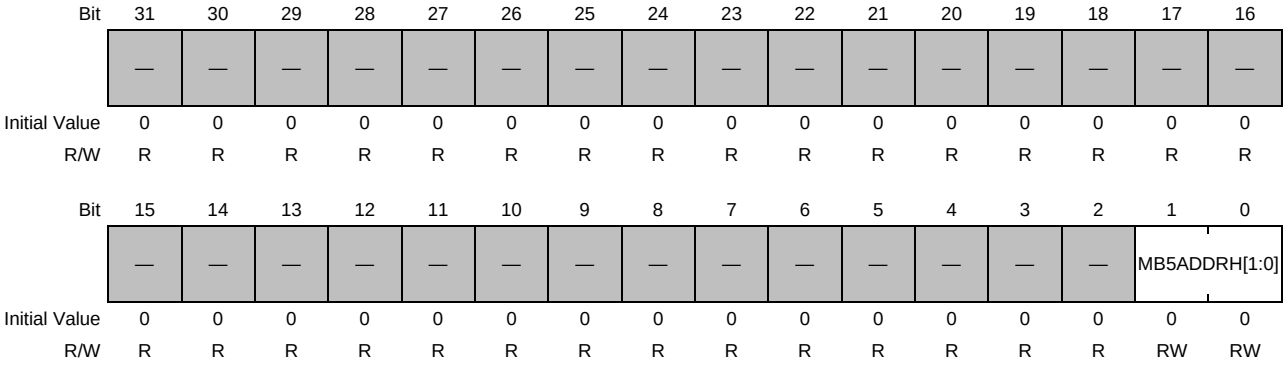
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB4ADDRH [1:0]	H'0	RW	Image data transfer destination base address 4 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.14 Memory Bank 5 Base Address (Lower) Register for CRU Image Data (AMnMB5ADDRL)



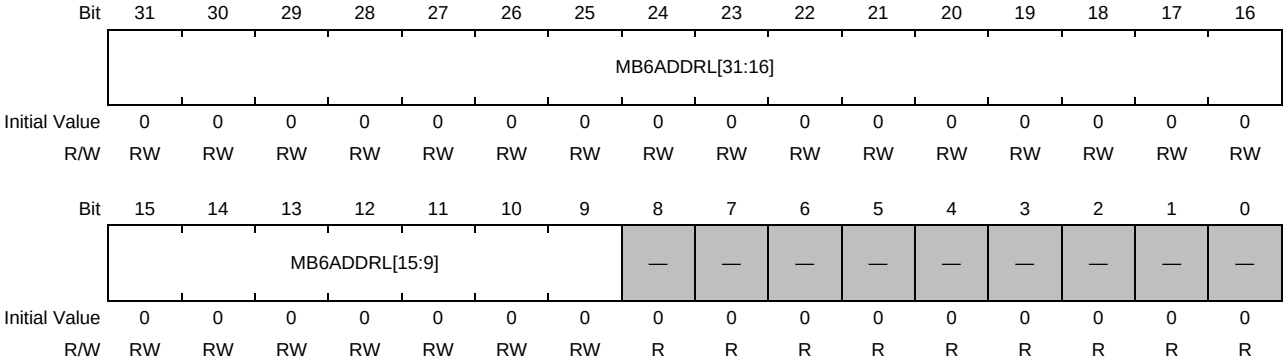
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB5ADDRL [31:9]	H'0	RW	Image data transfer destination base address 5 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.15 Memory Bank 5 Base Address (Higher) Register for CRU Image Data (AMnMB5ADDRH)



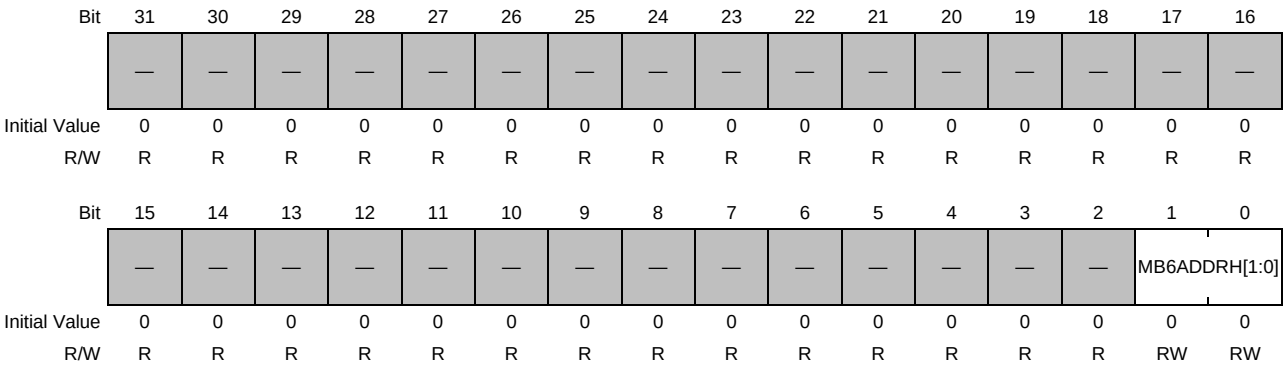
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB5ADDRH [1:0]	H'0	RW	Image data transfer destination base address 5 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.16 Memory Bank 6 Base Address (Lower) Register for CRU Image Data (AMnMB6ADDRL)



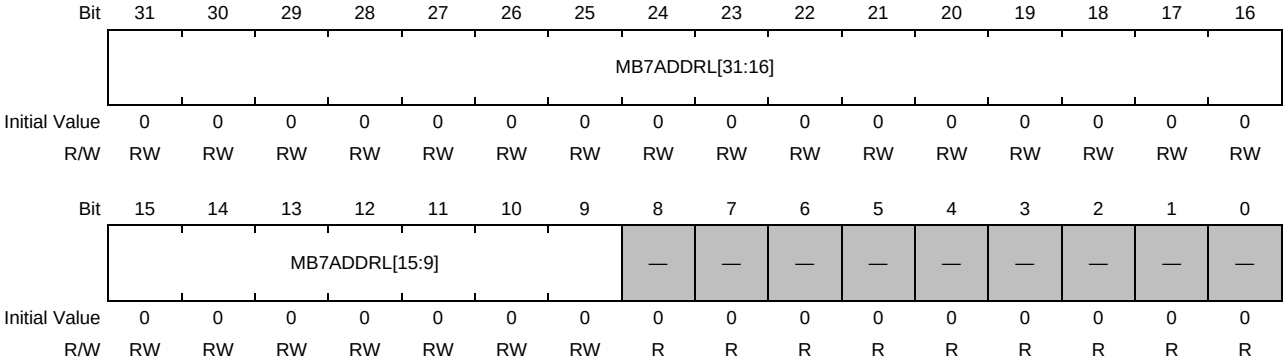
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB6ADDRL [31:9]	H'0	RW	Image data transfer destination base address 6 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.17 Memory Bank 6 Base Address (Higher) Register for CRU Image Data (AMnMB6ADDRH)



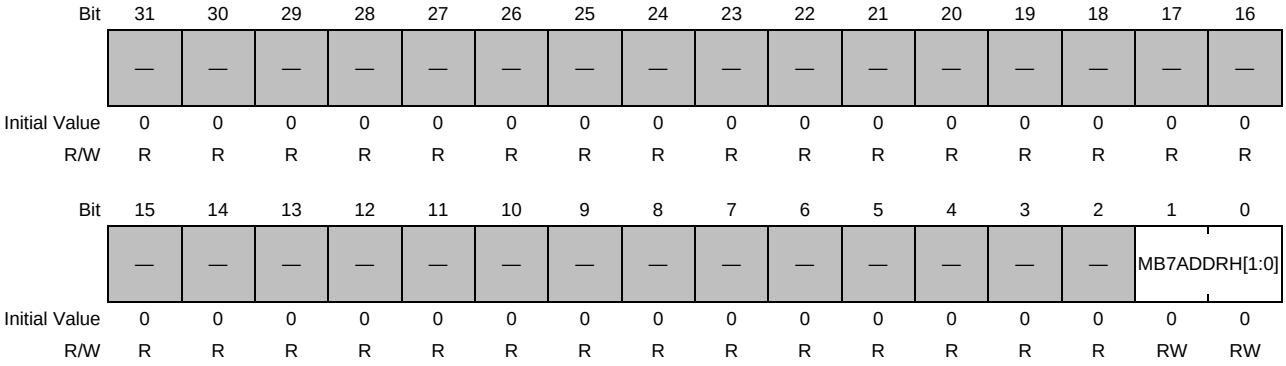
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB6ADDRH [1:0]	H'0	RW	Image data transfer destination base address 6 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.18 Memory Bank 7 Base Address (Lower) Register for CRU Image Data (AMnMB7ADDRL)



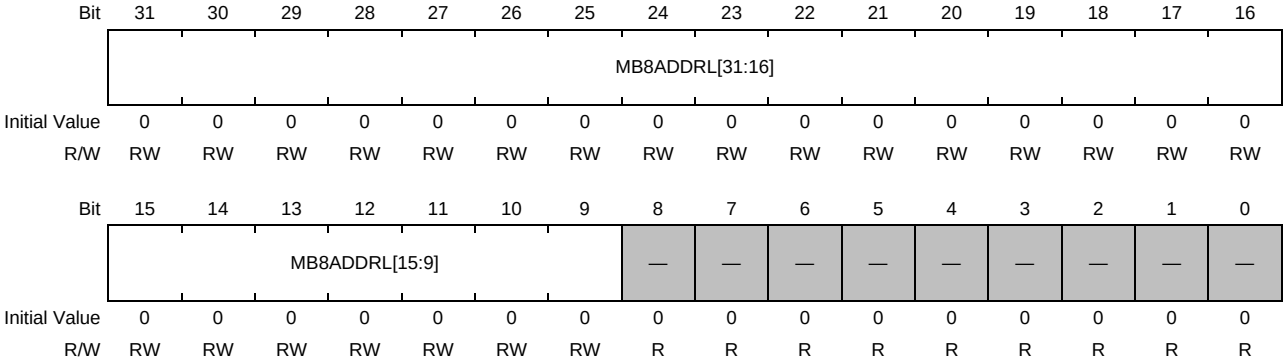
Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB7ADDRL [31:9]	H'0	RW	Image data transfer destination base address 7 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..

35.2.3.19 Memory Bank 7 Base Address (Higher) Register for CRU Image Data (AMnMB7ADDRH)



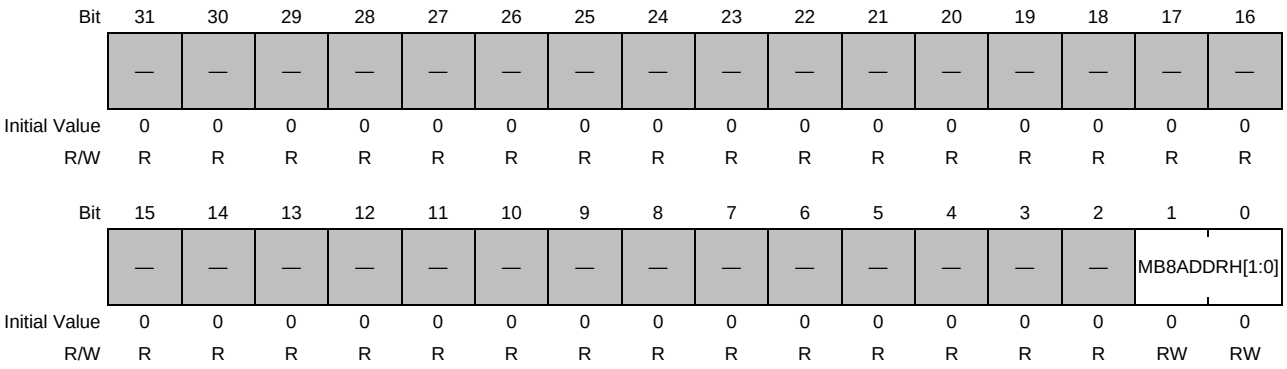
Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	MB7ADDRH [1:0]	H'0	RW	Image data transfer destination base address 7 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.20 Memory Bank 8 Base Address (Lower) Register for CRU Image Data (AMnMB8ADDRL)



Bit	Bit Name	Initial Value	R/W	Description
31 to 9	MB8ADDRL [31:9]	H'0	RW	Image data transfer destination base address 8 (valid bits: [31:9]) Set it as the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.21 Memory Bank 8 Base Address (Higher) Register for CRU Image Data (AMnMB8ADDRH)



Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
1 to 0	MB8ADDRH [1:0]	H'0	RW	Image data transfer destination base address 8 (valid bits: [33:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.22 UV Data Address Offset (Lower) Register for CRU Image Data (AMnUVAOFL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UVAOFL[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UVAOFL[15:9]							—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	UVAOFL [31:9]	H'0	RW	UV data address offset when outputting image data YUV (valid bits: [31:9]) Set it in the base address in units of 512 bytes. *Note*: The lower nine bits cannot be written to (cannot be modified while the AXI is operating).
8 to 0	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

35.2.3.23 UV Data Address Offset (Higher) Register for CRU Image Data (AMnUVAOFH)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UVAOFH[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	UVAOFH[2:0]	H'0	RW	UV data address offset when outputting image data YUV (valid bits: [34:32]) (These bits cannot be modified while the AXI is operating.)

35.2.3.24 Memory Bank Enable Register for CRU Image Data (AMnMBVALID)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MBVALID[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	MBVALID[7:0]	H'01	RW	Image data transfer destination valid address (Details is written in **Section 35.2.4.3**.) [0]: 0: MB1 invalid, 1: MB1 valid [1]: 0: MB1 invalid, 1: MB2 valid [2]: 0: MB1 invalid, 1: MB3 valid [3]: 0: MB1 invalid, 1: MB4 valid [4]: 0: MB1 invalid, 1: MB5 valid [5]: 0: MB1 invalid, 1: MB6 valid [6]: 0: MB1 invalid, 1: MB7 valid [7]: 0: MB1 invalid, 1: MB8 valid *Note*: Set the valid destination address from the LSB continuously. Data transferred from the LSB is written sequentially only in valid banks, and the process is repeated from the start (LSB) when the last address is reached. (These bits cannot be modified while the AXI is operating.)

35.2.3.25 Memory Bank Status Register for CRU Image Data (AMnMBS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MBSTS[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	MBSTS[2:0]	H'0	R	Indicates which memory bank the image data is being transferred to, MB1 to MB8. (H'0: MB1, H'1: MB2 … H'6: MB7, H'7: MB8)

35.2.3.26 AXI Master Transfer Setting Register for CRU Image Data (AMnAXIATTR)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AXILEN[3:0]			
Initial Value	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0
R/W	R	R	RW	RW	R	R	RW	RW	R	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 24	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
22 to 16	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to14	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
13 to 12	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 10	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
9 to 8	—	H'1	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	—	H'5	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	AXILEN[3:0]	H'0	RW	AXI burst length setting for image data (these bits cannot be modified while the AXI is operating.)

35.2.3.27 AXI Master FIFO Setting Register for CRU Image Data (AMnFIFO)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FIFOOVFREC
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	FIFOOVFREC	1b	RW	Recovery mode when image data FIFO overflowed The image-related AXI master stops when the image data FIFO overflowed. The operation after an overflow can be selected: 0b: Auto recovery: The CRU recovers automatically in the next frame after the image-related AXI master stopped and the FIFO was cleared. After recovery, transfer resumes to the start address of the MB to which data was being transferred to. 1b: Stop: The image-related AXI master stops and the FIFO is cleared. The status can be verified by the reg_axi_mst_err_int interrupt. The CRU recovers in the next frame after AXI_TRANS_START bit in the AMnFIFOTRST register is set to 1. The image data being processed at the time of the FIFO overflow will be corrupted. The FIFO overflow may have been caused by bus congestion. Take action for bus congestion.

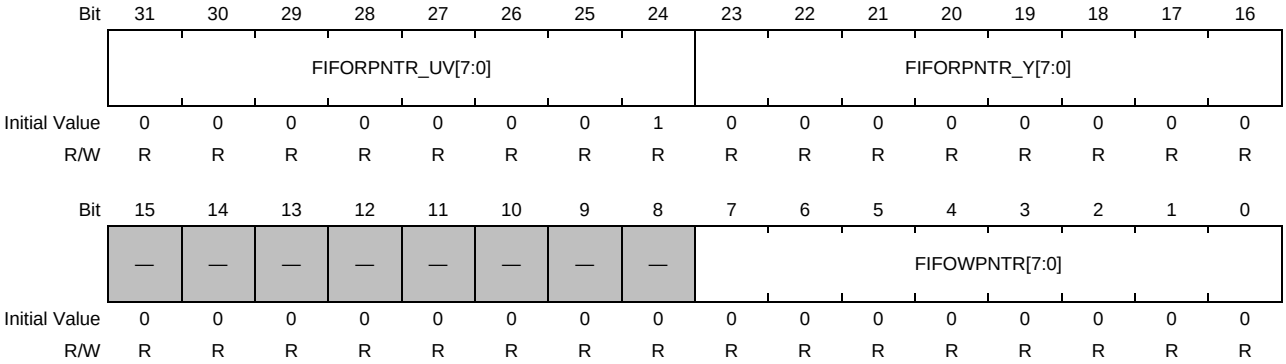
35.2.3.28 AXI Master Transfer Resume Register for CRU Image Data (AMnFIFOTRST)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_TRANS_START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_TRANS_START	0b	RW	AXI transfer control for image data (valid when AMnFIFO.FIFOOVFREC = 1). See **Section 35.2.3.27**. 0b: Writing prohibited. Write 1 to this bit to recover the image-related AXI (transfer resume) (This bit returns to 0 when transfer is resumed.)

35.2.3.29 AXI Master FIFO Pointer Register for CRU Image Data (AMnFIFOPNTR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FIFORPNTR_UV[7:0]	H'1	R	FIFO read pointer for image data (for UV) Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Unused During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): FIFO read pointer for UV data [7:1] RAM read pointer value for UV data FIFO [0] Fixed to 1
23 to 16	FIFORPNTR_Y[7:0]	H'0	R	FIFO read pointer for image data Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): All FIFO read pointer [7:0] RAM read pointer value for FIFO During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): Y data FIFO read pointer [7:1] RAM read pointer value for Y data FIFO [0] Fixed to 0
15 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	FIFOWPNTR[7:0]	H'0	R	FIFO write pointer for image data Not during YC separation mode (ICnDMR.YCMODE[2:0] = 010b): [7:0] RAM write pointer value for FIFO *Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:0] - FIFORPNTR_Y[7:0]. During YC separation mode (ICnDMR.YCMODE[2:0] = 010b): [7:1] RAM write pointer value for FIFO [0] Fixed to 0 *Note*: The amount of data stored in the FIFO can be found by FIFOWPNTR[7:1] - FIFORPNTR_Y[7:1] o FIFOWPNTR[7:1] - FIFORPNTR_UV[7:1].

35.2.3.30 AXI Master Transfer Stop Register for CRU Image Data (AMnAXISTP)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_STOP	0b	RW	Image data AXI transfer stop (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.3**.) 0b: Does not stop the AXI master from transferring data. 1b: Stops the AXI master from transferring data.

35.2.3.31 AXI Master Transfer Stop Status Register for CRU Image Data (AMnAXISTPACK)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AXI_STOP_ACK
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	AXI_STOP_ACK	0b	R	Image data AXI transfer stop response (used to stop the CRU from receiving data. Perform the reception stop procedure described in **Section 35.3.3**.) 0b: The AXI master is transferring data. 1b: The AXI master has finished transferring data (valid when AXI_STOP = 1)

35.2.3.32 CRU Image Processing Enable Register (ICnEN)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ICEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	ICEN	0b	RW	Enables the operation of the image processing module. (Enable or disable the operation according to **Section 35.3.1** and **Section 35.3.3**.) 0b: Disables the image processing module. 1b: Enables the image processing module. *Note*: If this bit is set to 0, a frame start is not detected. If this bit is changed from 1 to 0 while a frame is being processed, the data at that time is processed as the frame end and then the next frames are not processed.

35.2.3.33 CRU Image Processing Register Setting Change Control Register (ICnREGC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REFEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	REFEN	0b	RW	Allows register setting changes to be reflected. By using this register for an MIPI CSI-2 input, the registers at addresses H'1083_0208 to H'1083_0244 can be changed through frame synchronization during operation. (Allow or disallow this according to **Section 35.3.4.1**, **Section 35.3.4.2**.) 0b: Does not allow register setting changes to be reflected. 1b: Allows register setting changes to be reflected. *Note*: If this bit is set to 1 while the image processing module is operating (ICnEN.ICEN = 1), the register setting values (at addresses H'1083_0208 to H'1083_0244) are reflected at a frame start, and then the bit is cleared to 0 automatically. *Note*: If the image processing module is stopped (ICnEN.ICEN = 0), the register setting values can be reflected irrespective of this register. Note that registers other than the above cannot be changed during operation.

35.2.3.34 CRU Image Processing Main Control Register (ICnMC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VCSEL[1:0]		INF[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0
R/W	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	IBINSEL	CLP[1:0]		—	—	—	—	—	LUTTHR	CSCTHR	—	—	CLPTHR	DECTHR	ICTHR
Initial Value	0	0	1	1	0	0	0	0	1	1	1	1	1	1	1	0
R/W	RW	RW	RW	RW	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
25 to 24	—	H'0	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 22	VCSEL[1:0]	H'0	RW	Specify a virtual channel to be processed by the image processing module. A single channel specified by the register is selected from virtual channels 0 to 3.
21 to 16	INF[5:0]	H'1E	RW	Specify the MIPI input image formats to be processed in the image processing module. For details about the formats, see Data Type Codes in the MIPI CSI-2 V2.1 Specification. From the formats specified here, only one format is processed. *Note 1.* Initial value: YUV422 8-bit *Note 2.* The following values can be set. Other settings are prohibited. H'13 to H'16: Generic Long Packet Data Type H'18 to H'1A, H'1C to H'1F: YUV Data H'20 to H'24: RGB Data H'28 to H'2F: RAW Data H'30 to H'37: User-Defined Byte-based Data The data types specified here must have been set in CSI2nDTEL.DTEN and CSI2DTEH.DTEN of MIPI CSI2.
15	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14	IBINSEL	0b	RW	Binary selection for UV of input image format YUV422 0b: Offset binary (straight binary) 1b: Two's complement binary
13 to 12	CLP[1:0]	11b	RW	Data clipping setting for the YCbCr (YUV) format To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240. 00b: No clipping for Y Values below 16 and above 240 are clipped for CbCr 01b: Values below 16 and above 240 are clipped for Y Values below 16 and above 240 are clipped for CbCr 10b: No clipping for Y Values below 16 are increased to 128 and values above 240 are clipped to 128 for CbCr 11b: No clipping for Y and CbCr (initial value)
11 to 8	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7	—	1b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.

Bit	Bit Name	Initial Value	R/W	Description
6	LUTTHR	1b	RW	Bypassing LUT-based image color conversion 0b: Image color conversion is performed. 1b: Image color conversion is not performed (bypassed). *Note*: This setting applies only to input image formats YUV422 (8-bit), YUV422 (10-bit), RGB565, RGB666, RGB888, RAW8, RAW10, RAW12, RAW14, and RAW16. For other image data, image color conversion is not performed irrespective of this setting.
5	CSCTHR	1b	RW	Bypassing color space conversion (YCbCr(YUV) → RGB, RGB → YCbCr(YUV)) 0b: Color space conversion is performed. 1b: Color space conversion is not performed (bypassed). *Note*: This setting applies only to input image formats YUV422 (8-bit), YUV422 (10-bit), RGB565, RGB666, RGB888. For other image data, color space conversion is not performed irrespective of this setting.
4 to 3	—	H'3	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	CLPTHR	1b	RW	Bypassing image clipping (Details is described in **Section 35.2.4.4**.) 0b: Image clipping is performed. 1b: Image clipping is not performed (bypassed). *Note*: This setting applies only to input image formats YUV422 (8-bit), YUV422 (10-bit), RGB565, RGB666, RGB888, RAW8, RAW10, RAW12, RAW14, and RAW16. For other image data, image clipping is not performed irrespective of this setting.
1	DECTHR	1b	RW	Bypassing frame skip (Details is described in **Section 35.2.4.5**.) 0b: Frame subsampling is performed. 1b: Frame subsampling is not performed (bypassed). *Note*: This setting applies only to input image formats YUV422 (8-bit), YUV422 (10-bit), RGB565, RGB666, RGB888, RAW8, RAW10, RAW12, RAW14, and RAW16. For other image data, frame subsampling is not performed irrespective of this setting.
0	ICTHR	0b	RW	Bypassing all image processing for an MIPI input 0b: Performs image conversion processing according to settings. 1b: All processing is bypassed and the data from LINK is output as is to the image AXI mater.

(1) Bypass Setting for Each Function

Figure 35.9 shows where the bypass settings by the ICTHR, DECTHR, CLPTHR, CSCTHR, and LUTTHR bits of the ICnMC register work.

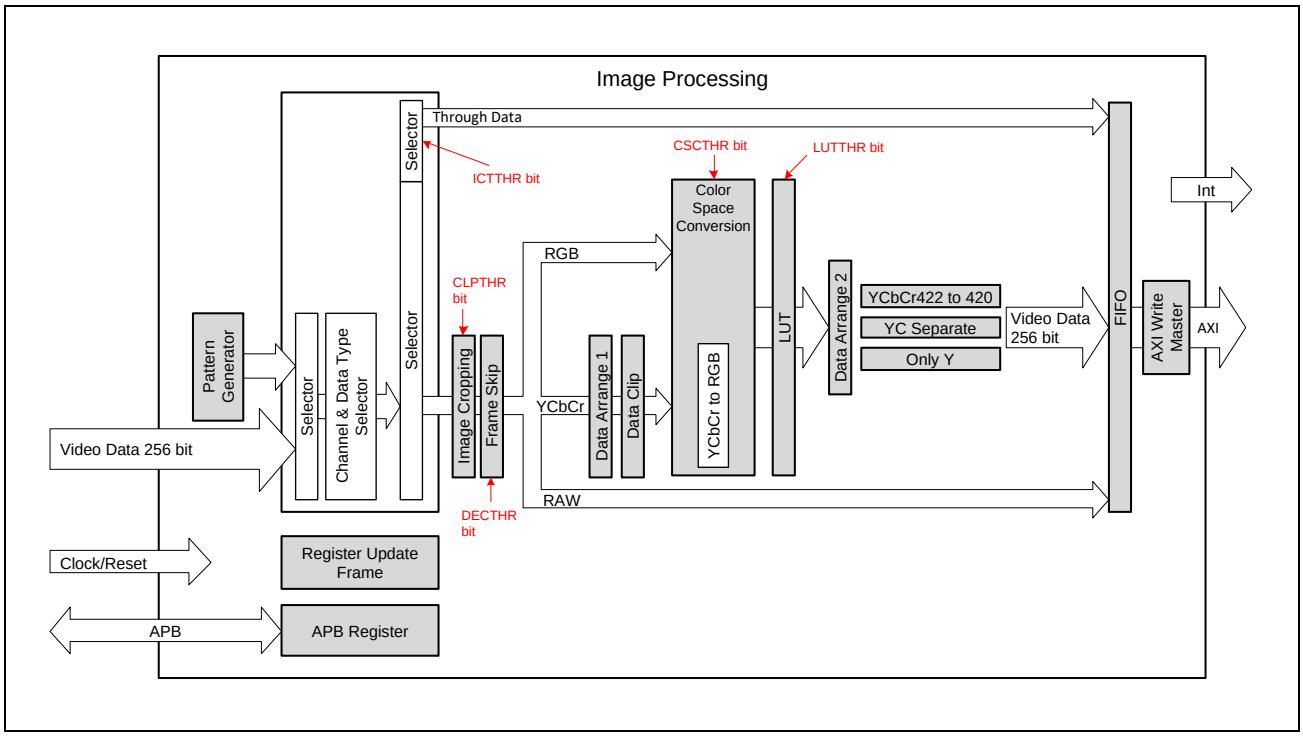


Figure 35.9 Bypass Setting of Each Function

35.2.3.35 CRU Image Clipping Start Line Register (ICnSLPrC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored..
11 to 0	ELPrC[11:0]	H'0	RW	End line in the vertical direction when clipping the input image to the specified area Set a value of 1 or greater because the frame start is processed as the first line. The image is output up to the specified line. *Note*: Set a value in a way that 1 ≤ ICnSLPrC.SLPrC ≤ ICnELPrC.ELPrC.

35.2.3.37 CRU Image Clipping Start Pixel Register (ICnSPPrC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SPPrC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	SPPrC[11:0]	H'0	RW	Start pixel in the horizontal direction when clipping the input image to the specified area Set a value of 1 or greater because the line start is processed as the first pixel. The image is output from the specified pixel data. (If 0 is specified, the same operation as for setting of 1 is performed.) *Note 1.* Set a value in a way that 1 ≤ ICnSPPrC.SPPrC ≤ (ICnEPPrC.EPPrC+1-320). *Note 2.* Specify an odd value when the input format is YUV422 (ICnMC.INF[5:0] = H'1E to H'1F or ICnPIFC.PINF[3:0] = H'0 to H'B). If an even number of 2 or greater is specified, the CRU operates as if an odd number (the specified number - 1) is specified. (Example: When 34 is specified, the data is output from the 33rd pixel.) *Note 3.* Even when the input format is RGB, etc., set a value that satisfies the following formula so that a line consists of an even number of pixels if the RGBtoYCbCr output is YUV422/420. ICnEPPrC.EPPrC - ICnSPPrC.SPPrC = 2N - 1 (N = 160, 161, 162,...)

35.2.3.38 CRU Image Clipping End Pixel Register (ICnEPPrC)

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	EPPrC[11:0]	H'0	RW	End pixel in the horizontal direction when clipping the input image to the specified area Set a value of 1 or greater because the line start is processed as the first pixel. The image is output up to the specified image data. *Note 1.* Set a value in a way that 1 ≤ ICnSPPrC.SPPrC ≤ (ICnEPPrC.EPPrC + 1 - 320). *Note 2.* Specify an even value when the input forma is YUV422 (ICnMC.INF[5:0] = H'1E to H'1F or ICnPIFC.PINF[3:0] = H'0 to H'B). If an odd number is specified, the CRU operates as if an even number (the specified number + 1) is specified. (Example: When 127 is specified, the data is output up to the 128th pixel.) *Note 3.* Even when the input format is RGB, etc., set a value that satisfies the following formula so that a line consists of an even number of pixels if the RGBtoYCbCr output is YUV422/420. ICnEPPrC.EPPrC - ICnSPPrC.SPPrC = 2N - 1 (N = 160, 161, 162,...)

35.2.3.39 CRU Scan Line Interrupt Register (ICnSI)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SI[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	SI[11:0]	H'0	RW	Line specification for generating a scan line interrupt When the line number being processed in a frame of the image processing module matches the line setting value specified by this bit, an image_conv_int interrupt can be generated. *Note*: By using the ICnINTCTRL.DECINTE bit, whether to generate interrupts in subsampled frames can be specified.

35.2.3.40 CRU Module Status Register (ICnMS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	IA	AV	CA
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2	IA	0b	R	Indicates whether the image converter block (module covering the video data input up to the pre-FIFO stage) is processing. 0b: Image data has not been received yet. 1b: Image data is being converted.
1	AV	0b	R	Indicates whether processing is performed within the image-clipped area. (For details, see **Section 35.2.4.4**.) 0b: Processing is performed outside the image-clipped area. 1b: Processing is performed within the image-clipped area.
0	CA	0b	R	Indicates whether the frame is subsampled. (For details, see **Section 35.2.4.5**.) 0b: A subsampled frame is being processed. 1b: A frame which is not subsampled is being processed. *Note*: This bit is 0 when CRUnRST.VRESETN is 0. This bit is set to 1 two cycles of PCLK after CRUnRST.VRESETN is changed from 0 to 1.

35.2.3.41 CRU Frame Subsampling Control Register (ICnDEC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	FRMDEC[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	FRMDEC[3:0]	H'0	RW	Subsampling interval in frame subsampling (For details, see **Section 35.2.4.5**.) H'0: All images are passed. H'1: One pass every two frames H'2: One pass every three frames Omitted H'14: One pass every 15 frames H'15: One pass every 16 frames

35.2.3.42 CRU Line Count Register (ICnLC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	LC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	LC[11:0]	H'0	R	Indicate the line counter value before image clipping and subsampling in the image processing module.

35.2.3.43 CRU Word Count Register (ICnWC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	WCLC[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	WC[15:0]	H'0	R	Indicate the current word count from LINK for the MIPI CSI-2 input. *Note 1.* These bits are cleared to 0 at a frame start. *Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	WCLC[11:0]	H'0	R	Indicate the count of continuous lines for which the word count value from LINK for the MIPI CSI-2 input matches the value set in ICnEWC.EWC[15:0]. *Note 1.* This value is cleared by a frame start. *Note 2.* If the word count value does not match the value set in ICnEWC.EWC[15:0], the unmatched value is retained until the next frame start.

35.2.3.44 CRU Word Count Check Control Register (ICnEWC)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EWC[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 0	EWC[15:0]	H'0	RW	Specify an expected word count value that is output from LINK for the MIPI CSI-2 input. If this setting value does not match the word count value that is output from LINK for the MIPI CSI-2 input, the image_conv_err_int interrupt can be output. This bit is used for debugging when the operation for the MIPI CSI-2 input is abnormal.

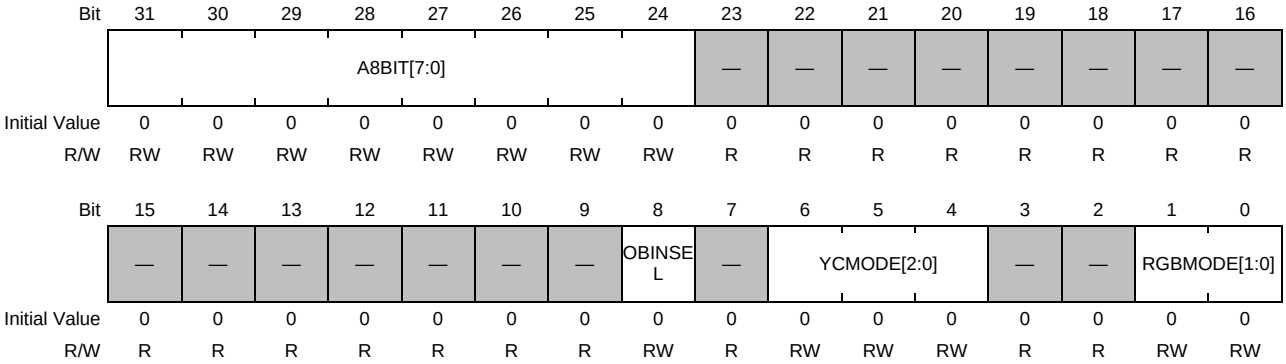
35.2.3.45 CRU Frame Subsampling Interrupt Control Register (ICnINTCTRL)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DECINTE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	DECINTE	0b	RW	Specifies whether an interrupt (CRUnINTS.SFS, CRUnINTS.EFS, or CRUnINTS.SI) is generated for a subsampled frame. 0b: No interrupt is generated for a subsampled frame. (Initial value) 1b: An interrupt is generated for a subsampled frame.

35.2.3.46 CRU Output Image Format Register (ICnDMR)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	H'0	RW	Alpha bit Alpha value in the ARGB8888 format output
23 to 9	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	OBINSEL	0b	RW	Output binary selection for YCbCr data 0b: Offset binary (straight binary) 1b: Two's complement binary *Note*: Valid when the output is YUV422/420.
7	—	0b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
6 to 4	YCMODE[2:0]	000b	RW	YC data output format selection 000b: YCbCr422, 8-bit multiplexed (YUYV format (Y 1st)) 001b: YCbCr422, 8-bit multiplexed (UYVY format (Cb 1st)) 010b: YC separation from YCbCr422 011b: Y component extraction from YCbCr422 100b: YCbCr420, 8-bit multiplexed (YUYV format (Y 1st)) 101b: YCbCr420, 8-bit multiplexed (UYVY format (Cb 1st)) 110b: Setting prohibited 111b: Setting prohibited *Note*: YCbCr420 output is not supported YC separation .
3 to 2	—	00b	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	RGBMODE [1:0]	00b	RW	Format selection for RGB data output 00b: RGB888 (24-bit) 01b: RGB888 (32-bit) (The upper eight bits are padded with H'00.) 10b: ARBG888 (32-bit, B First A Last) 11b: ARBG888 (32-bit, A First B Last)

35.2.3.47 CRU YCbCr → RGB Color Space Conversion Coefficient 1 Register (ICnCSCC1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	YMUL[13:0]													
Initial Value	0	0	0	1	0	0	1	0	1	0	0	1	1	1	1	1
R/W	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	YMUL[13:0]	H'129F	RW	Y data multiplication coefficient These bits specify a Y data multiplication coefficient in YCbCr → RGB color space conversion. (Initial value: 1.164) Specify an unsigned 14-bit integer which is the desired coefficient value multiplied by 4096.

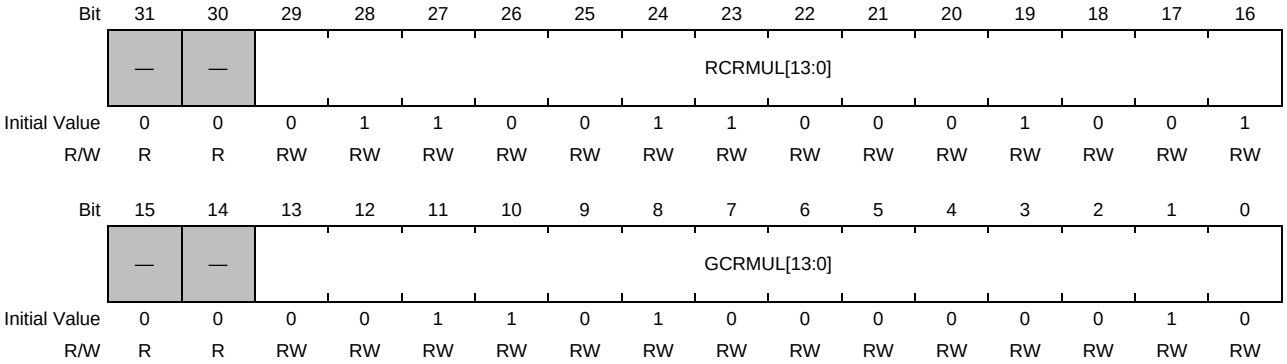
35.2.3.48 CRU YCbCr → RGB Color Space Conversion Coefficient 2 Register (ICnCSCC2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	YSUB[11:0]											
Initial Value	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSUB[11:0]											
Initial Value	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

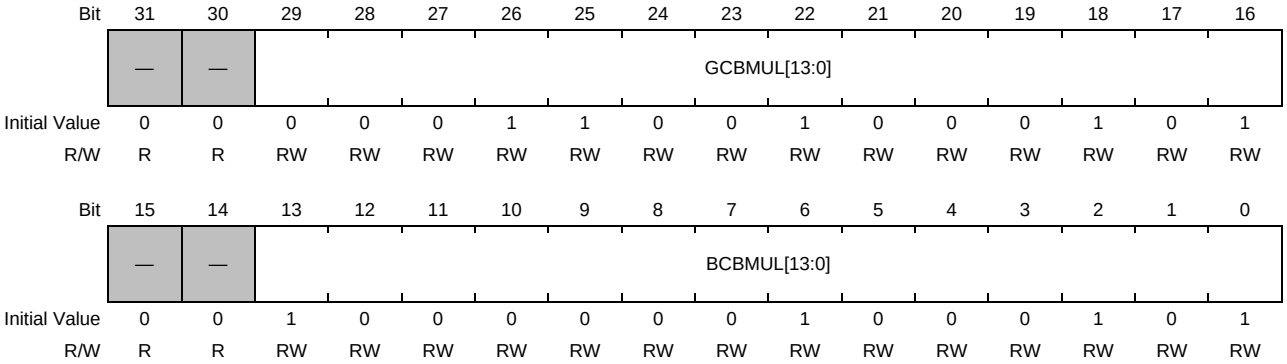
Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	YSUB[11:0]	H'100	RW	Y data subtraction coefficient These bits specify a Y data subtraction coefficient in YCbCr → RGB color space conversion. Specify an unsigned 12-bit integer. Calculate on 12 bits extended from YCbCr422 8-/10-bit.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	CSUB[11:0]	H'800	RW	CbCr data subtraction coefficient These bits specify a Cb and Cr data subtraction coefficient in YCbCr → RGB color space conversion. Specify an unsigned 12-bit integer. Calculate on 12 bits extended from YCbCr422 8-/10-bit.

35.2.3.49 CRU YCbCr → RGB Color Space Conversion Coefficient 3 Register (ICnCSCC3)



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	RCRMUL [13:0]	H'1989	RW	Cr multiplication coefficient in R data calculation These bits specify a Cr multiplication coefficient for the R data equation in YCbCr → RGB color space conversion. (Initial value: 1.596) Specify an unsigned 14-bit integer which is the desired coefficient value multiplied by 4096.
15 to 14	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	GCRMUL [13:0]	H'0D02	RW	Cr multiplication coefficient in G data calculation These bits specify a Cr multiplication coefficient for the G data equation in YCbCr → RGB color space conversion. (Initial value: 0.813) Specify an unsigned 14-bit integer which is the desired coefficient value multiplied by 4096.

35.2.3.50 CRU YCbCr → RGB Color Space Conversion Coefficient 4 Register (ICnCSCC4)



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	GCBMUL [13:0]	H'0645	RW	Cb multiplication coefficient in G data calculation These bits specify a Cb multiplication coefficient for the G data equation in YCbCr → RGB color space conversion. (Initial value: 0.392) Specify an unsigned 14-bit integer which is the desired coefficient value multiplied by 4096.
15 to 14	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	BCBMUL [13:0]	H'2045	RW	Cb multiplication coefficient in B data calculation These bits specify a Cb multiplication coefficient for the B data equation in YCbCr → RGB color space conversion. (Initial value: 2.017) Specify an unsigned 14-bit integer which is the desired coefficient value multiplied by 4096.

35.2.3.51 CRU RGB → YCbCr Color Space Conversion Y Coefficient 1 Register (ICnYCCR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

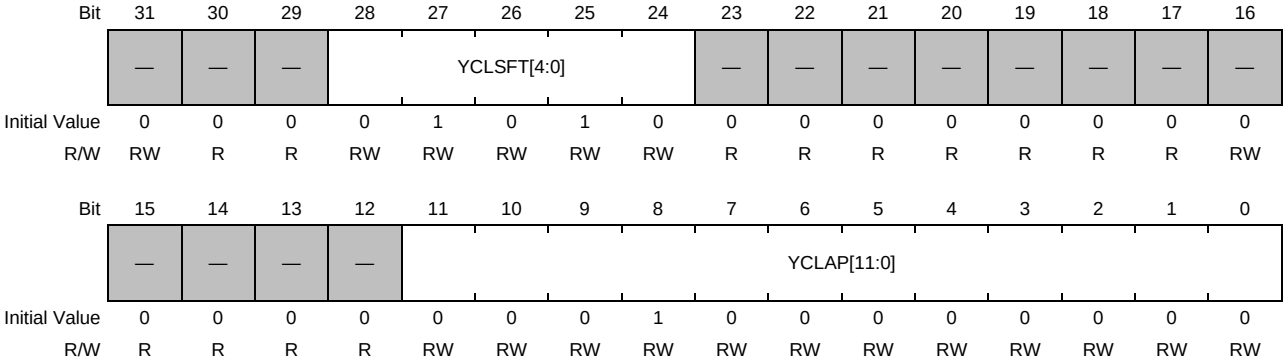
Initial Value	0	0	0	0	0	0	1	0	0	0	0	0	0	1	0	0
R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to29	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 16	YCLBP[12:0]	H'0064	R/W	B multiplication coefficient in Y calculation (B multiplication coefficient for the Y data equation in RGB → YCbCr color space conversion)
15 to 13	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	YCLGP[12:0]	H'0204	R/W	G multiplication coefficient in Y calculation (G multiplication coefficient for the Y data equation in RGB → YCbCr color space conversion)

35.2.3.53 CRU RGB → YCbCr Color Space Conversion Y Coefficient 3 Register (ICnYCCR3)



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 29	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 24	YCLSFT[4:0]	H'0A	RW	Amount of downward shift in Y calculation (specification of the amount of downward shift for Y calculation in RGB → YCbCr color space conversion)
23 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	YCLAP[11:0]	H'100	RW	Value added for normalization of Y calculation data (specification of Y data addition constant in RGB → YCbCr color space conversion)

35.2.3.54 CRU RGB → YCbCr Color Space Conversion Cb Coefficient 1 Register (ICnCBCCR1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
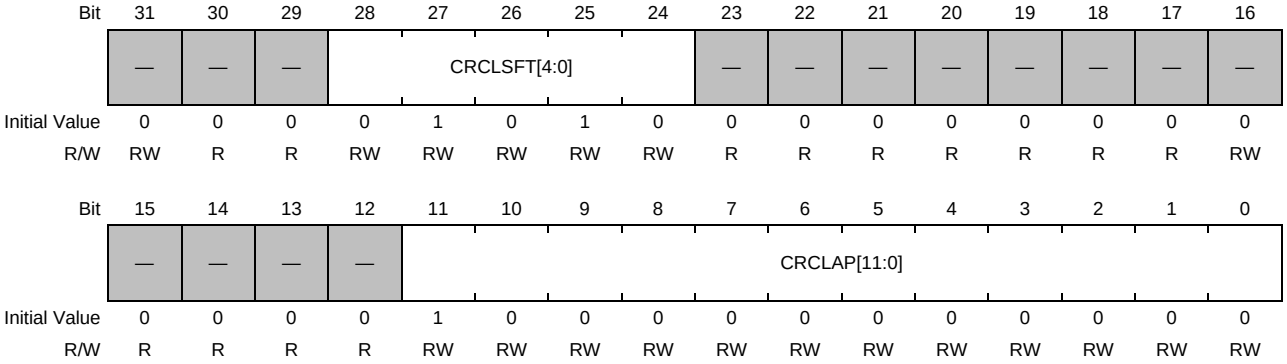
28 to 16	CRCLBP [12:0]	H'1FB7	RW	B multiplication coefficient in Cr calculation (B multiplication coefficient for the Cr data equation in RGB → YCbCr color space conversion)
15 to 13	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
12 to 0	CRCLGP [12:0]	H'1E87	RW	G multiplication coefficient in Cr calculation (G multiplication coefficient for the Cr data equation in RGB → YCbCr color space conversion)

35.2.3.59 CRU RGB → YCbCr Color Space Conversion Cr Coefficient 3 Register (ICnCRCCR3)



Bit	Bit Name	Initial Value	R/W	Description
31	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 29	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28 to 24	CRCLSFT [4:0]	H'0A	RW	Amount of downward shift in Cr calculation (specification of the amount of downward shift for Cr calculation in RGB → YCbCr color space conversion)
23 to 17	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	—	0b	RW	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	CRCLAP [11:0]	H'800	RW	Value added for normalization of Cr calculation data (specification of Cr data addition constant in RGB → YCbCr color space conversion)

35.2.3.60 CRU Lookup Table Control Register (ICnLUT)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUTWR	LUTSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	LUTWR	0b	RW	Enables APB read/write access to the lookup table (LUT). 0b: Disables APB access (set this bit to 0 in operation with the normal path). 1b: Enables APB access (normal access is unavailable in this case). *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.
0	LUTSEL	0b	RW	Specifies the access path of the lookup table (LUT). 0b: Normal path (image conversion by using the LUT) 1b: APB I/F (read/write from registers) Used to write (and confirm) data to the LUT in initial setting. Set this bit to 0 after finishing writing and reading data. Note that the LUT data is retained even after a reset. *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.

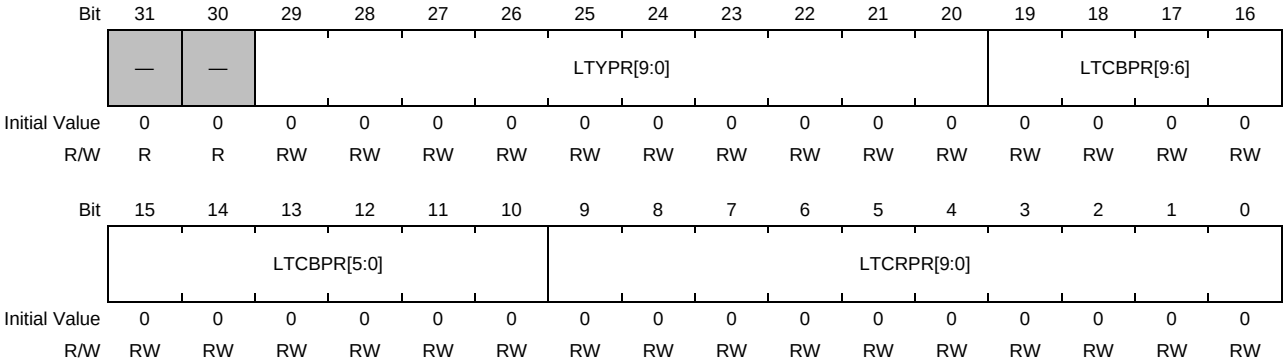
35.2.3.61 CRU Lookup Table Status Register (ICnLUTS)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LUTREGSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

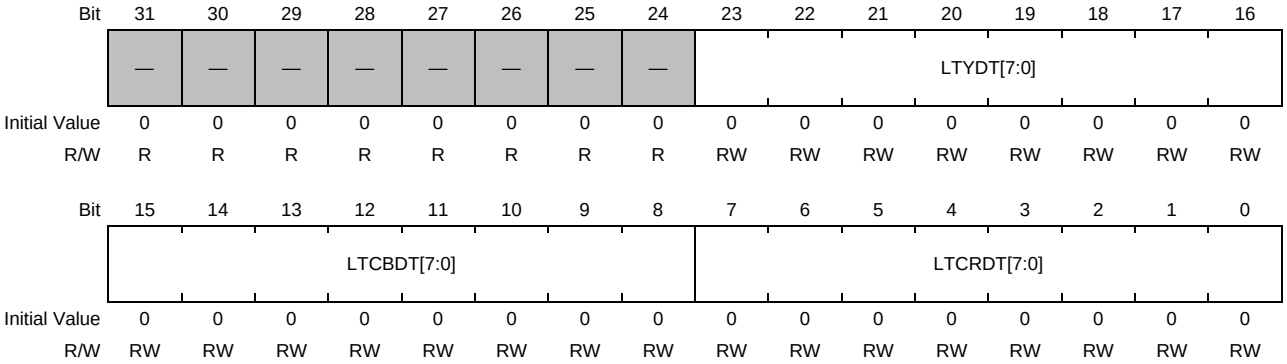
Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	LUTREGSEL	0b	R	Indicates that the lookup table (LUT) can be accessed for a read and write from the APB. The LUTWR register value is reflected in this register after a while. Access the lookup table after confirming this bit. 0b: Both read access and write access are unavailable. 1b: Both read access and write access are available. *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.

35.2.3.62 CRU Lookup Table Pointer Register (ICnLUTP)



Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 20	LTYPR[9:0]	H'0	RW	Lookup table (LUT) Y/R pointer Specify the current pointer (access point) to lookup table Y/R in APB access. The pointer is incremented automatically when ICnLUTD.LTYDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.
19 to 10	LTCBPR[9:0]	H'0	RW	Lookup table (LUT) Cb/G pointer Specify the current pointer (access point) to lookup table Cb/G in APB access. The pointer is incremented automatically when ICnLUTD.LTCBDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.
9 to 0	LTCRPR[9:0]	H'0	RW	Lookup table (LUT) Cr/B pointer Specify the current pointer (access point) to the lookup table Cr/B in APB access. The pointer is incremented automatically when ICnLUTD.LTCRDT[7:0] are written. It returns to 0 upon an overflow. It is not incremented when reading these bits. *Note*: **Figure 35.30, Storing LUT Data (Both)** for the LUT setting procedure.

35.2.3.63 CRU Lookup Table Data Register (ICnLUTD)



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	LTYDT[7:0]	H'0	RW	Lookup table (LUT) Y/R data Read and write data to the location indicated by the ICnLUTP.LTYPR[9:0] pointer in lookup table Y/R through the APB interface.
15 to 8	LTCBDT[7:0]	H'0	RW	Lookup table (LUT) Cb/G data Read and write data to the location indicated by the ICnLUTP.LTCBPR[9:0] pointer in lookup table Cb/G through the APB interface.
7 to 0	LTCRDT[7:0]	H'0	RW	Lookup table (LUT) Cr/B data Read and write data to the location indicated by the ICnLUTP.LTCRPR[9:0] pointer in lookup table Cr/B through the APB interface.

35.2.3.64 CRU Test Image Generation Control 1 Register (ICnTICTRL1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	TIRATE[4:0]				
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNV1[3:0]				TIPTNU1[3:0]				TIPTNY1[3:0]				—	—	TIMODE	TIEN
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	R	R	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
20 to 16	TIRATE[4:0]	H'0	RW	Specify the test image generation rate. 16 pixels / (18 + TIRATE) cycles
15 to 12	TIPTNV1[3:0]	H'0	RW	Specify the pixel (V) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
11 to 8	TIPTNU1[3:0]	H'0	RW	Specify the pixel (U) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
7 to 4	TIPTNY1[3:0]	H'0	RW	Specify the pixel (Y) counter bits for the test image pattern. 0000b: Selects bits [3:0]. 0001b: Selects bits [4:1]. 0010b: Selects bits [5:2]. Omitted 1100b: Selects bits [15:12]. 1101b to 1111b: Setting prohibited
3 to2	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	TIMODE	0b	RW	Specifies a test image generation pattern. 0b: Selects a counter value for YUV output. 1b: Same-color YUV output for the entire screen
0	TIEN	0b	RW	Enables generation of a test image pattern. 0b: Does not generate a test image pattern (processes image data from LINK). 1b: Generates a test image pattern.

35.2.3.65 CRU Test Image Generation Control 2 Register (ICnTICTRL2)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	TIPTNV2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TIPTNU2[7:0]								TIPTNY2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	TIPTNV2[7:0]	H'0	RW	Specify V for the entire-screen same-color test image pattern.
15 to 8	TIPTNU2[7:0]	H'0	RW	Specify U for the entire-screen same-color test image pattern.
7 to 0	TIPTNY2[7:0]	H'0	RW	Specify Y for the entire-screen same-color test image pattern.

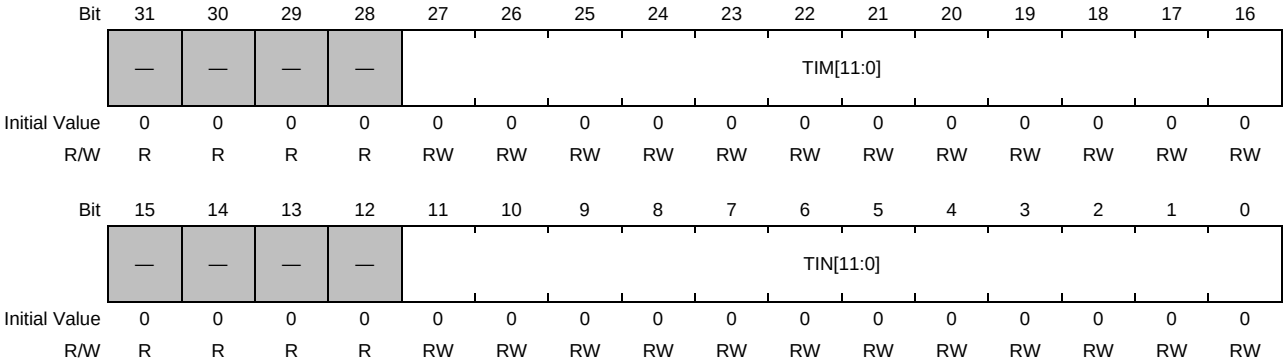
35.2.3.66 CRU Test Image Size Setting 1 Register (ICnTISIZE1)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	TIPPL[11:0]											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW	RW

Bit	Bit Name	Initial Value	R/W	Description
31 to12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	TIPPL[11:0]	H'0	RW	Number of valid pixels per line in the test image pattern *Note 1.* If a value from 0 to 15 is specified, it is assumed that 16 is specified. *Note 2.* The lower four bits are invalid.

35.2.3.67 CRU Test Image Size Setting 2 Register (ICnTISIZE2)



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	TIM[11:0]	H'0	RW	Invalid period (number of lines) per frame in the test image pattern *Note*: If 0 is specified, it is assumed that 1 is specified.
15 to 12	—	H'0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	TIN[11:0]	H'0	RW	Valid period (number of lines) per frame in the test image pattern *Note*: If 0 is specified, it is assumed that 1 is specified.

35.2.4 Operation

35.2.4.1 Input Formats and Image Processing

Table 35.10 lists the input image formats that can be processed by this module, and corresponding image processing. Output format will be limited depending on this setting.

Table 35.10 Input Format and Image Processing (1/2)

Input Format			All Bypassed (ICnMC.ICTHR = 1)	Image Processing										Interrupt					Output format			
Data Type	Data Type Classes	Data Type Name		SAV/EAV Decode	Frame Subsampling	Image Clipping	Data Arrange (Input)	Data Clipping	YCbCr to RGB	RGB to YCbCr	LUT	Data Arrange (Output)	YCbCr422 to 420	Frame Start	Frame End	Scan Line	Abnormal Word Count Value	ITU656 DECERR	YCbCr422	YCbCr420	RGB	RAW

Note 1. Output format
YCbCr422 output format supports YCbCr multiplexed 8bit,YC Separation and Only Y.
YCbCr420 output format supports YCbCr multiplexed 8bit.
RGB output format supports RGB888(24bit),RGB888(32bit)and ARGB8888(32bit).
RAW output format only supports the same width as the input RAW.

35.2.4.2 Output Formats

Table 35.11 lists the image output formats.

35.2.4.3 Transfer to DRAM

(1) Image Data Transfer Destination Address (Image Storage Destination)

- The transfer destination address (image data storage destination) is determined by the AMnMB1ADDRL to AMnMB8ADDRL, and AMnMB1ADDRH to AMnMB8ADDRH registers (MB1ADDR, MB2ADDR, …).
- Up to eight transfer destination addresses (image data storage destinations) are supported.
- A valid register (MB1ADDR, MB2ADDR, …) is switched by AMnMBVALID.
- UV data address offset UVAOF when outputting YUV image data is determined by the AMnUVAOFL and AMnUVAOFH registers.

(a) AMnMBVALID[7:0] = 1111_1111b (eight transfer destinations)

Transfer sequence: MB1 → MB2 → . . . → MB8 → MB1 → MB2 → . . .

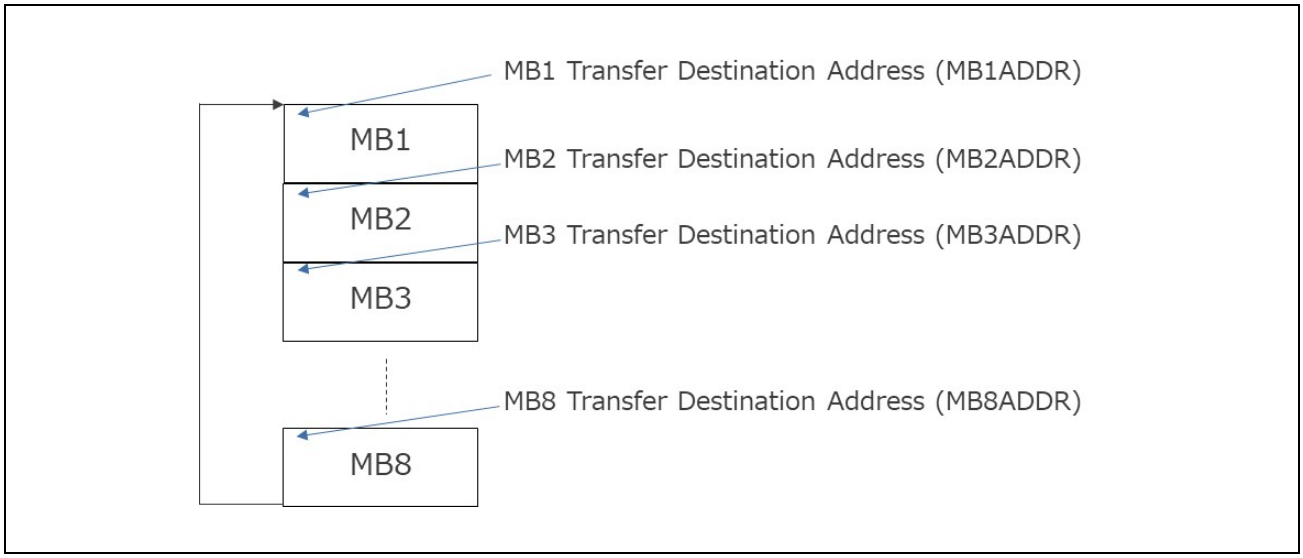

Figure 35.10 Memory Banks (Eight Transfer Destinations)

(b) AMnMBVALID[7:0] = 0000_1111b (four transfer destinations)

MB1 → MB2 → MB3 → MB4 → MB1 → MB2 → . . .

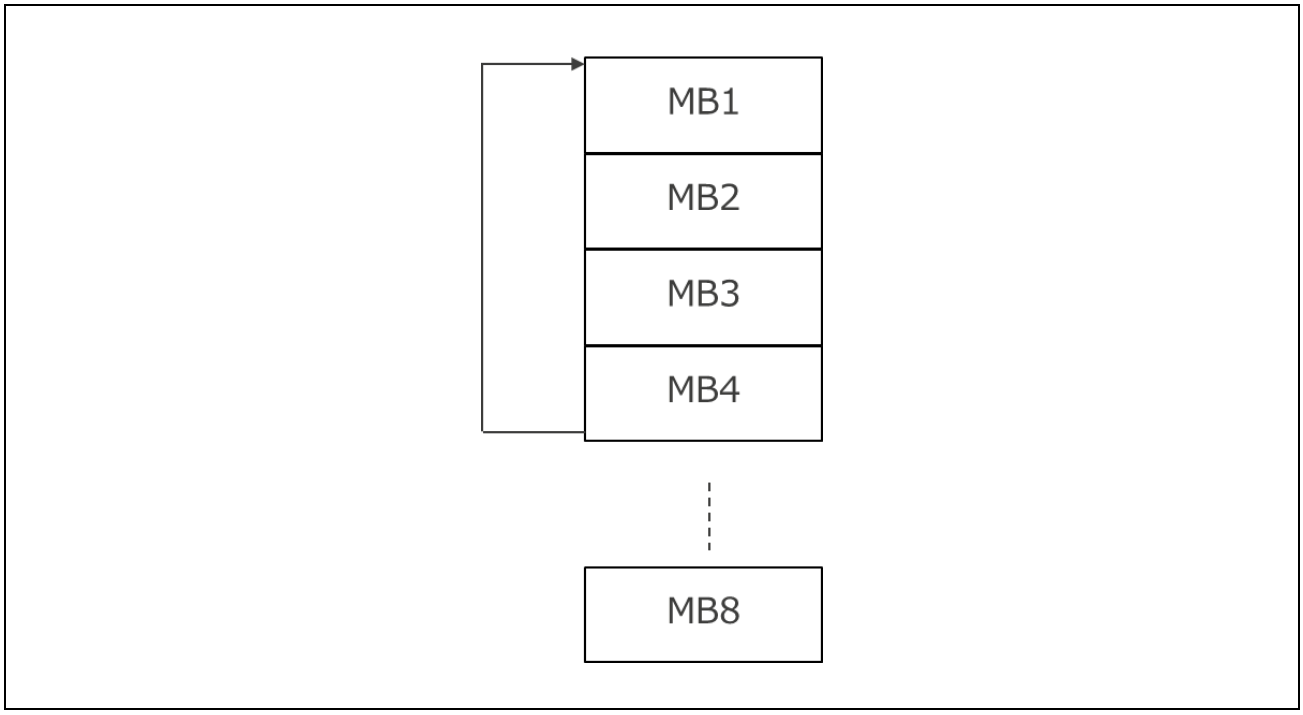

Figure 35.11 Memory Banks (Four Transfer Destinations)

(c) AMnMBVALID[7:0] = 0000_0001b (one transfer destination)

MB1 → MB1 → MB1 → . . .

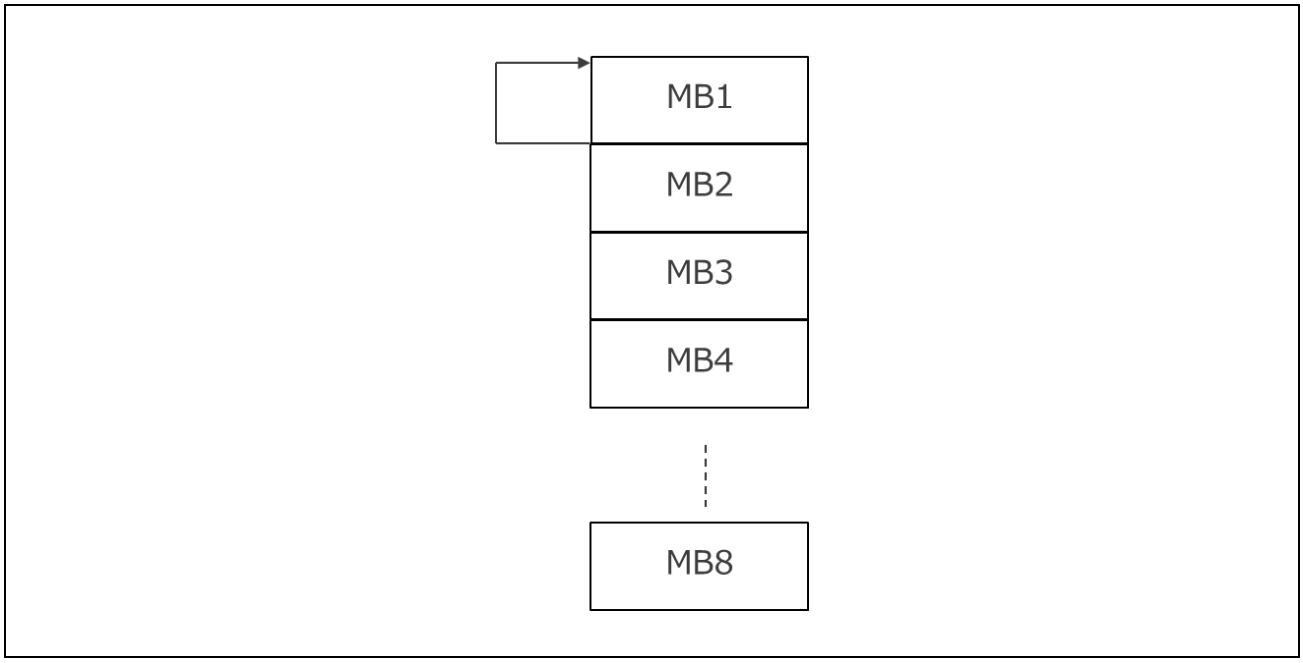

Figure 35.12 Memory Banks (One Transfer Destinations)

(2) Image Data Transfer Destination Address (Storage in Y/UV Separation)

The following shows the sequence of data storage in the MB1 transfer destination address (MB1ADDR) in the case of Y First (YUYV...).

(a) When YUV Is Not Separated (ICnDMR.YCMODE[2:0] = 000b to 001b, 100b to 101b):

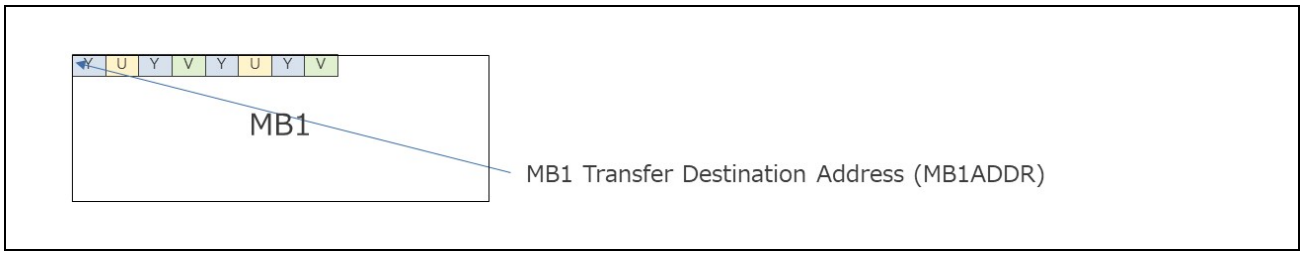

Figure 35.13 Data Storage (YUV Is Not Separated)

(b) When YUV Is Separated (ICnDMR.YCMODE[2:0] = 010b):

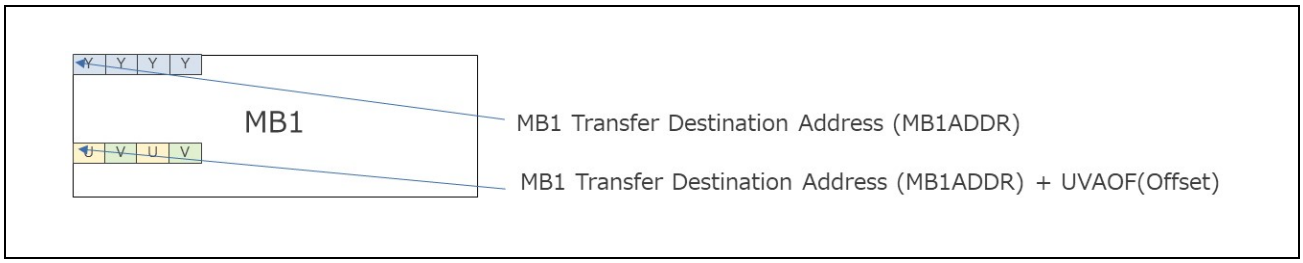

Figure 35.14 Data Storage (YUV Is Separated)

(c) When Only Y Is Separated (ICnDMR.YCMODE[2:0] = 011b)

Figure 35.15 Data Storage (Only Y Is Separated)

(3) Processing of the Last Line in a Frame

Note that data is written to the end of the frame (32 bytes × number of AXI bursts specified by the AXILEN[3:0] bits in the AMnAXIATTR register). Because overrun data is written for a frame, ignore it. Set the start address taking this into consideration.

The figure below shows the case of full HD YUV422.

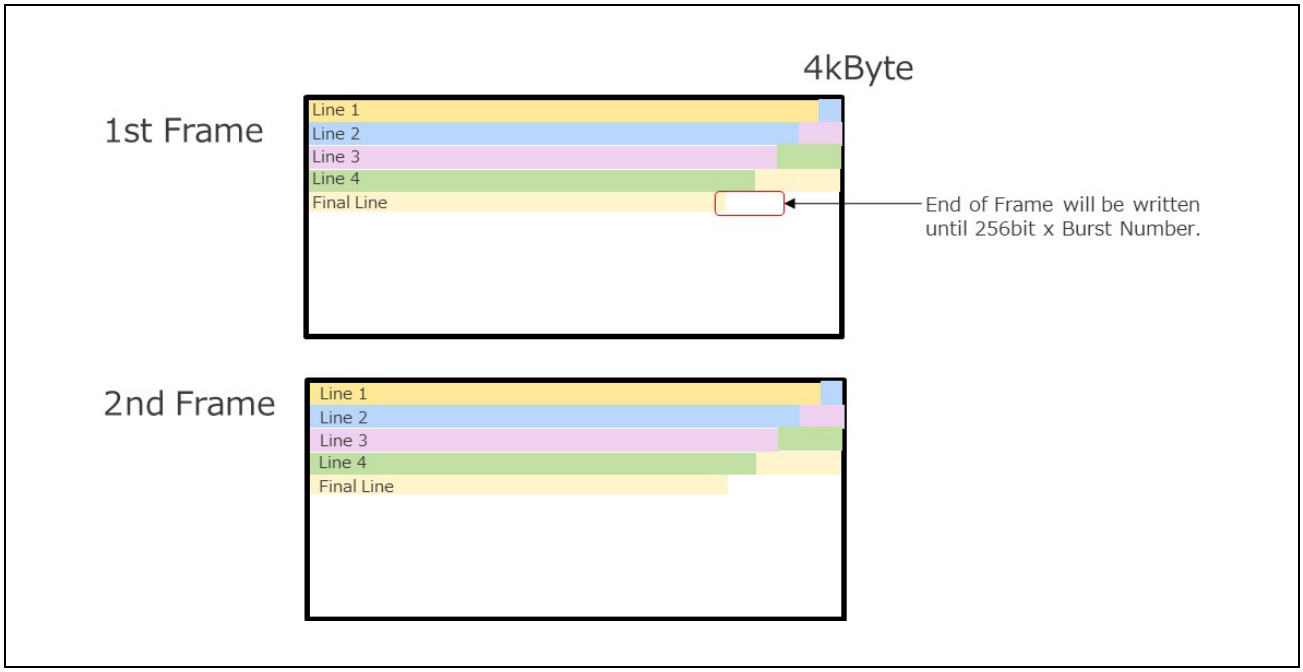

Figure 35.16 Data Storage

35.2.4.4 Image Clipping

This function clips the input image to the range specified by registers. Specify the clipping range by setting the following registers.

(Horizontal direction)

- Image clipping start pixel register: ICnSPPrC.SPPrC[11:0]
- Image clipping end pixel register: ICnEPPrC.EPPrC[11:0]

(Vertical direction)

- Image clipping start line register: ICnSLPrC.SLPrC[11:0]
- Image clipping end line register: ICnELPrC.ELPrC[11:0]

While the image clipped to the size which is indicated in grey is being processed, the AV bit of the ICnMS register is set to 1. If any other part of the image is being processed, the AV bit of the ICnMS register is set to 0. An image is clipped in the same way even if the image is subsampled.

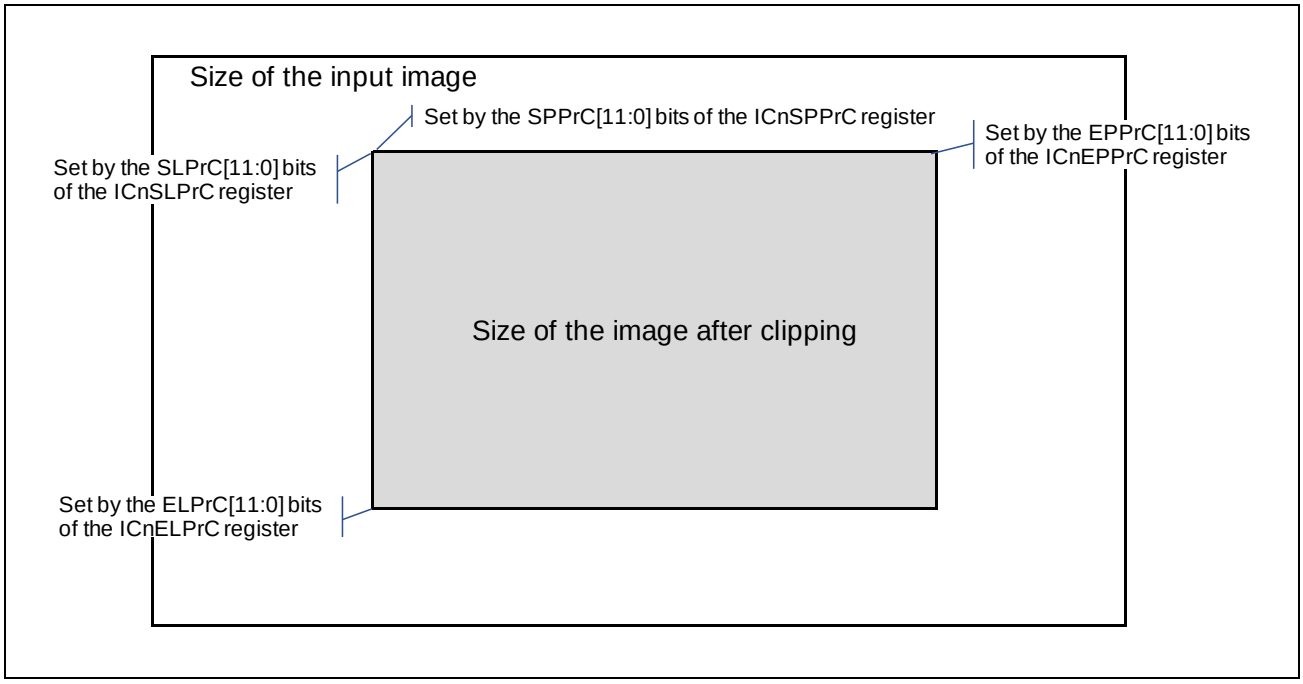

Figure 35.17 Image Clipping

35.2.4.5 Frame Subsampling

This function subsamples the input image by setting a register. Set the following register to specify the reduced frequency of transmission (once every x frames).

- Frame subsampling control register: ICnDEC.FRMDEC[3:0]

The following shows the operation when ICnDEC.FRMDEC[3:0] is set to 2.

The image is sampled every (register value + 1) frames. ICnMS.CA is set to 1 when a non-subsampled image is being processed.

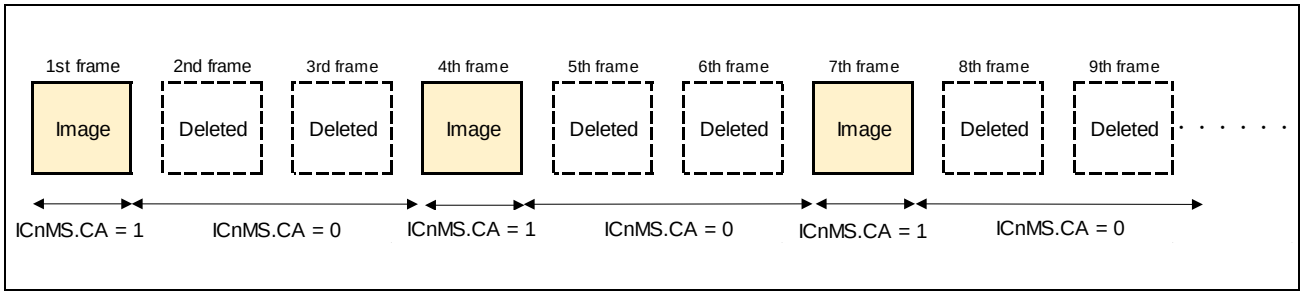

Figure 35.18 Frame Subsampling When ICnDEC.FRMDEC[3:0] Is Set to 2 (Progressive)

35.2.4.6 Data Arrange

This function converts the negative expression of UV in the YUV (YCbC) data when inputting and outputting image data. The Data Arrange1 input side is set by the IBINSEL bit of the ICnMC register, and the Data Arrange2 output side is set by the OBINSEL bit of the ICnDMR register.

Set Data Arrange1 according to the sensor specifications. Set Data Arrange2 according to the specifications used by the output destination. YUV of the MIPI CSI-2 module is usually used in offset binary. It may be output in two's complement depending on the sensor used.

Table 35.12 Input Format and Image Processing

UV Value (Hex)	Offset Binary (Dec) Register Settings: DataArrange1: ICnMC.IBINSEL = 0 DataArrange2: ICnDMR. OBINSEL = 0	Two's Complement (Dec) Register Settings: DataArrange1: ICnMC.IBINSEL = 1 DataArrange2: ICnDMR. OBINSEL = 1
H'FF	127	-1
H'FE	126	-2
. . .	. . .	. . .
H'81	1	-127
H'80	0	-128
H'7F	-1	127
. . .	. . .	. . .
H'01	-127	1
H'00	-128	0

35.2.4.7 Data Clipping

Data in the YCbCr (YUV) format is clipped. To make the input data to be RGB-converted comply with the ITU-R BT.601 standard, specify whether to clip the values below 16 and above 240. Data clipping can be set by the CLP[1:0] bits in the ICnMC register. (See **Section 35.2.3.34**.)

35.2.4.8 Color Space Conversion

(1) RGB to YCbCr

The RGB data (8 or 10 bits) which is image-clipped or frame-subsampled is extended to 12 bits, and then is converted into YCbCr (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709.

Perform calculations according to the coefficients and formulas specified by the following registers:

YCLRP = ICnYCCR1.YCLRP[12:0]
YCLBP = ICnYCCR2.YCLBP[12:0]
YCLGP = ICnYCCR2.YCLGP[12:0]
YCLSFT = ICnYCCR3.YCLSFT[4:0]
YCLAP = ICnYCCR3.YCLAP[11:0]

CBCLRP = ICnCBCCR1.CBCLRP[12:0]
CBCLBP = ICnCBCCR2.CBCLBP[12:0]
CBCLGP = ICnCBCCR2.CBCLGP[12:0]
CBCLSFT = ICnCBCCR3.CBCLSFT[4:0]
CBCLAP = ICnCBCCR3.CBCLAP[11:0]

CRCLRP = ICnCRCCR1.CRCLRP[12:0]
CRCLBP = ICnCRCCR2.CRCLBP[12:0]
CRCLGP = ICnCRCCR2.CRCLGP[12:0]
CRCLSFT = ICnCRCCR3.CRCLSFT[4:0]
CRCLAP = ICnCRCCR3.CRCLAP[11:0]

$Y = ((YCLRP \times R + YCLGP \times G + YCLBP \times B) / 2^{YCLSFT}) + YCLAP$
$Cb = ((CBCLRP \times R + CBCLGP \times G + CBCLBP \times B) / 2^{CBCLSFT}) + CBCLAP$
$Cr = ((CRCLRP \times R + CRCLGP \times G + CRCLBP \times B) / 2^{CRCLSFT}) + CRCLAP$

In the case of ITU-R BT.601 (8 bits) (same as defaults):

$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$
$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$
$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$

Register Settings:

YCLRP = H’0107
YCLBP = H’0204
YCLGP = H’0064
YCLSFT = H’10
YCLAP = H’100

CBCLRP = H’FF69
CBCLBP = H’FED7
CBCLGP = H’01C1
CBCLSFT = H’10
CBCLAP = H’800

CRCLRP = H’01C1
CRCLBP = H’FE88
CRCLGP = H’FFB8
CRCLSFT = H’10
CRCLAP = H’800

(2) YCbCr to RGB

The YCbCr data (8 or 10 bits) which is data-arranged and data-clipped is extended to 12 bits (the extension method: 0 added to lower bits), and then is converted into RGB (10 bits). By setting coefficients in registers, perform calculations equivalent to ITU-R BT.601 and ITU-R BT.709. Perform calculations according to the coefficients and formulas specified by the following registers:

YMUL = ICnCSCC1.YMUL[13:0]
YSUB = ICnCSCC2.YSUB[11:0]
RCRMUL = ICnCSCC2.CSUB[11:0]
GCRMUL = ICnCSCC3.RCRMUL[13:0]
GCBMUL = ICnCSCC3.GCRMUL[13:0]
BCBMUL = ICnCSCC4.GCBMUL[13:0]
CSUB = ICnCSCC4.BCBMUL[13:0]

$$R = \frac{YMUL \times (Y - YSUB)^{*1} + RCRMUL \times (Cr - CSUB)}{4096}$$

$$G = \frac{YMUL \times (Y - YSUB)^{*1} - GCRMUL \times (Cr - CSUB) - GCBMUL \times (Cb - CSUB)}{4096}$$

$$B = \frac{YMUL \times (Y - YSUB)^{*1} + BCBMUL \times (Cb - CSUB)}{4096}$$

Note 1. A negative value is rounded to 0.

In the case of ITU-R BT.601 (8 bits) (same as defaults):

R = 1.164 × (Y - 16) + 1.596 × (Cr - 128)
G = 1.164 × (Y - 16) - 0.813 × (Cr - 128) - 0.392 × (Cb - 128)
B = 1.164 × (Y - 16) + 2.017 × (Cb -128)

Register Settings:

YMUL = H’129F
YSUB = H’100
RCRMUL = H’1989
GCRMUL = H’0D02
GCBMUL = H’0645
BCBMUL = H’2045
CSUB = H’800

35.2.4.9 LUT (Lookup Table)

Used to convert 10-bit data after color space conversion (YCbCr to RGB or RGB to YCbCr) into 8-bit data.

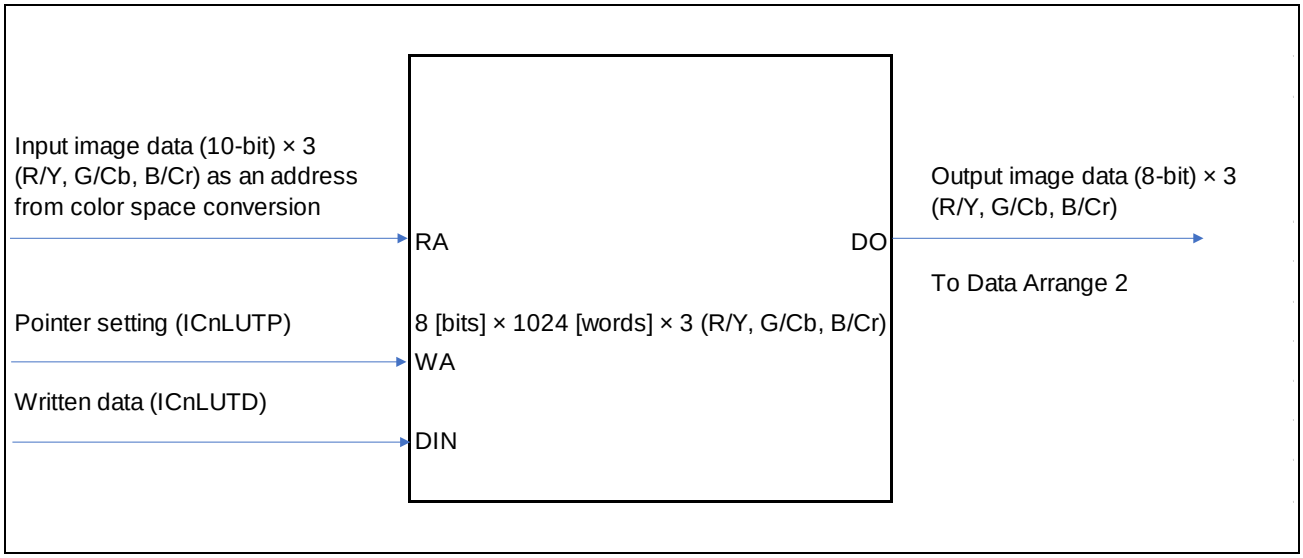

Figure 35.19 Lookup Table (LUT)

(1) Pointer Access

The pointer is incremented every time the ICnLUTD register is written.

The incremented value can be read from the ICnLUTP register. When the ICnLUTD register is read, the pointer is not incremented. The pointer must be set immediately before the register is read.

Follow the procedure below to access the lookup table. See **Section 35.3.1**.

The lookup table cannot be accessed from the CPU in normal mode.

(2) Lookup Table Usage Notes

1. Set the lookup table only after the CRU has stopped its operation.
2. Rewrite the entire lookup table before use because the initial values are not guaranteed after the power is turned on.
3. Data to be set in the lookup table must be restricted to the range that is compatible with the input bit width.

35.2.4.10 YCbCr422 to 420

Data is skipped from YCbCR422 to produce YCbCr420. Averaging or any other calculations are not performed. This conversion can be set by the YCMODE[2:0] bits in the ICnDMR register. (See **Section 35.2.3.46**.)

35.2.4.11 Y/C Separation / Only Y

Only Y can be separated or extracted from Y/C, and then can be stored in memory. For details, see **Section 35.2.4.3(2)**.

35.2.4.12 Pattern Generator (for Debugging)

A test image (YUV422 only) can be generated for use as an MIPI CSI-2 input by setting the following registers. This function is used for debugging to identify where the problem is originated (in the sensor or in the internal settings). Two modes are implemented for this pattern (monochrome or pattern). See **Section 35.3** for the setting procedure.

TIEN = ICnTICTRL1.TIEN: Enables generation of a test image pattern.
TIMODE = ICnTICTRL1.TIMODE: Selects a test image generation pattern (monochrome or pattern).

TIPTNY1[3:0] = ICnTICTRL1.TIPTNY1[3:0]: Bit settings for the pixel (Y) counter
TIPTNU1[3:0] =ICnTICTRL1.TIPTNU1[3:0]: Bit settings for the pixel (U) counter
TIPTNV1[3:0] = ICnTICTRL1.TIPTNV1[3:0]: Bit settings for the pixel (V) counter

TIRATE[4:0] = ICnTICTRL1.TIRATE[4:0]: Specify a test image generation rate.

TIPTNY2[7:0] = ICnTICTRL2.TIPTNY2[7:0]: Specify V for the entire-screen same-color test image pattern.
TIPTNU2[7:0] = ICnTICTRL2.TIPTNU2[7:0]: Specify U for the entire-screen same-color test image pattern.
TIPTNV2[7:0] = ICnTICTRL2.TIPTNV2[7:0]: Specify Y for the entire-screen same-color test image pattern.

TIPPL[11:0] = ICnTISIZE1.TIPPL[11:0]: Number of valid pixels per line in the test image pattern
TIN[11:0] = ICnTISIZE2.TIN[11:0]: Valid period (number of lines) per frame in the test image pattern
TIM[11:0] = ICnTISIZE2.TIM[11:0]: Invalid period (number of lines) per frame in the test image pattern

(1) Image and Settings (Common to Monochrome and Pattern Generation)

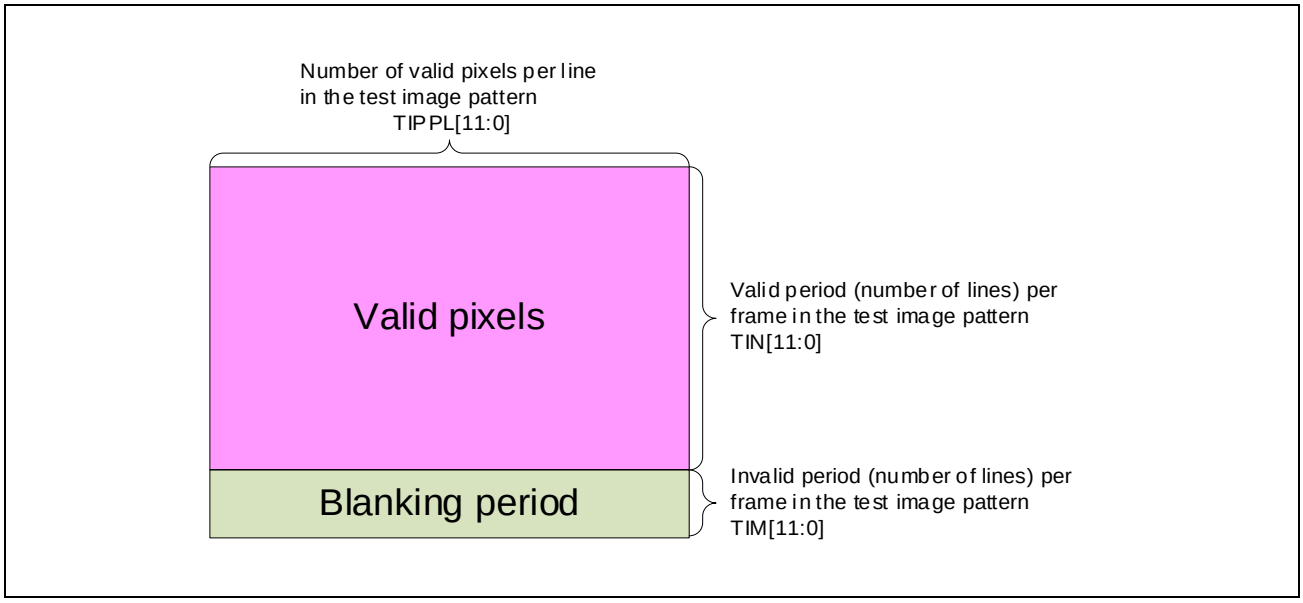

Figure 35.20 Image and Settings

(2) Timing Generation and Settings (Common to Monochrome and Pattern Generation)

(Bits TIRATE[4:0] allow the test image generation rate to be set in the range between 3.783 Gbps and 1.390 Gbps.)

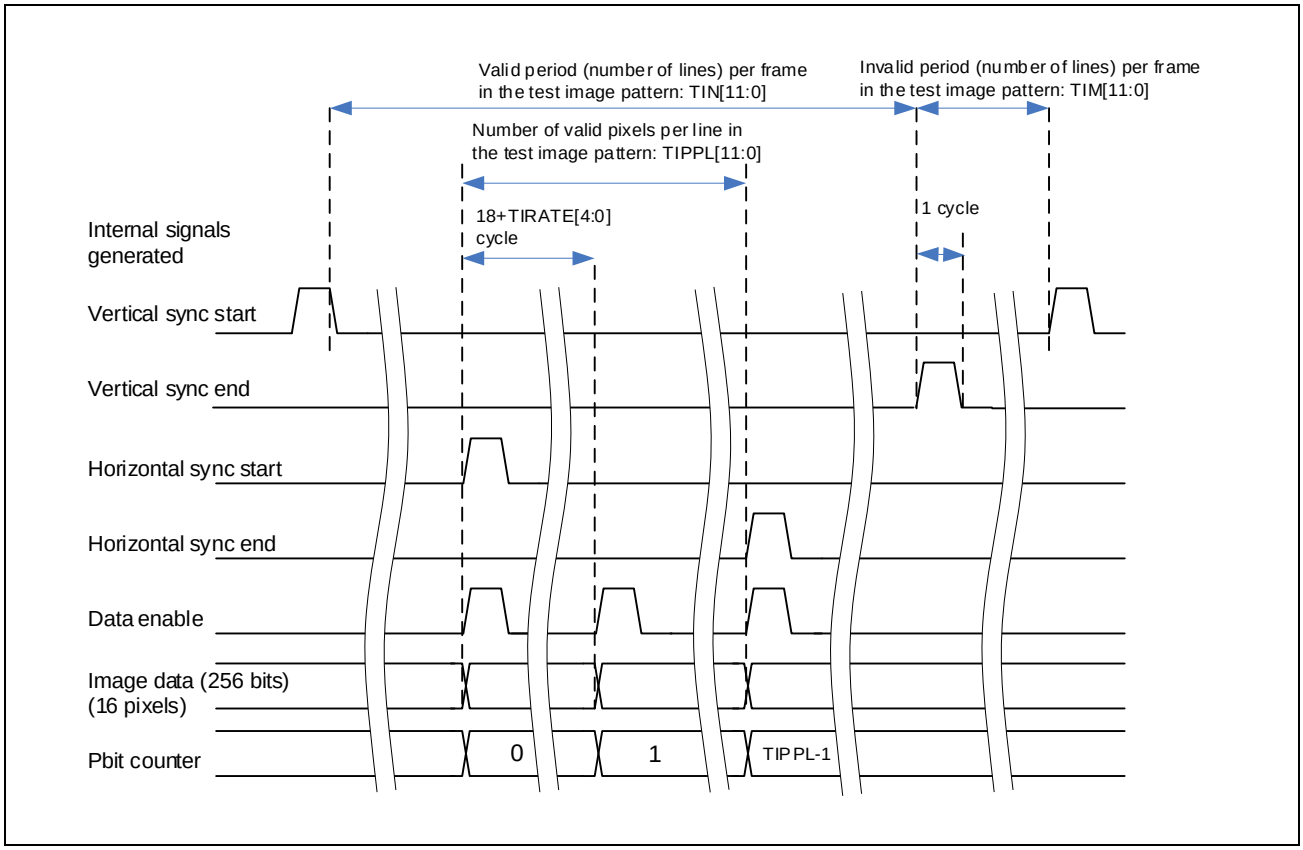

Figure 35.21 Timing Generation and Settings

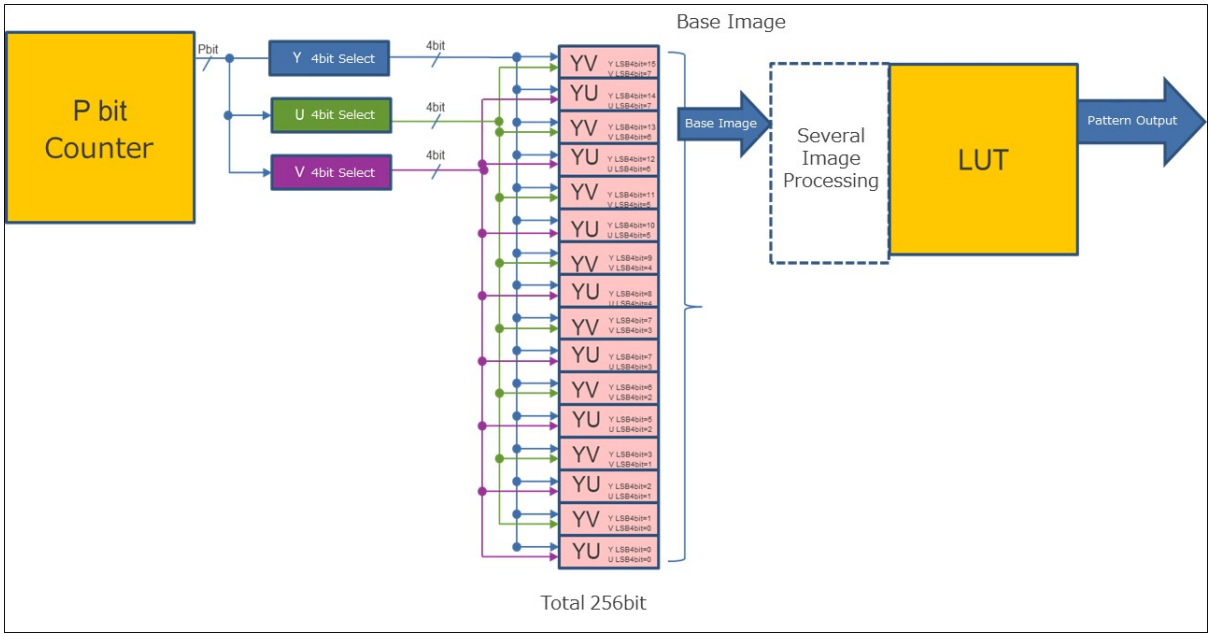
(3) Data Generation Circuit (in the Case of Pattern Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated as follows (other formats cannot be generated). The 16-bit Pbit counter is incremented in 18 + TIRATE[4:0] (cycles @266 MHz). The bits of this Pbit counter are selected by the TIPTNV1[3:0], TIPTNU1[3:0], and TIPTNY1[3:0] bits, and then they are packed and sent as follows:



Note: The counter is 16 bits wide.

Figure 35.22 Data Generation Circuit (in the Case of Pattern Generation)

(4) Data Generation Circuit (in the Case of Monochrome Generation)

Image YUV422 8-bit data of 256 bits (16 pixels) is generated in monochrome as follows (other formats cannot be generated). The values set by the TIPTNV2[7:0], TIPTNU2[7:0], and TIPTNY2[7:0] bits are packed and sent as follows:

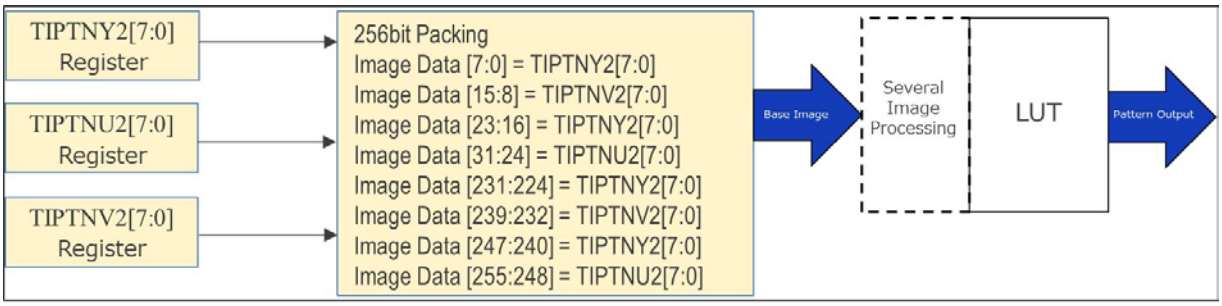


Figure 35.23 Data Generation Circuit (in the Case of Monochrome Generation)

(5) Generated Image Data Example (in the Case of Pattern Generation)

VGA (640x480): TIEN = 1b, TIMODE = 0b, TIPTNY1[3:0] = 0000b, TIPTNU1[3:0] = 0100b, TIPTNV1[3:0] = 1001b (Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

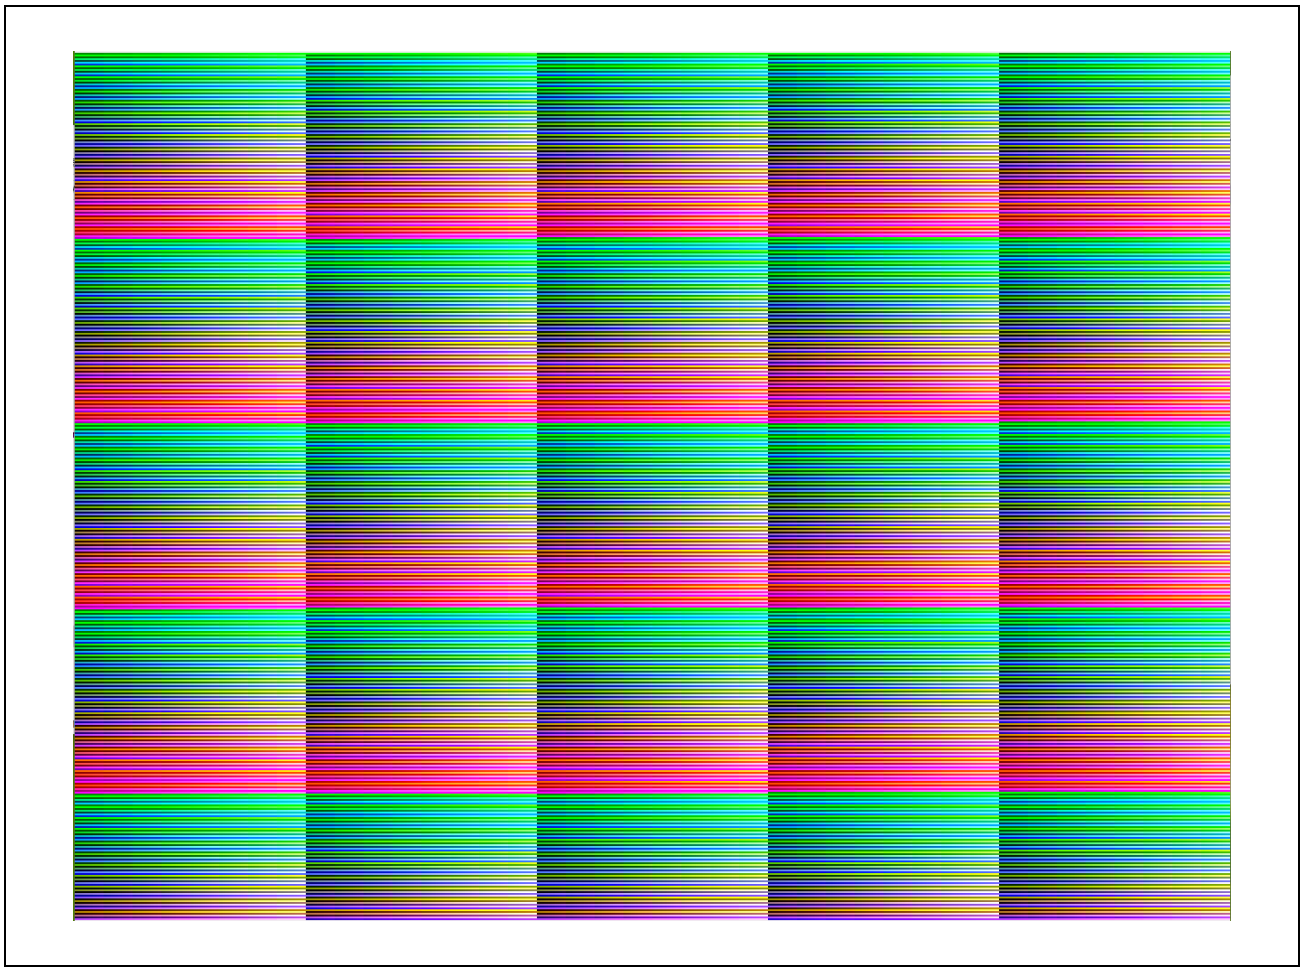

Figure 35.24 Generated Image Data Example (in the Case of Pattern Generation)

(6) Generated Image Data Example (in the Case of Monochrome Generation)

VGA (640x480): TIEN = 1b, TIMODE = 1b, TIPTNY2[7:0] = H’52, TIPTNU2[7:0] = H’5A, TIPTNV2[3:0] = H’F0
(Offset binary: ICnMC.IBINSEL = 0, ICnDMR.OBINSEL = 0)

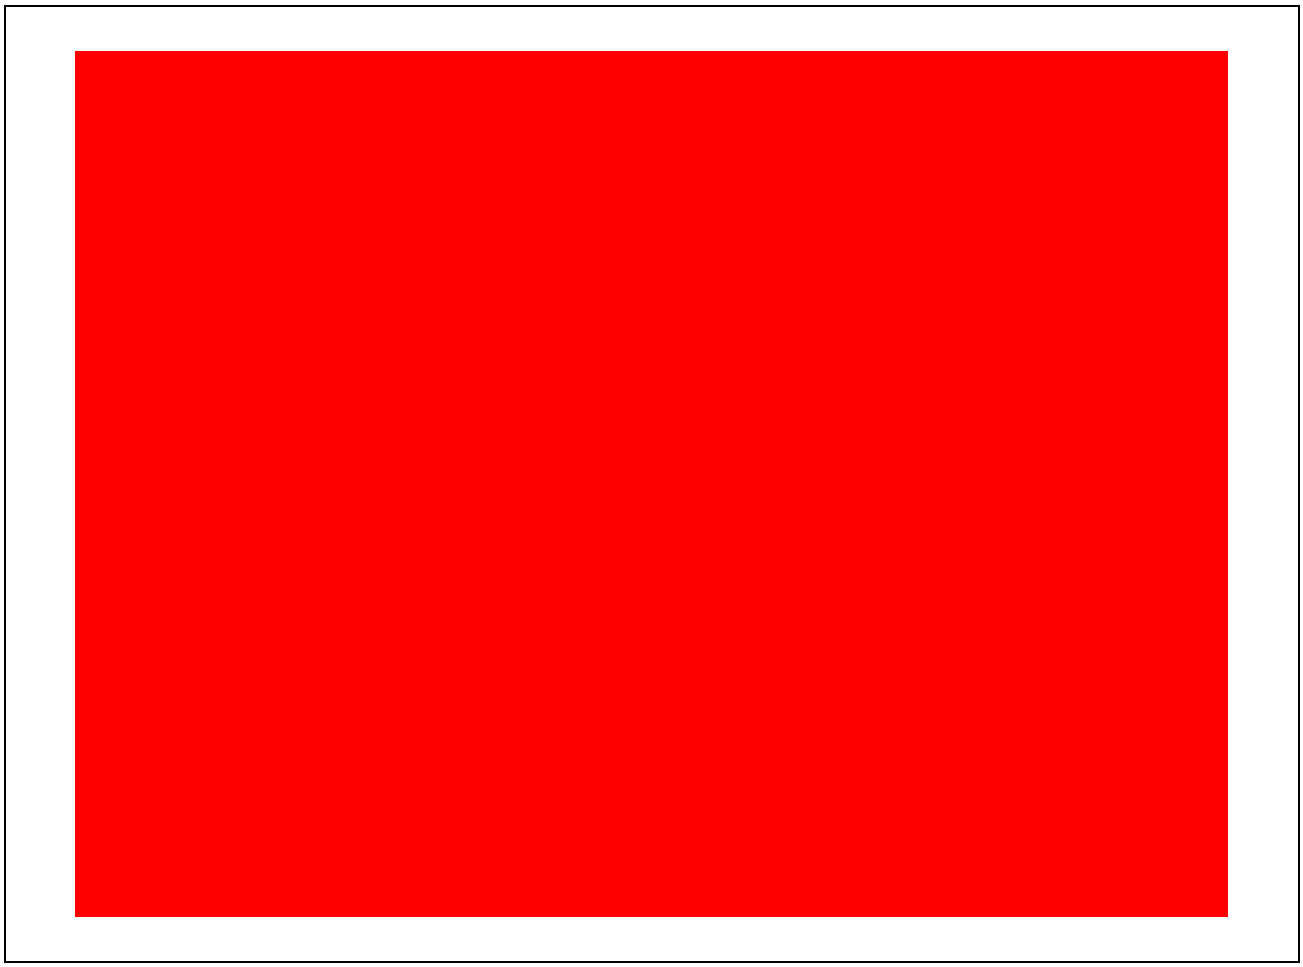

Figure 35.25 Generated Image Data Example (in the Case of Monochrome Generation)

35.2.5 Interrupts

Table 35.13 lists the interrupt sources, registers, and interrupt signals to the interrupt controller.

Table 35.13 Interrupt Sources, Registers, and Interrupt Signals to the Interrupt Controller

Internal Signal Name	Item	Interrupt Source Status/Clear	Interrupt Enable Register Field	Generation Condition
axi_mst_err_int	FIFO overflow (image-related)	CRUnINTS.FOS	CRUnIE.FOE	When the image-related FIFO overflowed
	SLVERR error (image-related)	CRUnINTS.SLVES	CRUnIE.SLVEE	When an SLVERR error occurred in the image-related AXI
	DECERR error (image-related)	CRUnINTS.DECES	CRUnIE.DECEE	When a DECERR error occurred in the image-related AXI
	FrameEnd OverWrite (image-related)	CRUnINTS.FEOVWS	CRUnIE.FEOVWE	When the Frame End is overwritten in the image-related FIFO
image_conv_int	Frame Start	CRUnINTS.SFS	CRUnIE.SFE	When a frame starts *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
	Frame End	CRUnINTS.EFS	CRUnIE.EFE	When a frame ends *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
	Scan Line	CRUnINTS.SIS	CRUnIE.SIE	When there is a match with the line number specified in the register (ICnSI.SI[11:0]) *Note*: By using the ICnINTCTRLDECINTE register, whether to generate interrupts in subsampled frames can be specified.
image_conv_err_int	Abnormal word count Value	CRUnINTS.WIS	CRUnIE.WIE	When the word count value set in the register (ICnEWC.EWC[15:0]) did not match the word count value of MIPI
	ITU656 DECERR	CRUnINTS.CES	CRUnIE.CEE	When an ITU656 error was detected

35.2.6 Usage Notes

There are no special usage notes currently.

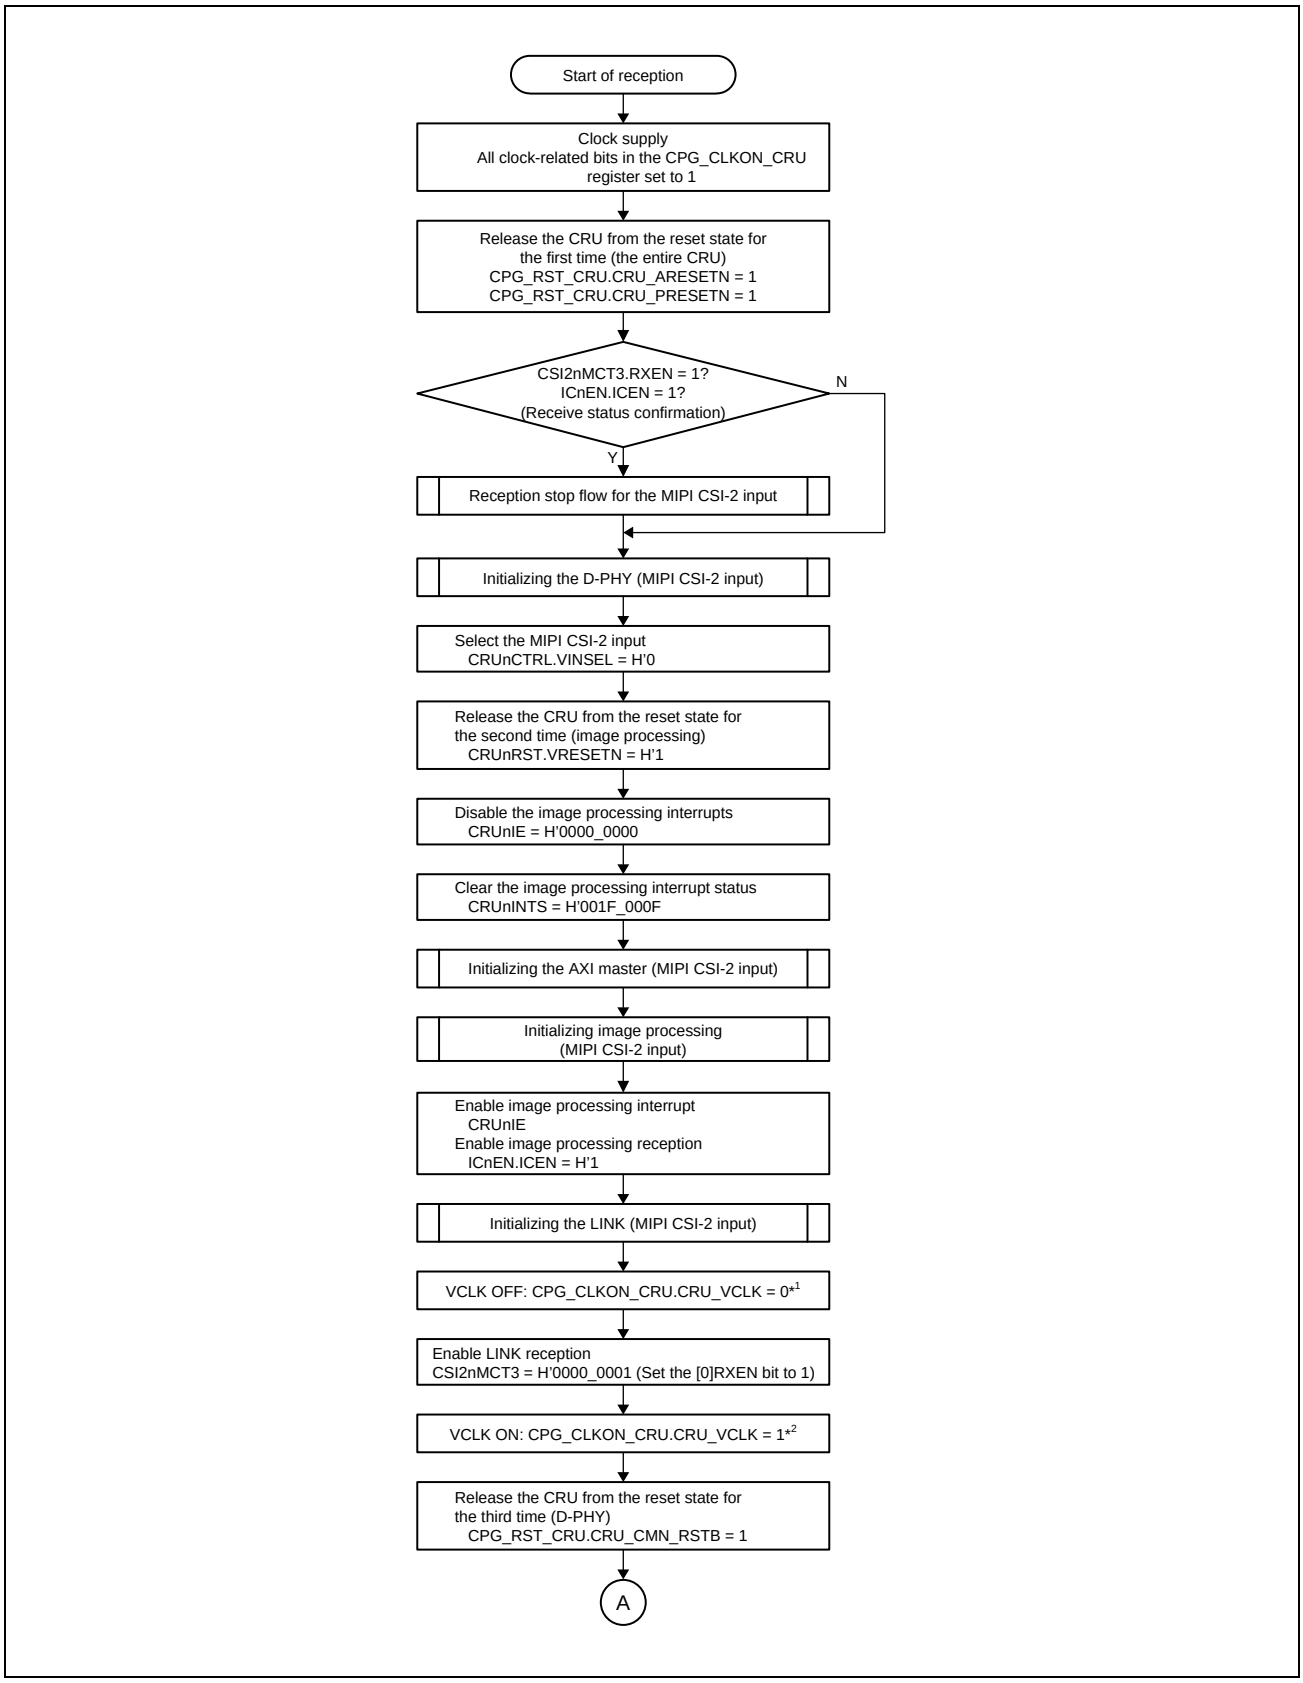
35.3 Operation

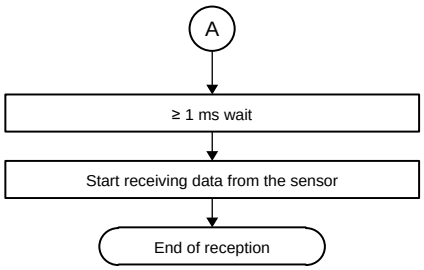
Table 35.14 lists the operations that this section deals with. Follow the procedures described below. If the procedure is not followed, an unexpected behavior may result. The subsections that follow describe each operation.

Table 35.14 List of Operations

Item		Description
Starting reception for the MIPI CSI-2 input		Describes the procedure to start reception for the MIPI CSI-2 input (including the pattern generator).
Initializing the D-PHY (MIPI CSI-2 input)		Describes the procedure to initialize the D-PHY for the MIPI CSI-2 input.
Initializing the AXI master (MIPI CSI-2 input)		Describes the procedure to initialize the AXI master for the MIPI CSI-2 input.
Initializing image processing (MIPI CSI-2 input)		Describes the procedure to initialize image processing for the MIPI CSI-2 input.
Storing LUT data (both)		Describes the procedure to store LUT data for both the MIPI CSI-2 input.
Initializing the LINK (MIPI CSI-2 input)		Describes the procedure to initialize the LINK for the MIPI CSI-2 input.
Stopping reception for the MIPI CSI-2 input		Describes the procedure to stop reception for the MIPI CSI-2 input (not including the pattern generator).
Determining LINK packet stop (MIPI CSI-2 input)		Describes the procedure to determine LINK packet stop for the MIPI CSI-2 input.
Stopping the D-PHY (MIPI CSI-2 input)		Describes the procedure to stop the D-PHY for the MIPI CSI-2 input.
Stopping image processing reception (MIPI CSI-2 input)		Describes the procedure to stop image processing reception for the MIPI CSI-2 input.
Changing frame synchronization settings	By setting registers	Describes the procedure to change the frame synchronization settings by setting registers from the CPU for the MIPI CSI-2 input.
	By using the DMAC	Describes the procedure to change the frame synchronization settings by using the DMAC for the MIPI CSI-2 input.
Stopping the pattern generator		Describes the stop procedure using the pattern generator.

35.3.1 Starting Reception for the MIPI CSI-2 Input





Note 1. After VCLK OFF setting, confirm whether VCLK is off by reading CPG_CLKMON_CRU.CLK1_ON = 0.

Note 2. After VCLK ON setting, confirm whether VCLK is on by reading CPG_CLKMON_CRU.CLK1_ON = 1.

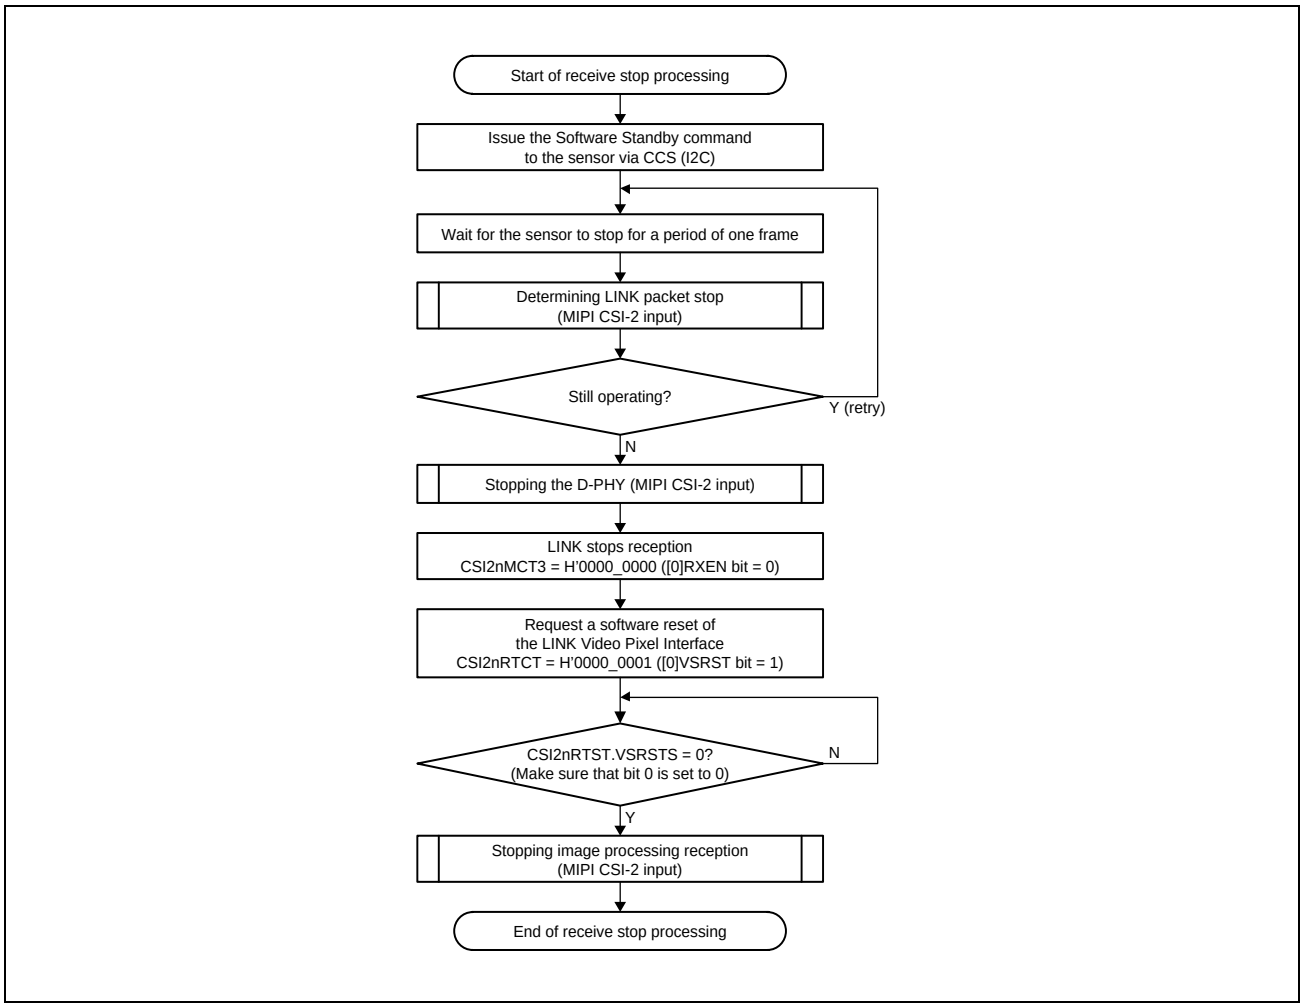

Figure 35.32 Reception Stop Flow for the MIPI CSI-2 Input

35.3.3.1 Determining LINK Packet Stop (MIPI CSI-2 Input)

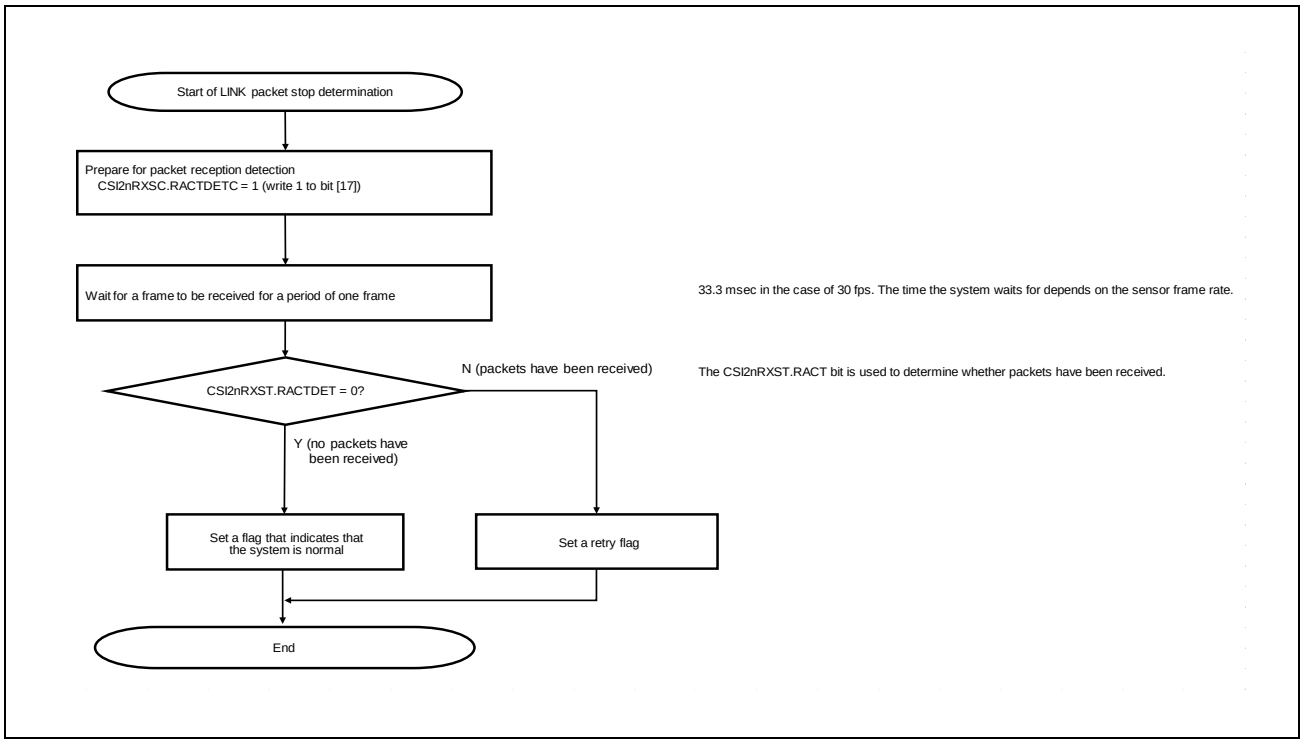

Figure 35.33 Determining LINK Packet Stop (MIPI CSI-2 Input)

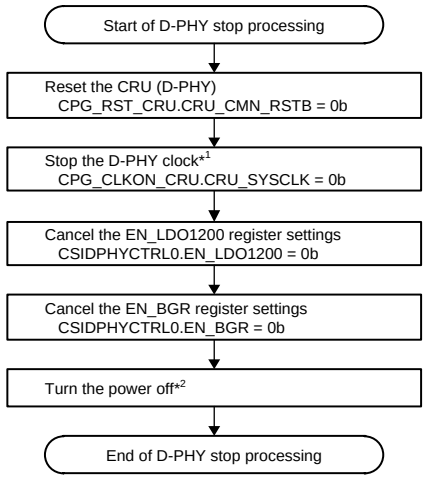
35.3.3.2 Stopping the D-PHY (MIPI CSI-2 Input)



Note 1. This step can be skipped if D-PHY is to be restarted immediately.

Note 2. This step can be skipped if D-PHY is to be restarted immediately.

Figure 35.34 Stopping the D-PHY (MIPI CSI-2 Input)

35.3.3.3 Stopping Image Processing Reception (MIPI CSI-2 Input)

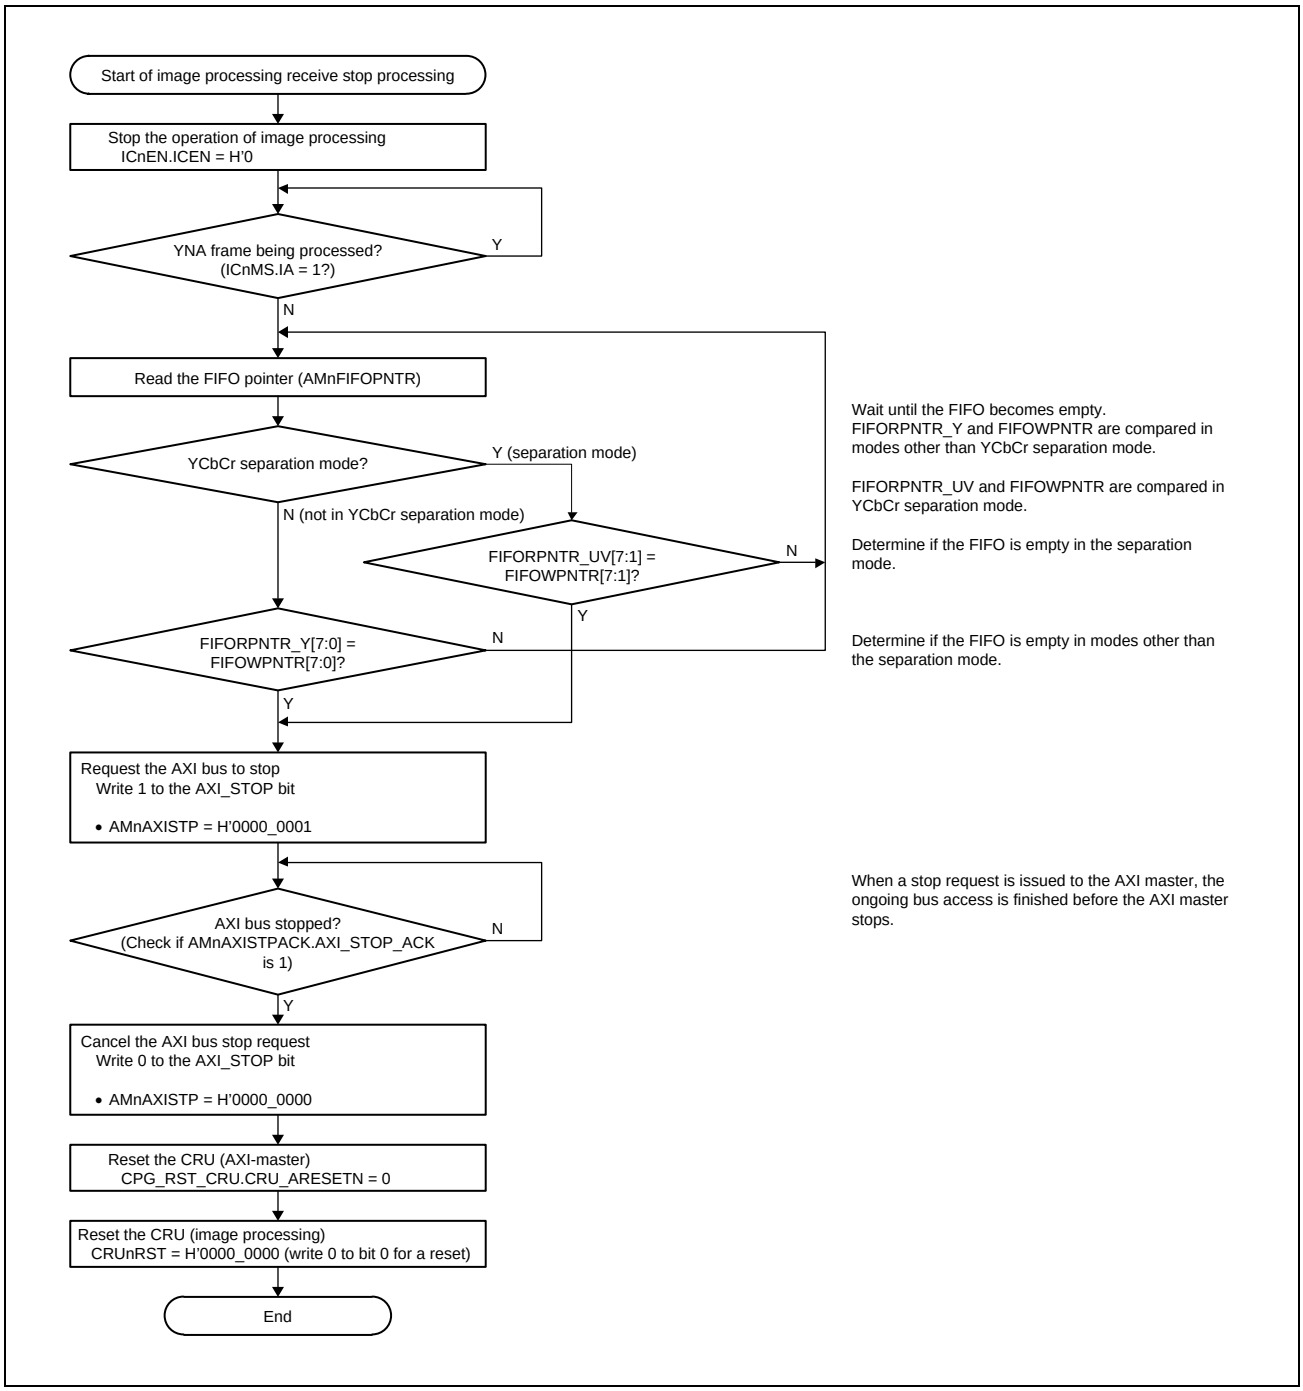


Figure 35.35 Stopping Image Processing Reception (MIPI CSI-2 Input)

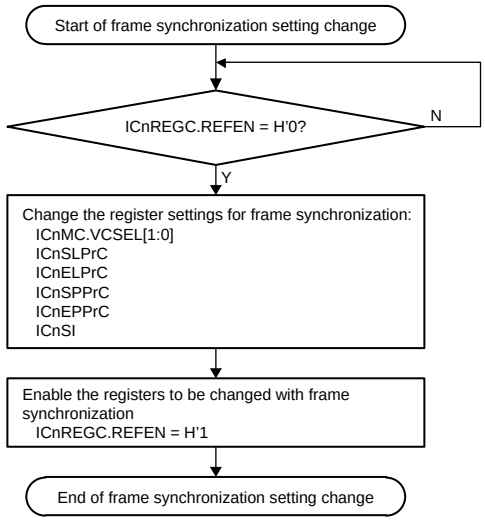
35.3.4 Frame Synchronization Settings

During the CRU is receiving data via the MIPI CSI-2 input, the following registers can only be changed with frame synchronization:

- ICnMC.VCSEL[1:0]
- ICnSLPrC
- ICnELPrC
- ICnSPPrC
- ICnEPPrC
- ICnSI

This section shows the flows for changing the frame synchronization settings both by setting registers from the CPU and by using the DMAC.

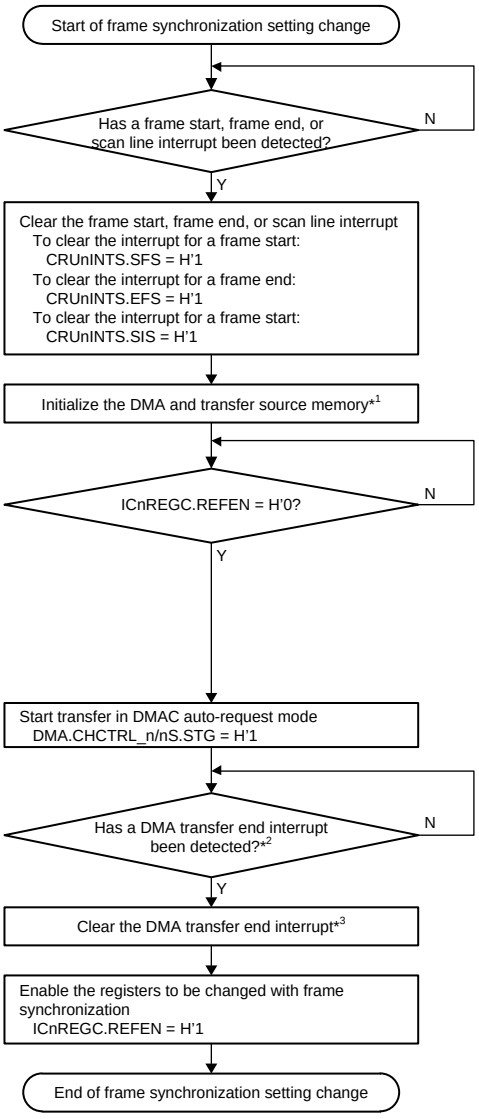
35.3.4.1 Changing Frame Synchronization Settings (by Setting Registers)



Note: This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input.

Figure 35.36 Flow for Changing the Frame Synchronization Settings (by Setting Registers)

35.3.4.2 Changing Frame Synchronization Settings (by Using the DMAC)



NOTES:

1. This flow for changing the frame synchronization settings is only valid for the MIPI CSI-2 input. It cannot be used for the parallel input.
2. In the initial settings when the CRU starts, interrupts for a frame start, frame end and scan line must be set.

   To set an interrupt for a frame start:
   CRUnIE.SFE = H'1

   To set an interrupt for a frame end:
   CRUnIE.EFE = H'1

   To set an interrupt for a frame start:
   CRUnIE.SIE = H'1

   In addition, CRU and DMA interrupts must be enabled by seeing the section about the interrupt controller.

Note 1. Perform initialization by seeing the section about DMA.

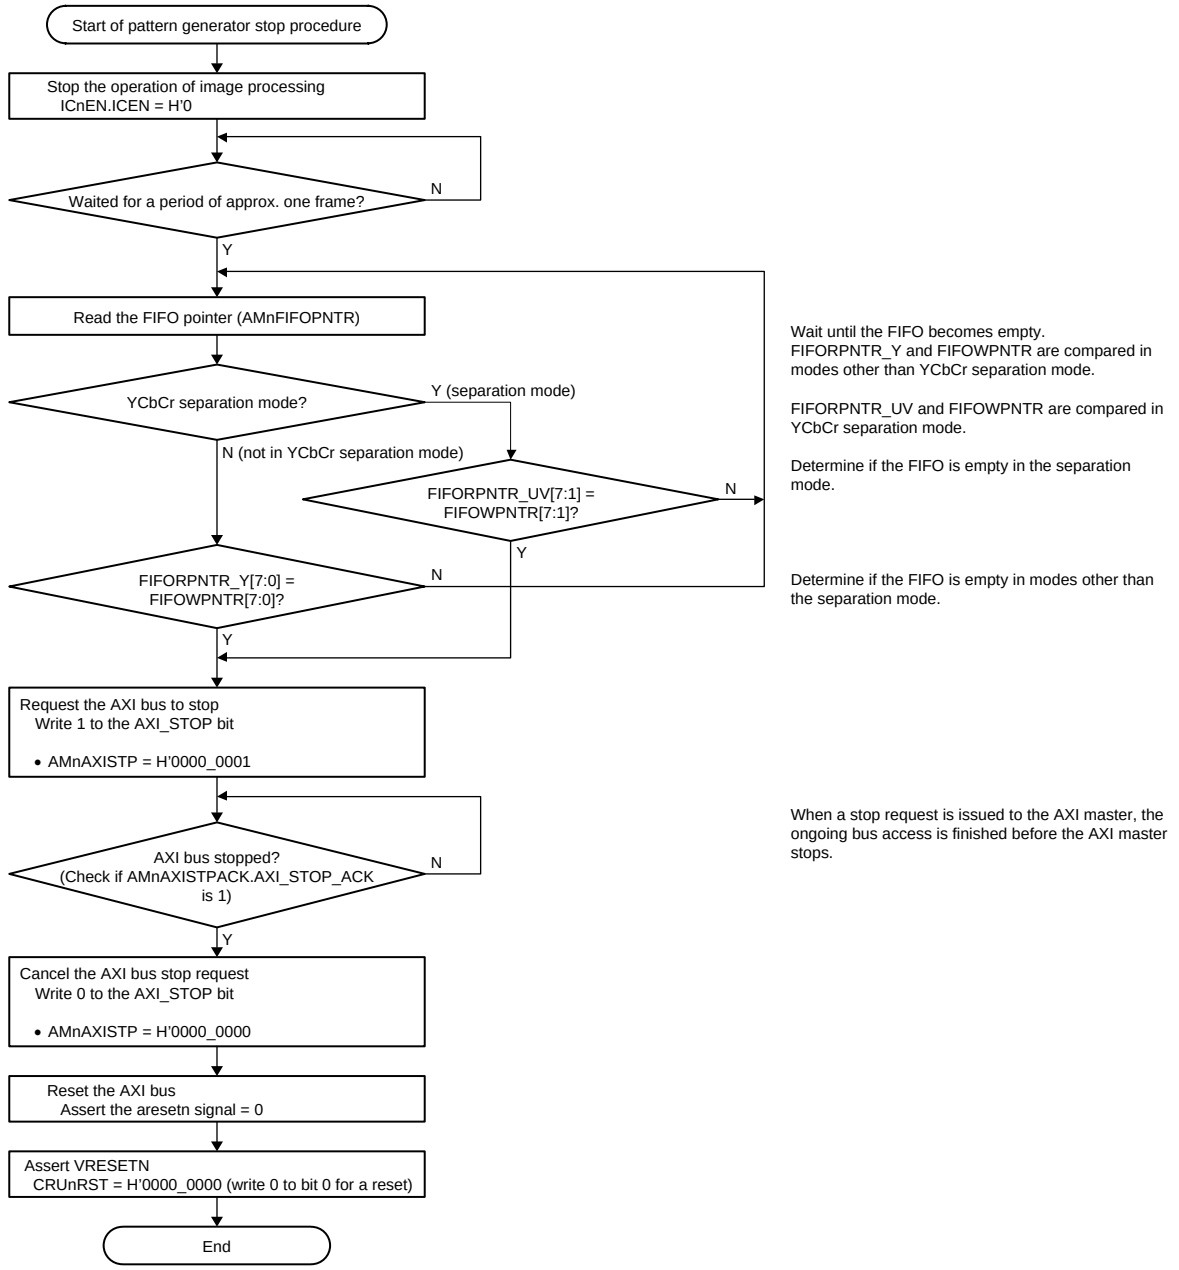
- Note that the following register settings are required:
  DMA.CHCFG_n/nS.DAD = H'0: Increment
  DMA.CHCFG_n/nS.SAD = H'0: Increment
  DMA.CHCFG_n/nS.DDS = H'3: 32 bits
- Set the DMA transfer size to 32 bits for both transfer destination and transfer source
- In transfer source memory initialization, store the values that set the following register: (Start address: Up to 64 bytes in ICnMC)
  ICnMC.VCSEL[1:0]
  ICnSLPrC
  ICnELPrC
  ICnSPPrC
  ICnEPPrC
  ICnSI

Note 2. A setting is required in advance (see the sections about DMA and interrupt controller).

Note 3. Clear the interrupt by seeing the section about DMA and interrupt controller.

Figure 35.37 Flow for Changing the Frame Synchronization Settings (by Using the DMAC)

35.3.5 Stopping the Pattern Generator



Note: The waiting time is determined by the pattern generator setting values.

Figure 35.38 Flow for Stopping the Pattern Generator

36. Image Scaling Unit (ISU)

The ISU is a module that reads out the image stored in the external DRAM, scale down image size, and outputs the reduced image into the DRAM. ISU also support a color format conversion and cropping image.

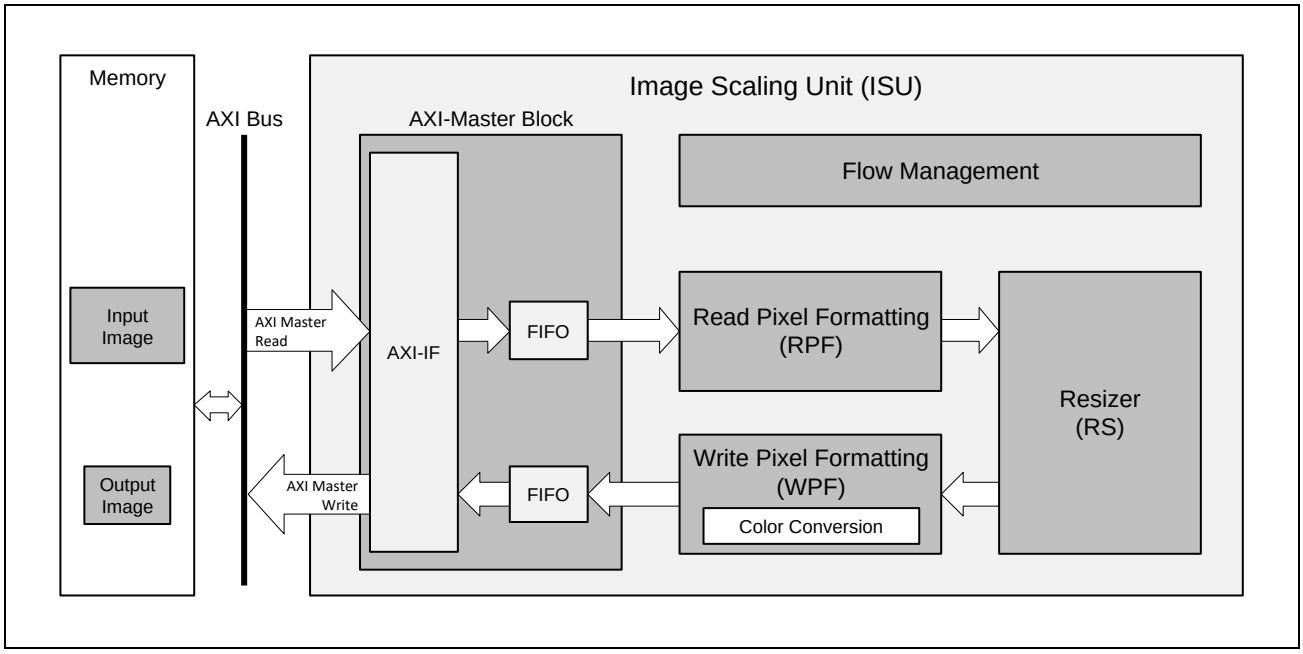


Figure 36.1 ISU Block Diagram

36.1 Features

The ISU functionality consists of “Resizer” and “Color Format Conversion”. “Color Format Conversion” can convert color space and color format (RGB/ARGB, YCbCr/YUV, RAW).

- Resizer
  - Scaling ratio: × 1/1 to 1/15 (Scale down)
  - Scaling algorithm: Bilinear
  - Horizontal and Vertical image scaling ratio are adjustable individually.
  - Cropping image

- Color Space and Color Format Conversion
  - Supported color format: RGB/ARGB, YCbCr/YUV, RAW(Grayscale)
    A(Alpha) of ARGB format is transparency. Zero is transparent (colorless).
  - Color space conversion by using 3 × 3 matrix which coefficients can be set arbitrary.
  - Convert color space and color format each other.
  - Endian Correction.

Table 36.1 Supported Image Format

Item	Description
Input	• Color Format – RGB/ARGB: 8 Formats RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 Format YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 3 Format RAW8, RAW10, RAW12 (Grayscale)*1 • Maximum Size 2800 × 2047
Output	• Color Format – RGB/ARGB: 8 Format RGB565, RGB888, BGR888, BGR666, ARGB8888, ARGB1555, RGBA8888, ABGR8888 – YCbCr/YUV: 4 Format YCbCr422 (Interleave) = UYVY YCbCr422 (Interleave) = YUY2 (YUYV) YCbCr422 (Semi-Planar) = NV16 YCbCr420 (Semi-Planar) = NV12 – RAW: 3 Format RAW8, RAW10, RAW12 (Grayscale)*1 • Maximum Size 1920 × 1080

Note 1. RAW10 and RAW12 are rounded to 8-bit internally.

36.1.1 Flow Management (FM)

Controls the processing of the entire ISU. The frame processing is controlled by receiving the frame processing start instruction from the register. There are three types of frame processing:

1. Register Mode
2. Descriptor Mode (without automatic start of next frame)
3. Descriptor Mode (with automatic start of next frame)

36.1.1.1 Frame Processing Mode

There are the following three types of frame processing methods depending on the register settings.

- Register Setting Mode (1) is one-time processing operation according to register setting at once.
- Descriptor Mode without Auto-start (2) is also one-time processing operation according descriptor, not register setting. Descriptor Mode with Auto-start (3) automatically reads out the descriptor and continues its operation until all descriptors have been processed.

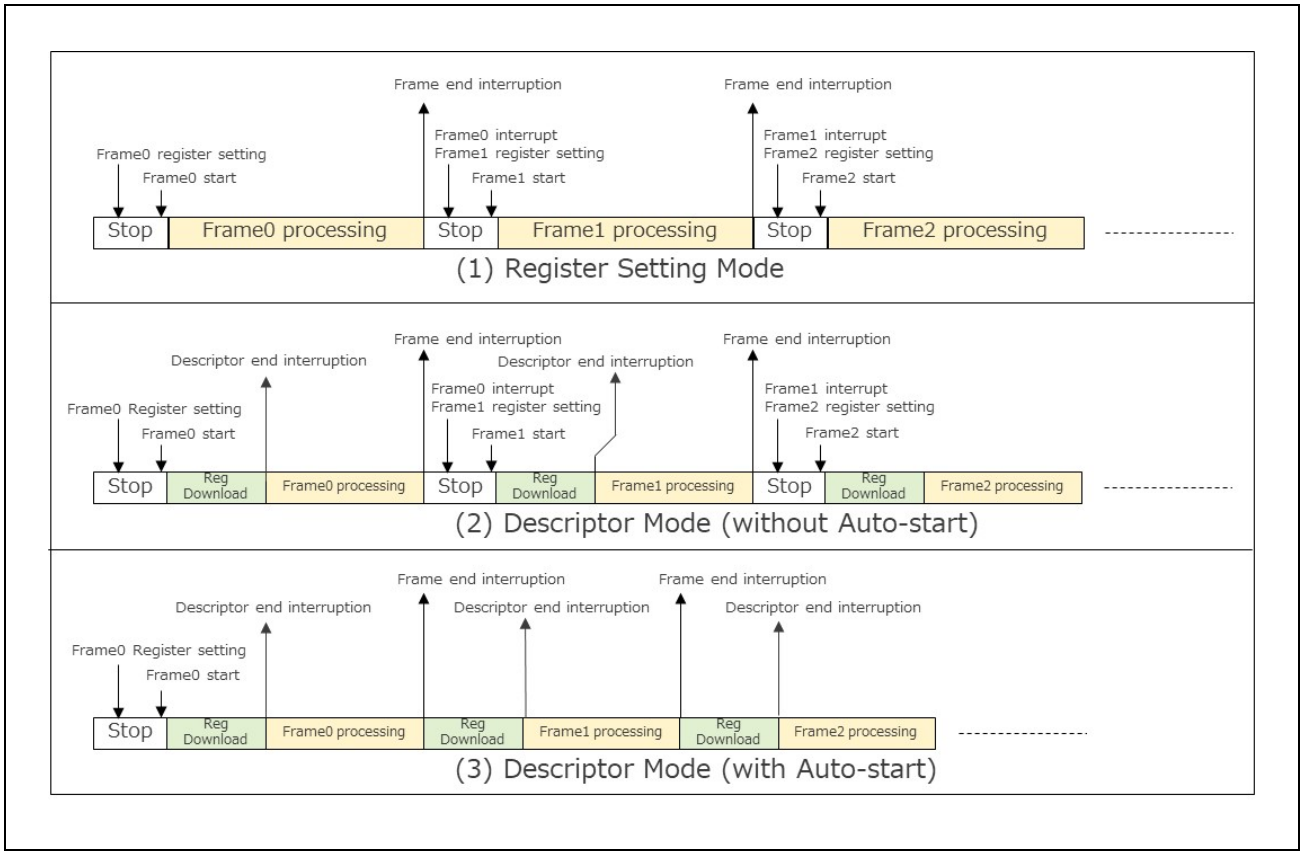

Figure 36.2 Frame Processing Mode

36.1.1.2 Descriptor

Descriptor Mode is the processing which reads out the descriptor format data stored in the memory and sets the registers automatically. It also includes the Auto-start setting for the next frame.

Flow Management (FM) read this descriptor setting data while not frame processing.

(1) Descriptor Format

The descriptor format is shown below.

Table 36.2 Descriptor Format

No.	Category	Item	Byte	Setting Range	Description
1	Header*1 *2	Descriptor Table Byte Count Setting	4 bytes	H'0000_0000 to H'0000_2000	Up to 8 Kbytes. The total number of bytes of register address and register setting data.
2	Register Setting Main body*3 *4 *5	Register Address 1	4 bytes	H'0000_0100 to H'0000_01F0	1st Register Setting Address
		Register Setting Data 1	4 bytes	H'0000_0000 to H'FFFF_FFFF	1st Register Setting Data
		Register Address 2	4 bytes	H'0000_0100 to H'0000_020C	2nd Register Setting Address
		Register Setting Data 2	4 bytes	H'0000_0000 to H'FFFF_FFFF	2nd Register Setting Data
		Register Address 3	4 bytes	H'0000_0100 to H'0000_020C	3rd Register Setting Address
		Register Setting Data 3	4 bytes	H'0000_0000 to H'FFFF_FFFF	3rd Register Setting Data
		Register Address 4	4 bytes	H'0000_0100 to H'0000_020C	4th Register Setting Address
		Register Setting Data 4	4 bytes	H'0000_0000 to H'FFFF_FFFF	4th Register Setting Data
		•	•	•	•
		•	•	•	•
		•	•	•	•
3	Footer*2	Next Descriptor Table Address	8 bytes	H'0000_0000_0000_0000 to H'0000_0002_3FFF_FFFF	The next address is a multiple of 32 bytes. The setting range will be changed according to the product specifications.
		Control identifier register	4 bytes	H'0000_0000 to H'0000_0003	b31 to 2: All-0
					b1: Select bit to generate a frame end interruption. 0: Does not generate a Frame end interruption. 1: Generate a Frame end interruption.
					b0: Select bit for auto-start of next frame or end at this frame. 0: Disable next frame auto-start. (Exit without next frame operation.) 1: Enable next frame auto-start.

Note 1. The location of the Descriptor List is a 32-byte boundary. (Address that is a multiple of 32-byte) 0,32,64 ...

Note 2. The number of bytes is fixed for the header and footer. The register body is 8 bytes per set (address 4 bytes, data 4 bytes)

Note 3. The registers that can be set in the descriptor are limited to the Common register.

Note 4. Operation when the same register address is described in multiple addresses is not guaranteed.

Note 5. Specify in the offset address to be added to the Base Address(H'1084_0000). Specifically, the lower 10 bits [9: 0] should be the address of the register map, and the upper 22 bits [31:10] should be the address of All '0'. If the upper 22 bits are other than All '0', it will be out of the register area and a list error will occur.

(2) Descriptor Error

An error flag is issued in the following cases.

(a) When the number of bytes in the header exceeds the limit, or when the value is not in units of 8 bytes

An error interrupt is generated, and subsequent frame processing is not executed.

Normal operation and recovery are not guaranteed unless the system is reset.

(b) When the register address is outside the specified address

A decoding error will occur if decoding is performed for items outside the register area.

Ignore the write to the register where the error occurred and continue the process itself.

36.1.2 AXI-Master

In response to a descriptor read request or input image read request from Flow Management (FM), the descriptor or input image is read from the DRAM. It also writes a reduced image to DRAM in response to a reduced image write request from WPF.

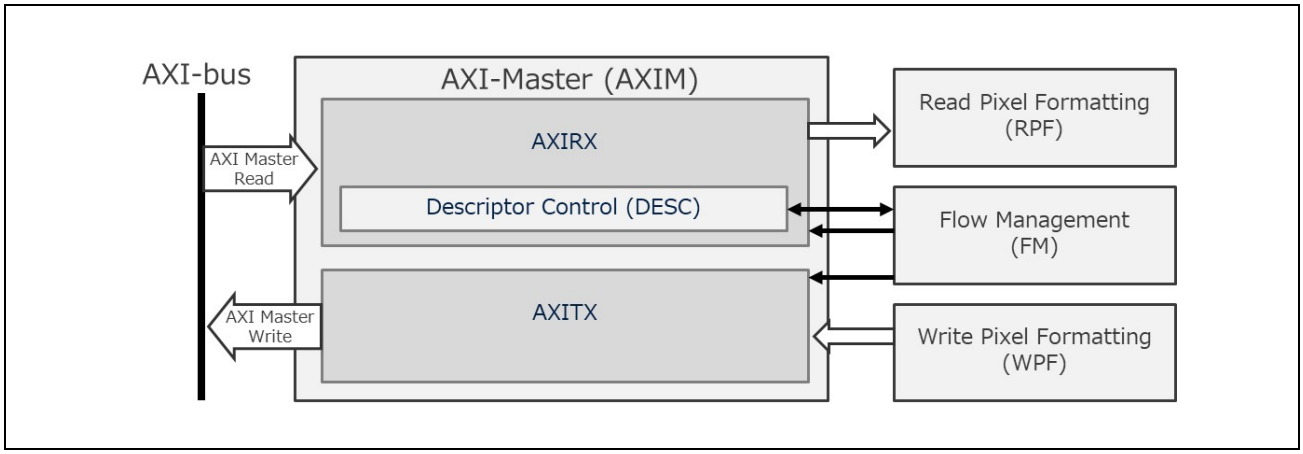

Figure 36.3 AXI-Master Block Diagram

36.1.2.1 Read Input Image (AXIRX)

In response to the descriptor read request from FM or the frame transfer start request, the descriptor or input image data is read from DRAM by AXI.

(1) Image Input Format

AXIRX support to read following formats from memory.

Table 36.3 Input Image Format

Read Method	Image Format	Variation
Interleave (Plane Number = 1)	ARGB (8 Types)	• The order of colors is different / the number of color bits is different. • There may or may not be A.
	YCbCr422 8-bit (2 Types)	The two types differ only in the order of the colors of Cb and Cr.
	RAW (3 Types)	Grayscale 8-/10-/12-bit.
Semi-Planner (Plane Number = 2)	YCbCr422 8-bit (1 Types)	
	YCbCr420 8-bit (1 Types)	

- Interleave

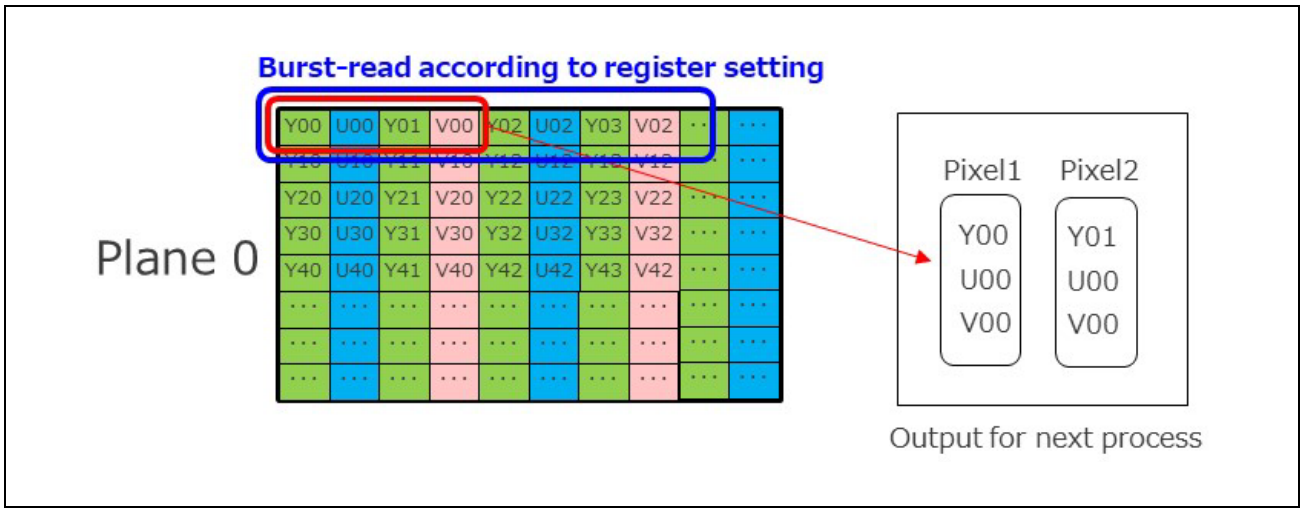

Figure 36.4 Example of Interleave Format for YCbCr422 (YUV422)

- Semi-planar

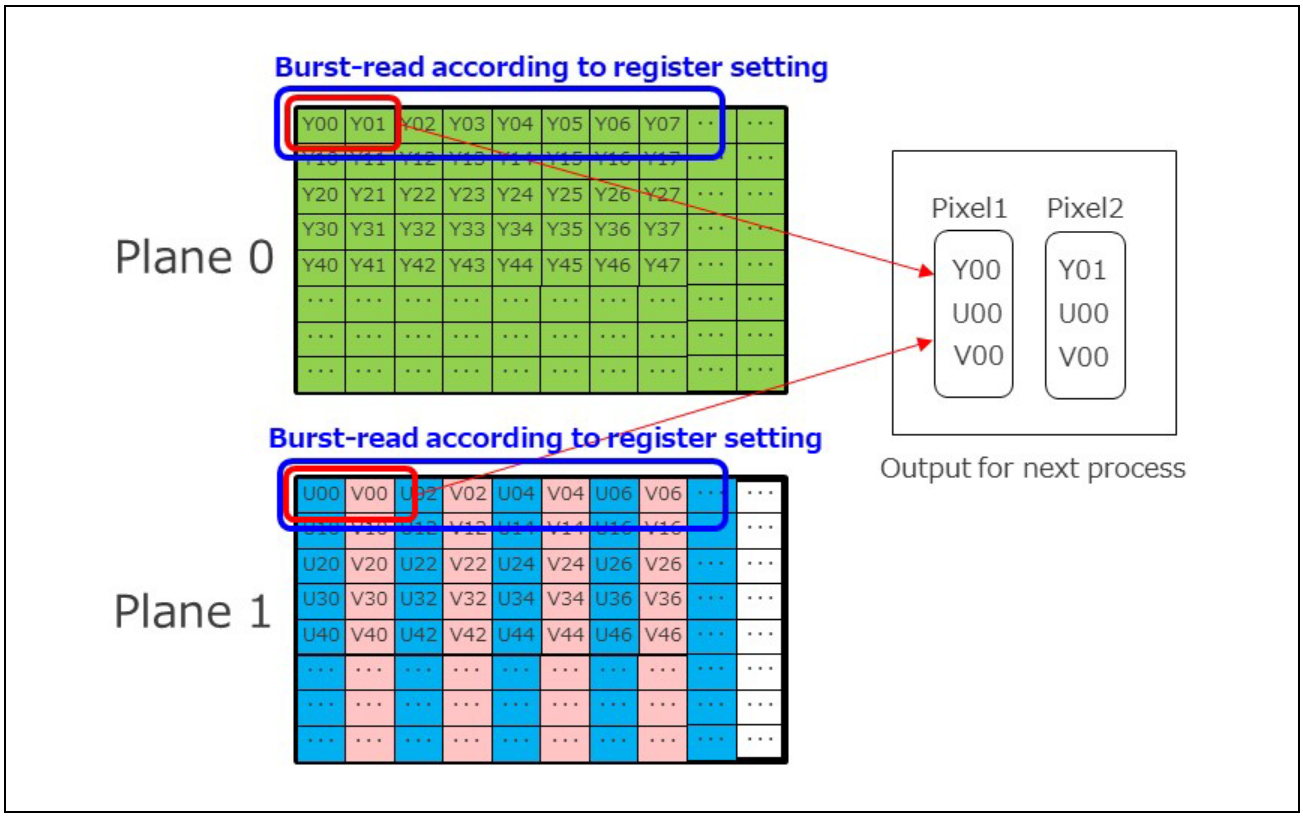

Figure 36.5 Example of Semi-planar Format for YCbCr422 (YUV422)

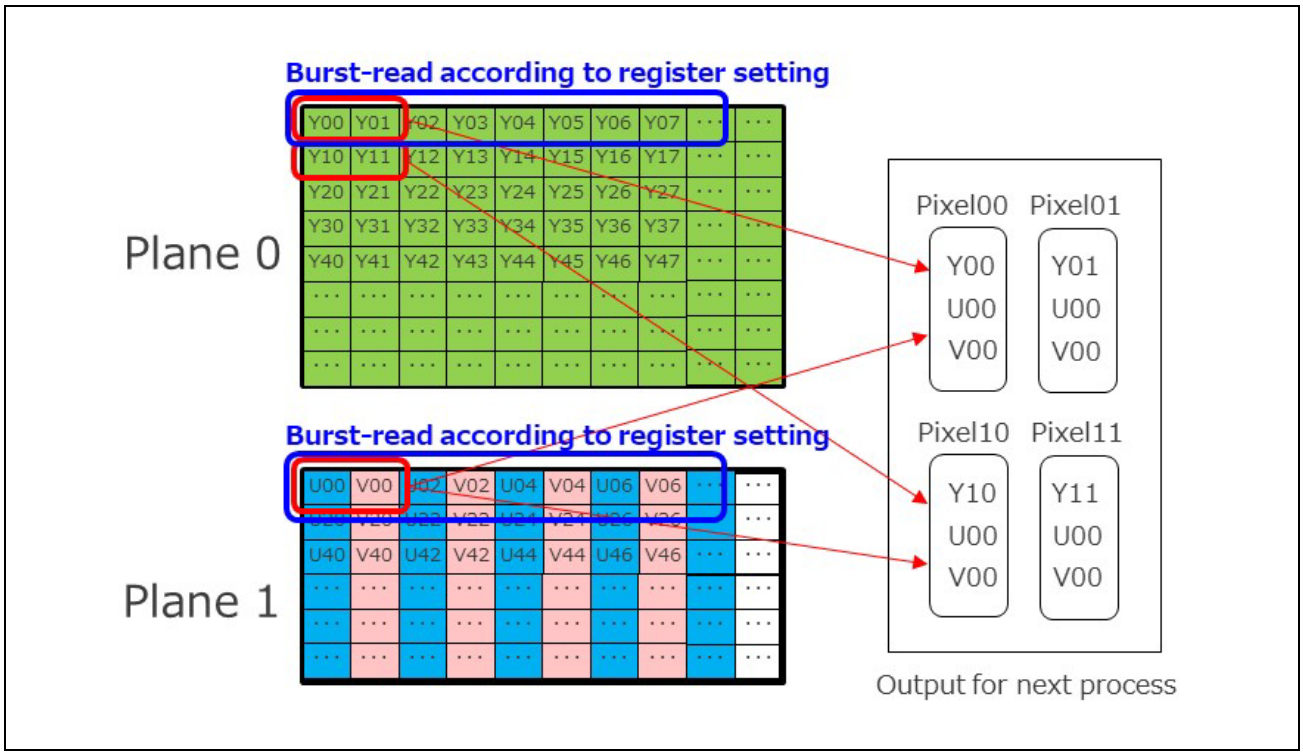

Figure 36.6 Example of Semi-planar format for YCbCr420 (YUV420)

(2) Input Setting

Data is read from each plane according to following register setting. Registers are required to set for each plane (Max 2 Plane).

Table 36.4 Input Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_RPF_SRC_ADDH_PL0.SADD_PL0[1:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL0[31:0]	• Start address for Plane0 of input image.
		ISU_RPF_SRC_ADDH_PL0.SADD_PL1[1:0] ISU_RPF_SRC_ADDL_PL0.SADD_PL1[31:0]	• Start address for Plane1 of input image.
(2)	Image Stride	ISU_RPF_SRC_STRD.SSTRPL0[15:0]	• Image stride of Plane0 [Byte]
		ISU_RPF_SRC_STRD.SSTRPL1[15:0]	• Image stride of Plane1 [Byte]
(3)	Input Area	ISU_RPF_SRC_SIZE.S_HSIZE[11:0]	• Horizontal size of processing area [Pixel] • Max 2800 pixels
(4)		ISU_RPF_SRC_SIZE.S_VSIZE[10:0]	• Vertical size of processing area [Pixel] • Max 2047 pixels

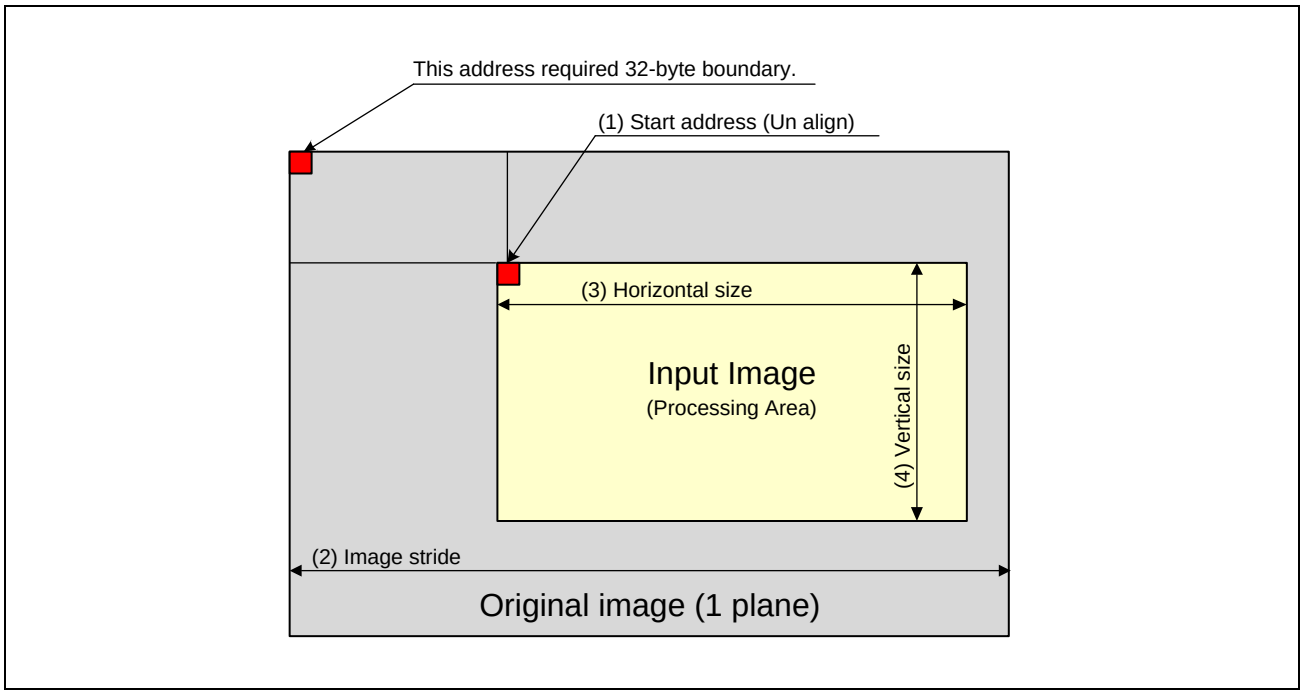

Figure 36.7 Input Area (Processing Area) Setting

(3) Write Output Image (AXITX)

This function write the resized (reduced) image data to DRAM.

(4) Support Format

AXITX support same format as AXIRX.

(5) Output Setting

Data is written out for each plane according to following setting. Registers are required to set for each plane (Max plane number is 2).

Table 36.5 Output Image Setting

No.	Category	Register	Variation
(1)	Start Address	ISU_RPF_DST_ADDH_PL0.DADD_PL0[1:0] ISU_RPF_DST_ADDL_PL0.DADD_PL0[31:0]	• Start address of Plane0 for output image.
		ISU_RPF_DST_ADDH_PL1.DADD_PL1[1:0] ISU_RPF_DST_ADDL_PL1.DADD_PL1[31:0]	• Start address of Plane1 for output image.
(2)	Image Stride	ISU_RPF_DST_STRD.DSTRPL0[15:0]	• Image stride of Plane0 [Byte]
		ISU_RPF_DST_STRD.DSTRPL1[15:0]	• Image stride of Plane1 [Byte]
(3)	Processing Area	ISU_RS_OS_CROP.O_HSIZE[10:0]	• Horizontal crop size [Pixel] • Max 1920 pixel
(4)		ISU_RS_OS_CROP.O_VSIZE[10:0]	• Vertical crop size [Pixel]

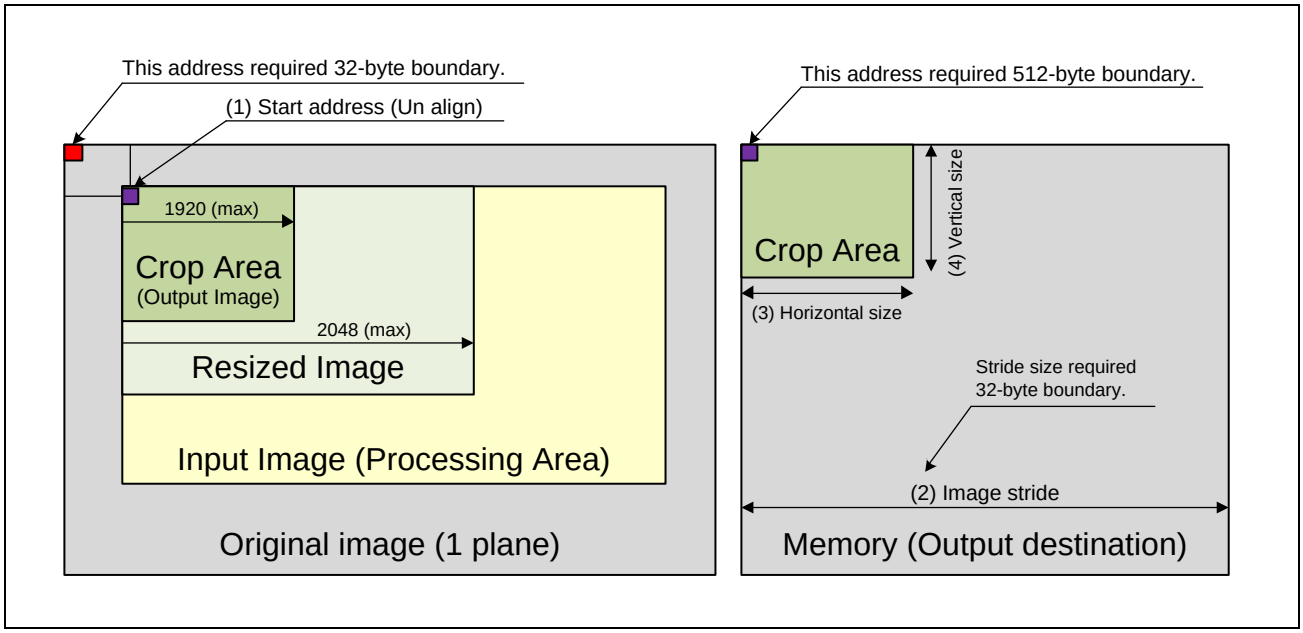

Figure 36.8 Output Setting

36.1.3 Read Pixel Formatting (RPF)

This function converts the input image data from AXI-Master and outputs it to the resizer. There are four types of conversion: Data swap, Data extraction, Offset binary conversion (YCbCr only), and pixel normalization. RPF also includes a test pattern generation function.

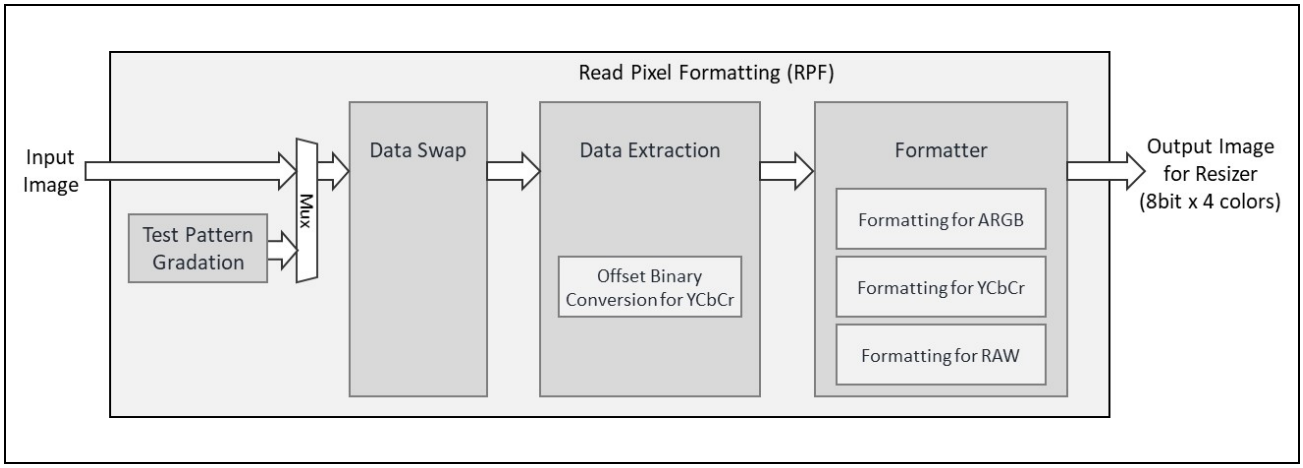

Figure 36.9 RPF Block Diagram

36.1.3.1 Data Swap (Endian Correction)

This function corrects byte order so that image data can be handled by ISU. Each bytes can be arranged any order according the register setting of ISU_RPF_SRC_DSWAP.RD_SWAP[2:0].

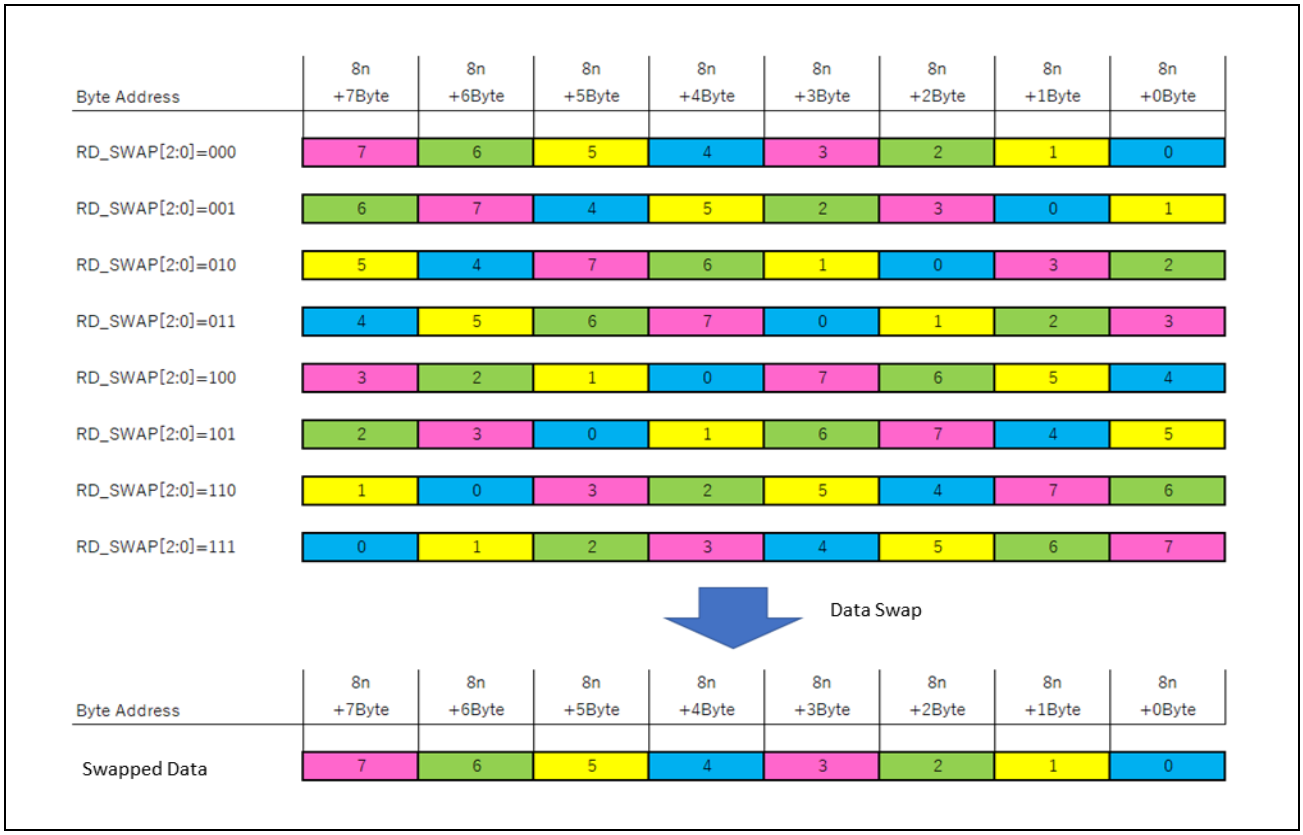

Figure 36.10 Data Swap Correction

36.1.3.2 Data Extraction

These functions extract each color components (ex. R, G, B) and normalized as 8-bit for each so that image data can be handled by Resizer. Appropriate processing is performed for each input color format (RGB/ARGB, YCbCr/YUV, RAW) by setting of ISU_RPF_FMT.RDFMT[5:0].

■ RGB/ARGB

This function support 8 ARGB/RGB formats as bellow. All formats are “Number of planes = 1”.

Table 36.6 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3							
RDFMT [5:0]	Color Format	Padding	bit/pixel	phase	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

■ YCbCr/YUV

This function support 4 YCrCb/YUV formats as bellow.

Table 36.7 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	H'20	YCbCr422 8-bit	UYVY	
	H'21	YCbCr422 8-bit	YUY2	
Semi-Planar (Number of Planes = 2)	H'22	YCbCr422 8-bit	NV16	
	H'23	YCbCr420 8-bit	NV12	

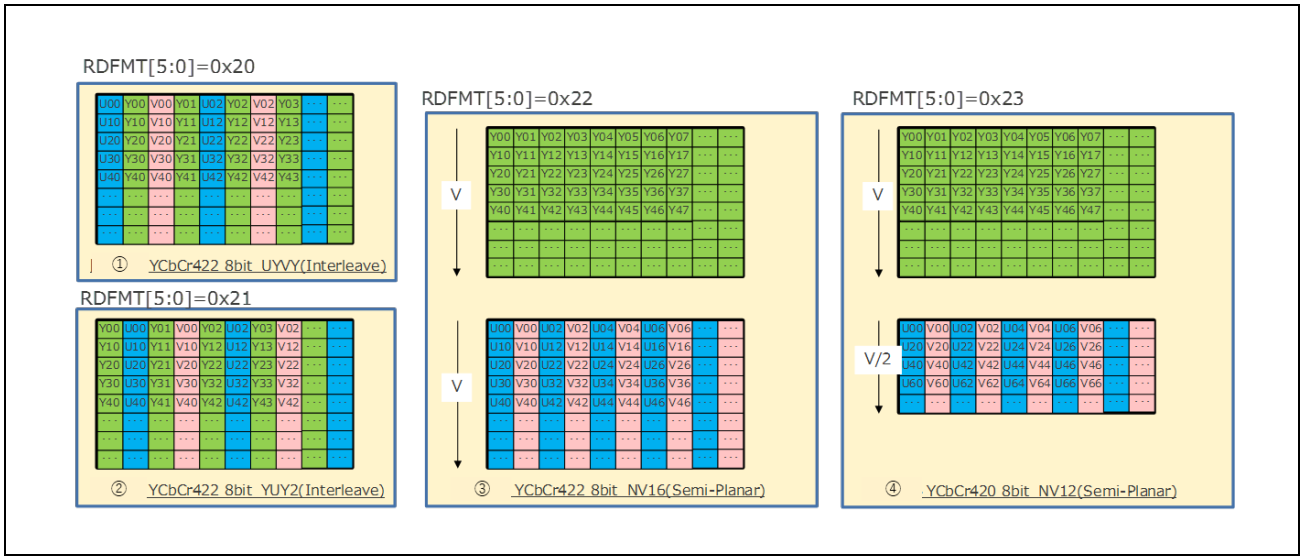

Figure 36.11 YCbCr/YUV Support Format

ISU can handle only Offset Binary as the chroma data format (CbCr/UV). Therefore, it is necessary to convert from Two's Complement Binary to Offset Binary.

■ ISU_RPF_UVBIN.UVCHG = 0 (Default)

ISU uses original data on DRAM as chroma value when RDFMT = H'20 to H'23.
(CrCb/UV is Offset Binary.)

■ ISU_RPF_UVBIN.UVCHG = 1

ISU convert chroma data (CrCb/UV) from Two's Complement Binary to Offset Binary.

Decimal Number	Offset Binary	Decimal Number	Two's compliment Binary
127	1111 1111	127	0111 1111
126	1111 1110	126	0111 1110
1	1000 0001	1	0000 0001
0	1000 0000	0	0000 0000
-1	0111 1111	-1	1111 1111
-128	0000 0000	-128	1000 0000

Figure 36.12 Types of Binary Expression

■ RAW

This function support 3 RAW formats as bellow. All formats are "Number of planes = 1".

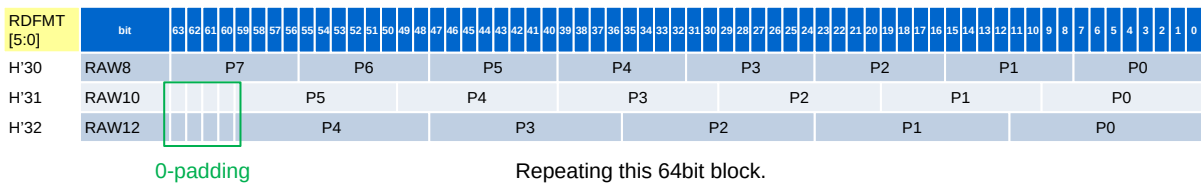

Figure 36.13 RAW Support Format

36.1.3.3 Formatter

8-bit normalization is required for ARGB/RGB and RAW formats since Resizer can handle 8-bit format only.

On the other hand, although YCbCr/YUV does not need 8-bit normalization since its components are already 8-bit, it is necessary to exchange into YCbCr/YUV444 format.

■ **RGB/ARGB**

For RGB/ARGB format normalization, upper bits are copied to lower bits.

Figure 36.14 8-bit Normalization for RGB Format

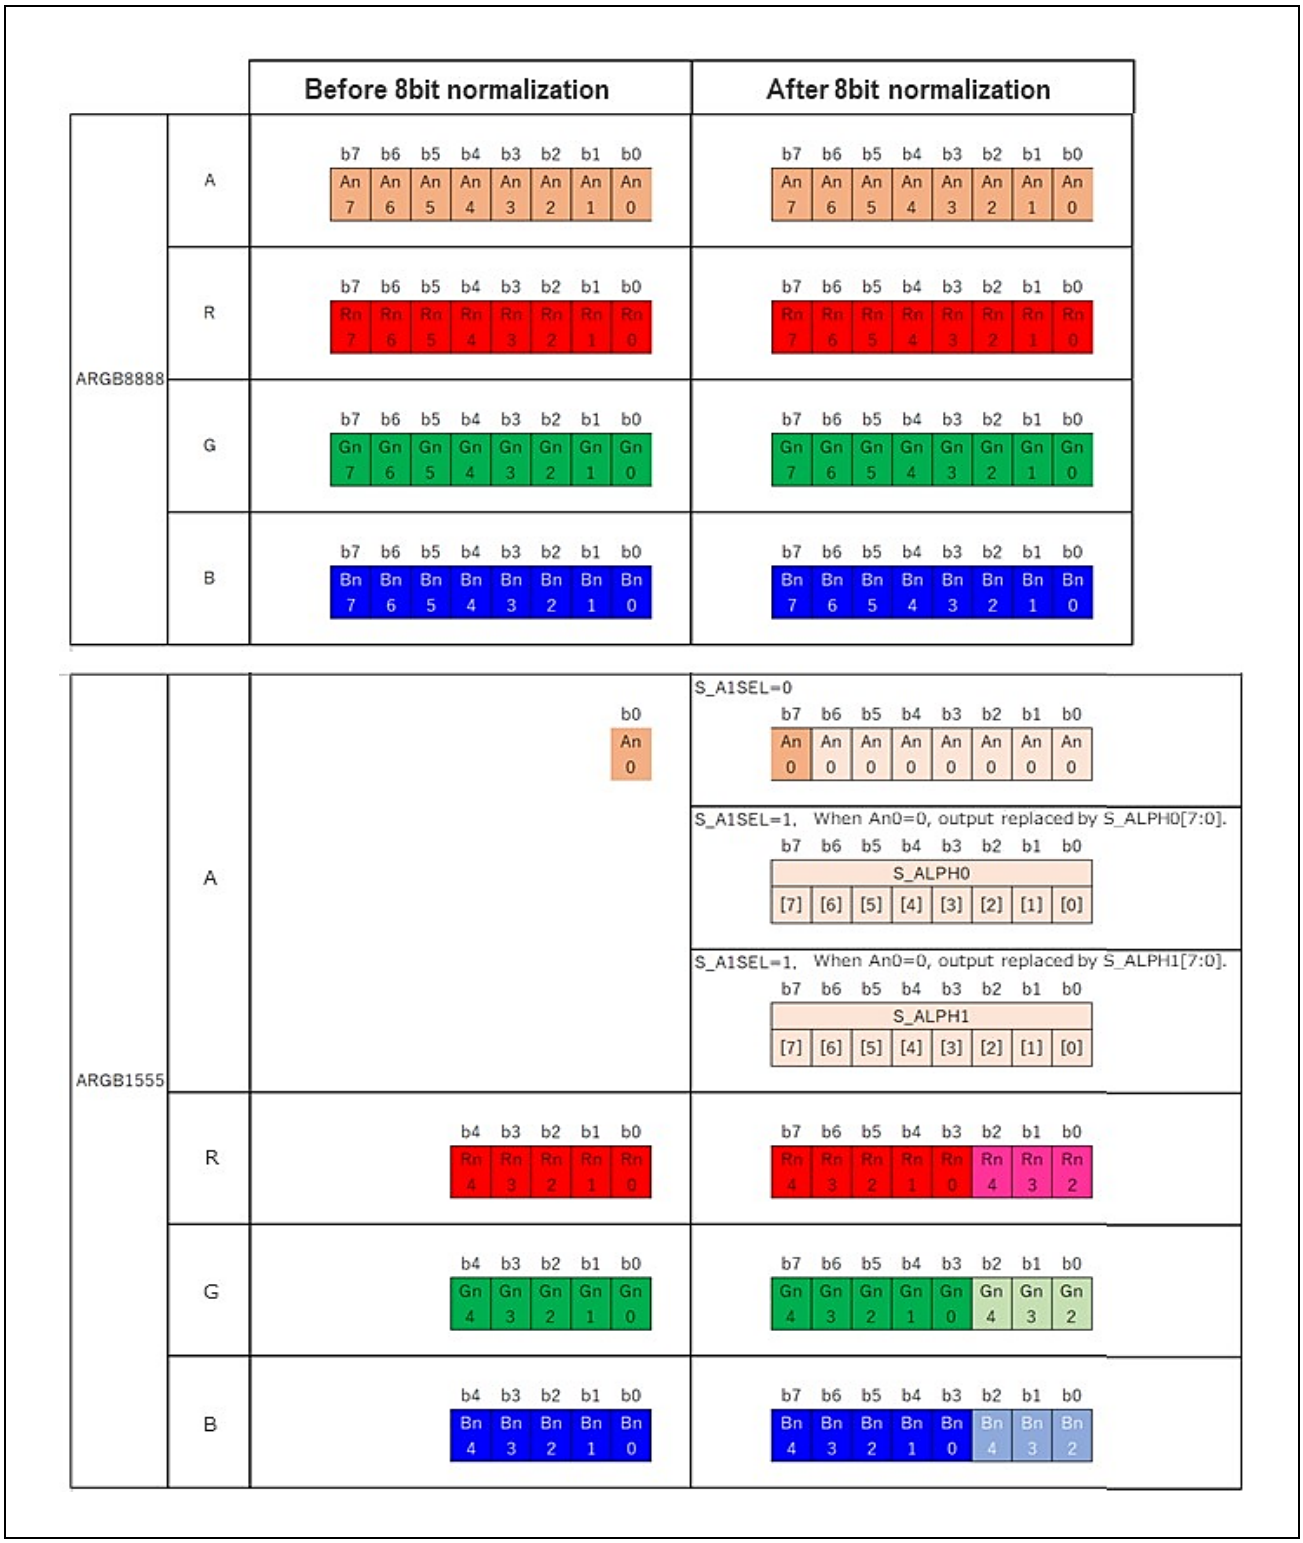

Figure 36.15 8-bit Normalization for ARGB Format

■ **YCbCr/YUV**

For YCbCr/YUV420 Semi-Planar format, even line re-use previous odd line's chroma information.

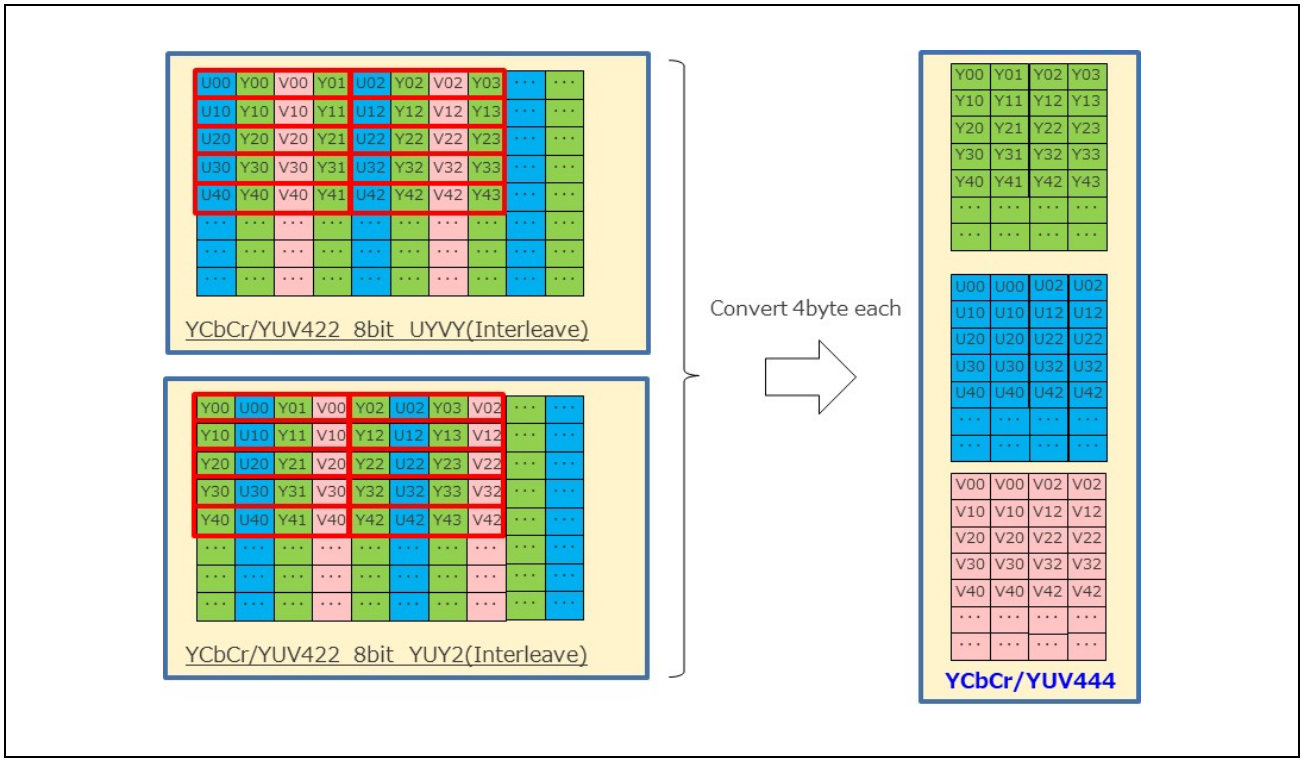

Figure 36.16 YCbCr/YUV444 Conversion from YCbCr/YUV422 Format

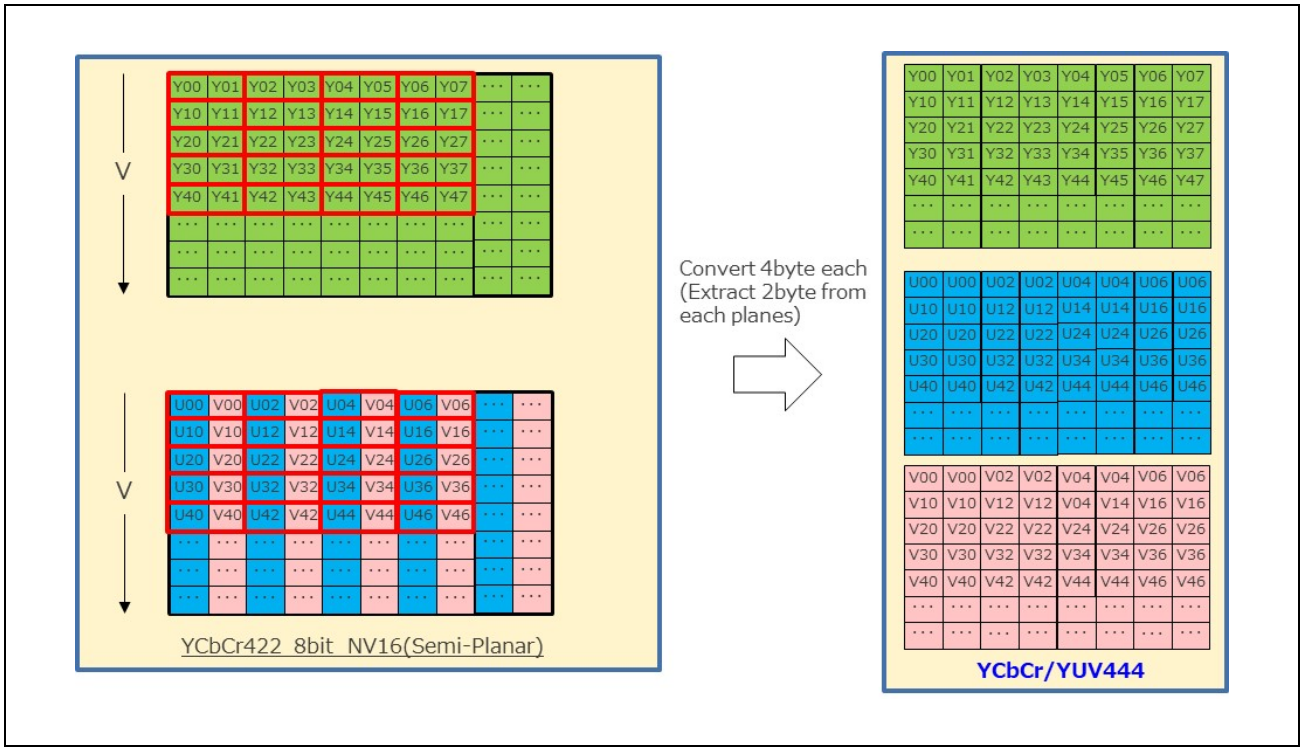

Figure 36.17 YCbCr/YUV444 Conversion from YCbCr/YUV422 Semi-Planar Format

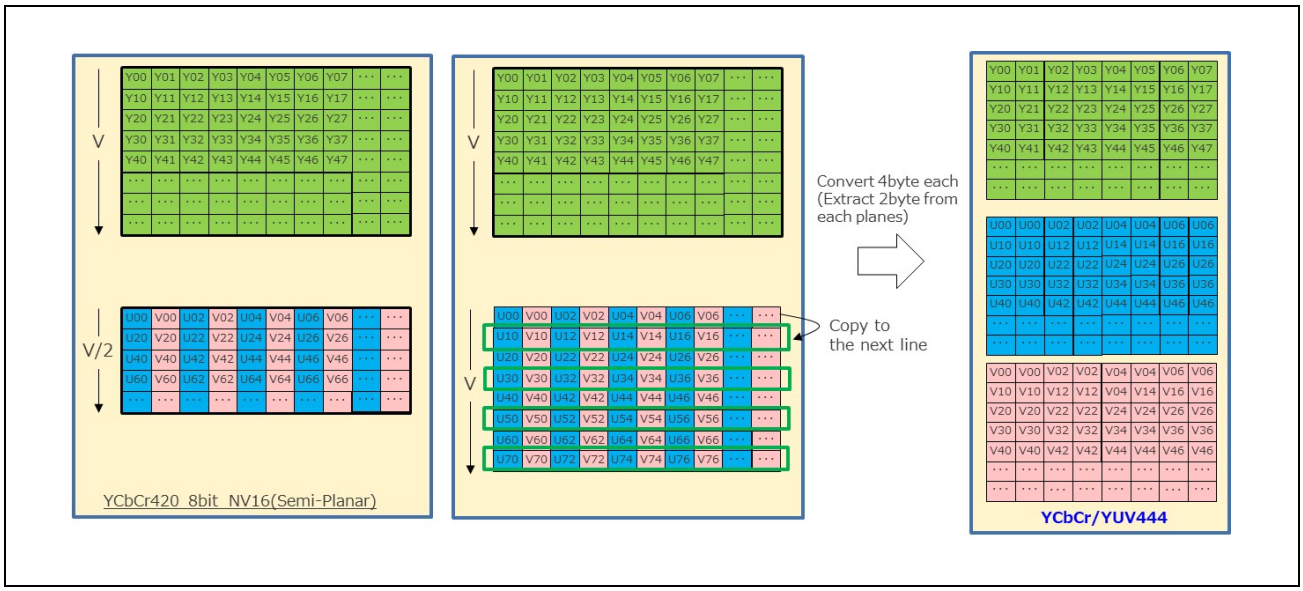

Figure 36.18 YCbCr/YUV444 Conversion from YCbCr/YUV420 Semi-Planar Format

■ RAW

RAW is converted to 8-bit by using upper 8-bit of RAW8-/10-/12-bit.

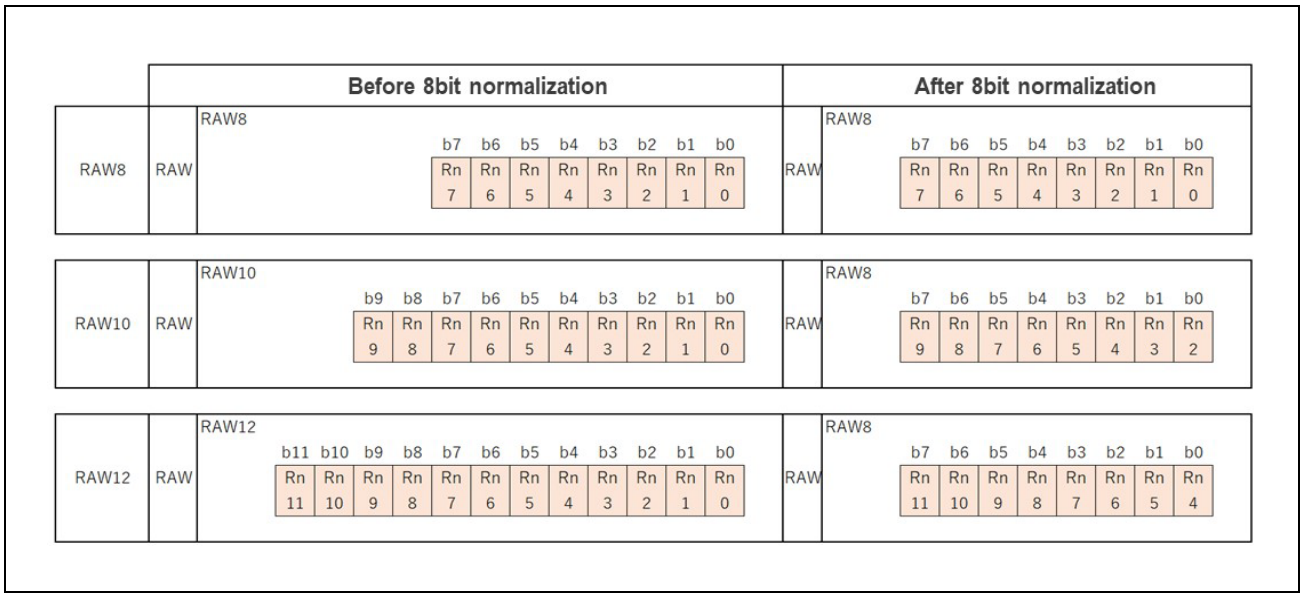

Figure 36.19 8-bit Normalization for RAW Format

36.1.3.4 Test Pattern Generation

Instead of the input image data from AXI-Master, RPF can generates a test pattern and outputs it to the Resizer.

The test pattern is an 8-bit gradation image from the upper left to the lower right in ARGB8888 format according to the register setting.

Please switch between the test pattern and the input image data from AXI-Master according below procedure.

1. Enable the test pattern. (ISU_RPF_SRC_TD1.TMODE_EN = 1b)
2. Start the resizing process. (ISU_FM_FRCON.START = 1b)

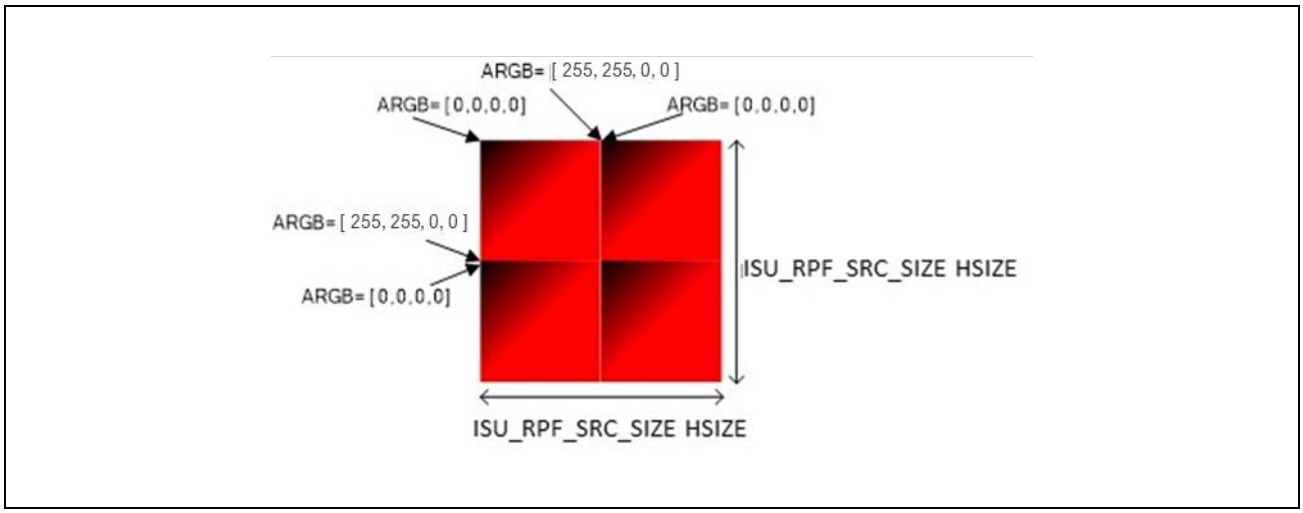

Figure 36.20 Test Pattern of R Gradation

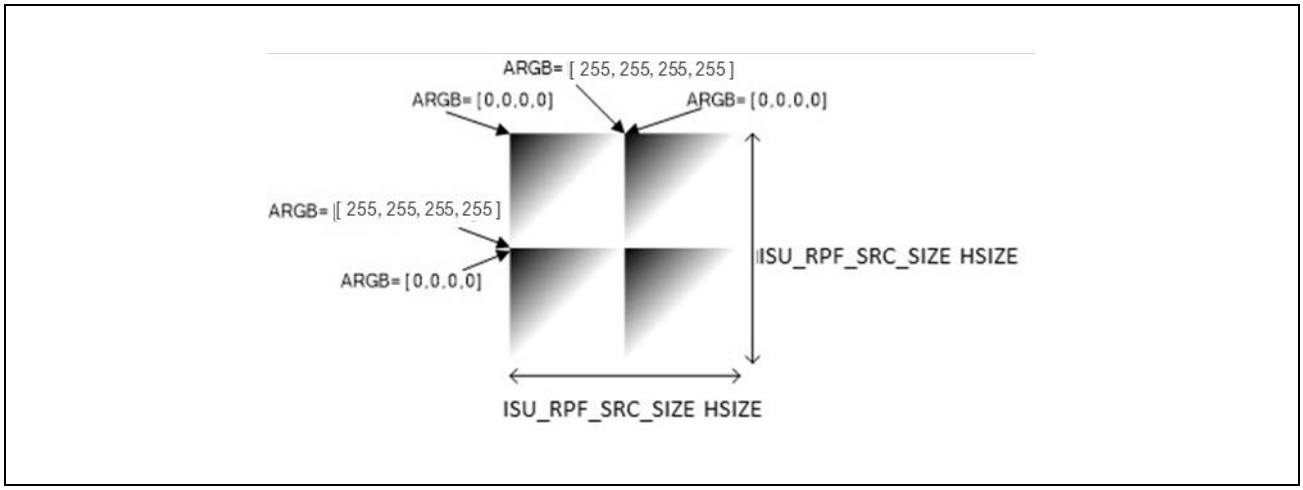

Figure 36.21 Pattern of R,G,B Gradation

36.1.4 Resizer (RS)

Resizer (RS) reduces the image size by using bi-linear algorithm (4-point linear interpolation) according to register setting of horizontal / vertical resize ratio.

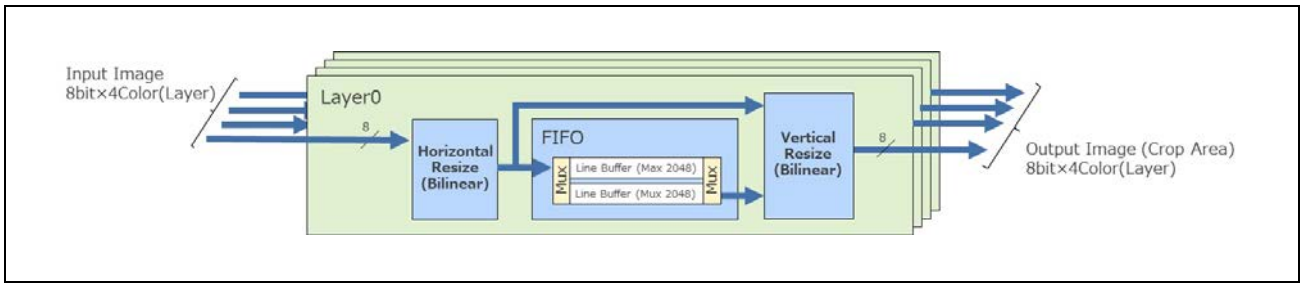

Figure 36.22 Resizer Block Diagram

The resize processing is different whether the Resized image size is smaller or larger than the Crop area.

If the Resized image size is smaller than the Crop area, fill in the missing edge pixels according to the register settings below.

When ISU_RS_PADDMODE.PADSEL = 0, Fill in the padding area by copying the right / bottom edge pixels after the reduction.

When ISU_RS_PADDMODE.PADSEL = 1, Fill in the padding area with the value specified by the register.

If the Resized image size is larger than the Crop area, it will be cut off by the Crop area.

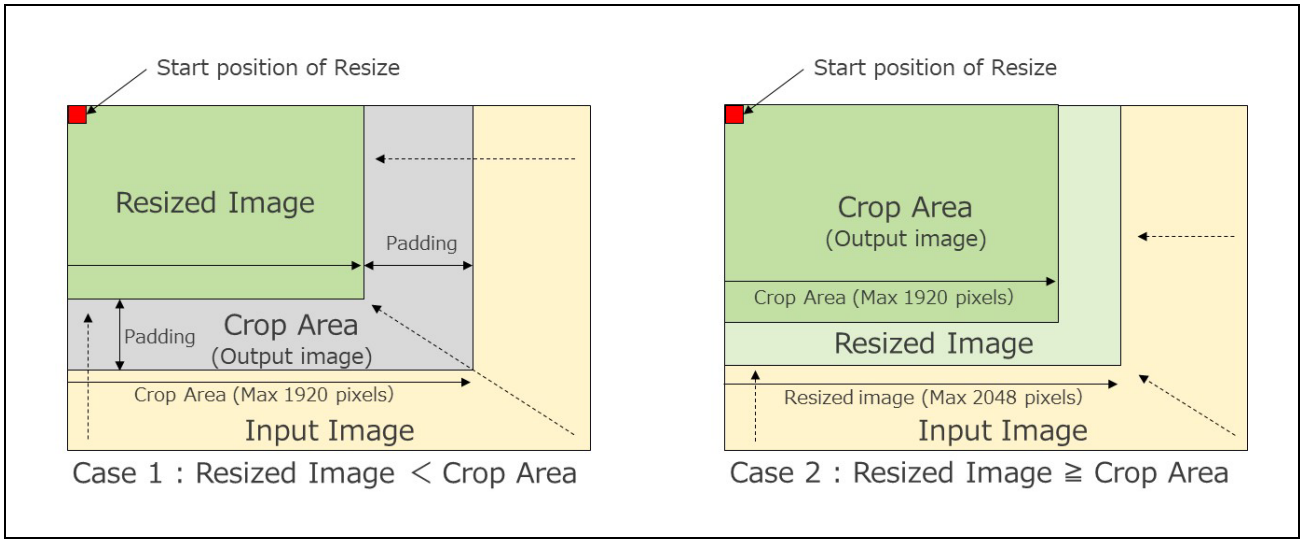

Figure 36.23 Relationship of Resized Image and Crop Area

36.1.4.1 Resize Start Position

The resize processing start from Resize Start Position (ISU_RS_STPOS) on the input image in according to the register setting. This position setting is specified in pixel coordinates from the top left of the image. If 0 is specified, the input image will be the Resizer (RS) target image as it is.

Padding area will be filled based on the setting of ISU_RS_PADDMODE.PADSEL.

- Register ISU_RS_STPOS.HSTART = Resize Start H position
- Register ISU_RS_STPOS.VSTART = Resize Start V position

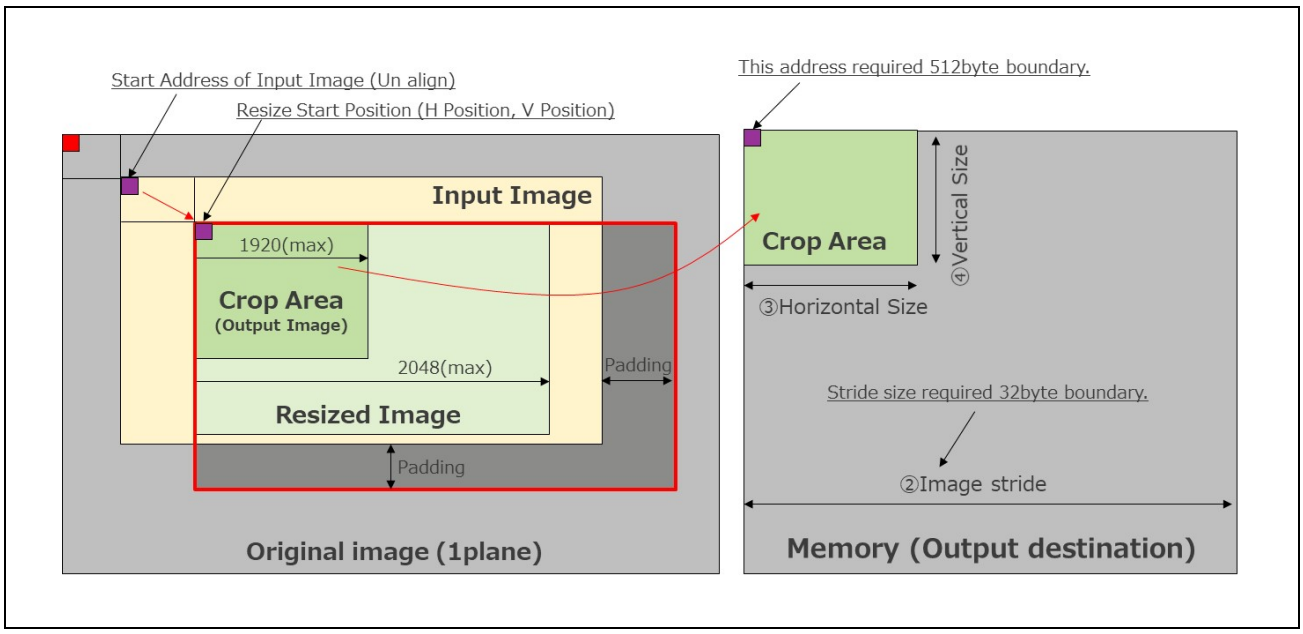

Figure 36.24 Resize Start Position

36.1.4.2 Sub Pixel Offset

The Resize Start Position Tuning (ISU_RS_POS_TUNE) can be used to adjust the start position by sub pixel level to reduce moiré.

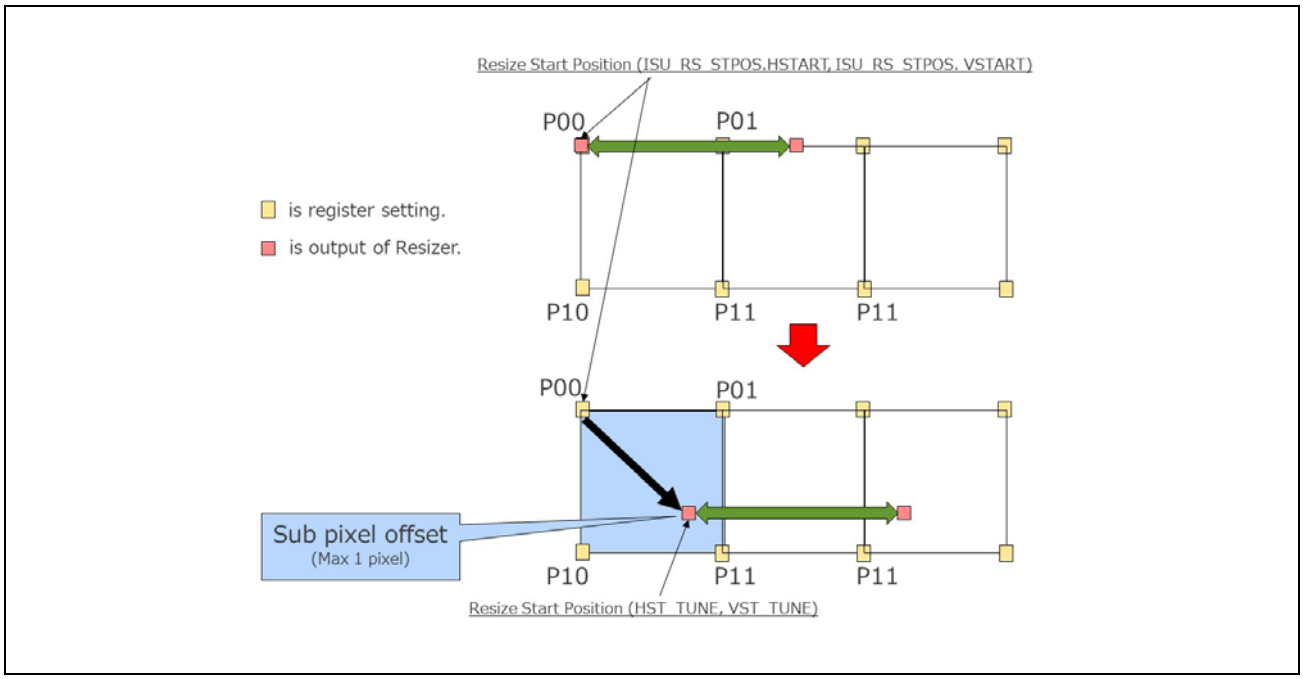

Figure 36.25 Sub Pixel Position Adjustment

36.1.4.3 Scaling Calculation

The resizer can be handled resizing magnification independently for horizontally and vertically. The image size of this processing result can be calculated approximately by using “Input image horizontal size x hscale” and “Input image vertical size × vscale”.

Table 36.8 Scaling Coefficient Setting

No.	Category	Register	Variation
(1)	Horizontal Scaling Ratio	RS_HSCALE.HMANT[3:0]	• m_h: Integer part of Horizontal scaling coefficient.
		RS_HSCALE.HFRAC[11:0]	• f_h: Fraction part of Horizontal scaling coefficient.
(2)	Vertical Scaling Ratio	RS_VSCALE.VMANT[3:0]	• m_v: Integer part of Vertical scaling coefficient.
		RS_VSCALE.VFRAC[11:0]	• f_v: Fraction part of Vertical scaling coefficient.

$$\mathrm{hascale} = \frac{4096}{4096 \times m_h + f_h} \qquad \mathrm{vscale} = \frac{4096}{4096 \times m_v + f_v}$$

Figure 36.26 Sub Pixel Position Adjustment

$$\mathrm{hascale} = \frac{4096}{4096 \times m_h + f_h}$$

hsize_{org}: Horizontal Size of Input Image

$$\mathrm{hsize}_{down_scaled} = \langle 1 + \left[\langle 1 + \frac{\langle \mathrm{hsize}_{org} - 1 \rangle}{m_{\acute{h}}} \rangle - 1 \right] \times m_{\acute{h}} \times \mathrm{hscale} \rangle$$

$$\mathrm{hsize}_{down_scaled} = \langle 1 + \left[\left[\langle 1 + \frac{\langle \mathrm{hsize}_{org} - 1 \rangle}{m_{\acute{h}}} \rangle - 1 \right] \times m_{\acute{h}} \times 4096 \right] / (4096 \times m_h + f_h) \rangle$$

Figure 36.27 Horizontal Scaling Calculation

$$\mathrm{vscale} = \frac{4096}{4096 \times \mathrm{m_v} + \mathrm{f_v}}$$

$\mathrm{vsize_{org}}$: Vertcal Size of Input Image

$$\mathrm{vsize_{down_scaled}} = \langle 1 + \left[\langle 1 + \frac{\langle \mathrm{vsize_{org}} - 1 \rangle}{\mathrm{m_{\acute{v}}}} \rangle - 1 \right] \times \mathrm{m_{\acute{v}}} \times \mathrm{vscale} \rangle$$

$$\mathrm{vsize_{down_scaled}} = \langle 1 + \left[\left[\langle 1 + \frac{\langle \mathrm{vsize_{org}} - 1 \rangle}{\mathrm{m_{\acute{v}}}} \rangle - 1 \right] \times \mathrm{m_{\acute{v}}} \times 4096 \right] / (4096 \times \mathrm{m_v} + \mathrm{f_v}) \rangle$$

Figure 36.28 Vertical Scaling Calculation

36.1.4.4 Resize Processing

Following figure shows the processing image of bi-linear algorithm (4-point interpolation).

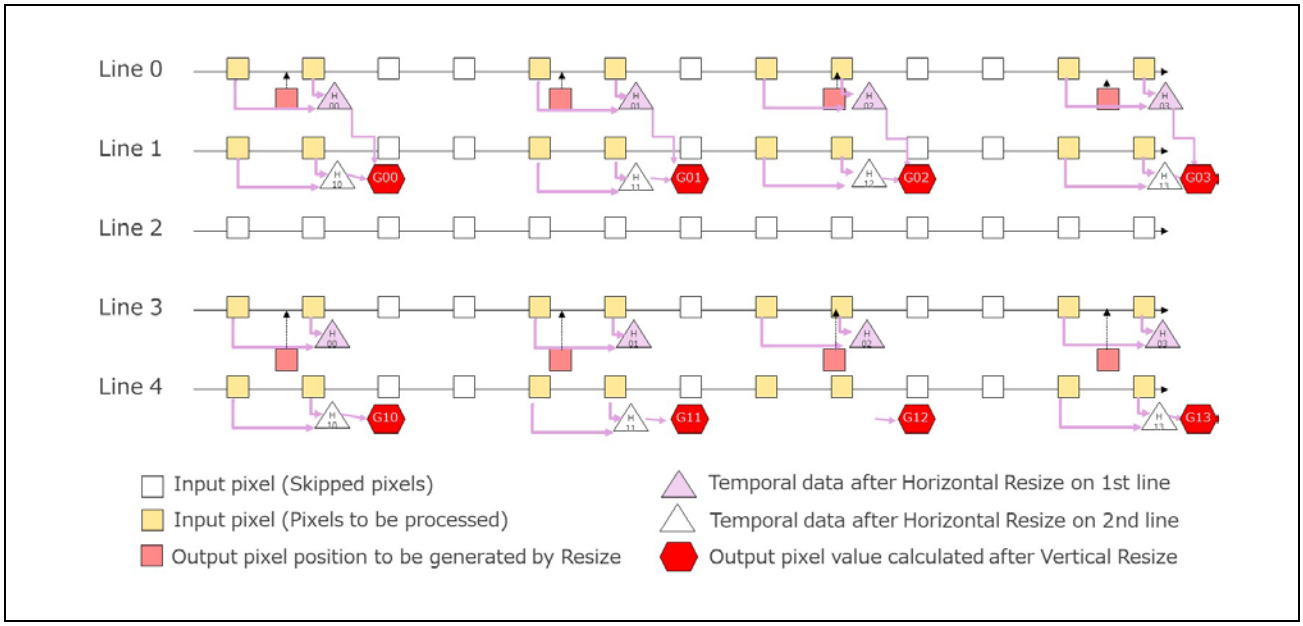

Figure 36.29 Points Bi-Linear Resize

The outline of the calculation procedure of 4-point linear interpolation is shown below.

Although dH and dV are not exist actually, it is used to help understanding for this algorithm. The pixel value of the target pixel position G00 will be calculated from the nearest 4 input pixels, and dH and dV indicate sub pixel position of G00 calculated from Horizontal/Vertical scaling ratio.

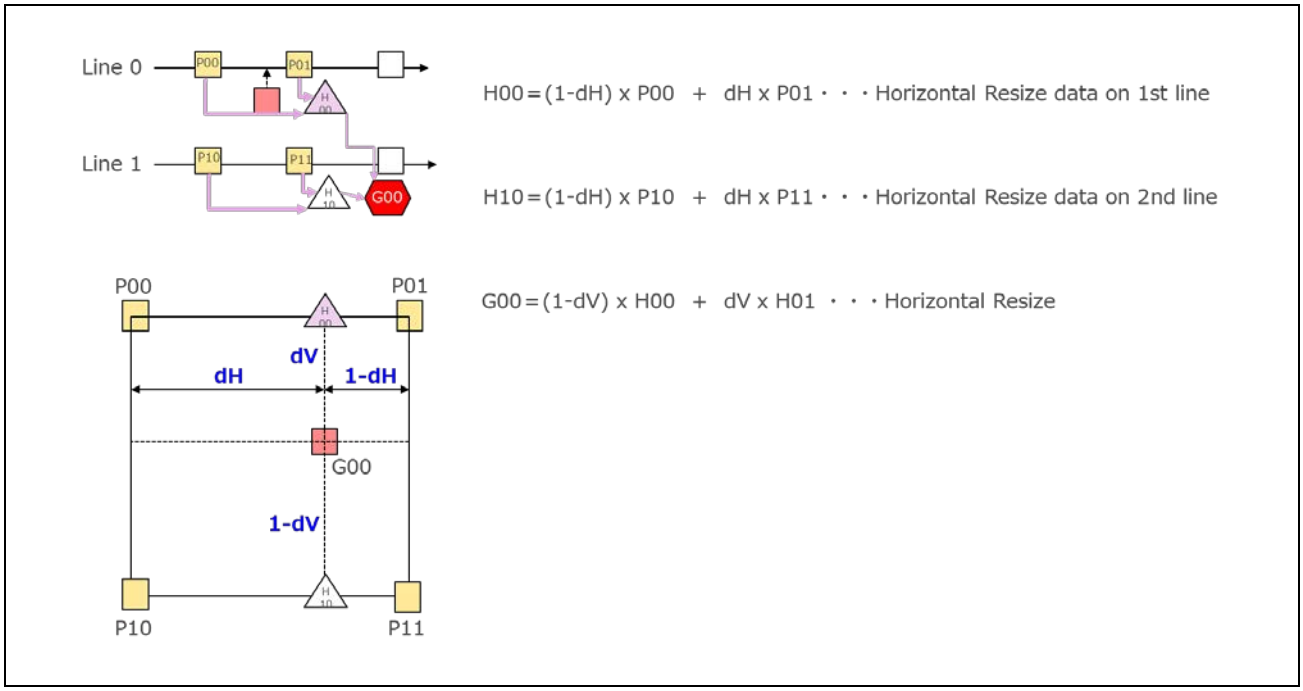

Figure 36.30 Calculation for 4 Points Bi-linear Resize

36.1.5 Write Pixel Formatting (WPF)

WPF converts the resized image data from RS and outputs it to AXI-Master.

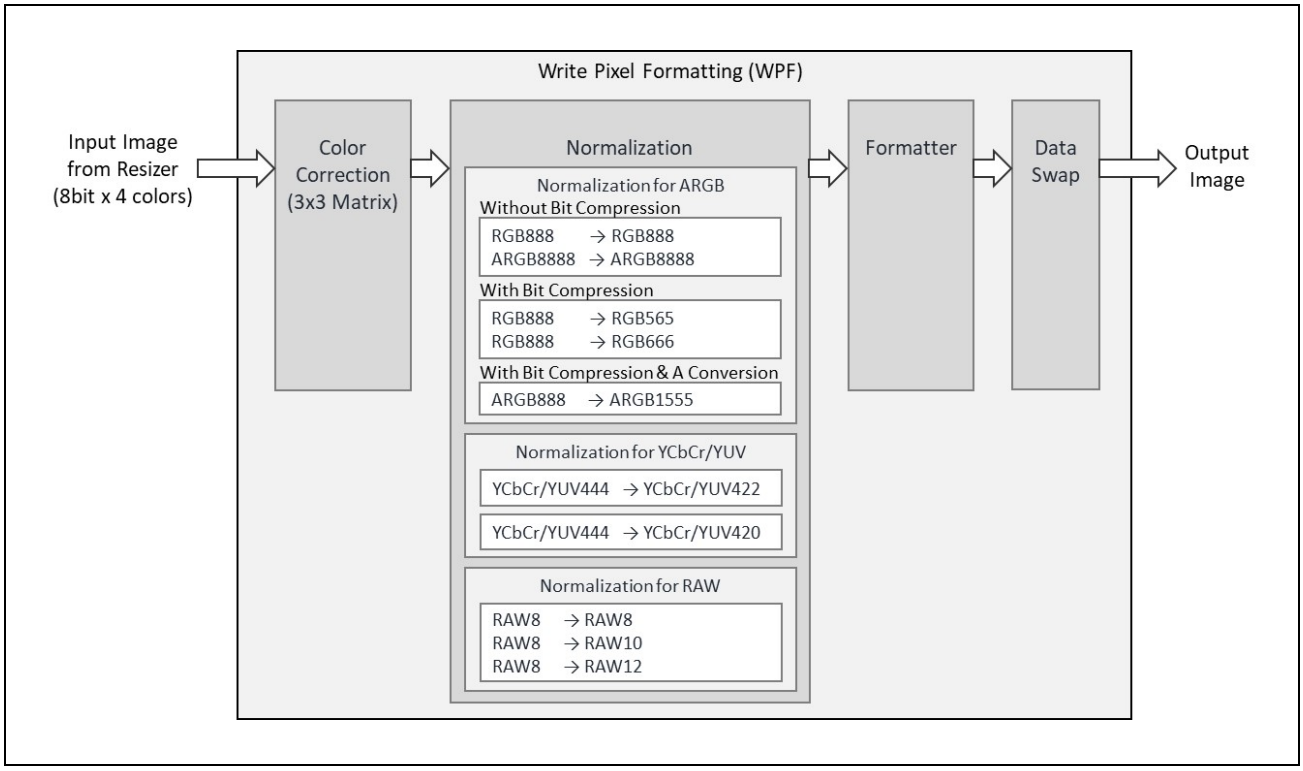

Figure 36.31 WPF Block Diagram

36.1.5.1 Color Correction

This function is color space conversion between RGB and YCbCr and YUV by using 3 × 3 color matrix. Matrix coefficients can be set by registers. The matrix calculation formula and circuit block diagram are shown below.

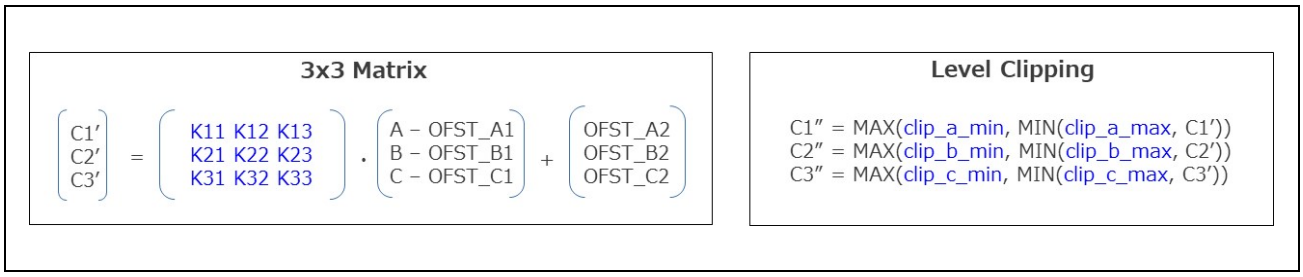

Figure 36.32 Color Correction Equation

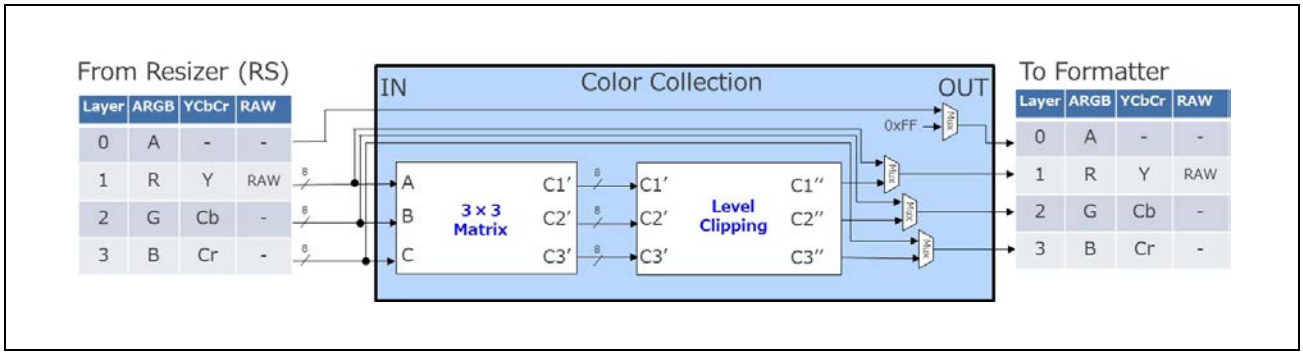

Figure 36.33 Color Correction Block Diagram

Sample setting of color matrix are shown below.

Conversion between RGB and YUV (PAL, SECAM)

$$\begin{bmatrix} Y_{out} \\ U_{out} \\ V_{out} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.147 & -0.289 & 0.436 \\ 0.615 & -0.515 & -0.100 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.140 \\ 1.000 & -0.395 & -0.580 \\ 1.000 & 2.032 & 0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (U_{in} - 128) \\ (V_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.601 / BT.709 (1250/50/2:1)

$$\begin{bmatrix} Y_{out} \\ Cb_{out} \\ Cr_{out} \end{bmatrix} = \begin{bmatrix} 0.299 & 0.587 & 0.114 \\ -0.169 & -0.331 & 0.500 \\ 0.500 & -0.419 & -0.081 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.402 \\ 1.000 & -0.344 & -0.714 \\ 1.000 & 1.772 & 0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion between RGB and YCbCr ITU-R BT.709 (1125/60/2:1)

$$\begin{bmatrix} Y_{out} \\ Cb_{out} \\ Cr_{out} \end{bmatrix} = \begin{bmatrix} 0.213 & 0.715 & 0.072 \\ -0.115 & -0.385 & 0.500 \\ 0.500 & -0.454 & -0.046 \end{bmatrix} \begin{bmatrix} R_{in} \\ G_{in} \\ B_{in} \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix} \qquad \begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 1.575 \\ 1.000 & -0.187 & -0.468 \\ 1.000 & 1.856 & 0.000 \end{bmatrix} \begin{bmatrix} Y_{in} \\ (Cb_{in} - 128) \\ (Cr_{in} - 128) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Conversion from RAW to RGB or YCbCr/YUV (Grayscale)

$$\begin{bmatrix} R_{out} \\ G_{out} \\ B_{out} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \\ 1.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \qquad \begin{bmatrix} Y_{out} \\ Cb_{out} \\ Cr_{out} \end{bmatrix} = \begin{bmatrix} 1.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \\ 0.000 & 0.000 & 0.000 \end{bmatrix} \begin{bmatrix} RAW_{in} \\ 0 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 128 \\ 128 \end{bmatrix}$$

36.1.5.2 Normalization

This function converts each color data into appropriate bit depth.

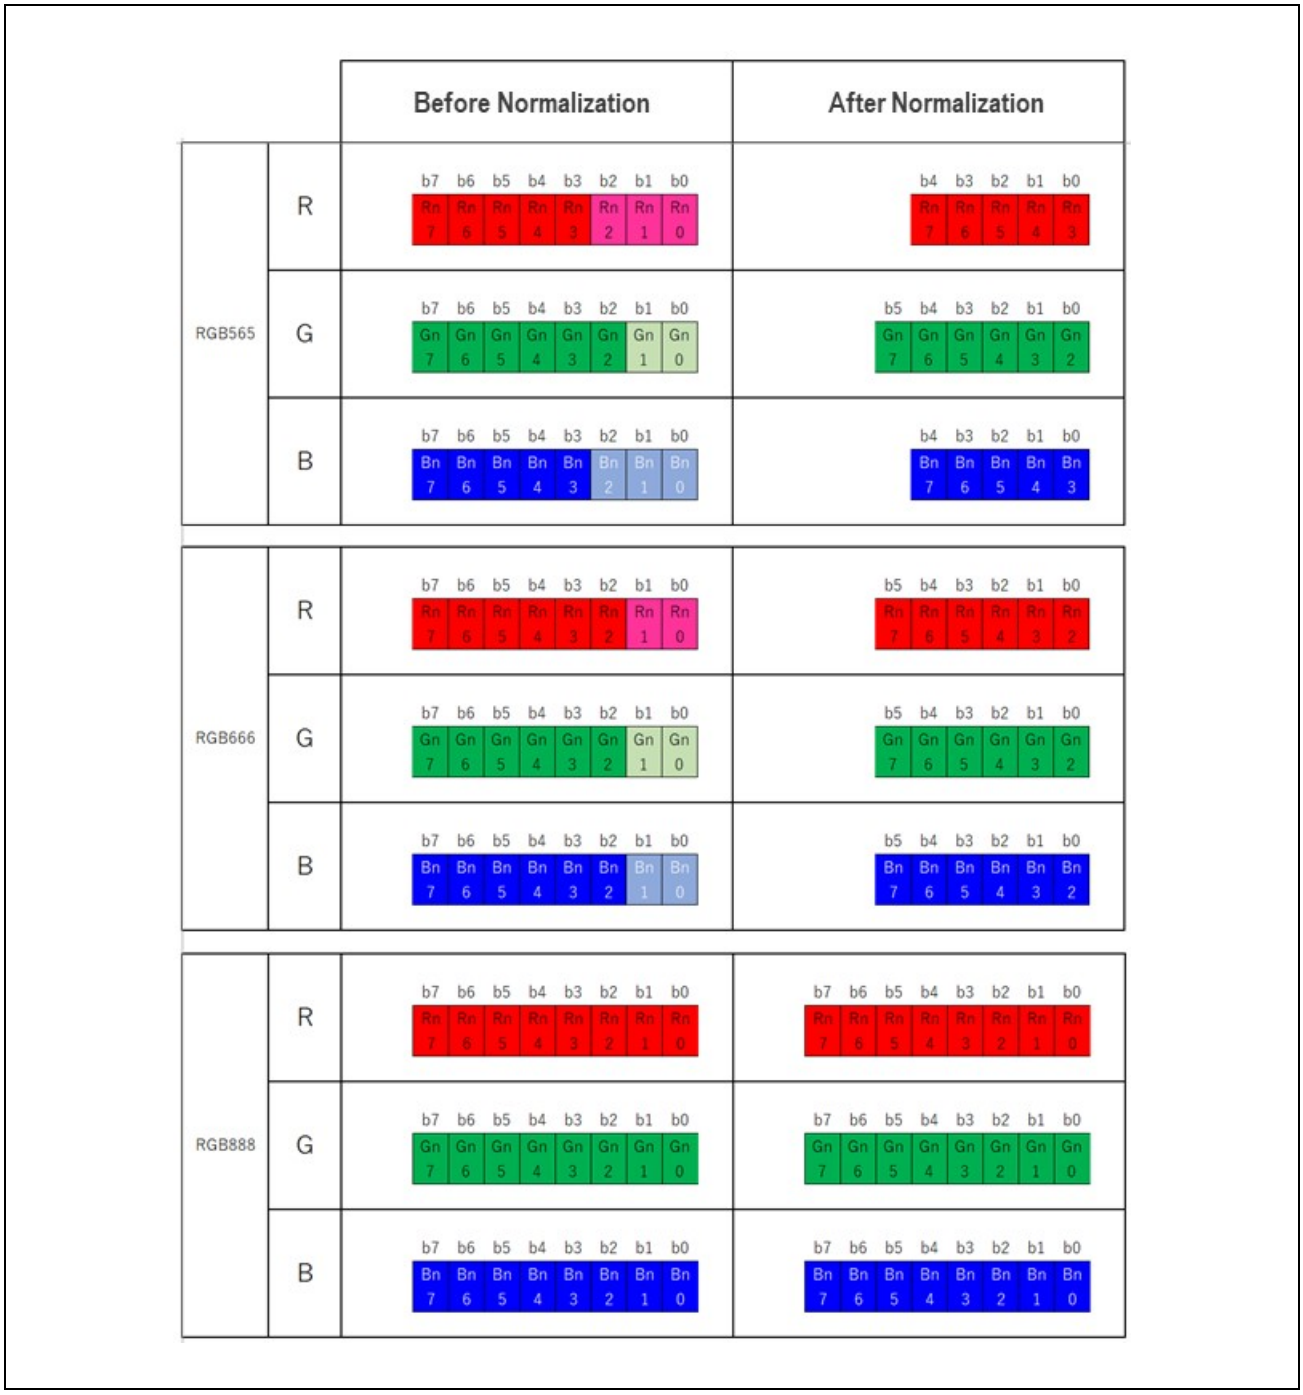

Figure 36.34 Normalization for RGB Format

■ **ARGB**

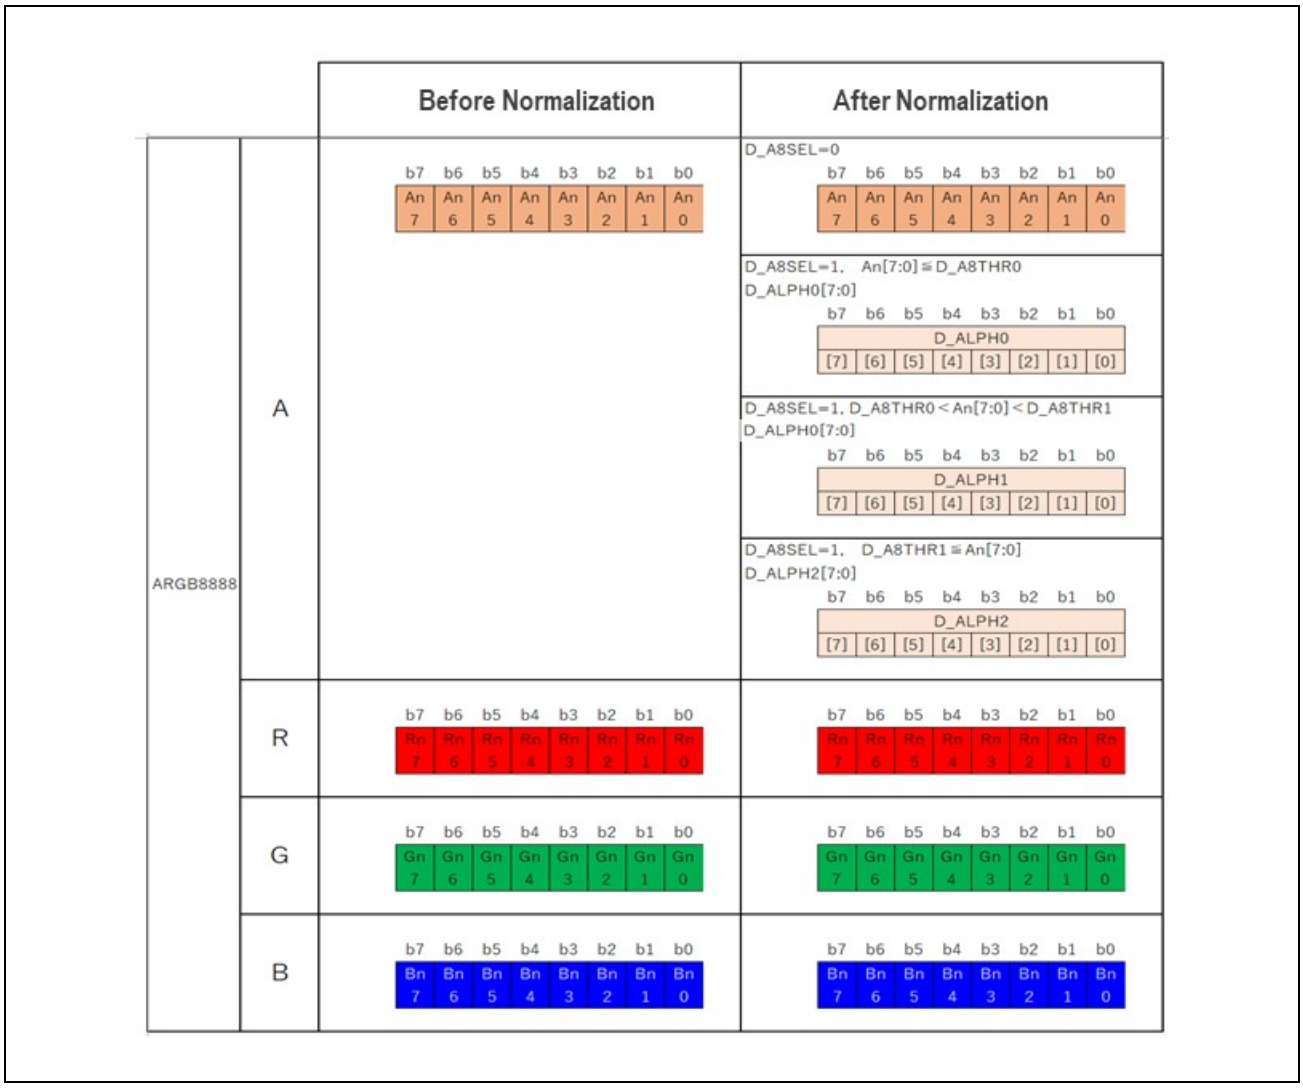

Figure 36.35 Normalization for ARGB8888 Format

“A(An)” of ARGB8888 is normalized according to the following logic.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 0, An is output as it is.

If ISU_WPF_ALPH_SEL2.D_A8SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL2.D_A8THR0 to 1 and An.

If An ≤ D_A8THR0, replace it with ISU_WPF_ALPH_VAL.D_ALPH0.

If D_A8THR0 < An <D_A8THR1, replace it with ISU_WPF_ALPH_VAL.D_ALPH1.

If D_A8THR1 ≤ An, replace it with ISU_WPF_ALPH_VAL.D_ALPH2.

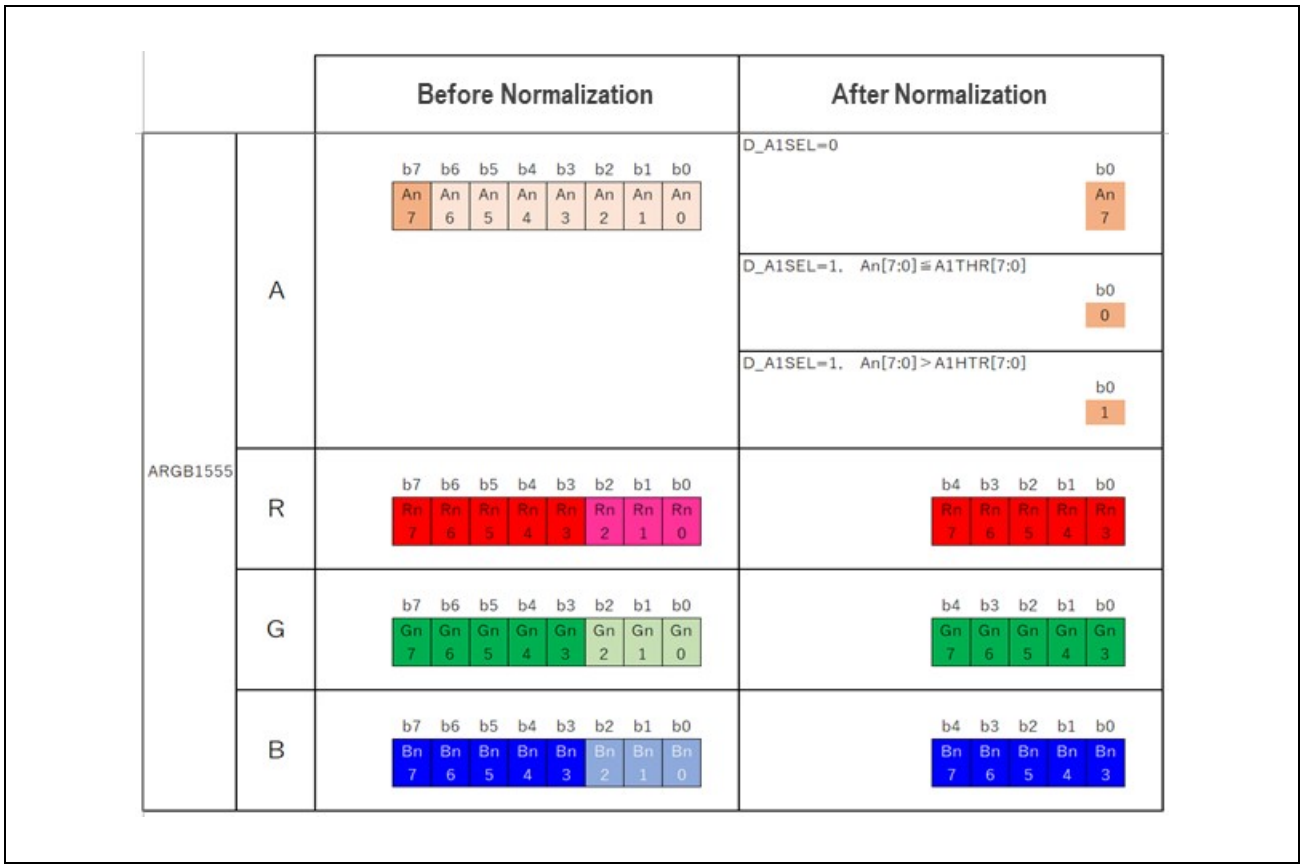

Figure 36.36 Normalization for ARGB1555 Format

“A(An)” of ARGB1555 A is compressed according to the following.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 0, An7 is output.

If ISU_WPF_ALPH_SEL1.D_A1SEL = 1, replace it with the following value according to the relationship between ISU_WPF_ALPH_SEL1.D_A1THR and An.

If An ≤ D_A1THR, 0 is output.

If D_A1THR < An, 1 is output.

■ YCbCr/YUV

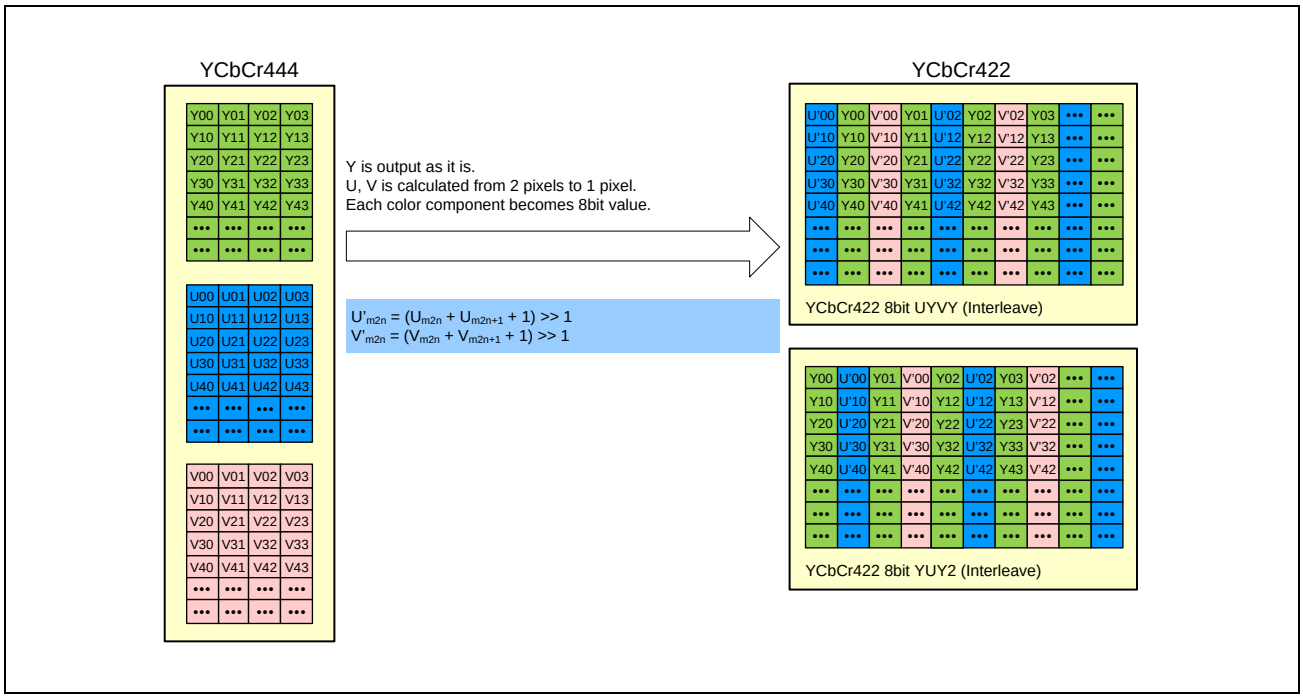

Figure 36.37 Normalization for YCbCr/YUV422 (Interleave) Format

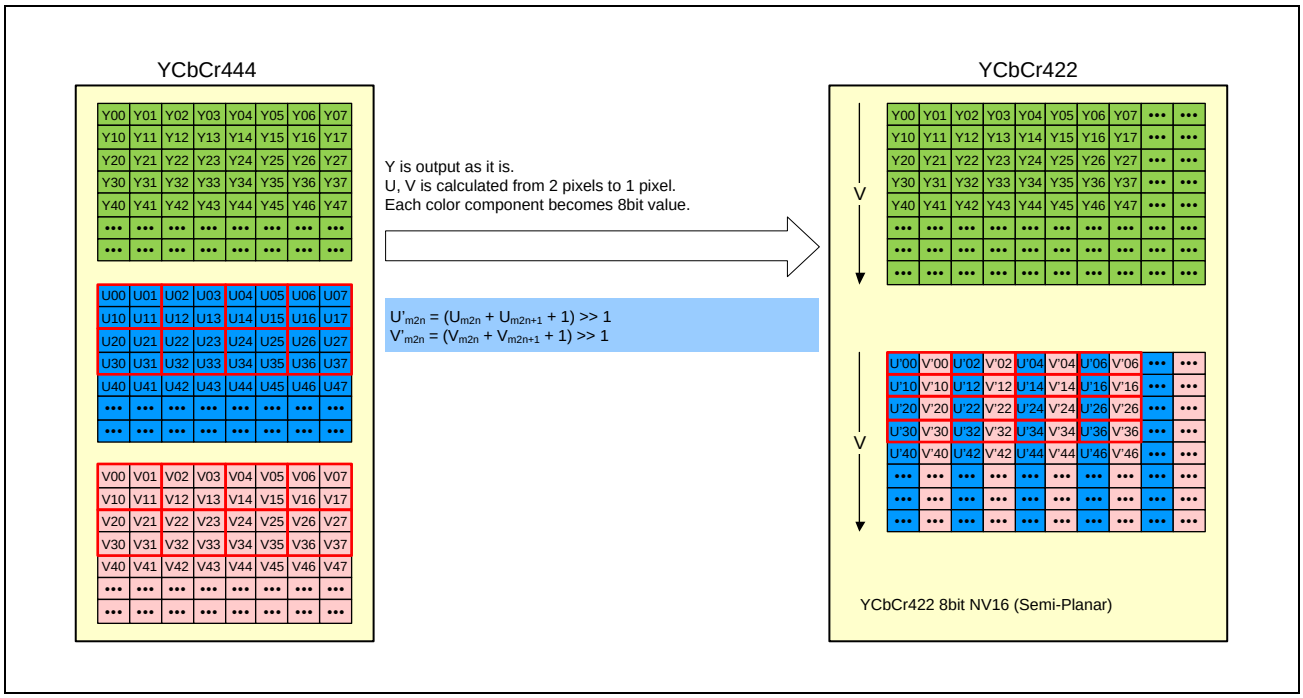

Figure 36.38 Normalization for YCbCr/YUV422 (Semi-Planar) Format

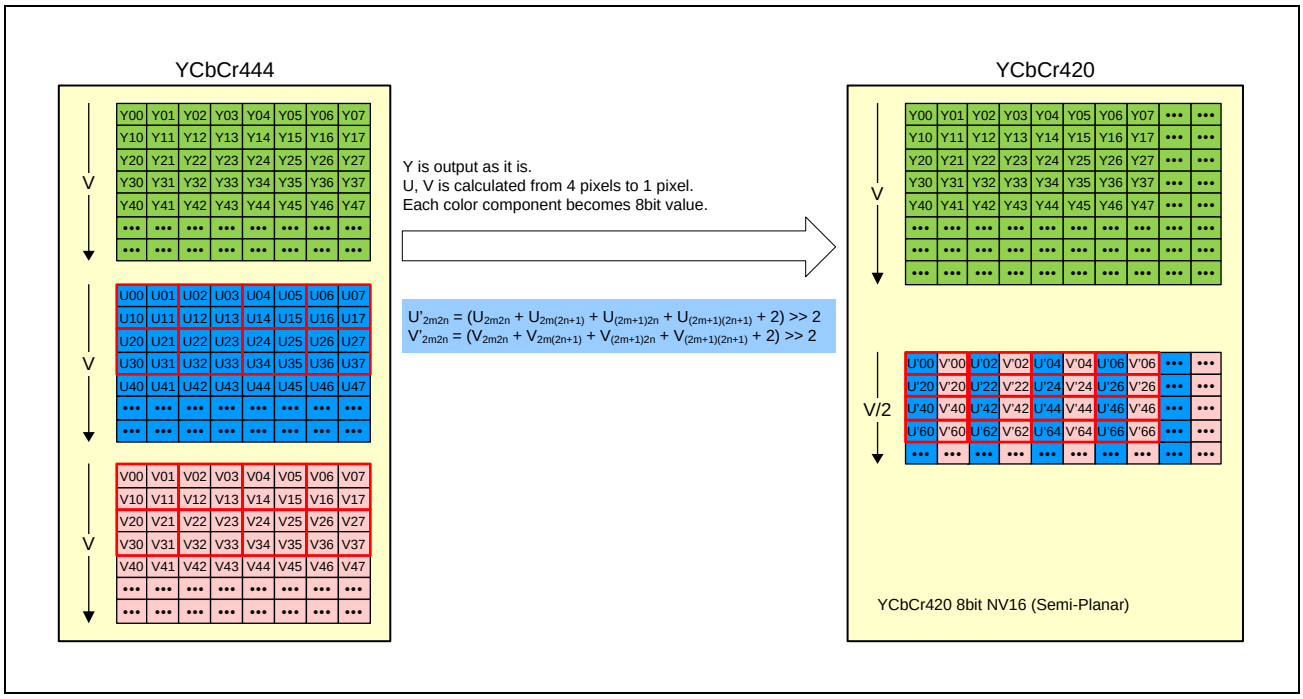

Figure 36.39 Normalization for YCbCr/YUV420 Format

■ RAW

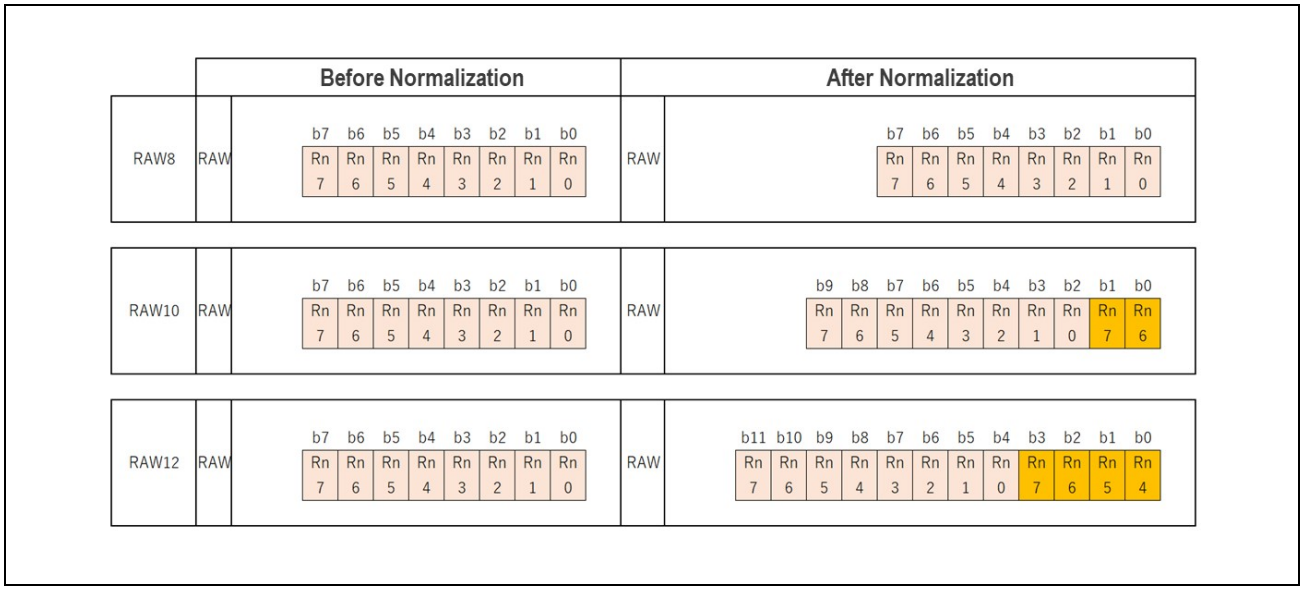

Figure 36.40 Normalization for RAW Format

36.1.5.3 Formatter

Following data format are described as 2-/3-/4-/8-byte per unit. Eventually, these data unit are packed in 32-byte (256-bit) each so that it can be handled in next process. Image format setting is indicated by ISU_WPF_FMT.WDFMT[5:0].

■ RGB/ARGB

This function support 8 ARGB/RGB formats as bellow. All formats are “Number of planes = 1”.

Table 36.9 ARGB Support Format

	Format				n								n + 1								n + 2								n + 3							
WDFMT [5:0]	Color Format	Padding	bit/pixel	phase	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

■ YCbCr/YUV

This function support 4 YCrCb/YUV formats as bellow.

Table 36.10 YCbCr/YUV Support Format

Data Format	RDFMT[5:0]	Color Format	Alias	Figure Index
Interleave (Number of Planes = 1)	H'20	YCbCr422 8-bit	UYVY	
	H'21	YCbCr422 8-bit	YUY2	
Semi-Planar (Number of Planes = 2)	H'22	YCbCr422 8-bit	NV16	
	H'23	YCbCr420 8-bit	NV12	

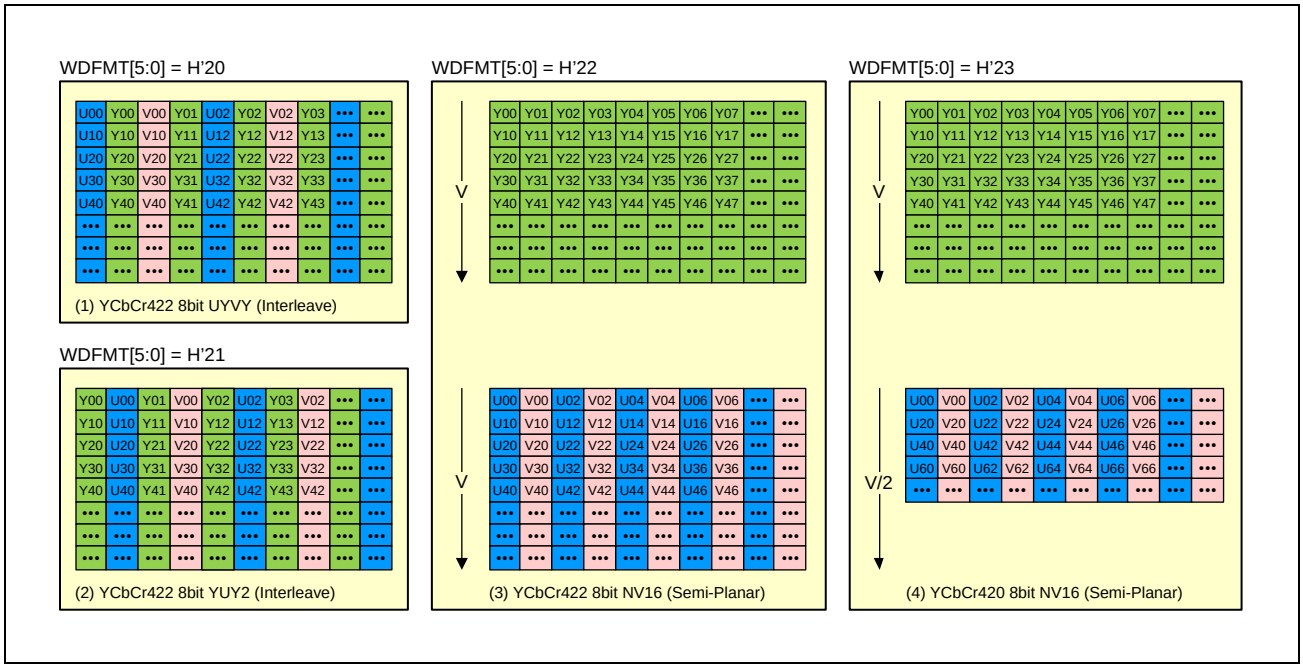

Figure 36.41 YCbCr/YUV Support Format

■ RAW

This function support 3 RAW formats as bellow. All formats are “Number of planes = 1”.

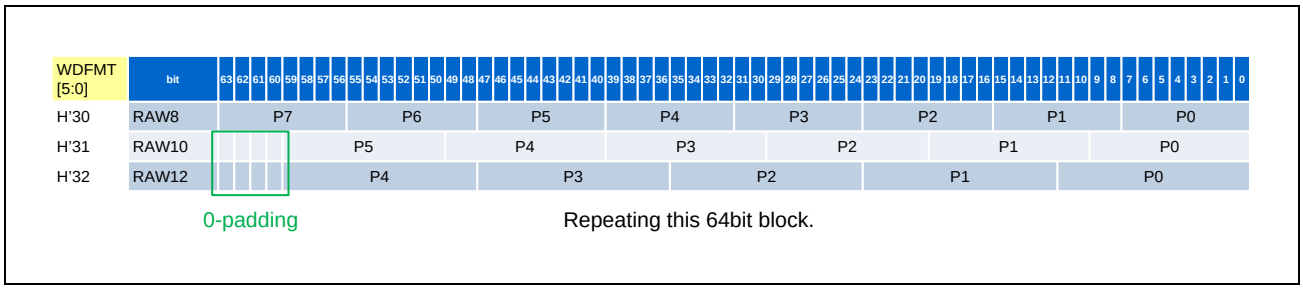

Figure 36.42 RAW Support Format

36.1.5.4 Data Swap (Endian Correction)

This function corrects byte order so that modify endian of data on memory. Each bytes can be arranged any order according the register setting.

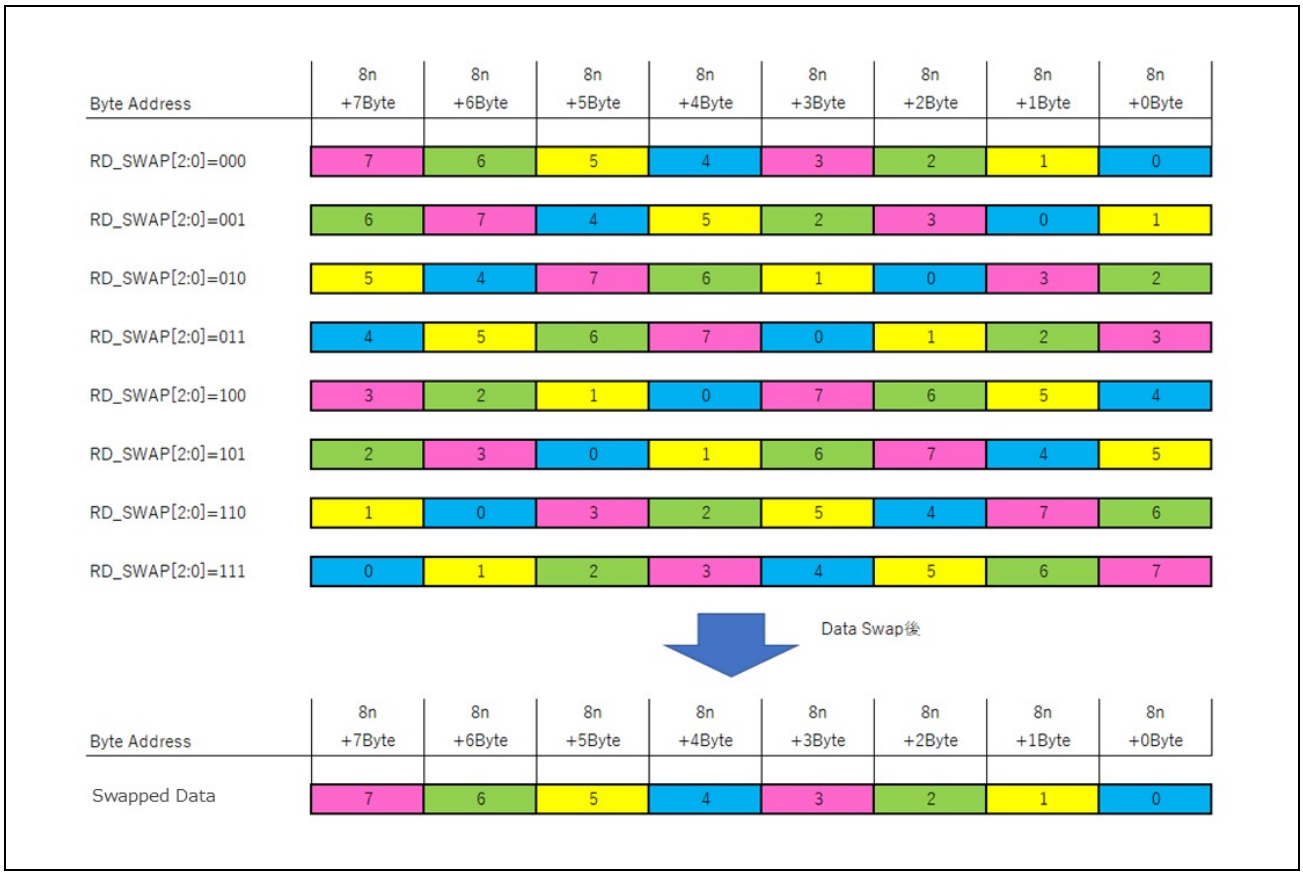

Figure 36.43 Data Swap Correction

36.2 Register Configuration

The address of the ISU register is represented by the offset address from the base address. ISU base address is as follows:

Base Address: H'0_1084_0000 (Cortex-A55 Address Space)

36.2.1 System Management Register

"System Management Register" sets descriptor processing and interrupts control.

The descriptor cannot access these registers.

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
FM Descriptor List Address Registers 0	ISU_FM_DL_STADDH	R/W	H'0000_0000	H'000	32
FM Descriptor List Address Registers 1	ISU_FM_DL_STADDL	R/W	H'0000_0000	H'004	32
FM Frame Control Registers	ISU_FM_FRCON	R/W	H'0000_0000	H'008	32
FM Module Stop Registers	ISU_FM_STOP	R/W	H'0000_0000	H'00C	32
FM Interrupt Enable Registers	ISU_FM_INT_EN	R/W	H'0000_0000	H'010	32
FM Interrupt Status Registers	ISU_FM_INT_STA	R/W	H'0000_0000	H'014	32
AXI Error Action Registers	ISU_AXI_ERACT	R/W	H'0000_0000	H'020	32
AXI FIFO Capability Registers	ISU_AXI_FIFO_CAP	R	H'4000_4000	H'02C	32

36.2.2 Common Register

“Common Register” sets input/output, reduction ratio and color conversion coefficient.

Prohibits write to these registers during frame processing.

The descriptor can access these registers.

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
RPF Source Image Size Registers	ISU_RPF_SRC_SIZE	R/W	H’0000_0000	H’100	32
RPF Source Stride Registers	ISU_RPF_SRC_STRD	R/W	H’0000_0000	H’104	32
RPF Source Plane0 Address Registers 0	ISU_RPF_SRC_ADDH_PL0	R/W	H’0000_0000	H’108	32
RPF Source Plane0 Address Registers 1	ISU_RPF_SRC_ADDL_PL0	R/W	H’0000_0000	H’10C	32
RPF Source Plane1 Address Registers 0	ISU_RPF_SRC_ADDH_PL1	R/W	H’0000_0000	H’110	32
RPF Source Plane1 Address Registers 1	ISU_RPF_SRC_ADDL_PL1	R/W	H’0000_0000	H’114	32
RPF Source Image Format Registers	ISU_RPF_FMT	R/W	H’0000_0000	H’118	32
RPF Source Image UV Format Register	ISU_RPF_UVBIN	R/W	H’0000_0000	H’11C	32
RPF Source Image Data Swap Registers	ISU_RPF_SRC_DSWAP	R/W	H’0000_0000	H’120	32
RPF Source ALPHA Data Selection Registers	ISU_RPF_ALPH_SEL	R/W	H’0000_0000	H’124	32
RPF Source TEST Data Register1	ISU_RPF_SRC_TD1	R/W	H’0000_0000	H’128	32
RPF Source TEST Data Register2	ISU_RPF_SRC_TD2	R/W	H’0000_0000	H’12C	32
RS Scaling Factor Registers 0	ISU_RS_HSCALE	R/W	H’0000_0000	H’140	32
RS Scaling Factor Registers 1	ISU_RS_VSCALE	R/W	H’0000_0000	H’144	32
RS Output Image Start Position Registers	ISU_RS_STPOS	R/W	H’0000_0000	H’148	32
RS Output Image Start Position Tuning Registers	ISU_RS_POS_TUNE	R/W	H’0000_0000	H’14C	32
RS Output Size Crop Registers	ISU_RS_OS_CROP	R/W	H’0000_0000	H’150	32

36.3 Register Descriptions

36.3.1 FM Descriptor List Address Registers 0 (ISU_FM_DL_STADDH)

This register sets the start address [33:32] of the “Descriptor List”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DLADD[33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DLADD [33:32]	All 0	R/W	Set the start address [33:32] of the “Descriptor-List”.

36.3.2 FM Descriptor List Address Registers 1 (ISU_FM_DL_STADDL)

This register sets the start address [31:0] of the “Descriptor List”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLADD[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DLADD[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DLADD [31:0]	All 0	R/W	Set the start address [31:0] of the “Descriptor List”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.3 FM Frame Control Registers (ISU_FM_FRCON)

This register controls the frame processing method selection and processing start.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DESON
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	DESON	All 0	R/W	Processing method selection Select “Register Mode” or “Descriptor Mode”. 0: Register Mode When executing in this mode, set the register before starting frame processing. 1: Descriptor Mode When executing in this mode, write a “Descriptor List” before starting frame processing.
15 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	START	All 0	R/W	Frame processing start instruction [Write] 0: NOP 1: Start frame processing [Read] This bit is always read as 0. *Note 1.* If 1 is written during frame processing, it will be ignored. *Note 2.* Also, when 1 is written, the frame end interrupt (ISU_FM_INT_STA.FREND) and descriptor footer read completion interrupt (ISU_FM_INT_STA.DESEND) are automatically cleared.

36.3.4 FM Module Stop Registers (ISU_FM_STOP)

This register controls an emergency stop.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STOP
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	STOP	All 0	R/W	Emergency stop instruction [Write] 0: NOP 1: Start emergency stop [Read] This bit is always read as 0. *Note 1.* It will be cleared automatically after the emergency stop is completed. If 1 is written during the emergency stop process, it will be ignored. *Note 2.* If you want to stop frame synchronously, you can stop it by setting the footer of the “Descriptor List” not to process the next frame.

36.3.5 FM Interrupt Enable Registers (ISU_FM_INT_EN)

This register controls the interrupt factor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	AXIRXERRE	—	—	—	AXITXERRE	—	—	—	—	—	—	—	LISTERRE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRSTENDE	—	—	—	—	—	—	DESENDE	FRENDE
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
28	AXIRXERRE	All 0	R/W	Control of AXI bus read error interrupt (ISU_INT_ERR) Controls interrupt by “ISU_FM_INT_STA.RRESPERR”. 0: Do not output interrupt factors 1: Output interrupt factor
27 to 25	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
24	AXITXERRE	All 0	R/W	Control of AXI bus write error interrupt (ISU_INT_ERR) Controls interrupt by “ISU_FM_INT_STA.BRESPERR”. 0: Do not output interrupt factors 1: Output interrupt factor
23 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	LISTERRE	All 0	R/W	Control of “Descriptor List” format violation interrupt (ISU_INT_ERR) Controls interrupt by the number of bytes set in the header exceeding the limit or not being in 8-byte units. 0: Do not output interrupt factors 1: Output interrupt factor
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SRSTENDE	All 0	R/W	Control of emergency stop completion interrupt (ISU_INT_STOPE) Controls interrupt by the completion of emergency stop. 0: Do not output interrupt factors 1: Output interrupt factor
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DESENDE	All 0	R/W	Control of descriptor footer read completion interrupt (ISU_INT_DESE) Controls interrupt by the completion of descriptor footer read. 0: Do not output interrupt factors 1: Output interrupt factor *Note 1.* When an error occurs due to a format violation of “Descriptor List”, the ISU_INT_DESE interrupt does not occur even if this bit is set to 1.

Bit	Bit Name	Initial Value	R/W	Description
0	FRENDE	All 0	R/W	Control of frame processing end interrupt (ISU_INT_FRE) Controls interrupt by the frame processing end. 0: Not output interrupt factor 1: Output interrupt factor *Note 1.* This bit is updated according to the setting of the footer if the descriptor mode is set.

36.3.6 FM Interrupt Status Registers (ISU_FM_INT_STA)

This register displays the status of the interrupt factors.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	RRESPERR[2:0]			—	BRESPERR[2:0]			—	—	—	—	—	—	LISTER R
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/WC0	R/WC0	R/WC0	R	R/WC0	R/WC0	R/WC0	R	R	R	R	R	R	R/WC0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SRSTEND	—	—	—	—	—	—	DESEND	FREND
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/WC0	R	R	R	R	R	R	R/WC0	R/WC0

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 27	RRESPERR [2:0]	All 0	R/WC0	Displays the status of the AXI read response. Each bit means the following factors. [0] EXOKAY 0: EXOKAY no response 1: EXOKAY response [1] SLVERR 0: SLVERR no response 1: SLVERR response [2] DECERR 0: DECERR no response 1: DECERR response *Note 1.* If you want to clear it, please clear 3-bit at the same time.
26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25 to 23	BRESPERR [2:0]	All 0	R	Displays the status of the AXI write response. Each bit means the following factors. [0] EXOKAY 0: EXOKAY no response 1: EXOKAY response [1] SLVERR 0: SLVERR no response 1: SLVERR response [2] DECERR 0: DECERR no response 1: DECERR response *Note 1.* If you want to clear it, please clear 3-bit at the same time.

Bit	Bit Name	Initial Value	R/W	Description
22 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	LISTERR	All 0	R/WC0	Displays the status of “Descriptor List” format violations (ISU_INT_ERR). 0: Descriptor list does not violate format 1: Descriptor list does violate format
15 to 9	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
8	SRSTEND	All 0	R/WC0	Displays the status of the emergency stop completion (ISU_INT_STOPE). 0: Emergency stop not completed 1: Emergency stop completed
7 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	DESEND	All 0	R/WC0	Displays the status of the descriptor footer read completion (ISU_INT_DESE). 0: Descriptor footer read incomplete 1: Descriptor footer read completed
0	FREND	All 0	R/WC0	Displays the status of the frame processing end (ISU_INT_FRE). 0: Frame processing incomplete 1: Frame processing completed

36.3.7 AXI Error Action Registers (ISU_AXI_ERACT)

This register sets the operation of AXI-Master after an AXI error occurs.

For each AXI error condition, choose whether to ignore and continue or stop subsequent transactions.

Transaction continuation settings are used for debugging purposes.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	RRESPEXO_ACT	RRESPSLV_ACT	RRESPDEC_ACT	—	BRESPEXO_ACT	BRESPSLV_ACT	BRESPDEC_ACT	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29	RRESPEXO_ACT	All 0	R/W	Operation settings after AXI read response EXOKAY occurs 0: Transaction stop 1: Transaction continuation (For debugging)
28	RRESPSLV_ACT	All 0	R/W	Operation settings after AXI read response SLVERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
27	RRESPDEC_ACT	All 0	R/W	Operation settings after AXI read response DECERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
26	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
25	BRESPEXO_ACT	All 0	R/W	Operation settings after AXI write response EXOKAY occurs 0: Transaction stop 1: Transaction continuation (For debugging)
24	BRESPSLV_ACT	All 0	R/W	Operation settings after AXI write response SLVERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
23	BRESPDEC_ACT	All 0	R/W	Operation settings after AXI write response DECERR occurs 0: Transaction stop 1: Transaction continuation (For debugging)
22 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

36.3.8 AXI FIFO Capability Registers (ISU_AXI_FIFO_CAP)

This register is a register that displays the free space of the FIFO in AXI-Master.

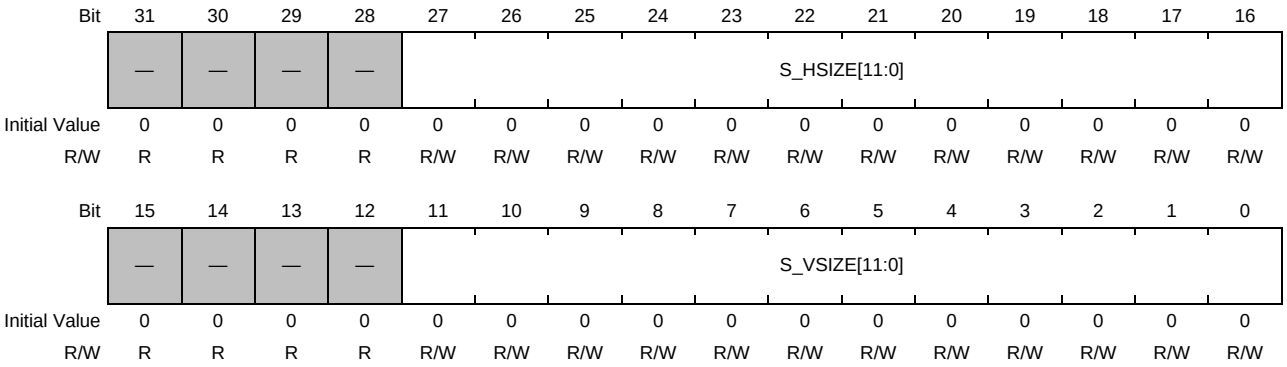
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SCAP_PL0[6:0]							—	—	SCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DCAP_PL0[6:0]							—	—	DCAP_PL1[5:0]					
Initial Value	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
30 to 24	SCAP_PL0 [6:0]	All 0	R	Free space in FIFO of the input image “Plane0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes.
23 to 22	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
21 to 16	SCAP_PL1 [5:0]	All 0	R	Free space in FIFO of the input image “Plane1” 0 to 32 in Semi-Planar mode. 0 in other modes.
15	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
14 to 8	DCAP_PL0 [6:0]	All 0	R	Free space in FIFO of the output image “Plane0” 0 to 32 in Semi-Planar mode. 0 to 64 in other modes.
7 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	DCAP_PL1 [5:0]	All 0	R	Free space in FIFO of the output image “Plane1” 0 to 32 in Semi-Planar mode. 0 in other modes.

36.3.9 RPF Source Image Size Registers (ISU_RPF_SRC_SIZE)

This register sets the size of the input image.



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	S_HSIZE [11:0]	All 0	R/W	Horizontal size of the input image Set the horizontal size of the input image in pixels. Set the size from 1 to 2800. 0: Setting prohibited 2801 to: Setting prohibited *Note 1.* For YCbCr type, set it to an even number.
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	S_VSIZE [11:0]	All 0	R/W	Vertical size of the input image Set the vertical size of the input image in pixels. Set the size from 1 to 2047. 0: Setting prohibited 2048 to: Setting prohibited *Note 1.* For YCbCr420, set it to an even number.

36.3.10 RPF Source Stride Registers (ISU_RPF_SRC_STRD)

This register sets the stride of the input image.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SSTRPL0[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSTRPL1[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SSTRPL0 [15:0]	All 0	R/W	Set the “Plane0 (Y/RGB/RAW)” stride Set the “Plane0 (Y/RGB/RAW)” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 0	SSTRPL1 [15:0]	All 0	R/W	Set the “Plane1 (C(Cb/Cr))” stride Set the “Plane1 (C(Cb/Cr))” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).

36.3.11 RPF Source Plane0 Address Registers 0 (ISU_RPF_SRC_ADDH_PL0)

This register sets the start address [33:32] of the input image of “Plane0”.

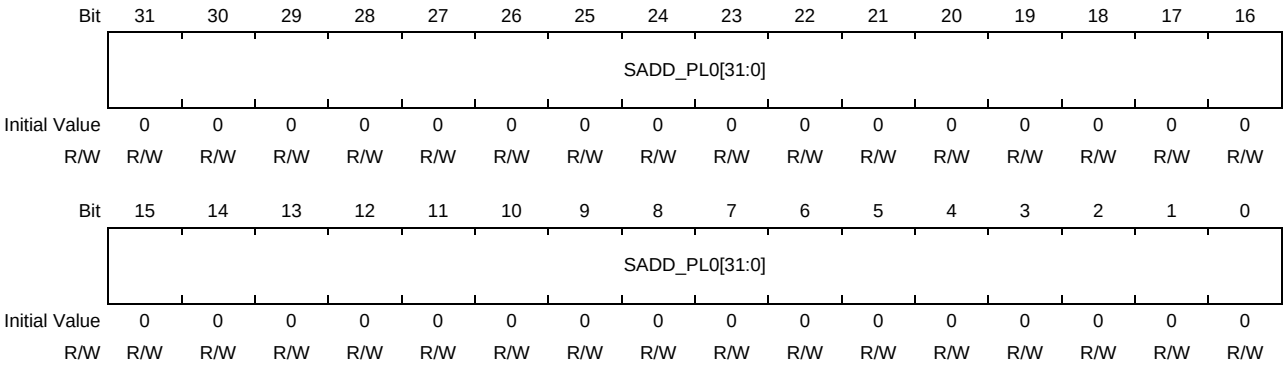
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SADD_PL0 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	SADD_PL0 [33:32]	All 0	R/W	Set the start address [33:32] for “Plane0 (Y/RGB/RAW)”.

36.3.12 RPF Source Plane0 Address Registers 1 (ISU_RPF_SRC_ADDL_PL0)

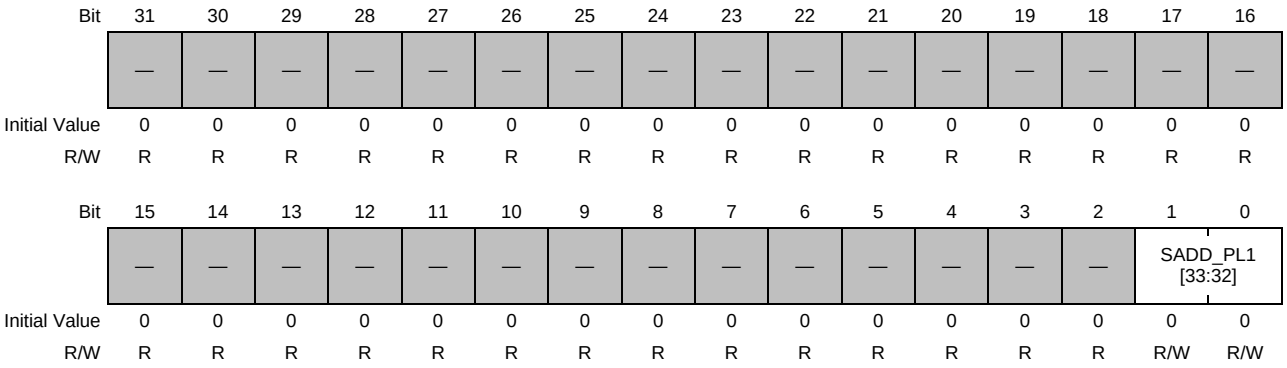
This register sets the start address [31:0] of the input image of “Plane0”.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL0 [31:0]	All 0	R/W	Set the start address [31:0] of “Plane0 (Y/RGB/RAW)”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.13 RPF Source Plane1 Address Registers 0 (ISU_RPF_SRC_ADDH_PL1)

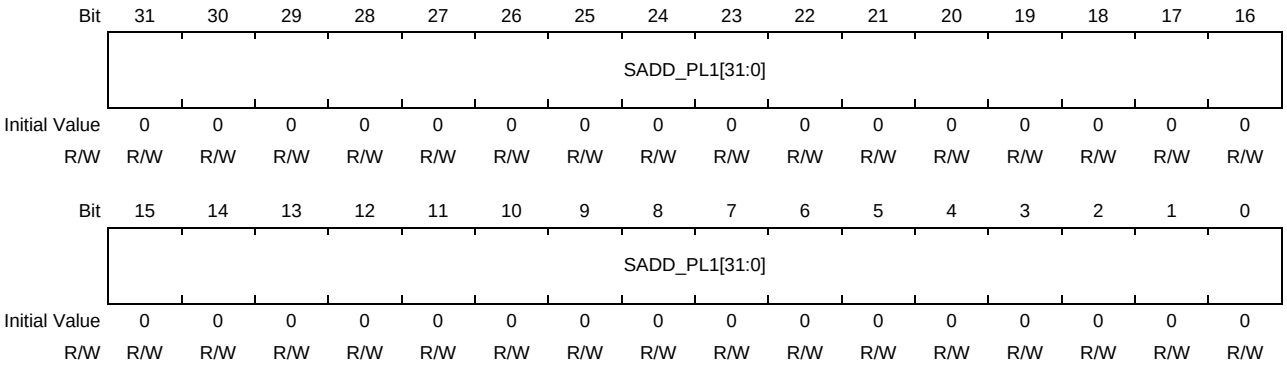
This register sets the start address [33:32] of the input image of “Plane1”.



Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R/W	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	SADD_PL1 [33:32]	All 0	R/W	Set the start address [33:32] of “Plane1 (C(Cb/Cr))”.

36.3.14 RPF Source Plane1 Address Registers 1 (ISU_RPF_SRC_ADDL_PL1)

This register sets the start address [31:0] of the input image of “Plane1”.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SADD_PL1 [31:0]	All 0	R/W	Set the start address [31:0] for “Plane1 (C(Cb/Cr))”. *Note 1.* Set an address that is a multiple of 32-byte.

36.3.15 RPF Source Image Format Registers (ISU_RPF_FMT)

This register sets the color format of the input image.

For details, refer to **Section 36.1.3.2, Data Extraction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	RDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	RDFM [5:0]	All 0	R/W	Color format of input image The following formats can be configured. H'00: ARGB1555 H'01: RGB565 H'02: BGR666 H'03: RGB888 H'04: BGR888 H'05: ARGB8888 H'06: RGBA8888 H'07: ABGR8888 H'20: YCbCr422 8-bit UYVY H'21: YCbCr422 8-bit YUY2 H'22: YCbCr422 8-bit NV16 H'23: YCbCr420 8-bit NV12 H'30: RAW8 H'31: RAW10 H'32: RAW12 Others: Setting prohibited

36.3.16 RPF Source Image UV Format Registers (ISU_RPF_UVBIN)

This register sets whether to convert CbCr / UV to offset binary.

For details, refer to **Section 36.1.3.2, Data Extraction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UVCHG
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	UVCHG	All 0	R/W	Offset binary conversion selection for CbCr / UV data 0: No conversion 1: Conversion

36.3.17 RPF Source Image Data Swap Registers (ISU_RPF_SRC_DSWAP)

This register sets the data swap of the input image.

For details, refer to **Section 36.1.3.1, Data Swap (Endian Correction)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

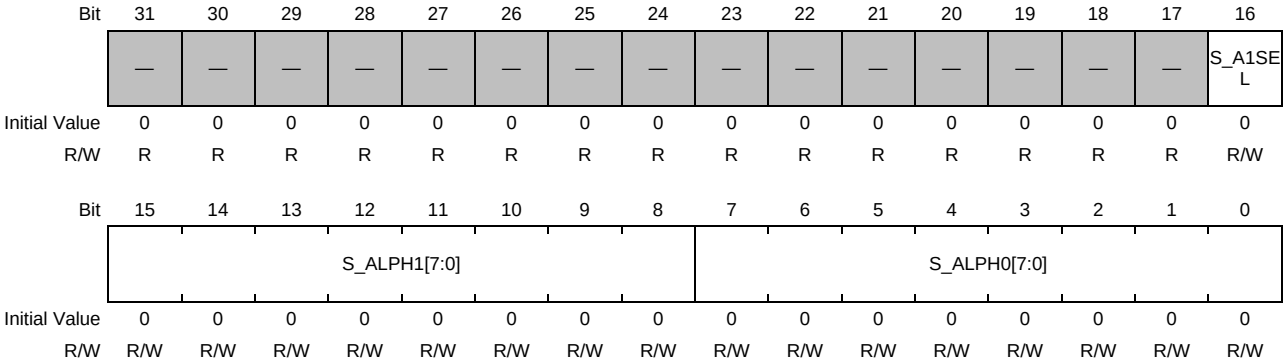
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	RD_SWAP[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	RD_SWAP [2:0]	All 0	R/W	Data swap for input images

36.3.18 RPF Source ALPHA Data Selection Registers (ISU_RPF_ALPH_SEL)

This register sets the extension method from A (Alpha) 1-bit to 8-bit at the time of ARGB1555 input.

For details, refer to **Section 36.1.5.3, Formatter**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	S_A1SEL	All 0	R/W	Setting of how to extend A(Alpha) from 1-bit to 8-bit 0: Copy input Alpha value 1-bit to all 8-bit 1: Select the register value according to the input Alpha value 1 bit S_ALPH0 when Alpha = 0 S_ALPH1 when Alpha = 1
15 to 8	S_ALPH1 [7:0]	All 0	R/W	Extended Alpha value when S_A1SEL = 1 and input Alpha value is 1.
7 to 0	S_ALPH0 [7:0]	All 0	R/W	Extended Alpha value when S_A1SEL = 1 and input Alpha value is 0.

36.3.19 RPF Source TEST Data Registers 1 (ISU_RPF_SRC_TD1)

This register controls the test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMODE_EN	—	—	—	—	—	—	—	—	—	—	—	GRADA_A	GRADA_R	GRADA_G	GRADA_B
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

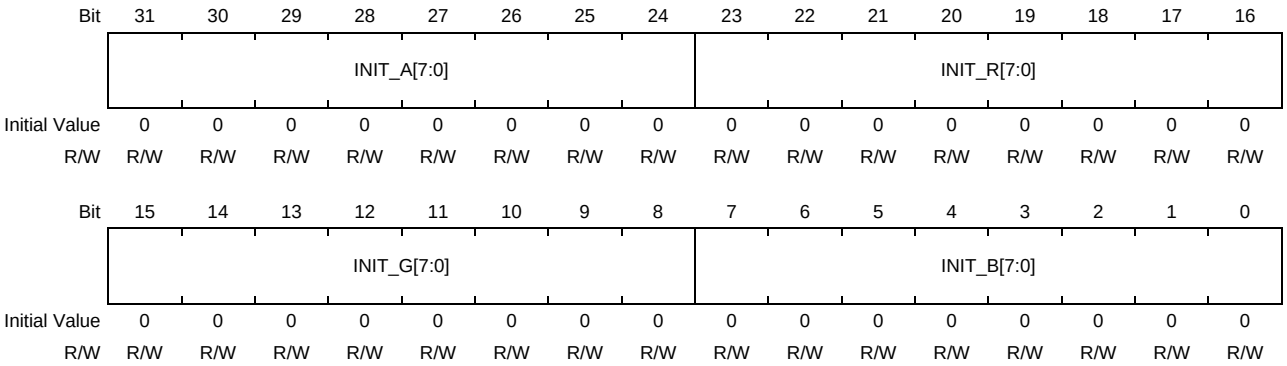
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GRAD_TYPE	GRADA_STEP[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TMODE_EN	All 0	R/W	Control of test pattern generation 0: Normal operation 1: Test pattern generation After one frame of the test pattern is generated, it is automatically cleared to 0. *Note 1.* Setting in descriptor mode is prohibited.
30 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19	GRADA_A	All 0	R/W	A color when generating a test pattern 0: 0 fixed 1: Gradation
18	GRADA_R	All 0	R/W	R color when generating a test pattern 0: 0 fixed 1: Gradation
17	GRADA_G	All 0	R/W	G color when generating a test pattern 0: 0 fixed 1: Gradation
16	GRADA_B	All 0	R/W	B color when generating a test pattern 0: 0 fixed 1: Gradation
15 to 5	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
4	GRADA_TYPE	All 0	R/W	Gradient type 0: Gradation from 0 to 255 1: Gradation from 255 to 0
3 to 0	GRADA_STEP[3:0]	All 0	R/W	Gradient step *Note 1.* If the setting is 0, the initial value (ISU_RPF_SRC_TD2.INIT_*) is entered.

36.3.20 RPF Source TEST Data Registers 2 (ISU_RPF_SRC_TD2)

This register sets the initial value of each color of ARGB for test pattern generation.

For details, refer to **Section 36.1.3.4, Test Pattern Generation**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	INIT_A[7:0]	All 0	R/W	Initial value of A color
23 to 16	INIT_R[7:0]	All 0	R/W	Initial value of R color
15 to 8	INIT_G[7:0]	All 0	R/W	Initial value of G color
7 to 0	INIT_B[7:0]	All 0	R/W	Initial value of B color

36.3.21 RS Scaling Factor Registers 0 (ISU_RS_HSCALE)

This register sets the reduction factor of the input image in the horizontal direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	HMANT[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	HMANT[3:0]	All 0	R/W	Horizontal reduction factor (integer part) 0: Setting prohibited
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	HFRAC[11:0]	All 0	R/W	Horizontal multiplication factor (decimal part)

36.3.22 RS Scaling Factor Registers 1 (ISU_RS_VSCALE)

This register sets the reduction factor of the input image in the vertical direction.

For details, refer to **Section 36.1.4.3, Scaling Calculation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	VMANT[3:0]	All 0	R/W	Vertical reduction factor (integer part) 0: Setting prohibited
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VFRAC[11:0]	All 0	R/W	Vertical reduction factor (decimal part)

36.3.23 RS Output Image Start Position Registers (ISU_RS_STPOS)

This register sets the resize start position.

For details, refer to **Section 36.1.4.1, Resize Start Position**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	HSTART[10:0]

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

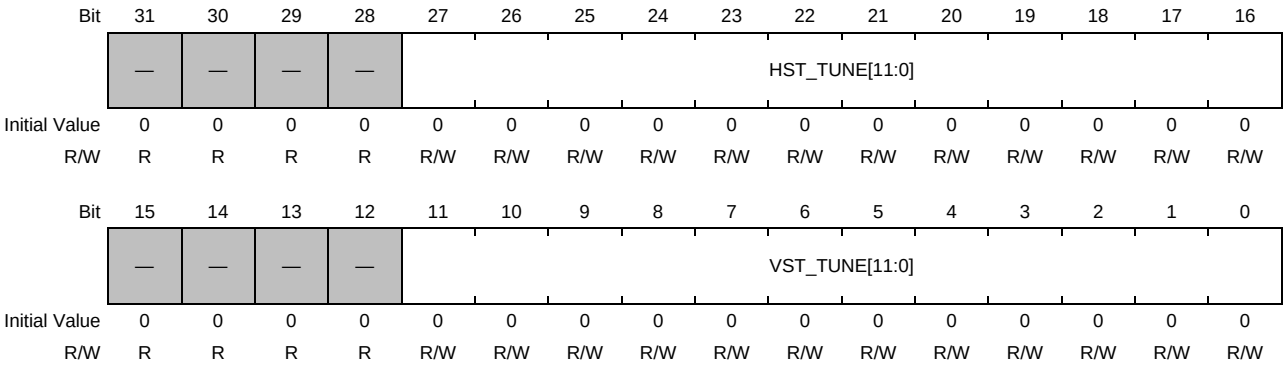
Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 16	HSTART [10:0]	All 0	R/W	Resize start horizontal position Set the resizing start horizontal position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input horizontal pixels (ISU_RPF_SRC_SIZE.S_HSIZE).
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 0	VSTART [10:0]	All 0	R/W	Resize start vertical position Set the resizing start vertical position by the number of pixels with the upper left of the input image as the origin. Set it with less than the number of input vertical pixels (ISU_RPF_SRC_SIZE.S_VSIZE).

36.3.24 RS Output Image Start Position Tuning Registers (ISU_RS_POS_TUNE)

This register sets the offset for fine adjustment of the reduction start position.

For details, refer to **Section 36.1.4.2, Sub Pixel Offset**.

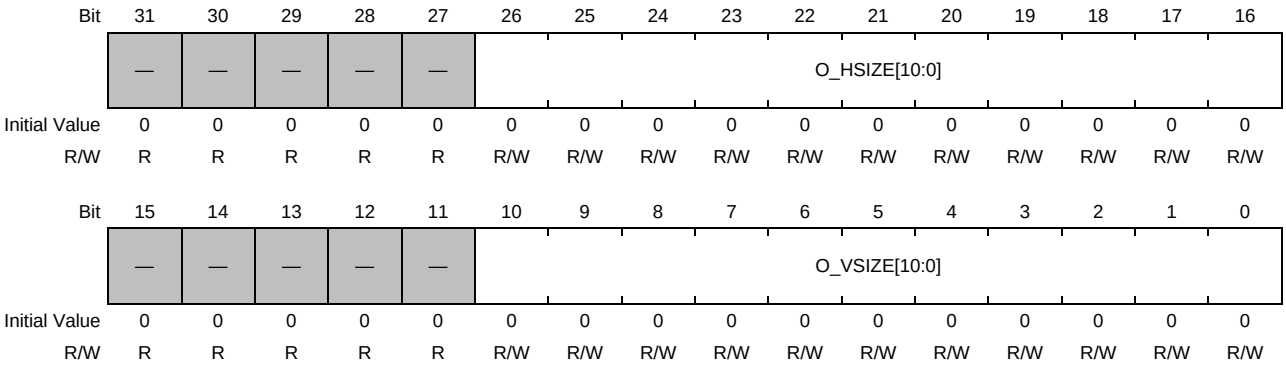


Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
27 to 16	HST_TUNE [11:0]	All 0	R/W	Offset from the resize-starting horizontal position (ISU_RS_STPOS.HSTART) Set the offset to be added to the horizontal position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).
15 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	VST_TUNE [11:0]	All 0	R/W	Offset from the resize-starting vertical position (ISU_RS_STPOS.VSTART) Set the offset to be added to the vertical position at the start of resizing in 4,096 steps (0 to less than 1 pixel of the input image).

36.3.25 RS Output Size Crop Registers (ISU_RS_OS_CROP)

This register sets the crop size of the reduced image.

For details, refer to **Section 36.1.4, Resizer (RS)**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
26 to 16	O_HSIZE [10:0]	All 0	R/W	Horizontal crop size Set the horizontal crop size in pixels. Set it in the range of 1 to 1920. 0: Setting prohibited 1921 to: Setting prohibited *Note 1.* For YCbCr type, set it to an even number.
15 to 11	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
10 to 0	O_VSIZE [10:0]	All 0	R/W	Vertical crop size Set the vertical crop size in pixels. Set it in the range of 1 to 1080. 0: Setting prohibited 1081 to: Setting prohibited *Note 1.* For YCbCr420, set it to an even number.

36.3.26 RS CROP Padding Mode Registers (ISU_RS_PADDMODE)

This register sets the padding method when the reduced image is smaller than the set crop size.

For details, refer to **Section 36.1.4, Resizer (RS)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

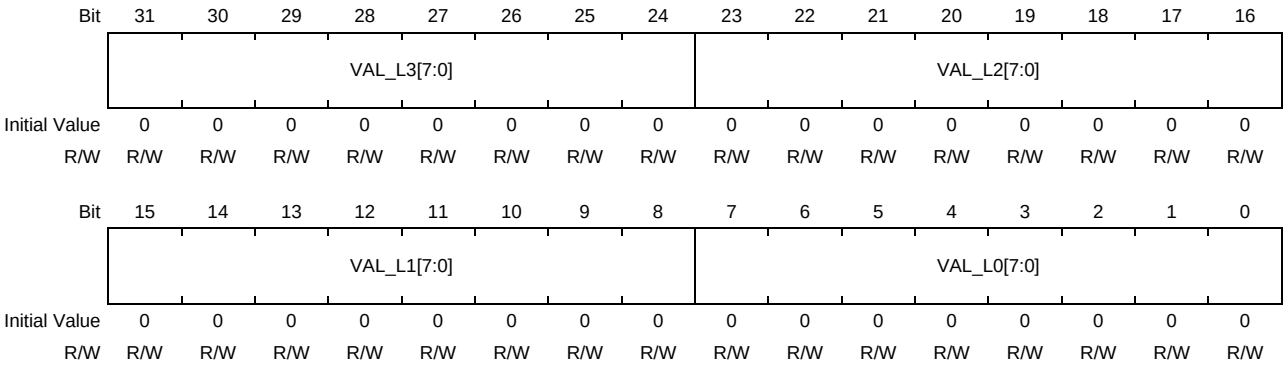
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PADDSEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	PADDSEL	All 0	R/W	Selecting a padding method Set the padding method when the reduced image is smaller than the set crop size. 0: Fill in the padding area by copying the edge pixels after the reduction. 1: Fill in the padding area with the color specified by the register (ISU_RS_PADDVAL.VAL_*).

36.3.27 RS CROP Padding Value Registers (ISU_RS_PADDVAL)

This register sets the color that fills the edges with padding.

For details, refer to **Section 36.1.4, Resizer (RS)**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	VAL_L3[7:0]	All 0	R/W	The value to fill Layer 3 if the reduced image is smaller than the set crop size.
23 to 16	VAL_L2[7:0]	All 0	R/W	The value to fill Layer 2 if the reduced image is smaller than the set crop size.
15 to 8	VAL_L1[7:0]	All 0	R/W	The value to fill Layer 1 if the reduced image is smaller than the set crop size.
7 to 0	VAL_L0[7:0]	All 0	R/W	The value to fill Layer 0 if the reduced image is smaller than the set crop size.

36.3.28 WPF Destination Plane0 Address Registers 0 (ISU_WPF_DST_ADDH_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DADD_PL0 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DADD_PL0 [33:32]	All 0	R/W	Set the write start address [33:32] for “Plane0 (Y/RGB/RAW)”.

36.3.29 WPF Destination Plane0 Address Registers 1 (ISU_WPF_DST_ADDL_PL0)

This register sets the start address [33:32] of the output image of “Plane0”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL0[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL0 [31:0]	All 0	R/W	Set the write start address [31:0] for “Plane0 (Y/RGB/RAW)”. *Note 1.* Set an address that is a multiple of 512-byte.

36.3.30 WPF Destination Plane1 Address Registers 0 (ISU_WPF_DST_ADDH_PL1)

This register sets the start address [33:32] of the output image of “Plane1”.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DADD_PL1 [33:32]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1 to 0	DADD_PL1 [33:32]	All 0	R/W	Set the write start address [33:32] for “Plane1 (C(Cb/Cr))”.

36.3.31 WPF Destination Plane1 Address Registers 1 (ISU_WPF_DST_ADDL_PL1)

This register sets the start address [31:0] of the output image of “Plane1”.

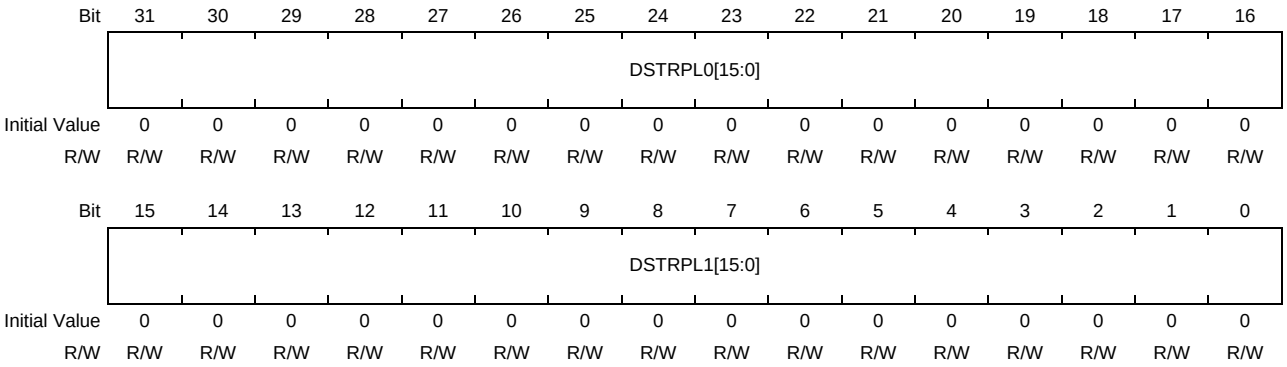
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DADD_PL1[31:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DADD_PL1 [31:0]	All 0	R/W	Set the write start address [31:0] for “Plane1 (C(Cb/Cr))”. *Note 1.* Set an address that is a multiple of 512-byte.

36.3.32 WPF Destination Stride Registers (ISU_WPF_DST_STRD)

This register sets the stride of the output image.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DSTRPL0 [15:0]	All 0	R/W	Set the “Plane0 (Y/RGB/RAW)” stride Set the “Plane0 (Y/RGB/RAW)” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).
15 to 0	DSTRPL1 [15:0]	All 0	R/W	Set the “Plane1 (C(Cb/Cr))” stride Set the “Plane1 (C(Cb/Cr))” stride in bytes. *Note 1.* Set it as a multiple of 32 bytes and at least the number of horizontal crop size (ISU_RS_OS_CROP.O_HSIZE).

36.3.33 WPF Destination Image Format Registers (ISU_WPF_FMT)

This register sets the color format of the output image.

For details, refer to **Section 36.1.3.2, Data Extraction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	WDFMT[5:0]					
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
5 to 0	WDFMT[5:0]	All 0	R/W	Color format of output image The following formats can be configured. H'00: ARGB1555 H'01: RGB565 H'02: BGR666 H'03: RGB888 H'04: BGR888 H'05: ARGB8888 H'06: RGBA8888 H'07: ABGR8888 H'20: YCbCr422 8-bit UYVY H'21: YCbCr422 8-bit YUY2 H'22: YCbCr422 8-bit NV16 H'23: YCbCr420 8-bit NV12 H'30: RAW8 H'31: RAW10 H'32: RAW12 Others: Setting prohibited

36.3.34 WPF Color Collection Control Registers (ISU_WPF_CCOL)

This register sets the color conversion correction control.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMAT_SEL	CMAT_ASEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	CMAT_SEL	0	R/W	Color conversion correction control 0: No conversion 1: Conversion
0	CMAT_ASEL	0	R/W	A (Alpha) color conversion correction control 0: No conversion 1: Conversion

36.3.35 WPF Color Collection MUL Coefficient Registers1 (ISU_WPF_MUL1)

This register sets the matrix value K11 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	K11[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K11[13:0]	All 0	R/W	Color Collection Coefficient K11 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.36 WPF Color Collection MUL Coefficient Registers2 (ISU_WPF_MUL2)

This register sets the matrix value K12 and K13 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	K12[13:0]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	K12[13:0]	All 0	R/W	Color Collection Coefficient K12 Signed fixed point: 4-bit integer part, 10-bit decimal part
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K13[13:0]	All 0	R/W	Color Collection Coefficient K13 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.37 WPF Color Collection MUL Coefficient Registers3 (ISU_WPF_MUL3)

This register sets the matrix value K21 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

13 to 0	K31[13:0]	All 0	R/W	Color Collection Coefficient K31 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.40 WPF Color Collection MUL Coefficient Registers6 (ISU_WPF_MUL6)

This register sets the matrix value K32 and K33 for the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

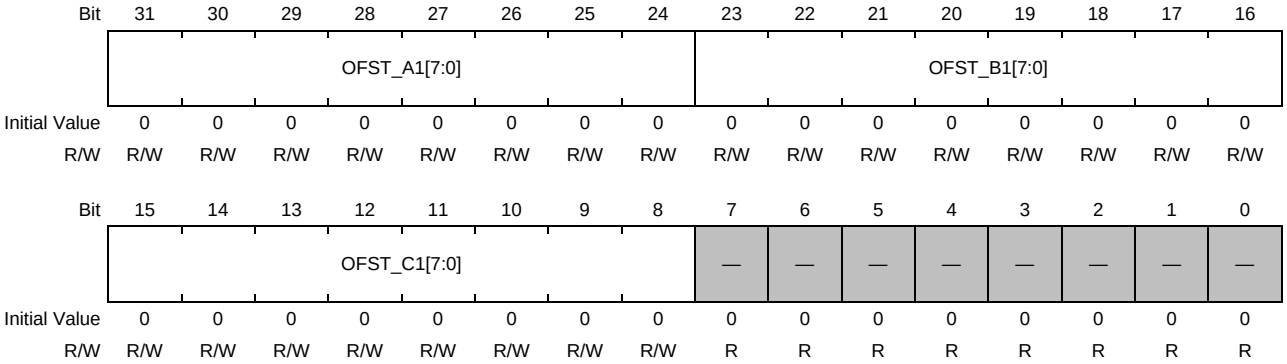
31 to 30	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
29 to 16	K32[13:0]	All 0	R/W	Color Collection Coefficient K32 Signed fixed point: 4-bit integer part, 10-bit decimal part
15 to 14	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
13 to 0	K33[13:0]	All 0	R/W	Color Collection Coefficient K33 Signed fixed point: 4-bit integer part, 10-bit decimal part

36.3.41 WPF Color Collection Offset Coefficient Registers1 (ISU_WPF_OFST1)

This register sets the offset 1 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

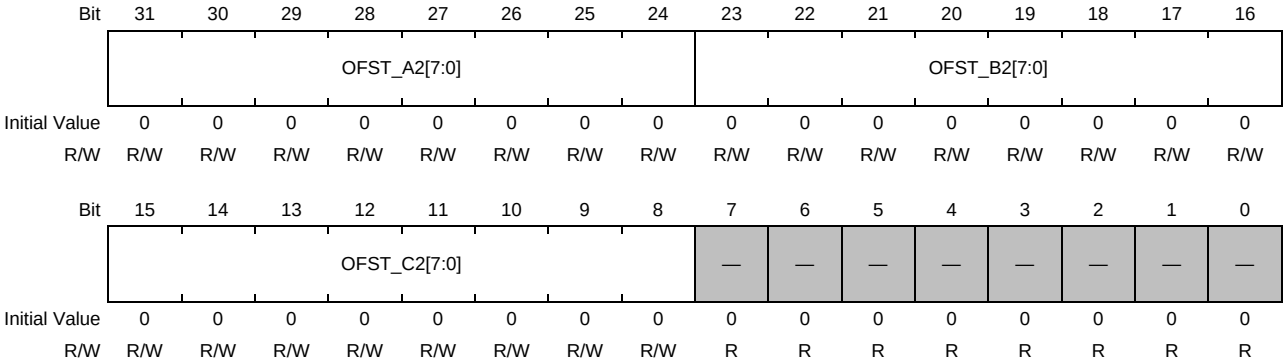


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OFST_A1 [7:0]	All 0	R/W	Color Collection Offset value A1 Unsigned integer 8-bit
23 to 16	OFST_B1 [7:0]	All 0	R/W	Color Collection Offset value B1 Unsigned integer 8-bit
15 to 8	OFST_C1 [7:0]	All 0	R/W	Color Collection Offset value C1 Unsigned integer 8-bit
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

36.3.42 WPF Color Collection Offset Coefficient Registers2 (ISU_WPF_OFST2)

This register sets the offset 2 of the color conversion correction.

For details, refer to **Section 36.1.5.1, Color Correction**.

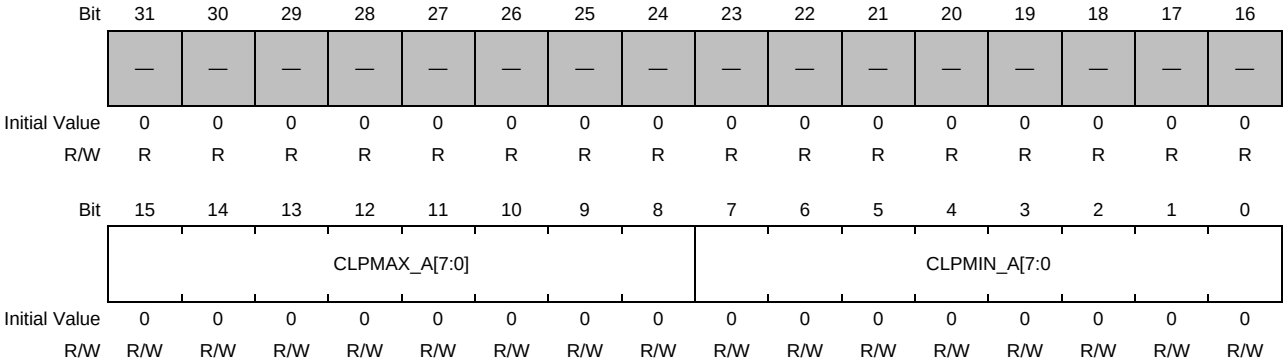


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	OFST_A2 [7:0]	All 0	R/W	Color Collection Offset value A2 Unsigned integer 8-bit
23 to 16	OFST_B2 [7:0]	All 0	R/W	Color Collection Offset value B2 Unsigned integer 8-bit
15 to 8	OFST_C2 [7:0]	All 0	R/W	Color Collection Offset value C2 Unsigned integer 8-bit
7 to 0	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.

36.3.43 WPF Color Collection Clip Registers1 (ISU_WPF_CLP1)

This register sets the maximum and minimum value of the color conversion correction for Layer 1.

For details, refer to **Section 36.1.5.1, Color Correction**.

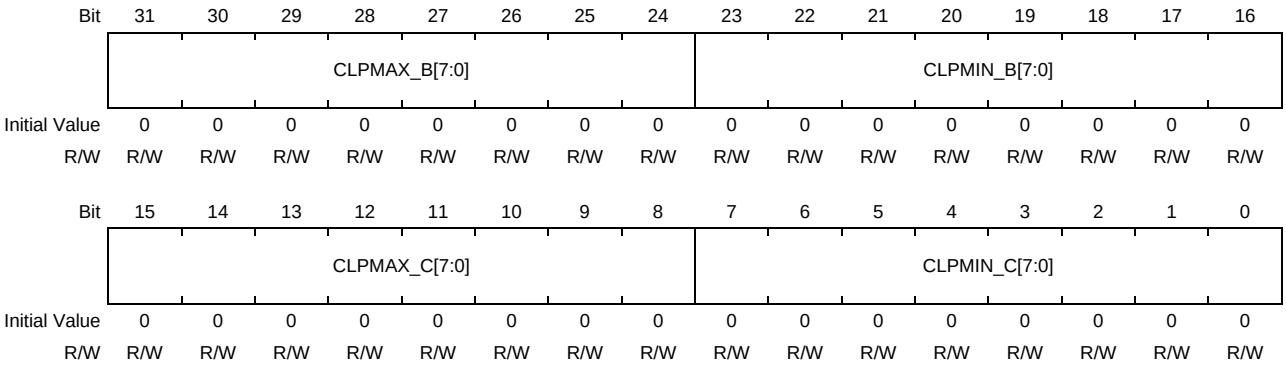


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
15 to 8	CLPMAX_A [7:0]	All 0	R/W	Color collection maximum clip level value A Set the value to CLPMAX_A ≥ CLPMIN_A
7 to 0	CLPMIN_A [7:0]	All 0	R/W	Color collection minimum clip level value A Set the value to CLPMAX_A ≥ CLPMIN_A

36.3.44 WPF Color Collection Clip Registers2 (ISU_WPF_CLP2)

This register sets the maximum and minimum value of the color conversion correction for Layer 2 and Layer 3.

For details, refer to **Section 36.1.5.1, Color Correction**.

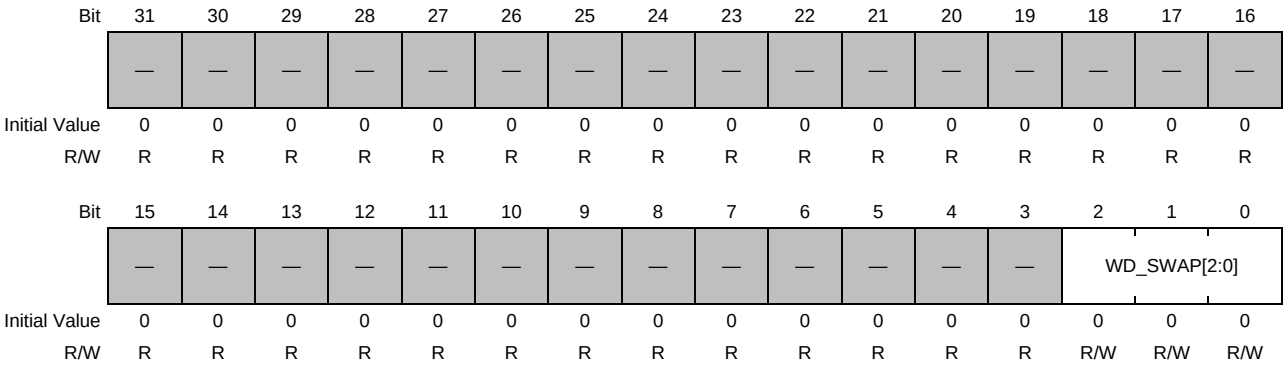


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	CLPMAX_B [7:0]	All 0	R/W	Color collection maximum clip level value B Set the value to CLPMAX_B ≥ CLPMIN_B
23 to 16	CLPMIN_B [7:0]	All 0	R/W	Color collection minimum clip level value B Set the value to CLPMAX_B ≥ CLPMIN_B
15 to 8	CLPMAX_C [7:0]	All 0	R/W	Color collection maximum clip level value C Set the value to CLPMAX_C ≥ CLPMIN_C
7 to 0	CLPMIN_C [7:0]	All 0	R/W	Color collection minimum clip level value C Set the value to CLPMAX_C ≥ CLPMIN_C

36.3.45 WPF Destination Image Data Swap Registers (ISU_WPF_DST_DSWAP)

This register sets the data swap of the output image data.

For details, refer to **Section 36.1.5.4, Data Swap (Endian Correction)**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
2 to 0	WD_SWAP [2:0]	All 0	R/W	Data swap for output images

36.3.46 WPF Destination ALPHA Selection Registers1 (ISU_WPF_ALPH_SEL1)

This register sets the method of compressing the A (Alpha) value at the ARGB1555 output from 8-bit to 1-bit.

For details, refer to **Section36.1.5.2, Normalization**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	D_A1SEL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

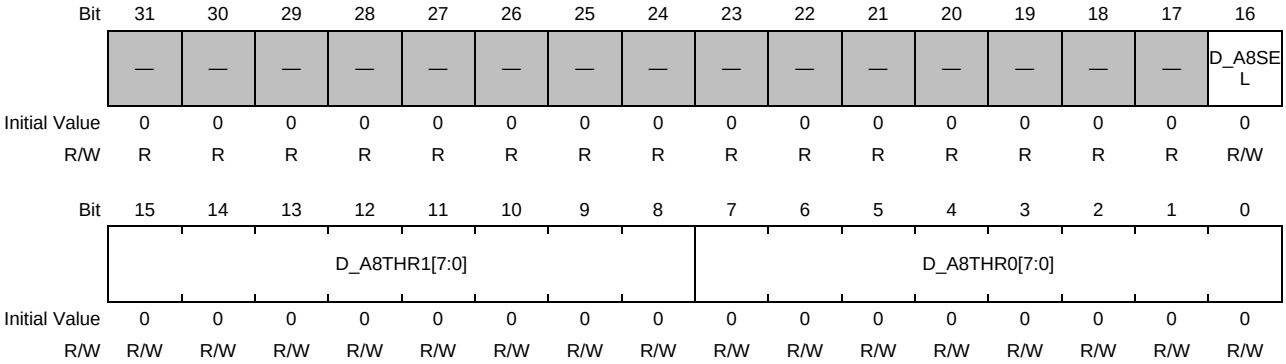
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	D_A1THR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	D_A1SEL	All 0	R/W	Setting of how to compress A (Alpha) from 8-bit to 1-bit 0: Outputs the MSB of alpha value 1: Selects the output according to the alpha value and threshold level Outputs 0b when Alpha ≤ D_A1THR Outputs 1b when Alpha > D_A1THR
15 to 8	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
7 to 0	D_A1THR[7:0]	All 0	R/W	Threshold level value Value used to determine when D_A1SEL = 1.

36.3.47 WPF Destination ALPHA Selection Registers2 (ISU_WPF_ALPH_SEL2)

This register sets the 8-bit A (Alpha) value at the time of ARGB8888 output.

For details, refer to **Section36.1.5.2, Normalization**.

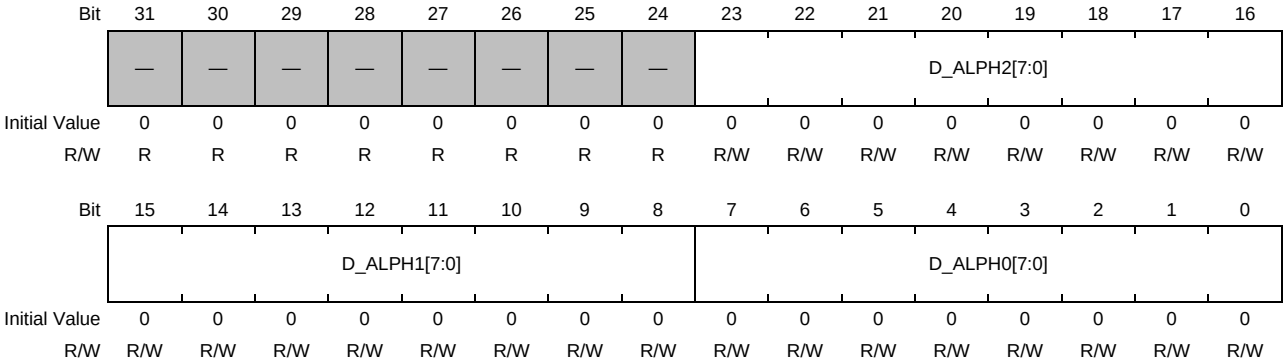


Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
16	D_A8SEL	All 0	R/W	A (Alpha) 8-bit output selection 0 Output Alpha value as it is 1: Outputs the register value according to the alpha value and the threshold level (D_A8THR0 and D_A8THR1) Outputs D_ALPH2 when D_A8THR1≤ Alpha Outputs D_ALPH1 when D_A8THR0 < Alpha < D_A8THR1 Outputs D_ALPH0 when Alpha ≤ D_A8THR0
15 to 8	D_A8THR1 [7:0]	All 0	R/W	Threshold level value 1 Value used to determine which register value is output as Alpha when D_A8SEL = 1. Set the value to D_A8THR0 < D_A8THR1.
7 to 0	D_A8THR0 [7:0]	All 0	R/W	Threshold level value 0 Value used to determine which register value is output as Alpha when D_A8SEL = 1. Set the value to D_A8THR0 < D_A8THR1.

36.3.48 WPF Destination ALPHA Value Registers (ISU_WPF_ALPH_VAL)

This register sets the A (Alpha) value to be output when ARGB8888 and D_A8SEL = 1.

For details, refer to **Section36.1.5.2, Normalization**.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
23 to 16	D_ALPH2 [7:0]	All 0	R/W	Conversion Alpha value 2 The value to be output when D_A8THR1 ≤ Alpha.
15 to 8	D_ALPH1 [7:0]	All 0	R/W	Conversion Alpha value 1 The value to be output when D_A8THR0 < Alpha < D_A8THR1.
7 to 0	D_ALPH0 [7:0]	All 0	R/W	Conversion Alpha value 0 The value to be output when Alpha ≤ D_A8THR0.

36.3.49 AXI Max Burst Length Registers (ISU_AXI_BLEN)

This register sets the upper limit to the burst length of the AXI-Master.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	ARLEN_MAX[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	AWLEN_MAX[3:0]			
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
19 to 16	ARLEN_ MAX[3:0]	All 0	R/W	Upper limit of read data burst length H'3: Up to 4-beat burst H'7: Up to 8-beat burst H'F: Up to 16-beat burst Others: Setting prohibited
15 to 4	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
3 to 0	AWLEN_ MAX[3:0]	All 0	R/W	Upper limit of write data burst length H'3: Up to 4-beat burst H'7: Up to 8-beat burst H'F: Up to 16-beat burst Others: Setting prohibited

36.4 Operation

36.4.1 Start Processing

After setting various registers, write 1 to the start instruction bit to start.

At that time, start it together with the setting of whether to execute by the descriptor method.

Table 36.11 Explanation for ISU MNG Frame Control Register Registers (ISU_FM_FRCON)

ICU_FM_FRCON		Description
Bit 16	DESON	0: Execute with Descriptor read OFF. 1: Execute with Descriptor read ON.
Bit 0	START	When the frame processing start is executed, the frame completion interrupt and descriptor capture completion interrupt are automatically cleared. [Write] 0: NOP 1: Start Frame Processing [Read] Always Zero is read.

36.4.1.1 Descriptor List Address

In the case of the descriptor method (DESON = 1 and START is set to 1), the access to acquire the descriptor list is performed first. The access destination is set in advance in the following register.

- FM Descriptor List Address Register0 (ISU_FM_DL_STADDH [2: 0])
- FM Descriptor List Address Register1 (ISU_FM_DL_STADDL [31: 0])

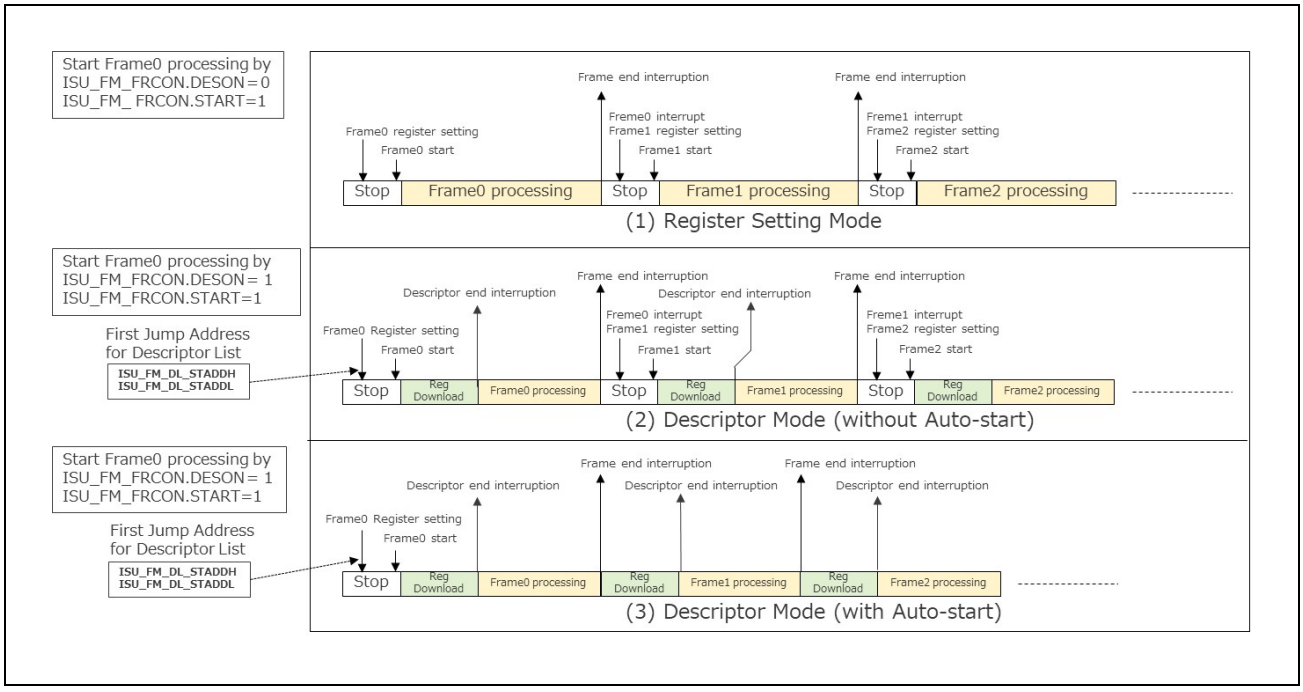


Figure 36.44 Relationship Between Register ISU_MNG_FRCON Setting and Frame Processing Mode

36.4.1.2 Frame End Interruption

- When started with ISU_FM_FRCON.DESON = 0
  - An interrupt is generated when one frame processing is completed inside the ISU.
  - Completion of 1-frame processing shall meet the following conditions.
    1) Write the reduced data from the AXI bus and receive the response of the response channel.
    2) The FIFO pointer of the input image is in the initial state (empty state), and the FIFO pointer of the output image is also in the initial state (empty state).
    3) You have not accidentally started capturing the image of the next frame.
  - When the descriptor is not used, only one interrupt is held instead of two interrupts.

- When started with ISU_FM_FRCON.DESON = 1
  - One frame processing by the descriptor is completed, and an interrupt is issued in the descriptor list. An interrupt is generated when it is enabled (see the corresponding bit in the footer).
  - In the descriptor method, it advances to the next frame without doing anything after the interrupt occurs. In this case, the interrupt remains on.
  - If an interrupt is issued in the next frame, it means that two interrupts have occurred. In this case, the interrupt is cleared by clearing the interrupt twice (clearing from the oldest one).
  - ISU retains the latest two interrupt information.

36.4.2 Stop Processing

There are two ways to stop it.

- Normal stop
  - When started with ISU_FM_FRCON.DESON = 0
    It will end automatically when the processing of one frame is completed. After completion, the read and write FIFOs on the AXI-Master side will also be empty.
  - When started with ISU_FM_FRCON.DESON = 1
    If there is no instruction to execute the next frame in the footer of the descriptor, it will automatically end after executing one frame. After completion, the read and write FIFOs on the AXI-Master side will also be empty.

- Emergency stop

Emergency stop will be stopped by register setting from APB.

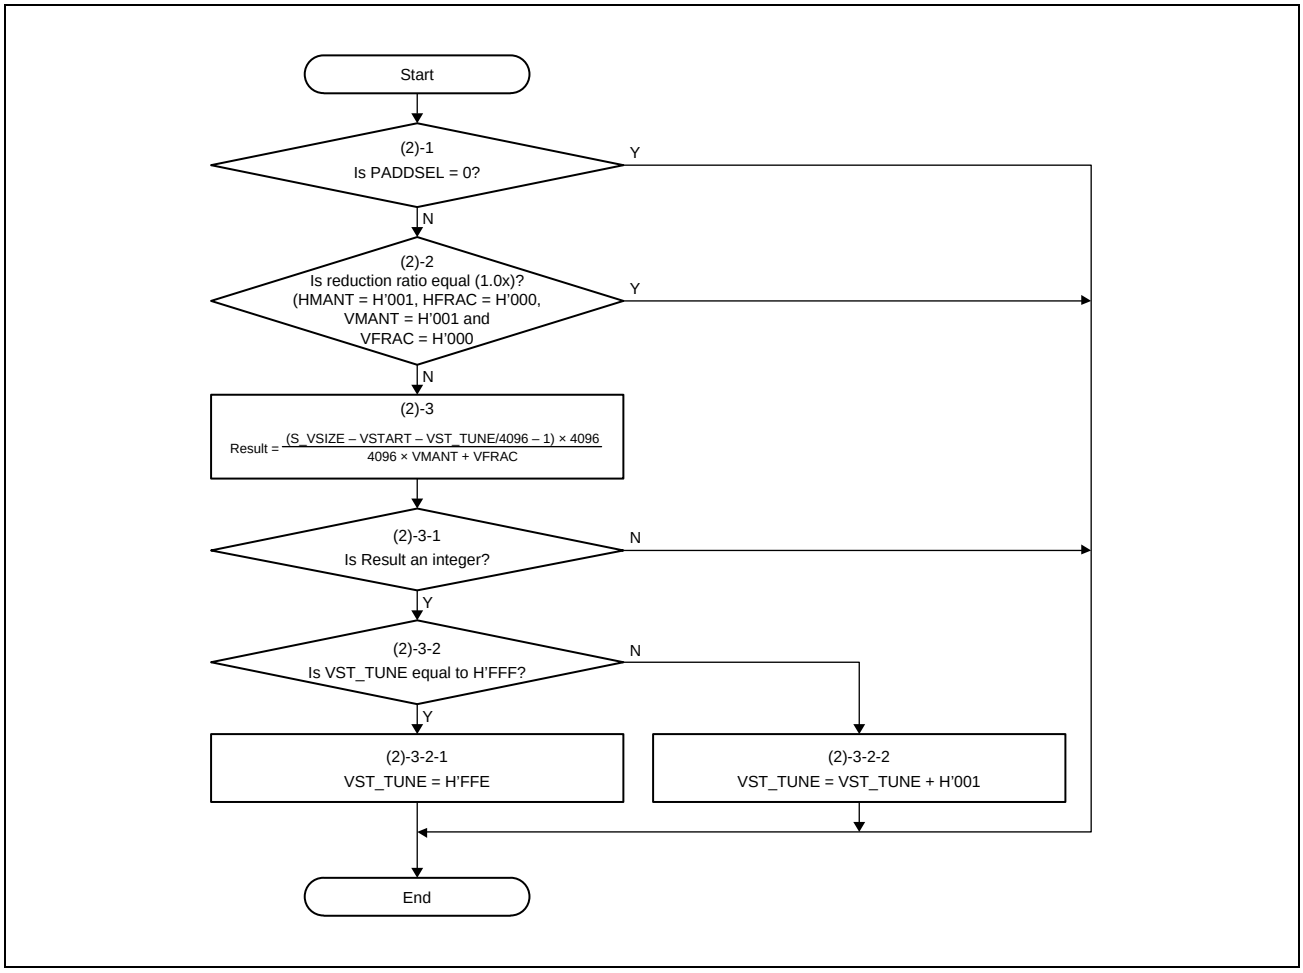
In response to the instruction from APB, the transfer to the bus in process of AXI-Master is executed until a correct response is made, and after it is completed, an interrupt signal is issued. After that, when restarting from the system side, ISU system reset is always applied from the outside and executed from initialization.

If the APB instructs the emergency stop again during the emergency stop process, only the first emergency stop instruction will be valid.

36.4.3 Setting the vertical size, start position and reduction factor

Set the input image size, start position, and reduction ratio before calculating the reduction by Resizer (RS).

Before setting the parameters, please check and adjust the following settings for the vertical direction.



(1) List of related registers

ISU_RPF_SRC_SIZE. S_VSIZE[11:0]
ISU_RS_STPOS.VSTART[10:0]
ISU_RS_POS_TUNE.VST_TUNE[11:0]
ISU_RS_VSCALE.VMANT[3:0]
ISU_RS_VSCALE.VFRAC[11:0]
ISU_RS_HSCALE.HMANT[3:0]
ISU_RS_HSCALE.HFRAC[11:0]
ISU_RS_PADDMODE.PADDSEL

(2) Confirmation and determination of setting values

(2)-1 When PADDSEL = 0
There is no need to change those register parameters.

(2)-2 When the reduction ratio is equal (1.0x)
In other words, when HMANT = H’1, HFRAC = H’000, VMANT = H’1 and VFRAC = H’000
There is no need to change those register parameters.

(2)-3 When the setting value is other than the above (other than equal)
Perform the following calculations.

$$\text{Result} = \frac{(\text{S_VSIZE} - \text{VSTART} - \text{VST_TUNE}/4096 - 1) \times 4096}{4096 \times \text{VMANT} + \text{VFRAC}}$$

(2)-3-1 If the calculation result (Result) is not an integer
There is no need to change those register parameters.

(2)-3-2 If the calculation result (Result) is an integer

(2)-3-2-1 If VST_TUNE is equal to H’FFF
VST_TUNE = H’FFE

(2)-3-2-2 If VST_TUNE is not equal to H’FFF
VST_TUNE = VST_TUNE + H’001 (Add 1 to correct the start position)

36.5 Usage Notes

This section shows examples of converting image size and color format using the image scaling unit (ISU).

36.5.1 Image Size Conversion

36.5.1.1 2800 × 2047 (ARGB8888) → 1920 × 1080 (ARGB8888) with Automatic start of the next frame

Set as follows to handle image size conversion.

Table 36.12 Image Size Conversion Example 1

Item	Description
Assuming that the following image is in the DDR	
Input size	2800 × 2047
Input format	ARGB8888
Input start address	1st frame: H'0_1000_0000 2nd frame: H'0_3000_0000
Input stride	11,200 (H'2BC0) //2800*4byte/pixel
ISU setting	
Output (CROP) size	1920 × 1080
Output format	ARGB8888
Output start address	1st frame: H'0_2000_0000 2nd frame: H'0_4000_0000
Output stride	7,680 (H'1E00) //1920*4byte/pixel
Reduction ratio	1st frame: H = 1/1.5, V = 1/1.5 2nd frame: H = 1/1.8984375, V = 1/1.8984375
Processing method	Descriptor method with automatic start of the next frame
Color format conversion	None
Descriptor address	Table 1: H'8000_0000 Table 2: H'8000_0100

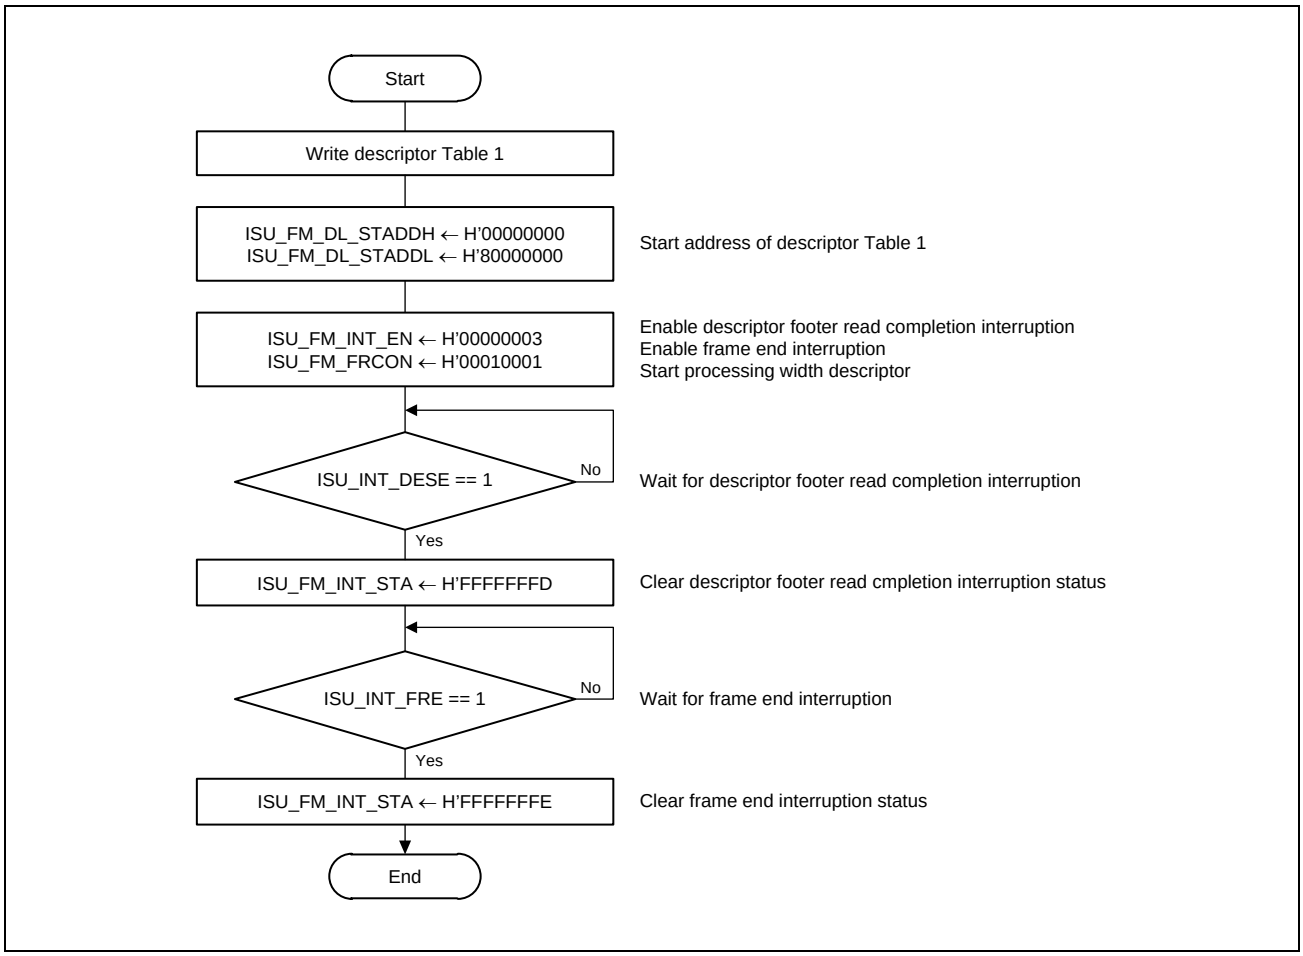

Figure 36.48 Flowchart of Image Size Conversion Example 2

36.5.1.3 5M (2800 × 2047) → FullHD (1920 × 1080)

Set as follows to handle image size conversion.

Table 36.18 Image Size Conversion Example 4

Item	Description
Assuming that the following image is input from the CRU	
Input size	2800 × 2047
Input format	ARGB8888 * (The ISU swaps data because of the BGRA format.)
Input start address	H'0_5000_0000
Input stride	Plane0 = H'2BC0
ISU setting	
Output (CROP) size	1920 × 1080
Output format	ARGB8888
Output start address	Plane0 = H'0_6000_000
Output stride	Plane0 = H'1E00
Processing method	Register
Color format conversion	None

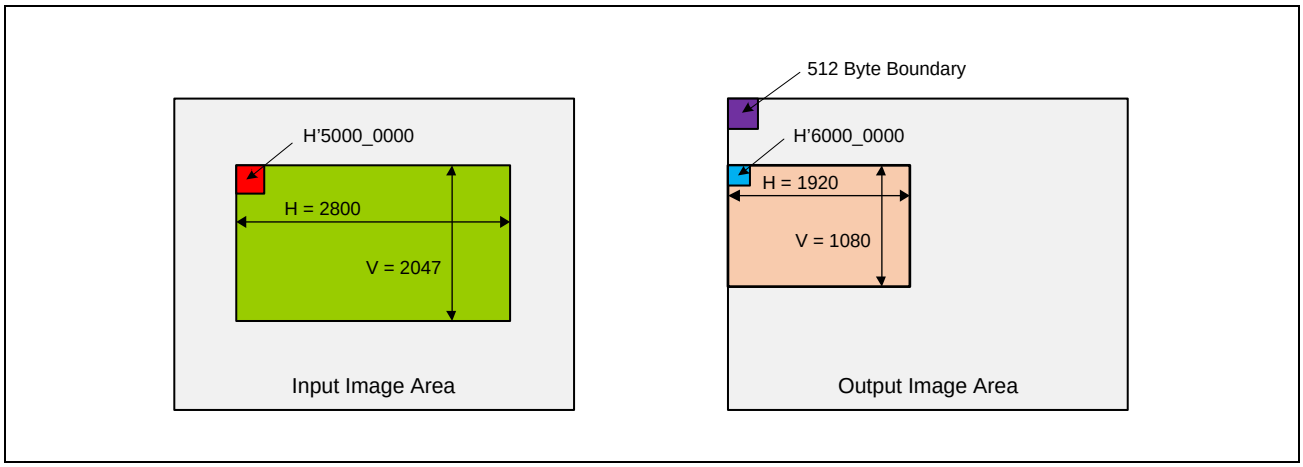

Figure 36.49 Image Size Conversion Example 4

Obtain the multiplication coefficient in the horizontal direction/

2800 / 1920 = 1.458333...
HMANT (integer part) = 1 = H'1
HFRAC (decimal part) = 0.458333 × 4096 (Q12) = 1877.3320 ... = H'755

Obtain the multiplication coefficient in the vertical direction.

2047 / 1080 = 1.895370...
VMANT (integer part) = 1 = H'1
VFRAC (decimal part) = 0.895370 × 4096 (Q12) = 3667.43552... = H'E53

Note: HFRAC and VFRAC are set by unsigned fixed point Q12 and are truncated after the decimal point.

36.5.2.2 YCbCr422 → ARGB8888

Set as follows to handle color format conversion.

Table 36.22 Color Format Conversion Example 2

Item	Description
Assuming that the following image is input from the CRU	
Input size	320 × 240
Input format	YCbCr422 8-bit UYVY (Interleave)
Input start address	H'0_5000_0000
Input stride	Plane 0 = H'280
ISU setting	
Output (CROP) size	320 × 240
Output format	ARGB8888
Output start address	Plane 0 = H'0_6000_000
Output stride	Plane 0 = H'500
Processing method	Register
Color format conversion	YCbCr → RGB (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11 & K12 & K13 \\ K21 & K22 & K23 \\ K31 & K32 & K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS_A1 \\ B - OFS_B1 \\ C - OFS_C1 \end{bmatrix} + \begin{bmatrix} OFST_A2 \\ OFST_B2 \\ OFST_C2 \end{bmatrix}$$

$$C1'' = MAX\ (clip_a_min, Min\ (clip_a_max, C1'))$$
$$C2'' = MAX\ (clip_b_min, Min\ (clip_b_max, C2'))$$
$$C3'' = MAX\ (clip_c_min, Min\ (clip_c_max, C3'))$$

Figure 36.52 Matrix Operation Formula for Conversion and Color Correction

The following shows the YCbCr422-to-RGB conversion formula (BT.601 SDTV).

R = 1.164 (Y − 16) + 1.596 (Cr − 128)
G = 1.164 (Y − 16) − 0.391 (Cb − 128) − 0.813 (Cr − 128)
B = 1.164 (Y − 16) + 2.018 (Cb − 128)
* R/G/B: 0 to 255

Perform YCbCr-to-RGB conversion with the following allocation.

R = K11 (Y − OFST_A1) + K12 (Cb – OFST_B1) + K13 (Cr − OFST_C1) + OFST_A2
G = K31 (Y − OFST_A1) + K22 (Cb – OFST_B1) + K23 (Cr − OFST_C1) + OFST_B2
B = K31 (Y − OFST_A1) + K32 (Cb – OFST_B1) + K33 (Cr − OFST_C1) + OFST_C2

Note: K** is set by signed fixed point Q10.
Example: K11 = 1.164 × 1024 = 1191.936 = H'4A8
Rounded to the nearest whole number.

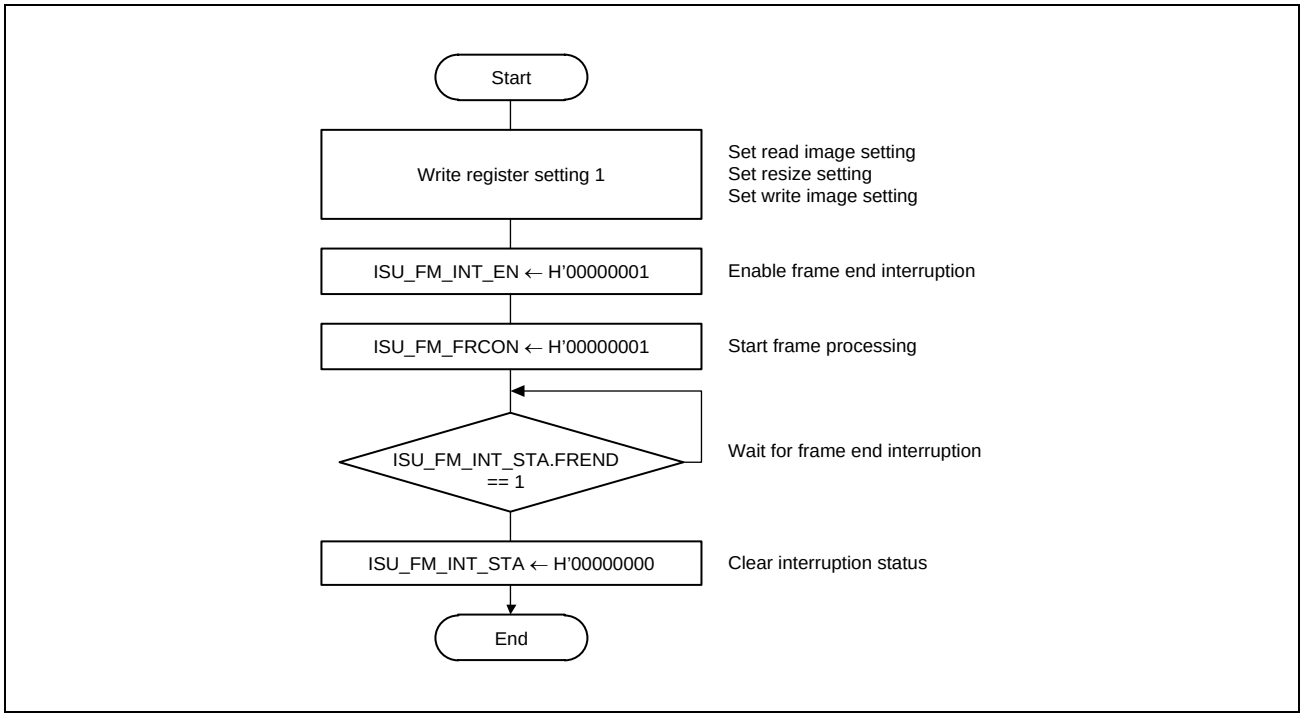

Figure 36.53 Flowchart of Color Format Conversion 2

36.5.2.3 RGB888 → YCbCr422

Set as follows to handle color format conversion.

Table 36.24 Color Format Conversion Example 3

Item	Description
Assuming that the following image is input from the CRU	
Input size	320 × 240
Input format	BGR888
Input start address	H'0_5000_0000
Input stride	Plane 0 = H'0500
ISU setting	
Output (CROP) size	320 × 240
Output format	YCbCr422 8-bit UYVY (Interleave)
Output start address	Plane 0 = H'0_6000_000
Output stride	Plane 0 = H'0280
Processing method	Register
Reduction setting	No reduction
Color format conversion	RGB → YCbCr (BT.601 SDTV)

The following shows the matrix operation formula for conversion and color correction.

$$\begin{bmatrix} C1' \\ C2' \\ C3' \end{bmatrix} = \begin{bmatrix} K11\ K12\ K13 \\ K21\ K22\ K23 \\ K31\ K32\ K33 \end{bmatrix} \cdot \begin{bmatrix} A - OFS_A1 \\ B - OFS_B1 \\ C - OFS_C1 \end{bmatrix} + \begin{bmatrix} OFST_A2 \\ OFST_B2 \\ OFST_C2 \end{bmatrix}$$

$$C1'' = MAX\ (clip_a_min, Min\ (clip_a_max, C1'))$$
$$C2'' = MAX\ (clip_b_min, Min\ (clip_b_max, C2'))$$
$$C3'' = MAX\ (clip_c_min, Min\ (clip_c_max, C3'))$$

Figure 36.54 Matrix Operation Formula for Conversion and Color Correction

The following shows the RGB-to-YCbCr422 conversion formula (BT.601 SDTV).

$Y = 0.257R + 0.504G + 0.098B + 16$
$Cb = -0.148R - 0.291G + 0.439B + 128$
$Cr = 0.439R - 0.368G - 0.071B + 128$
* Brightness: 16 to 235
* Color difference: 16 to 240

Perform RGB-to-YCbCr conversion with the following allocation.

$Y = K11\ (R - OFST_A1) + K12\ (G - OFST_B1) + K13\ (B - OFST_C1) + OFST_A2$
$Cb = K21\ (R - OFST_A1) + K22\ (G - OFST_B1) + K23\ (B - OFST_C1) + OFST_B2$
$Cr = K31\ (R - OFST_A1) + K32\ (G - OFST_B1) + K33\ (B - OFST_C1) + OFST_C2$

Note: K** is set by signed fixed point Q10.
Example: K11 = 0.257 × 1024 = 263.168 = H'107
Rounded to the nearest whole number.

40. SD/MMC Host Interface

NOTE

Development of the SD host--related products needs the conclusion of the following agreement. SD Host/Ancillary Product License Agreement (SD HALA)

40.1 Overview

40.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD, SDHC, and SDXC SD memory card access supported
- Default, high-speed, UHS-I/SDR50, and SDR104 transfer modes supported
- SD clock (SD_CLK) frequency = SDxϕ/4 frequency/2^n (n = 0 to 9) (x = 0, 1)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Interrupt request: 2
- Card detect function
- Write protect supported
- MMC interface (1-/4-/8-bit MMC bus)

NOTE

Channel 1 only supports a 1- or 4-bit MMC bus.

- e-MMC device access supported
- Backward-compatible, high-speed, HS200 transfer modes supported
- High-priority interrupt (HPI) supported

Block Diagram

Figure 40.1 shows a block diagram of the SD/MMC host interfaces.

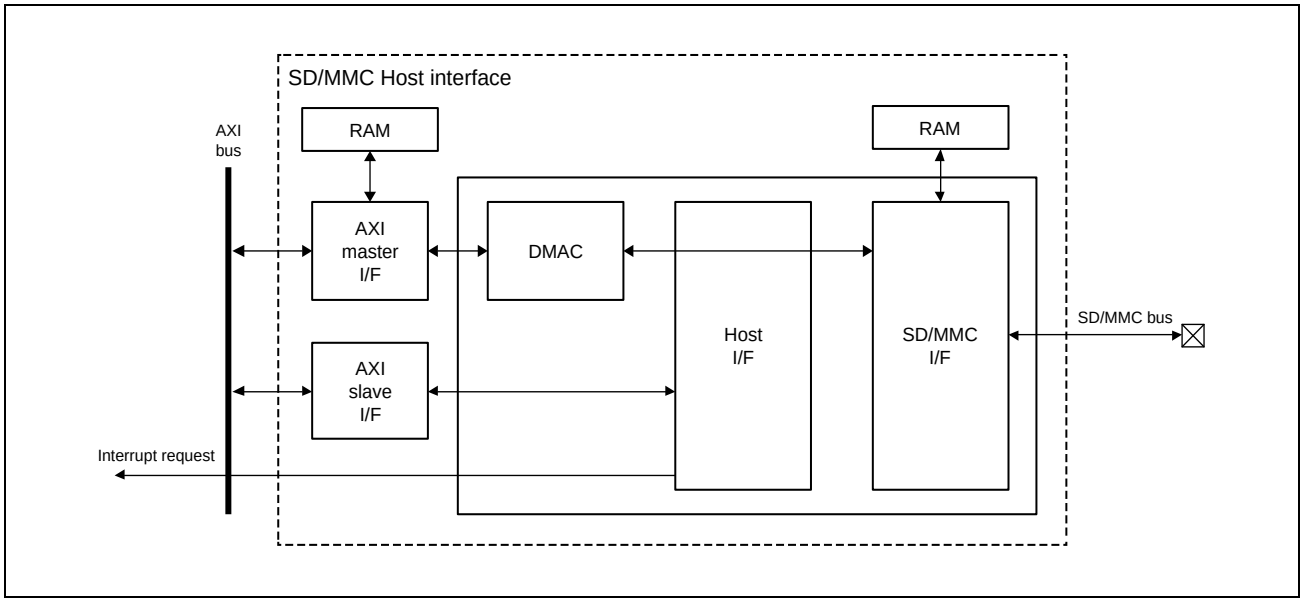

Figure 40.1 Block Diagram of SD/MMC Host Interface

40.1.2 External Pins

Table 40.1 lists the input and output pins used by the interface. The operating voltage on the pins of the SD/MMC host interface is 3.3 V or 1.8 V. Channels 0 and 1 can operate with different voltages. Before using the pins of the SD/MMC host interface, be sure to set the SD ch0/1 IO Voltage Mode Control Register (SD_ch0 and SD_ch1) and Driving Ability Control Register (IOLH).

For details, see the following sections:

Section 41.3.7, Driving Ability Control Register,
Section 41.3.17, SD ch0 IO Voltage Mode Control Register,
Section 41.3.18, SD ch1 IO Voltage Mode Control Register.

Table 40.1 Pin Configuration

PIN Name	I/O	Function
SDx_CLK*1	O	SD/MMC clock output
SDx_CMD*1	I/O	SD/MMC command output, response input
SDx_DATA0*1	I/O	SD/MMC Data 0 [bit 0]
SDx_DATA1*1	I/O	SD/MMC Data 1 [bit 1], SDIO interrupt
SDx_DATA2*1	I/O	SD/MMC Data 2 [bit 2], read wait
SDx_DATA3*1	I/O	SD/MMC Data 3 [bit 3], Card detection
SD0_DATA4*1	I/O	SD/MMC Data 4 [bit 4],
SD0_DATA5*1	I/O	SD/MMC Data 5 [bit 5]
SD0_DATA6*1	I/O	SD/MMC Data 5 [bit 6]
SD0_DATA7*1	I/O	SD/MMC Data 7 [bit 7]
SDx_CD*1	I	SD/MMC card detection*2
SDx_WP*1	I	SD/MMC write protection*2
SD0_RST#	O	SD/MMC reset

Note 1. x (= 0, 1) is the channel number of the SD/MMC host interface. In this manual, those pins are referred as SDDAT0, SDDAT1, …, SDDAT7.

Note 2. Fix to 1 when not in use.

40.1.3 Register Configuration

The base addresses for each channel are as follows. The SD interface and MMC interface are switched by setting the command type register (SD_CMD).

Channel 0:
H'0_11C0_0000 (Cortex-A55 Address Space)

Channel 1:
H'0_11C1_0000 (Cortex-A55 Address Space)

Table 40.2 Register Configurations (1/2)

Name	Abbreviation	Address	Access Width	Mirror

DM_CM_INFO1 interrupt mask register	DM_CM_INFO1_MASK	H'0848	16/32/64	
DMAC interrupt register 2	DM_CM_INFO2	H'0850	16/32/64	
DM_CM_INFO2 interrupt mask register	DM_CM_INFO2_MASK	H'0858	16/32/64	
DMAC address register	DM_DTRAN_ADDR	H'0880	16/32/64	
SCC register area*2	—	—	—	—

Note 1. Only for channel 0.

Note 2. Refer to **Section 40.7, SCC Register Descriptions**.

40.2 Register Description

40.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) is used to select the command type and response type. The command sequence is started by writing to SD_CMD.

For details on the SD_CMD setting, refer to **Section 40.4.14, Example of SD_CMD Register Setting**.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MD7	00	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
14	MD6			
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multi block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD/MMC host interfaces -> SD card) 1: Read (SD/MMC host interfaces <- SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	000	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/R1, R5, R6, or R7 response from the SD card 101: Extended mode/R1b response from the SD card 110: Extended mode/R2 response from the SD card 111: Extended mode/R3 or R4 response from the SD card Some commands cannot be used in normal mode. For details, see **Section 40.4.14, Example of SD_CMD Register Setting** to select mode/response type.
9	MD1			
8	MD0			
7	C1	00	R/W	00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited
6	C0			
5	CF45	000000	R/W	Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 0000 0110b CMD18: SD_CMD[7:0] = 0001 0010b ACMD13: SD_CMD[7:0] = 0100 1101b
4	CF44			
3	CF43			
2	CF42			
1	CF41			
0	CF40			

Note: SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

40.2.2 Command Argument Register (SD_ARG)

Command arguments for SD cards are set in the SD command argument registers (SD_ARG). Set the command arguments before writing to SD_CMD.

Note that the argument of CMD12 within command sequences is H'0000 0000 regardless of the setting of SD_ARG.

SD_ARG

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CF39 to CF8	All 0	R/W	Set command format[39:8] (argument).

SD_ARG1 (Mirror of SD_ARG[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Fixed 0
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument).

40.2.3 Data Stop Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
63 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
18	—	0*1	R/W	Reserved The write value should always be 0.
17	HPIMODE	0*1	R/W	HPI Mode Enable 0: Disables HPI mode. 1: Enables HPI mode.
16	HPICMD	0*1	R/W*3	HPI Command Issue When HPICMD is set to 1 while HPIMODE is 1, the HPI command (CMD12) is issued. This bit is cleared to 0 when reception of the response to CMD12 is completed. The timing with which this bit is set to 1 is as follows. • After reception of the response to CMD12 that was issued by setting the STP bit to 1 has been completed during the CMD6/CMD38 or CMD25 sequence. • After reception of the response to CMD24/CMD25 has been completed After HPICMD is set to 1, do not write 0 to this bit while the CBSY bit in SD_INFO2 is 1. Do not set this bit to 1 when the CBSY bit in SD_INFO2 is 0.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
0	STP	0*1	R/W	Stop • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD/MMC host interface. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set. • Set STP to 1 after the response end flag has been set. • Set STP to 0 after the response end flag has been set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 3. It is effective only if 1 is written.

40.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) is used to specify the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	CNT31 to CNT0	All 0	R/W	Number of Transfer Blocks*1 When H'0000 0001 is set, the number of transfer blocks is 1. : When H'0000 FFFF is set, the number of transfer blocks is 65535. : When H'FFFF FFFF is set, the number of transfer blocks is 4294967295. Do not set this register to H'0000 0000 if multiple blocks are to be transferred.

Note 1. Do not change the value of these bits when the CBSY bit in SD_INFO2 is set to 1.

40.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) hold the response from the SD card.

SD_RSP10

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	R71 to R8	All 0	R	Hold the response from the SD card

SD_RSP1 (Mirror of SD_RSP10[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R39 to R24	All 0	R	Hold the response from the SD card

SD_RSP32 (Mirror of SD_RSP10[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 0	R71 to R40	All 0	R	Hold the response from the SD card

SD_RSP3 (Mirror of SD_RSP32[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R71 to R56	All 0	R	Hold the response from the SD card

SD_RSP54

Bit	Bit Name	Initial Value	R/W	Description
63 to 56	—	All 0	R	These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
55 to 0	R127 to R72	All 0	R	Hold the response from the SD card

SD_RSP5 (Mirror of SD_RSP54[31:16])

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	R103 to R88	All 0	R	Hold the response from the SD card

SD_RSP76 (Mirror of SD_RSP54[63:32])

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 0	R127 to R104	All 0	R	Hold the response from the SD card

SD_RSP7 (Mirror of SD_RSP76[31:16])

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	R127 to R120	All 0	R	Hold the response from the SD card

Table 40.3 lists the response types and corresponding SD_RSP registers.

Table 40.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP10 SD_RSP54*1
R2[127:8]	SD_RSP54 and SD_RSP10
R3[39:8]	SD_RSP10
R4[39:8]	SD_RSP10
R5[39:8]	SD_RSP10
R6[39:8]	SD_RSP10
R7[39:8]	SD_RSP10

Note 1. The response to CMD18 and to CMD25 is stored in both R[39:8] and R[103:72].
This makes it possible to confirm the response to CMD18 and CMD25 by reading R[103:72] even if the response to automatic CMD12 is stored in R[39:8].

40.2.6 SD Card Interrupt Flag Register (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.

For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.

Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.

INFO10, INFO9, and INFO8 change depending on the SDDAT3 state after a reset is released and continue to change in 4-bit transfer mode.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	HPIRES	0*2	R/W*1	Response Reception Completion [Setting condition] When reception of the response to CMD12 that was issued by setting the STP bit to 1 is completed during the CMD6/CMD38 or CMD25 sequence in HPI mode. [Clearing condition] When 0 is written to HPIRES
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	INFO10	Unknown	R	Indicates the SDDAT3 state. 0: SDDAT3 is set to 0. 1: SDDAT3 is set to 1.
9	INFO9	0	R/W*1	SDDAT3 Card Insertion [Setting condition] After change in SDDAT3 from 0 to 1, two cycles of 2 P1φ have elapsed with SDDAT3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SDDAT3 Card Removal [Setting condition] After change in SDDAT3 from 1 to 0, two cycles of 2 P1φ have elapsed with SDDAT3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the ISDWP state. 0: ISDWP is set to 1. 1: ISDWP is set to 0.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
5	INFO5	Unknown	R	Indicates the ISDCD state. 0: Indicates that Mcycle has elapsed with ISDCD held 1. 1: Indicates that Mcycle has elapsed with ISDCD held 0. Mcycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
4	INFO4	0	R/W*1	ISDCD Card Insertion [Setting condition] After change in ISDCD from 1 to 0, Mcycle has elapsed with ISDCD held 0. [Clearing condition] When 0 is written to INFO4 Mcycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	ISDCD Card Removal [Setting condition] After change in ISDCD from 0 to 1, Mcycle has elapsed with ISDCD held 1. [Clearing condition] When 0 is written to INFO3 Mcycle is set by bits 3 to 0 in SD_OPTION.
2	INFO2	0*2	R/W*1	Access End [Setting conditions] 1. When read access to the buffer is completed in the case of transfer for single block read 2. When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read 3. When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 4. When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write 5. When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write 6. When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 7. When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read 8. When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write 9. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read 10. When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2 When the access end bit is set to 1, the command sequence is terminated.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

Bit	Bit Name	Initial Value	R/W	Description
0	INFO0	0*2	R/W*1	Response End [Setting conditions] 1. When the reception of the response is completed 2. When the transmission of the command not requiring a response is completed, 3. When receiving busy reception after R1b response 4. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read 5. When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write, In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0 When issuing a command without data, the command sequence ends when the response end is set to 1.

Note 1. It is effective only if 0 is written.

Note 2. The value is initialized by a reset and also in the case of a reset by the SDRST bit in SOFT_RST.

40.2.7 SD Card Interrupt Flag Register (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] 1. Writing of data to SD_CMD within a command sequence (CBSY=1) 2. When SD_CMD[11] = 1 (command with data transfer) and SD_CMD[7:0] = 0000 1100b (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 0: A command sequence has been completed. 1: A command sequence is being executed.
13	SCLKDIVEN	1*2	R	0: The SD bus (CMD, DAT) is busy. Do not attempt to write to the SD_CLK_CTRL register. 1: The SD bus (CMD, DAT) is not busy. When a command sequence is started by writing to SD_CMD, the CBSY bit is set to 1 and, at the same time, the SCLKDIVEN bit is set to 0. The SCLKDIVEN bit is set to 1 after 8 cycles of SDCLK have elapsed after setting of the CBSY bit to 0 due to completion of the command sequence.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
11	—	0	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BWE	0*2	R/W*1	SD_BUF Write Enable 0: Data cannot be written in SD_BUF0. 1: Data can be written in SD_BUF0. [Setting conditions] 1. When SD_BUF is empty at single block transfer 2. When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing conditions] 1. When 0 is written to BWE 2. Writing of a block of data to SD_BUF by DMA transfer When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3

Bit	Bit Name	Initial Value	R/W	Description
8	BRE	0*2	R/W*1	SD_BUF Read Enable 0: Data cannot be read from SD_BUF0. 1: Data can be read from SD_BUF0. [Setting conditions] 1. When data set in SD_SIZE is stored in SD_BUF at single block transfer 2. When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing conditions] 1. When 0 is written to BRE 2. Reading of a block of data from SD_BUF by DMA transfer When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.
7	DAT0	Unknown	R	SDDAT0 Indicates the SDDAT0 state. 0: SDDAT0 is set to 0. 1: SDDAT0 is set to 1. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0. While the SD clock (SDCLK) is stopped, the DAT0 bit retains the value before the clock is stopped.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received even after 640 cycles of SDCLK have elapsed (including a response to a command issued within a command sequence*5) [Clearing condition] When 0 is written to ERR6 The command sequence is halted by a response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] 1. When SD_BUF is empty while SD_BUF0 is read 2. When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] 1. When data is written to SD_BUF0 while it is not in the data read/write command state 2. When data is written to SD_BUF0 while SD_BUF is full 3. When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length 4. When data is written to SD_BUF0 while the interface remains in a busy state for at least Ncycle after the CRC status [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
3	ERR3	0*2	R/W*1	Data Timeout (except response timeout) [Setting conditions] 1. After R1b response, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 2. After CRC status, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 3. After write data, the CRC status is not received even after Ncycle has elapsed. 4. After read command, read data is not received even after Ncycle has elapsed. 5. After CMD12 has been issued within a command sequence, the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle. 6. After the reception of read data, read data for the next block are not received even after Ncycle has elapsed. 7. After release of the read wait state, read data for the next block are not received even after Ncycle has elapsed. [Clearing condition] When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.
2	ERR2	0*2	R/W*1	END Error [Setting conditions] 1. When an error occurs in the response length (and the end bit has not been detected) 2. When an error occurs in the read data length (and the end bit has not been detected among the valid bits) 3. When an error occurs in the CRC status length (and the end bit has not been detected) 4. An error in the length of a response to a command issued within a command sequence*5 (i.e. the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] 1. When an error occurs in the CRC status (i.e. the received CRC status was not 010') 2. When a CRC error occurs in the read data 3. When a CRC error occurs in the response 4. A CRC error in the response to a command issued within a command sequence*5 [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting conditions] 1. The command index of the transmitted command differing from the command index of the received response 2. The command index of a command issued within a command sequence*5 differing from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. When the WMODE bit in HOST_MODE is 0, the single byte from the fraction of a full 16-bit unit is regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE. When the WMODE bit in HOST_MODE is 1, the single byte or three bytes from the fraction of a full 64-bit unit are regarded as excess data due to an odd value for the number of bytes

setting in SD_SIZE, or the two bytes from the fraction of a full 64-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.

Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in **Figure 40.18** under **Section 40.4.8, IO_RW_EXTENDED (CMD53/Multiple Block Read)** or in **Figure 40.21** under **Section 40.4.9, IO_RW_EXTENDED (CMD53/Multiple Block Write)**.

Note 5. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) is used to enable or disable the SD_INFO1 interrupt.

When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	IMASK16	1	R/W	HPIRES interrupt masked
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IMASK0	1	R/W	INFO0 interrupt masked

40.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) is used to enable or disable the SD_INFO2 interrupt.

When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11	—	1	R/W	Reserved The write value should always be 1.
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

40.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) is used to control the SD clock (SDCLK) output and to set the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command. Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	—	0	R/W	Reserved The write value should always be 0.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
10	—	0*1	R/W	Reserved The write value should always be 0.
9	SDCLKOFFEN	0	R/W	SD Clock (SDCLK) Output Automatic Control Enable 0: Automatic control for SD clock (SDCLK) output is disabled. 1: Automatic control for SD clock (SDCLK) output is enabled. This function of automatic control for SD clock (SDCLK) output causes SDCLK output only within a command sequence. The timing with which SDCLK output starts and stops is as follows. SDCLK output starts after writing to SD_CMD. SDCLK output stops when 8 cycles of SDCLK have elapsed after the end of the command sequence. In addition, SDCLK is fixed to 0 while SCLKEN of SD_CLK_CTRL is 0, regardless of the value of this bit.
8	SCLKEN	0*1	R/W*2	SD Clock (SDCLK) Output Control Enable 0: SD clock (SDCLK) output is disabled. The SDCLK signal is fixed 0. 1: SD clock (SDCLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SDCLK) 1000 0000b: (SDxϕ/4)/512 0100 0000b: (SDxϕ/4)/256 0010 0000b: (SDxϕ/4)/128 0001 0000b: (SDxϕ/4)/64 0000 1000b: (SDxϕ/4)/32 0000 0100b: (SDxϕ/4)/16 0000 0010b: (SDxϕ/4)/8 0000 0001b: (SDxϕ/4)/4 0000 0000b: (SDxϕ/4)/2 1111 1111b: SDxϕ/4 (x = 0, 1) Other settings are prohibited. In addition, in the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set DIV[7:0] to 1111 1111b.
6	DIV6	0	R/W*2	
5	DIV5	1	R/W*2	
4	DIV4	0	R/W*2	
3	DIV3	0	R/W*2	
2	DIV2	0	R/W*2	
1	DIV1	0	R/W*2	
0	DIV0	0	R/W*2	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Writing to SD_CLK_CTRL is impossible when the CBSY bit in SD_INFO2 is 1.

Notes on when setting the SD clock (SDCLK) to P1ϕ (DIV[7:0] = 1111 1111b)

When changing the setting of bits DIV[7:0] to 1111 1111b, or from 1111 1111b to other setting, perform the following processing before writing to SD_CMD.

(1) Set the SCLKEN bit to 0 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

(2) Change the setting of bits DIV[7:0] by writing to SD_CLK_CTRL. (Do not change the setting of bits other than DIV[7:0] at this time. The SCLKEN bit should retain the value 0.)

(3) Set the SCLKEN bit to 1 by writing to SD_CLK_CTRL. (Do not change the setting of bits other than SCLKEN at this time.)

Also when changing the setting of bits DIV[7:0] to 1111 1111b after having set the SDRST bit in SOFT_RST to 0 and then changed it to 1, perform this processing before writing to SD_CMD.

40.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) is used to specify the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
63 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for single block transfer. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0. Do not specify a data size larger than 512 bytes.

Note 1. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

40.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) is used to set the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	WIDTH	0*1	R/W	Bus width*2 {WIDTH,WIDTH8} = 01: 8 bits width {WIDTH,WIDTH8} = 00: 4 bits width {WIDTH,WIDTH8} = 10,11: 1 bit width In the case of data transfer in DDR mode (DDR bit in SDIF_MODE = 1), do not set this bit to 1. In the case of writing of one-byte block, 8 bits width cannot be specified for the bus width. Change the bus width to 4 bits or 1 bit before writing one-byte block.
14	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
13	WIDTH8	0*1	R/W	Bus width*2 See the description of the WIDTH bit.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	EXTOP	0*1	R/W	Timeout Mode Select 0: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{13} to SDCLK*2^{27}. 1: Bits TOP27 to TOP24 specify the timeout count from SDCLK*2^{14} to SDCLK*2^{28}.
8	TOUTMASK	0*1	R/W	Timeout Mask 0: Enables timeout. 1: Disables timeout. (The ERR6 and ERR3 bits in SD_INFO2 and the E6 to E0 bits in SD_ERR_STS2 are not set.) If a timeout occurs while it is disabled, perform a software reset to terminate a command sequence.
7	TOP27	1*1	R/W	Timeout Counter*2 0000: SDCLK*2^{13} 0001: SDCLK*2^{14} : 1101: SDCLK*2^{26} 1110: SDCLK*2^{27} 1111: Setting prohibited
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 0000: SDCLK*2^{10} 0001: SDCLK*2^{11} : 1101: SDCLK*2^{23} 1110: SDCLK*2^{24} 1111: Setting prohibited
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the values of these bits when the CBSY bit in SD_INFO2 is 1.

40.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 15	—	Unknown	R	Reserved These bits are always read as unknown. The write value should always be 0.
14	E14	0*1	R	These bits hold the CRC status. (normal: 010)
13	E13	1*1		
12	E12	0*1		
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status.
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data.
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command issued within a command sequence*2).
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected).
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits).
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command issued within a command sequence*2).
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command issued within a command sequence*2. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command issued within a command sequence*2).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
63 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
6	E6	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after the CRC status.
5	E5	0*1	R	Set to 1 when the CRC status is not received even after Ncycle has elapsed after data writing.
4	E4	0*1	R	Set to 1 when read data is not received even after Ncycle has elapsed after the command has been read. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received even after Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the interface remains in a busy state for at least Ncycle after R1b response.
1	E1	0*1	R	Set to 1 when the response to a command issued within a command sequence*2 is not received even after 640 cycles of SDCLK have elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command issued within a command sequence*2) is not received even after 640 cycles of SDCLK have elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. “Command issued within a command sequence” refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

40.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
63 to 0	BUF63 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte buffers (SD_BUF). When both buffers are not empty at multiple block read, suspend data reception by stopping the SD clock. When either buffer becomes empty, restart data reception by starting supply of the SD clock.

Note: When using the DMAC, the bus width should be fixed at 64 bits.

40.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	C52PUB	0	R/W	SDIO None Abort • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued between blocks if SD_BUF becomes empty.C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1. • Set C52PUB to 1 after the response end flag has been set.
8	IOABT	0	R/W	SDIO Abort • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set. • Set IOABT to 1 after the response end flag has been set. Set IOABT to 0 after the access end flag has been set.
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between blocks. [Read wait state releasing] (1) The read wait state is released, when RWREQ is cleared to 0 in the read wait state. (2) When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. (3) When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end. Set RWREQ to 1 after the response end flag has been set.
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.
0	IOMOD	0	R/W	SDIO Mode*1 0: Disables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card 1: Enables the SD/MMC host interfaces to receive SDIO interrupt from the SDIO card

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

40.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] 1. While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. 2. While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	All 0*2	R/W	Reserved The write value should always be 1. The value may change during operation.
0	IOIRQ	0*2	R/W*1	[Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.

Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card. If the interrupt signal is not negated, this bit may be set again.

40.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	—	1	R/W	Reserved The write value should always be 1.
1	—	1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

40.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
63 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9, 8	—	All 0	R/W	Reserved The write value should always be 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5	—	0	R/W	Reserved The write value should always be 0.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to this bit.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*1 0: The SD_BUF read/write DMA transfer is disabled. 1: The SD_BUF read/write DMA transfer is enabled.
0	—	0	R/W	Reserved The write value should always be 0.

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

40.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Also use this register to check that release from the reset state has been completed before attempting to use the SD/MMC host interfaces and before attempting access to the other registers.

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2, 1	—	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SDRST	1	R/W	Software Reset of SD Interface Unit 0: Reset 1: Reset released

40.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD/MMC host interfaces.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15, 14	UR7, UR6	11	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
13, 12	UR5, UR4	00	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
11 to 8	UR3 to UR0	H'C	R	Version of Renesas' IP
7 to 0	IP7 to IP0	H'10	R	Version of introductory IP

40.2.22 Host Interface Mode Setting Register (HOST_MODE)

The host interface mode setting register (HOST_MODE) selects the width for access to the data bus.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	BUSWIDTH	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 16-bit access 1: 32-bit access This bit is enabled while the WMODE bit is set to 1.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	ENDIAN	0	R/W	SD_BUF0 data swap
0	WMODE	0	R/W	Width for Access to SD_BUF*1*2 Read or write access to SD_BUF0 can be performed with the specified width for access. 0: 64-bit access 1: 16-bit or 32-bit access

Note 1. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

Note 2. When using the built-in DMAC of this module, fix the bus width to 64 bits.

40.2.23 SD Interface Mode Setting Register (SDIF_MODE)

The SD interface mode setting register specifies DDR mode.

Bit	Bit Name	Initial Value	R/W	Description
63 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
9	—	0*1	R/W	Reserved The write value should always be 0.
8	NOCHKCR	0*1	R/W	CRC Check Mask (test command for MMC supported) Enables or disables checking of the CRC16 and CRC status. 0: Enables the CRC check. 1: Disables the CRC check (the CRC16 value is ignored at read, and the CRC status is not detected at write)
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DDR	0*1	R/W	DDR Mode Select*2 0: Normal mode (default, high speed, or SDR) 1: DDR mode Set this bit to 0 when the SD clock division ratio is specified as 1:1 (bits DIV[7:0] in SD_CLK_CTRL are set to 11111111).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

Note 2. Do not change the value of this bit when the CBSY bit in SD_INFO2 is set to 1.

40.2.24 SD Status Register (SD_STATUS)

The effective bit of the SD status register controls the output value on the SD0_RST# pin.

Bit	Bit Name	Initial Value	R/W	Description
63 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	SD_RST	0	R/W	Controls the output value on the SD0_RST# pin. 0: The output value on the SD0_RST# pin is 0. 1: The output value on the SD0_RST# pin is 1.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.

40.2.25 DMAC Transfer Mode Register (DM_CM_DTRAN_MODE)

The DMAC Transfer Mode Register (DM_CM_DTRAN_MODE) sets the operation mode of the module built-in DMAC.

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
17, 16	CH_NUM	00	R/W	DMAC channel selector 00 : SD down stream 01 : SD up stream Other settings are prohibited.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
5, 4	BUS_WIDTH [1:0]	11	R/W	Bus width selector 11: 64-bit Other settings are prohibited.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

40.2.26 DMAC Transfer Control Register (DM_CM_DTRAN_CTRL)

The DMAC Transfer Control Register (DM_CM_DTRAN_CTRL) controls the module built-in DMAC operation. High 32 bits (bit 63-32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8	—	0	R/W	Reserved The write value should always be 0.
7 to 1	—	All 0	R	Reserved
0	DM_START	0	R/W	DMAC Start Writing 1 to this bit starts DMAC operation. This bit is automatically cleared when DMA transfer is started.

40.2.27 DMAC Reset Register (DM_CM_RST)

High 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 10	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
9	DTRANRST1	1	R/W	Soft resets of the module built-in DMAC channel 1 0: Reset 1: Reset released
8	DTRANRST0	1	R/W	Soft resets of the module built-in DMAC channel 0 0: Reset 1: Reset released
7 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
0	SEQRST	1	R/W	Soft resets of the sequencer 0: Reset 1: Reset released

NOTE

Make sure there is no communication to the SD/MMC device before applying a software reset using this register.

40.2.28 DMAC Interrupt Register 1 (DM_CM_INFO1)

The DMAC interrupt register 1 (DM_CM_INFO1) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
20	DTRANEND1	0*1	R/W	Module built-in DMAC Channel 1 Transfer End [Setting conditions] 1. When transfer of DMAC channel 1 is completed 2. When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANEND1
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
16	DTRANEND0	0*2	R/W	Module built-in DMAC Channel 0 Transfer End [Setting conditions] 1. When transfer of DMAC channel 0 is completed 2. When an error occurs on DMAC channel 0 [Clearing condition] When 0 is written to DTRANEND0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQEND	0*3	R/W	Sequencer Operation End [Setting conditions] 1. When operation of a sequencer is completed 2. When a sequencer error occurs [Clearing condition] When 0 is written to SEQEND

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

40.2.29 DM_CM_INFO1 Interrupt Mask Register (DM_CM_INFO1_MASK)

The DM_CM_INFO1 interrupt mask register (DM_CM_INFO1_MASK) enables or disables the DM_CM_INFO1 interrupt. When 0 is set in DM_CM_INFO1_MASK while the corresponding flag in DM_CM_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 21	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
20	DTRANEND1_MASK	1	R/W	DTRANEND1 interrupt masked
19 to 17	—	All 1	R/W	Reserved The write value should always be 1.
16	DTRANEND0_MASK	1	R/W	DTRANEND0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQEND_MASK	1	R/W	SEQEND interrupt masked

40.2.30 DMAC Interrupt Register 2 (DM_CM_INFO2)

The DMAC interrupt register 2 (DM_CM_INFO2) indicates the status of the module built-in DMAC and a sequencer. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
63 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
19, 18	—	00	R	Reserved The write value should always be 0.
17	DTRANERR1	0*1	R/W	Module built-in DMAC Channel 1 Error [Setting condition] When an error occurs on DMAC channel 1 [Clearing condition] When 0 is written to DTRANERR1
16	DTRANERR0	0*2	R/W	Module built-in DMAC Channel 0 Error [Setting condition] When an error occurs on the DMAC channel 0 [Clearing condition] When 0 is written to DTRANERR0
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	SEQERR	0*3	R/W	Sequencer error [Setting condition] When a sequencer error occurs [Clearing condition] When 0 is written to SEQERR

Note 1. The initial value is applied at a reset and when the DTRANRST1 bit in DM_CM_RST is 0.

Note 2. The initial value is applied at a reset and when the DTRANRST0 bit in DM_CM_RST is 0.

Note 3. The initial value is applied at a reset and when the SEQRST bit in DM_CM_RST is 0.

40.2.31 DM_CM_INFO2 Interrupt Mask Register (DM_CM_INFO2_MASK)

The DM_CM_INFO2 interrupt mask register (DM_CM_INFO2_MASK) enables or disables the DM_CM_INFO2 interrupt. When 0 is set in DM_CM_INFO2_MASK while the corresponding flag in DM_CM_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 20	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
19, 18	—	11	R	Reserved The write value should always be 1.
17	DTRANERR1_MASK	1	R/W	DTRANERR1 interrupt masked
16	DTRANERR0_MASK	1	R/W	DTRANERR0 interrupt masked
15 to 1	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1. Operation is not guaranteed if a value other than 1 is written to these bits.
0	SEQERR_MASK	1	R/W	SEQERR interrupt masked

40.2.32 DMAC Transfer Address Register (DM_DTRAN_ADDR)

The DMAC Transfer Address Register (DM_DTRAN_ADDR) sets the transfer destination and source address of the module built-in DMAC.

Higher-order 32 bits (bit 63 to 32) are read only 0.

Bit	Bit Name	Initial Value	R/W	Description
63 to 32	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
31 to 3	DADDR	All 0	R/W	Destination address / Source address (8 byte unit) Note that the value of DM_DTRAN_ADDR + transfer data length is less than or equal to 2^{32}.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.

40.3 Operation

40.3.1 SD Interface

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD/MMC host interface receives data from the SD card via the SDDAT signal. (SDDAT signal: see **Figure 40.2**, **Figure 40.3** and **Figure 40.5**.)
2. The receive data is stored in SD_BUF of the SD/MMC host interfaces. (SD_BUF store data: see **Figure 40.7**)
3. The data stored in SD_BUF is read from SD_BUF0. (Reading from SD_BUF0: see **Table 40.4**)

When data is written to the SD card, the above procedure will be reversed.

When accessing SD_BUF0, caution should be taken for the transfer order in SDDAT and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See **Figure 40.7**)

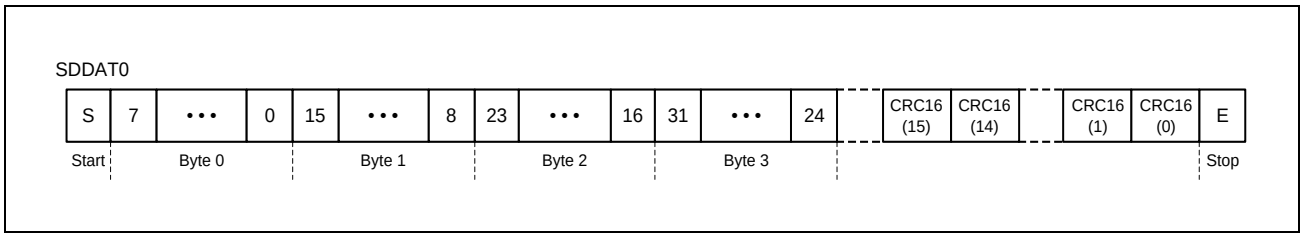

Figure 40.2 SDDAT in 1-Bit Width Mode

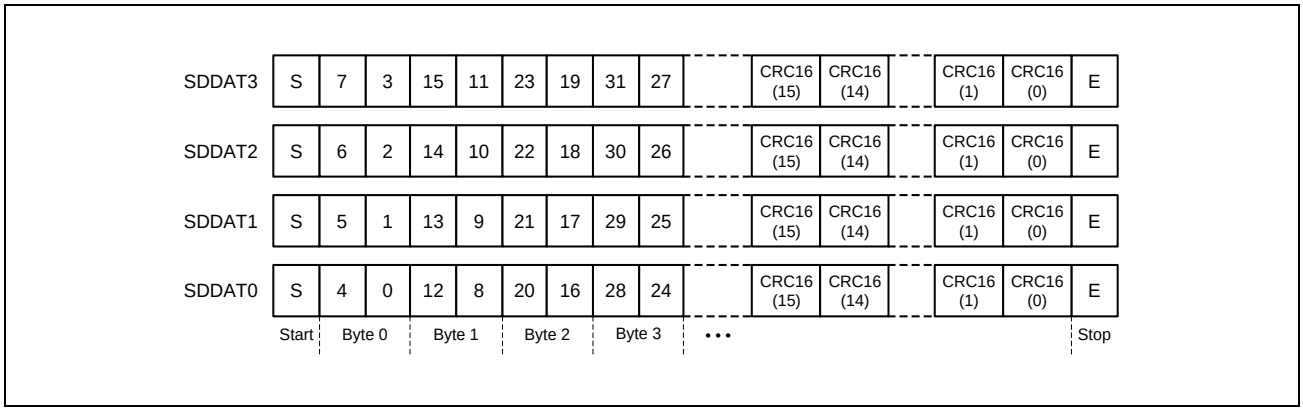

Figure 40.3 SDDAT in 4-Bit Width Mode

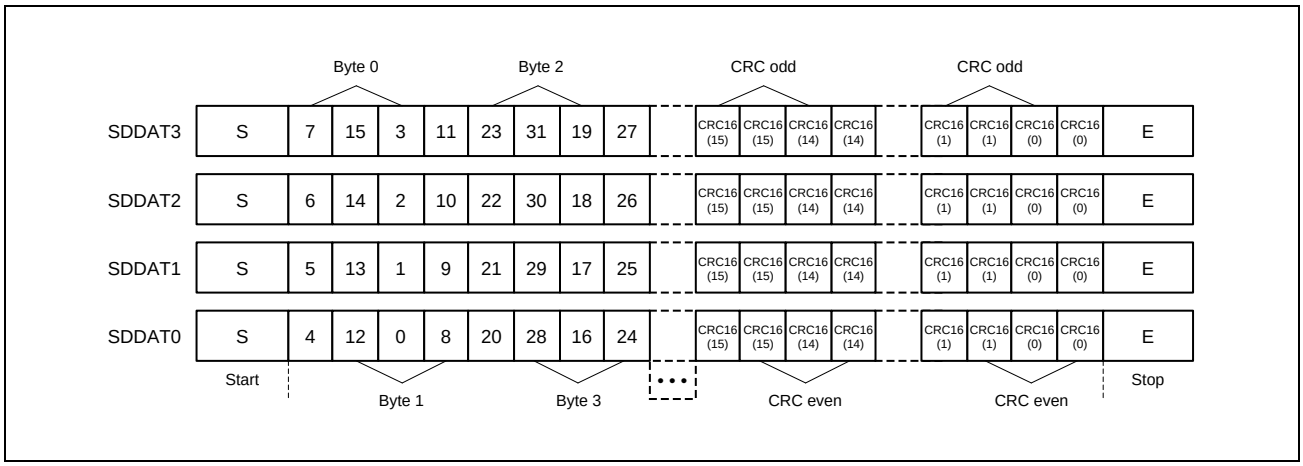

Figure 40.4 SDDAT in 4-Bit Width DDR Mode

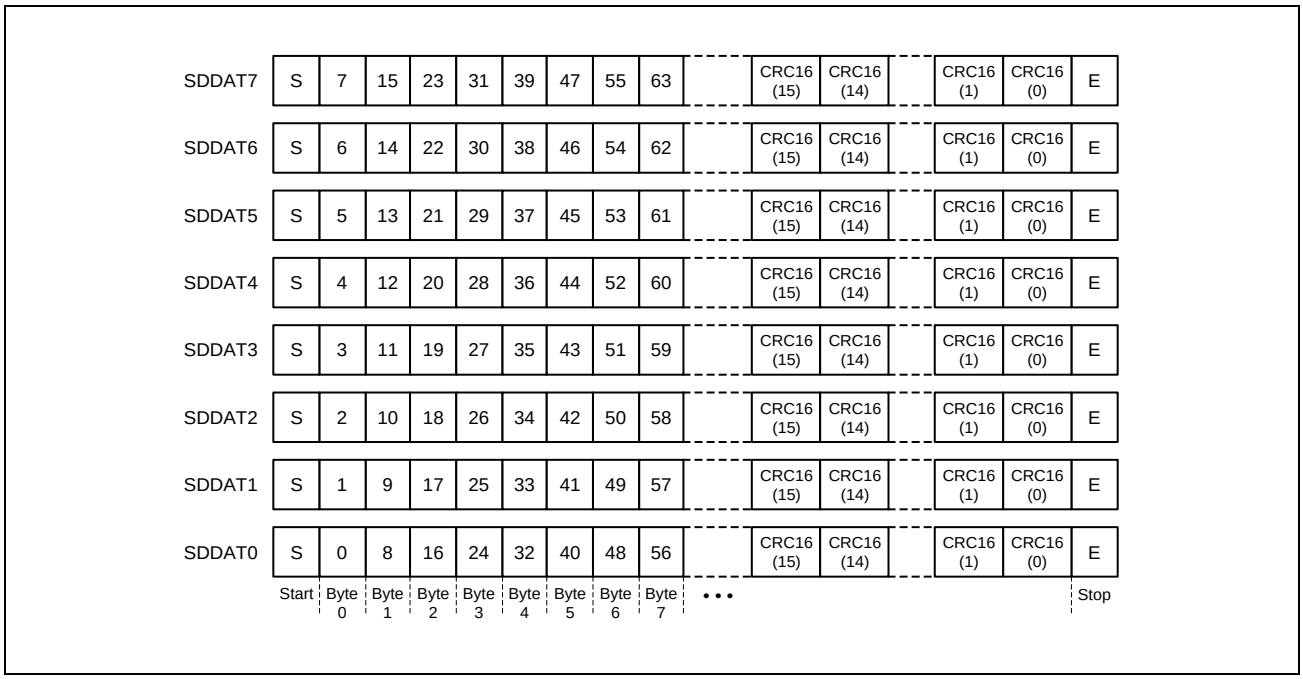

Figure 40.5 SDDAT in 8-Bit Width Mode

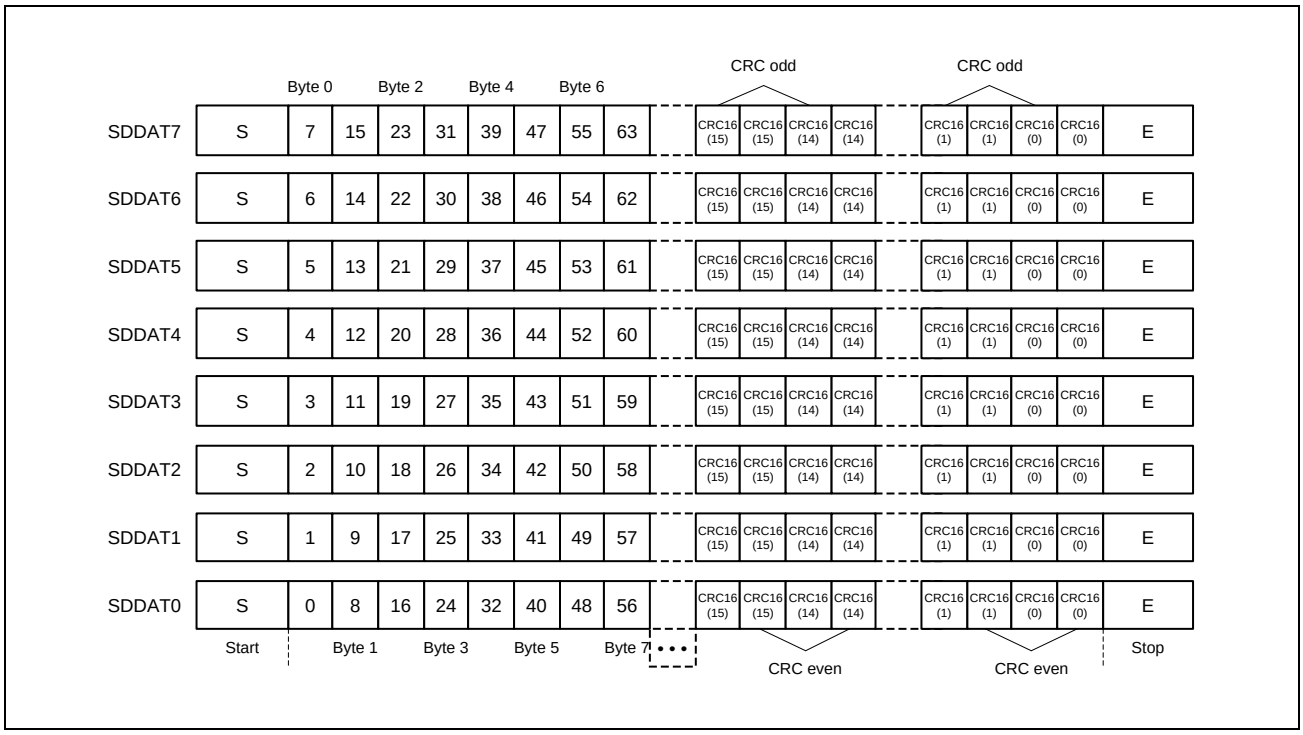

Figure 40.6 SDDAT in 8-Bit Width DDR Mode

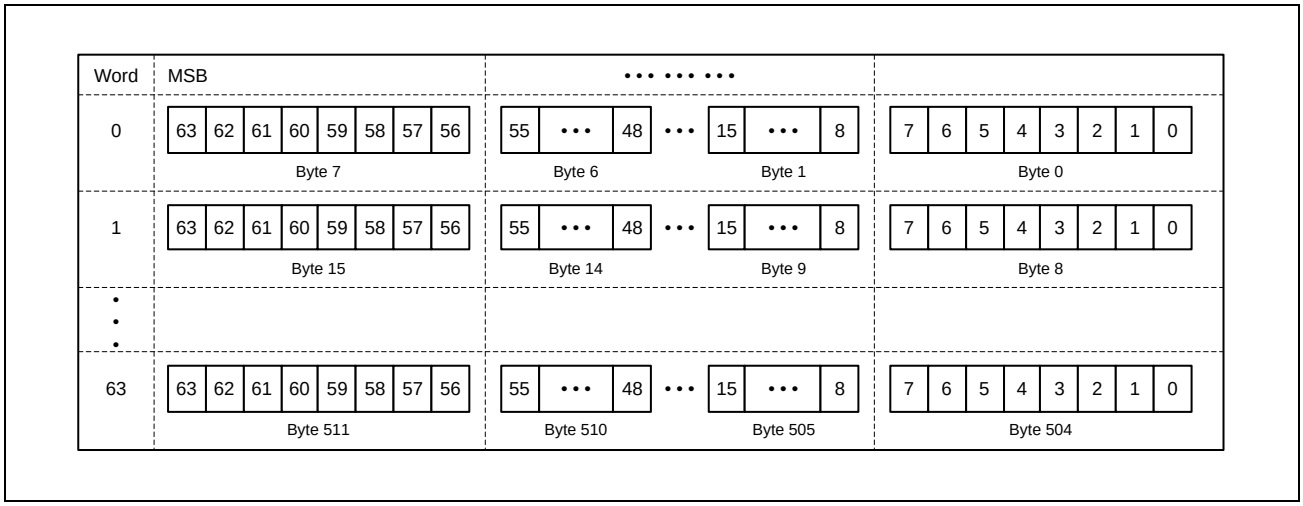

Figure 40.7 SD_BUF Store Data

Table 40.4 Reading from SD_BUF0

WMODE*1	BUSWIDTH*1	ENDIAN*1	Read Data*2
0	0	0	H'0123456789ABCDEF
0	0	1	H'EFCDAB8967452301
1	1	0	H'89ABCDEF (1st) H'01234567 (2nd)
1	1	1	H'EFCDAB89 (1st) H'67452301 (2nd)
1	0	0	H'CDEF (1st) H'89AB (2nd) H'4567 (3rd) H'0123 (4th)
1	0	1	H'EFCD (1st) H'AB89 (2nd) H'6745 (3rd) H'2301 (4th)

Note 1. The name of a bit in HOST_MODE.

Note 2. When the data stored in SD_BUF is H'0123456789ABCDEF

(2) Bus Signal Voltage Switch

Change the electric potential of the bus signal in the following procedure after checking that the SD card supports 1.8 V.

(1) Issuing CMD11
Perform command sequence processing of CMD11.

(2) Stopping the SD clock (a)
Set the SCLKEN bit in the SD_CLK_CTRL to 0 to stop*1 the output of the SD clock. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SDCLKOFFEN bit is also set to 0.

Note 1. When the SDCLKOFFEN bit in the SD_CLK_CTRL register is 1, the SD clock has automatically been stopped.

(3) Checking the value of SDDAT
Check that the DAT0 bit in the SD_INFO2 register is 0.

(4) Changing the supply voltage of the host device
Change the voltage which is supplied through the power supply pin of the given channel (PVcc_SD0 for channel 0 or PVcc_SD1 for channel 1) from 3.3 V to 1.8 V.

For details, see the following sections:

Section 41.3.4, Port Function Control Register,
Section 41.3.7, Driving Ability Control Register,
Section 41.3.17, SD ch0 IO Voltage Mode Control Register,
Section 41.3.18, SD ch1 IO Voltage Mode Control Register.

(5) Starting supply of the SD clock (b)
After the SD clock has been stopped ((a) above) and 5 ms or more has elapsed, set the SCLKEN bit in the SD_CLK_CTRL register to 1 and allow the output of the SD clock. The SDCLKOFFEN bit must be 0.

(6) Checking the value of SDDAT
After supplying the SD clock has been started ((b) above) and 1 ms or more has elapsed, check that the DAT0 bit in the SD_INFO2 register is 1. It is possible to set the SDCLKOFFEN bit in the SD_CLK_CTRL register to 1 and allow SD Clock (SDCLK) Output Automatic Control Enable.

40.3.2 Card Detect/Write Protect

(1) Card Detect

The SD/MMC host interface has two types of card detect functions as described in the following.

- Card detect with ISDCD

  Figure 40.8 shows the timing chart of card detect using ISDCD. ISDCD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

  [Card insertion]

  ISDCD is pulled down when a card is inserted. At this time, if ISDCD has been pulled down for the Mcycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  ISDCD is pulled up when a card is removed. At this time, if ISDCD has been pulled up for the Mcycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

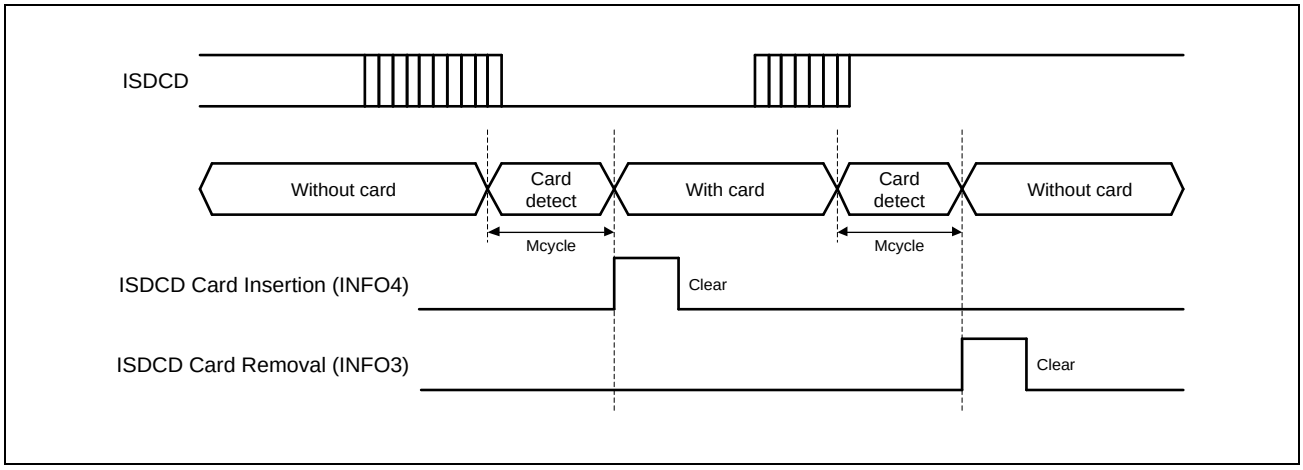

Figure 40.8 Example of Card Detect with ISDCD

- SD card detect with SDDAT3

  Figure 40.9 shows the timing chart when the SD card is detected using SDDAT3. In addition, SDDAT3 is pulled down on the host device. The resistance of the pull-down resistor is decided by the specification of the SD host device.

  [Card insertion]

  When an SD card is inserted, SDDAT3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

  [Card removal]

  When an SD card is removed, SDDAT3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

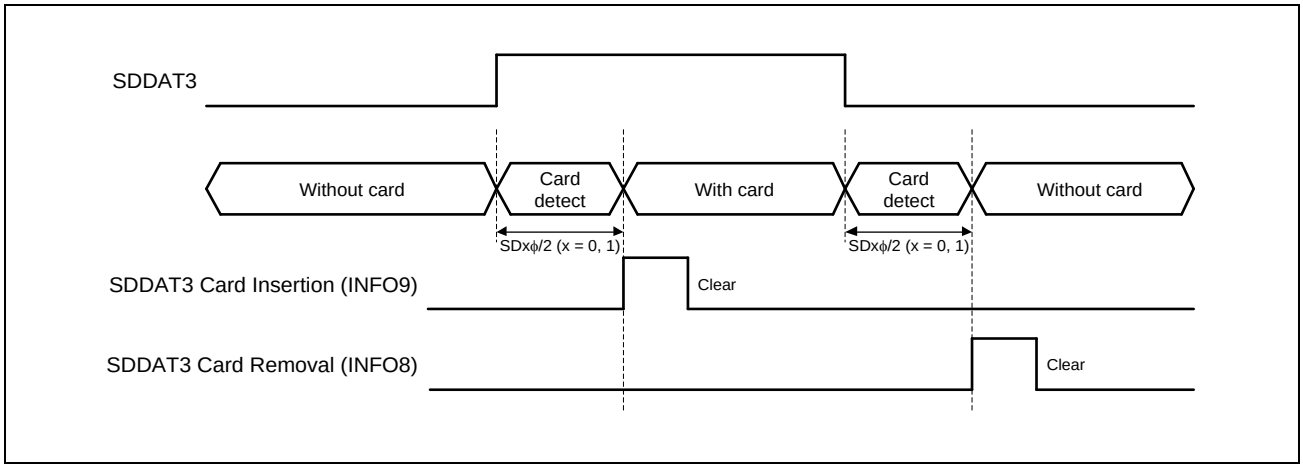

Figure 40.9 SD Card Detect with SDDAT3

(2) Write Protect

The SD/MMC host interface has two types of write protect functions.

- Write protect with ISDWP

  ISDWP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specifications of the SD host device. As the ISDWP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.

- Write protect with command

  The card's internal write protection and the card lock/unlock operation are realized by the command.

40.3.3 Interrupt Request

(1) Interrupt Request

The SD/MMC host interface has the interrupt requests shown in **Table 40.5** shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.

To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 40.5 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	Register Name	Bit Name	Register Name	Bit Name
Card access interrupt*1	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt*2	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt*1	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3
DMAC interrupt*1	DM_CM_INFO1	DTRANEND1	DM_CM_INFO1_MASK	DTRANEND1_MASK
		DTRANEND0		DTRANEND0_MASK
		SEQEND		SEQEND_MASK
	DM_CM_INFO2	DTRANERR1	DM_CM_INFO2_MASK	DTARERR1_MASK
		DTRANERR0		DTARERR0_MASK
		SEQERR		SEQERR_MASK

Note 1. Interrupt signal “OXMNIRQ” is asserted.

Note 2. Interrupt signal both “OXMNIRQ” and “OXASIOIRQ” are asserted.

40.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts

Table 40.6 and **Table 40.7** show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 40.6 Communications Errors

Communication Error	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence)
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 40.7 Timeouts

Timeout	SD Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received even after 640 cycles of SDCLK have elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received even after 640 cycles of SDCLK have elapsed
Data timeout (other than response timeout)		ERR3		E6	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after the CRC status
				E5	When the CRC status is not received t even after Ncycle*1 has elapsed after data writing
				E4	When read data is not received even after Ncycle*1 has elapsed after read command
					When read data for the next block are not received even after Ncycle*1 has elapsed after the reception of read data
					When read data for the next block are not received even after Ncycle*1 has elapsed after release of the read wait state
				E3	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after CMD12 has been issued within a command sequence
				E2	When the interface remains in a busy state (SDDAT0 = 0) for at least Ncycle*1 after R1b response

Note 1. Ncycle is set by bit 7 to bit 4 in SD_OPTION.

40.4 Usage Example

40.4.1 Command without Data Transfer

(1) Flowchart

Figure 40.10 and **Figure 40.11** show flowchart examples.

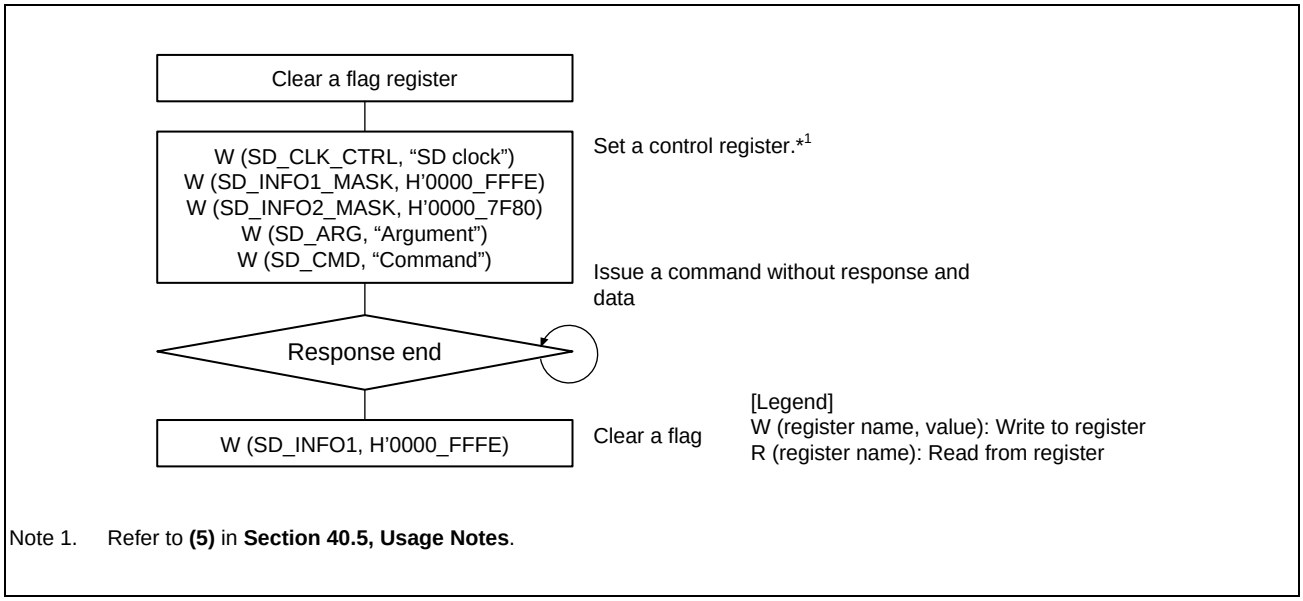

Figure 40.10 Flow Example of Command without Response and Data

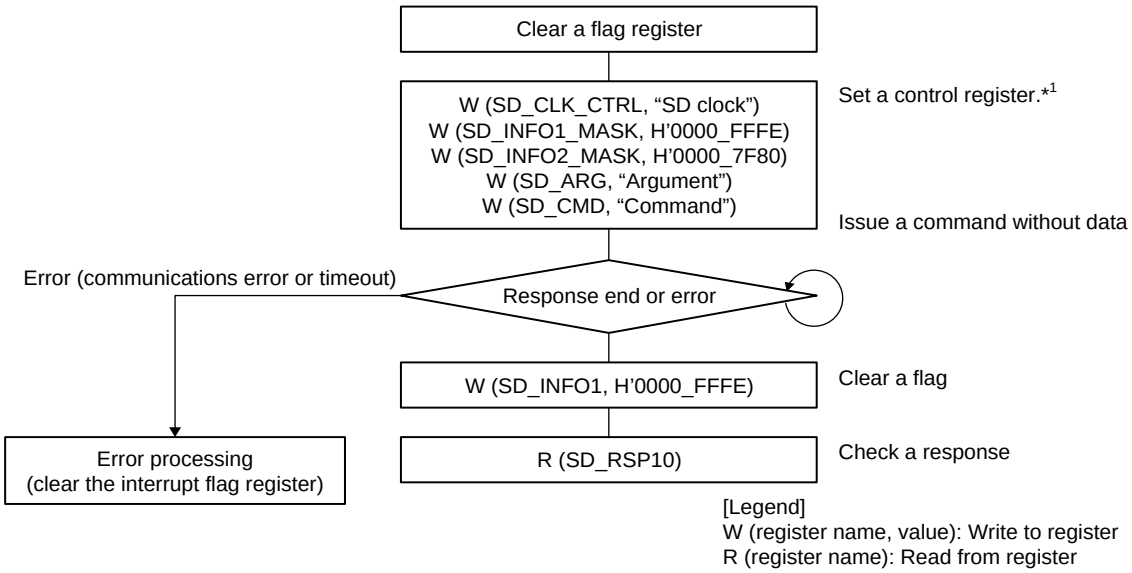


Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.11 Flow Example of Command without Data

(2) Operation for Command without Data Transfer

The legend below is used for description of register read/write.

W (register name, value):Write to register

R (register name):Read from register

The operation is described as below.

(a) Command without response and data

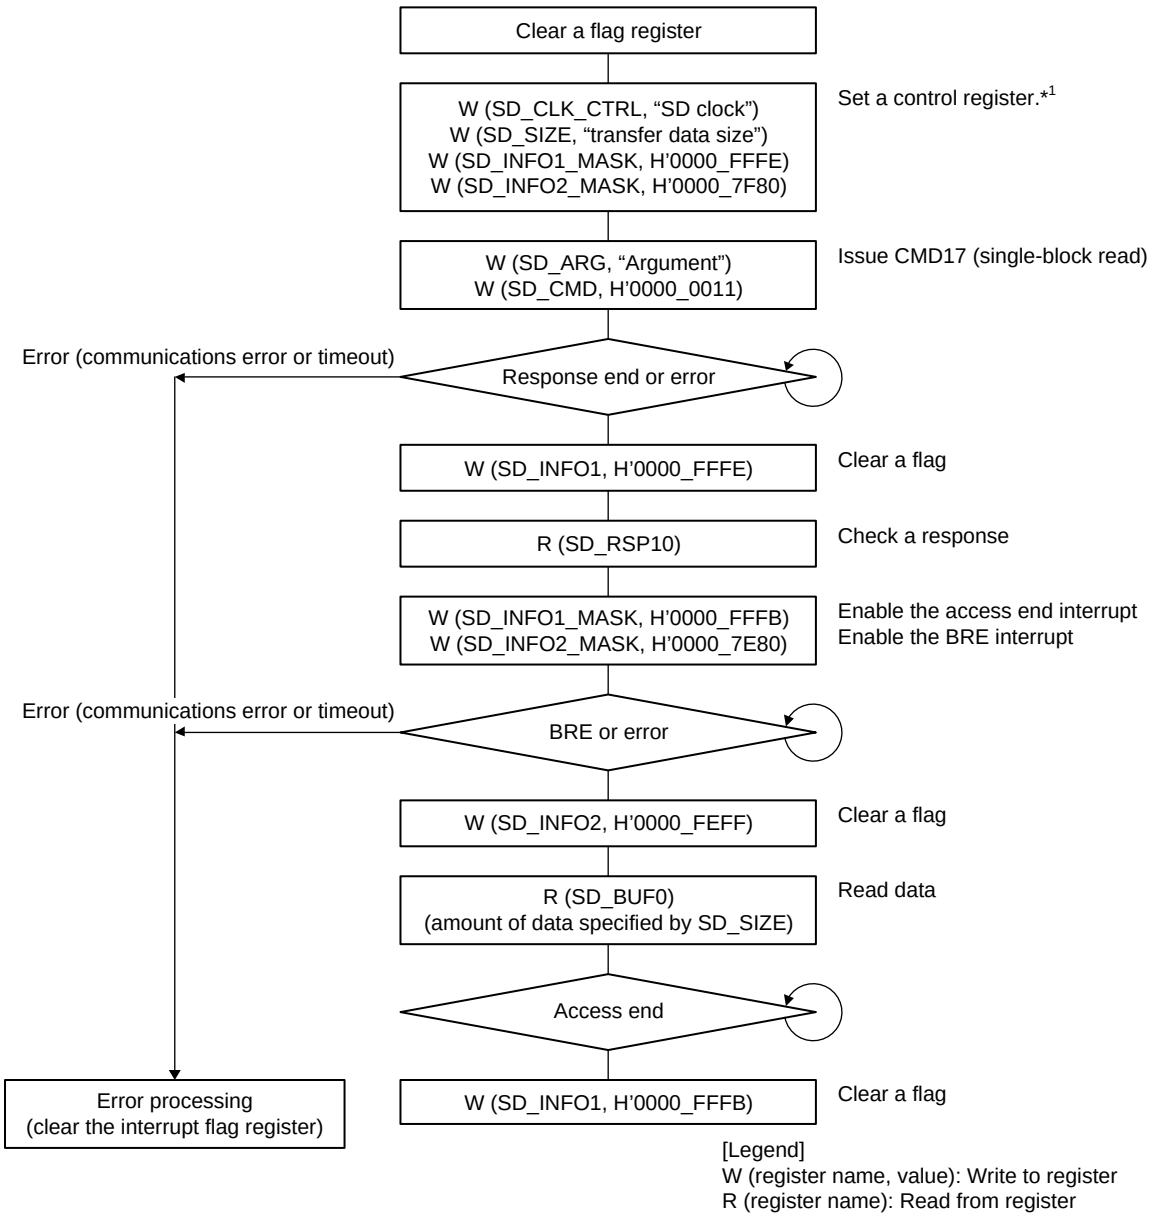
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

(b) Command without data

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
5. Read a response from SD_RSP10.
   Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.2 Single Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.12 Single Block Read Flowchart Example

(2) Operation for Single Block Read

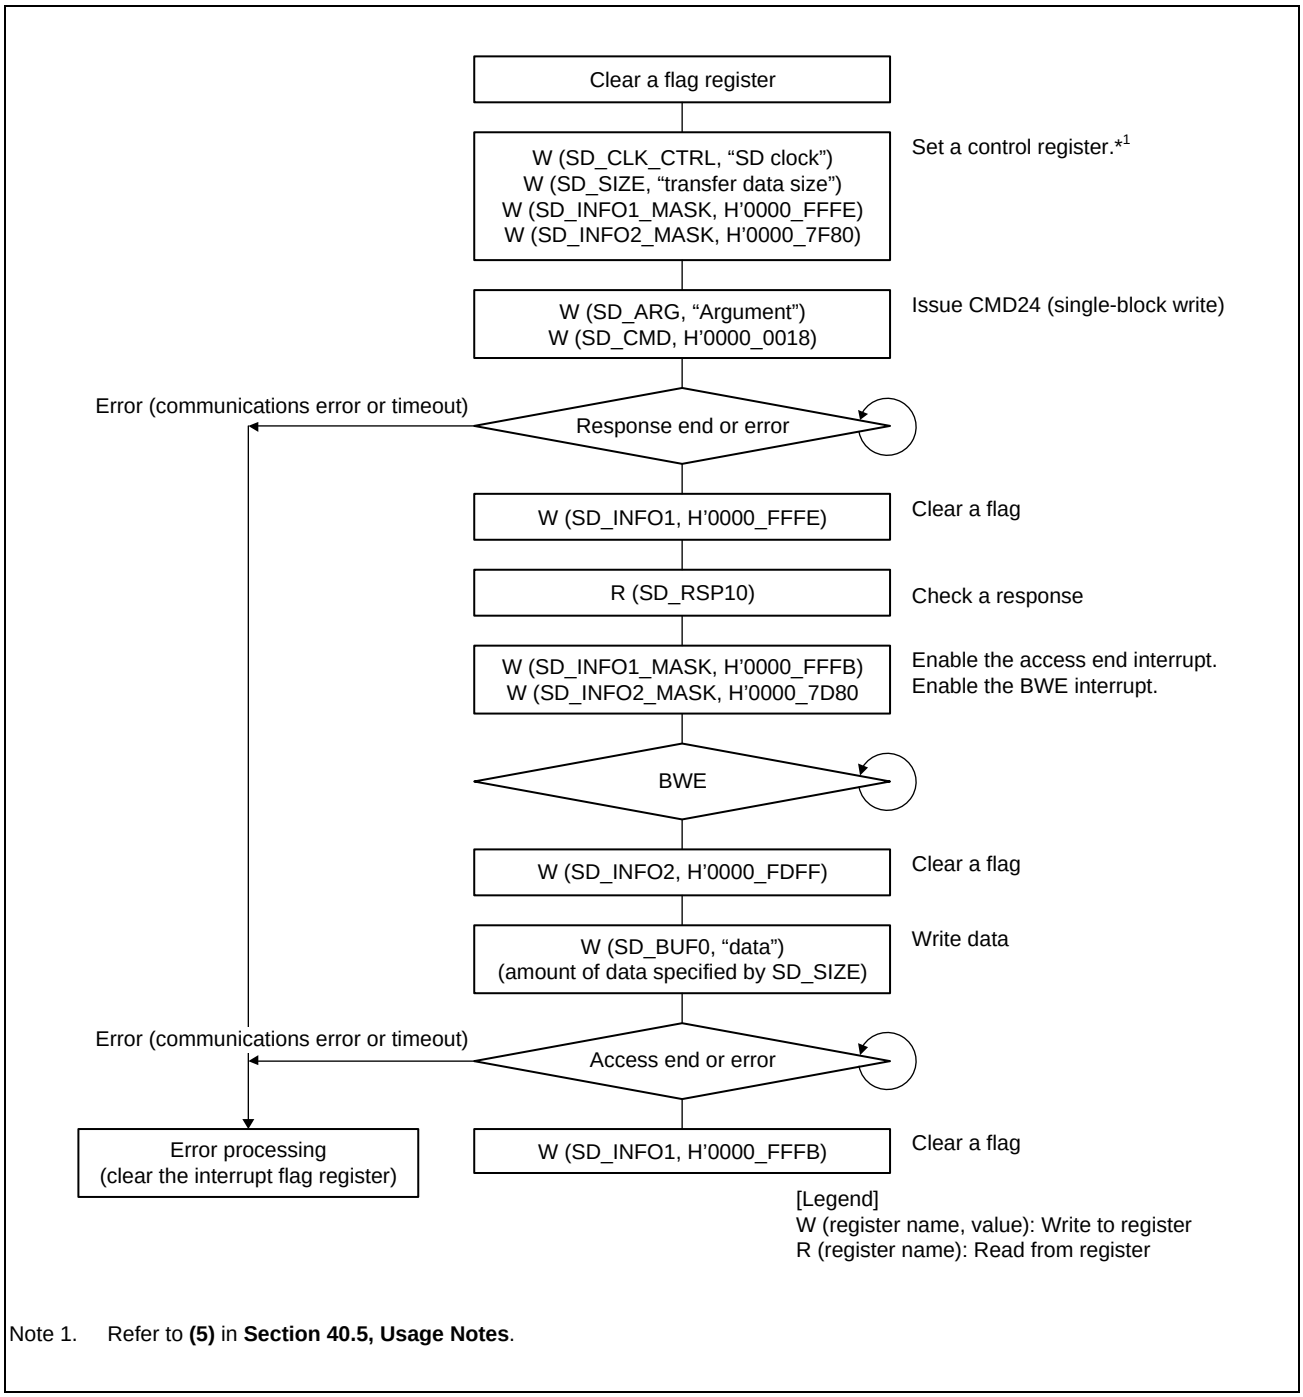
The operation of the single block read is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD17)
   Set CMD17 Argument in SD_ARG and write H’0000 0011 to SD_CMD.
   Accordingly, CMD17 is issued, and the single block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data receive from SD card and data read
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
   However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.
6. Operation complete
   When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.3 Single Block Write

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.13 Single Block Write Flowchart Example

(2) Operation for Single Block Write

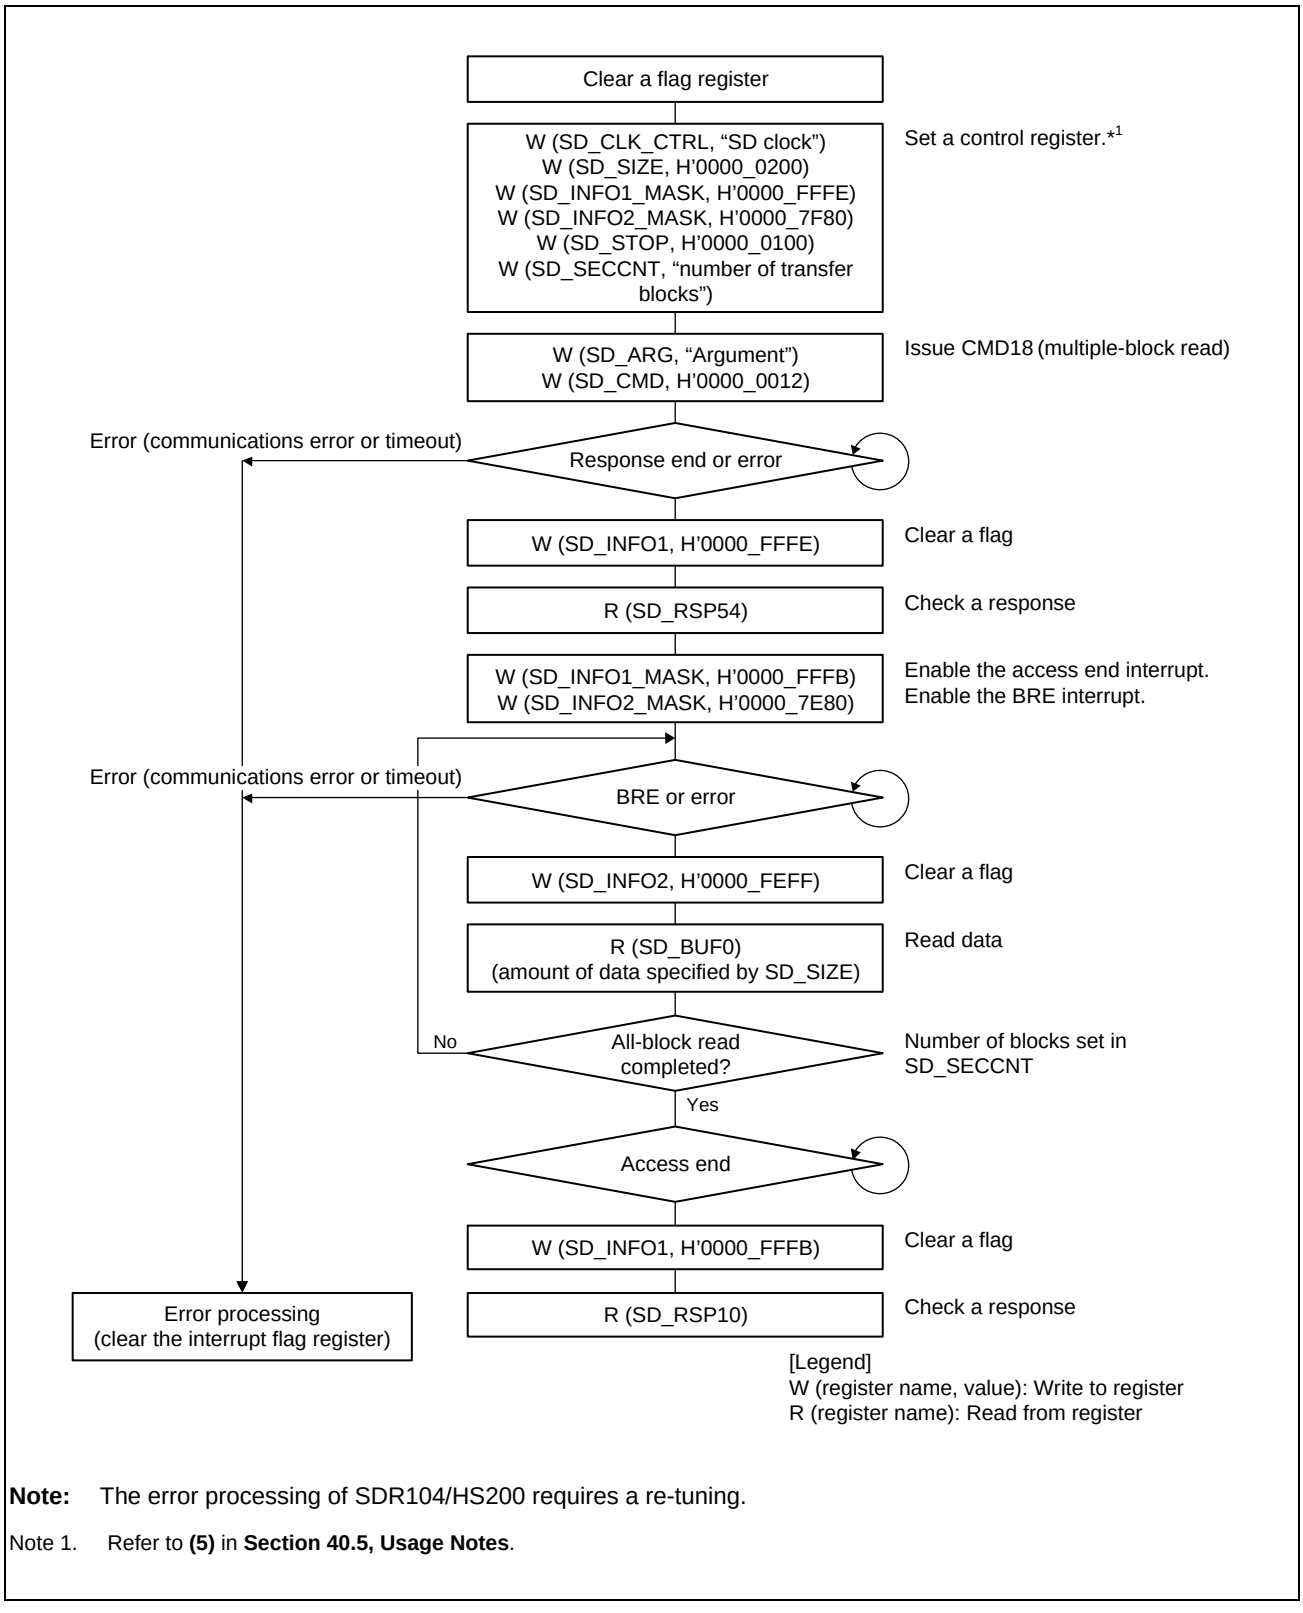
The operation of the single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.
6. Operation complete
   When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.4 Multiple Block Read

(1) Flowchart



Note: The error processing of SDR104/HS200 requires a re-tuning.

Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.14 Multiple Block Read Flowchart Example

(2) Operation for Multiple Block Read

The operation of the multiple block read is described below.

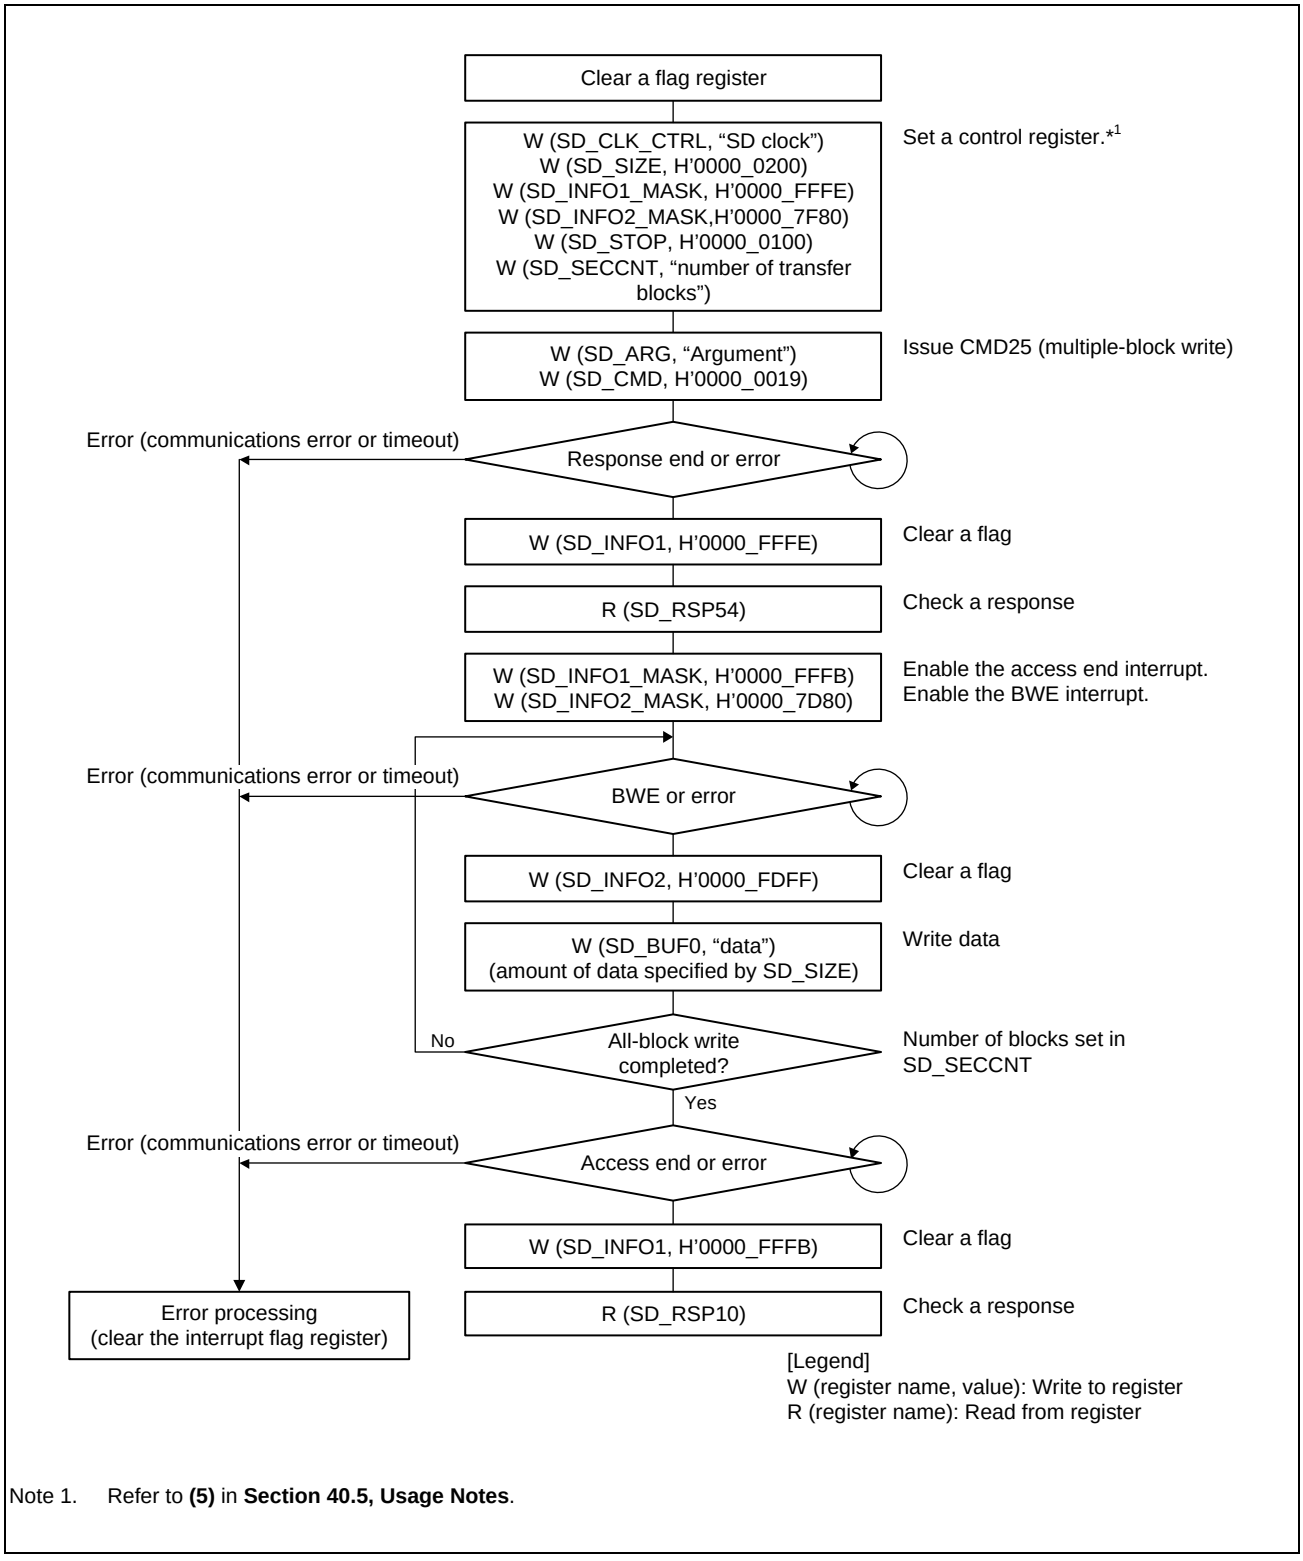
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD18)
   Set CMD18 Argument in SD_ARG and write H'0000 0012 to SD_CMD.
   Accordingly, CMD18 is issued, and the multiple block read operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data receive from SD card and data read
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H'0000 000.
6. Operation complete
   When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.5 Multiple Block Write (when Using Internal Timer)

(1) Flowchart

Figure 40.15 shows the flowchart when using an internal timer.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.15 Multiple Block Write Flowchart Example (when Using Internal Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

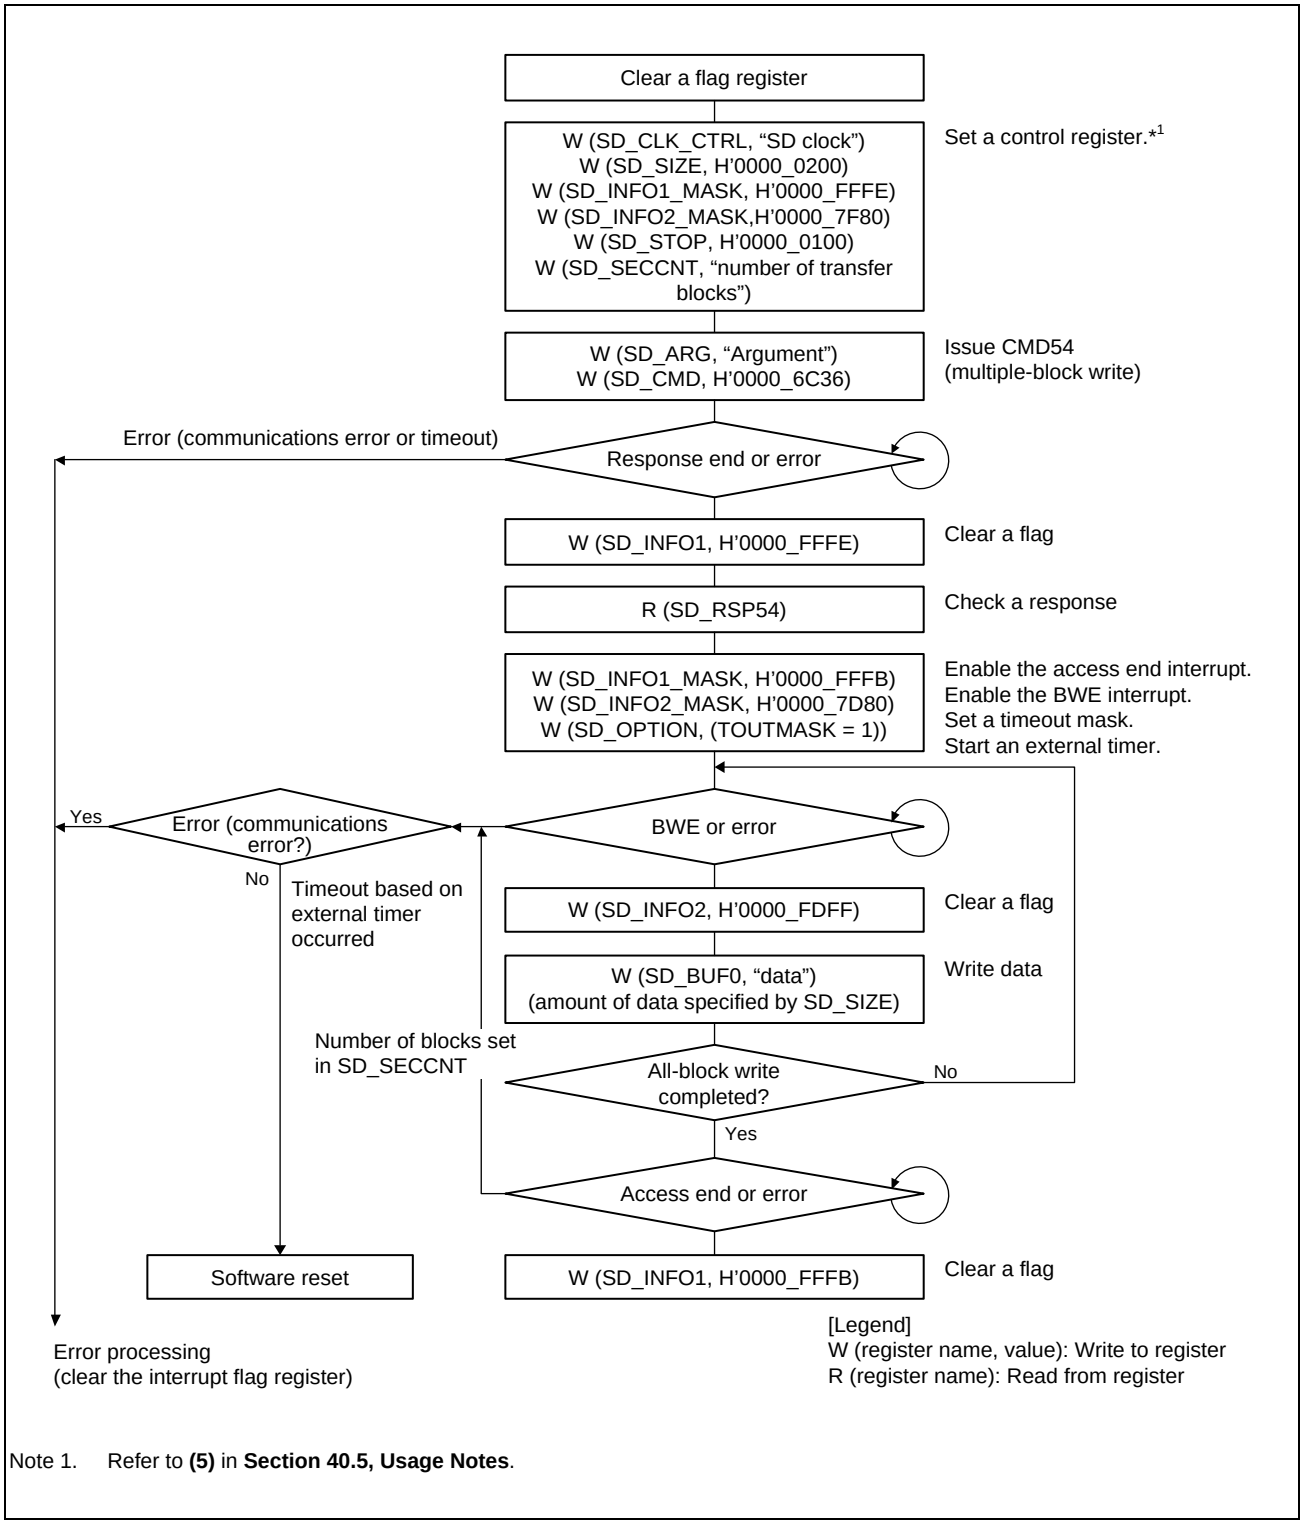
1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H’0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress. CMD12 is automatically issued to stop multi-block transfer with the number of blocks which is set to SD_SECCNT and the response is received. At this point, CMD12 Argument is automatically set to H’0000 0000.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.6 Multiple Block Write (when Using External Timer)

(1) Flowchart

The flowchart when using an external timer instead of an internal timer of this module is shown below.



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.16 Multiple Block Write Flowchart Example (when Using External Timer)

(2) Operation for Multiple Block Write

The operation of the multiple block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD54)
   Set CMD54 Argument in SD_ARG and write H’0000 6C36 to SD_CMD.
   Accordingly, CMD54 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H’0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H’0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. Set the TOUTMASK bit in SD_OPTION to disable timeout and start an external timer.
   When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Operation complete
   When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs at response reception (a communications error or timeout) or at data transmission. Perform a software reset if a timeout occurs at data transmission based on an external timer.

40.4.7 IO_RW_DIRECT Commend (CMD52)

Figure 40.26 Example of the High-Priority Interrupt (without Data Transfer) Flowchart

(2) Operation for High-Priority Interrupt without Data Transfer

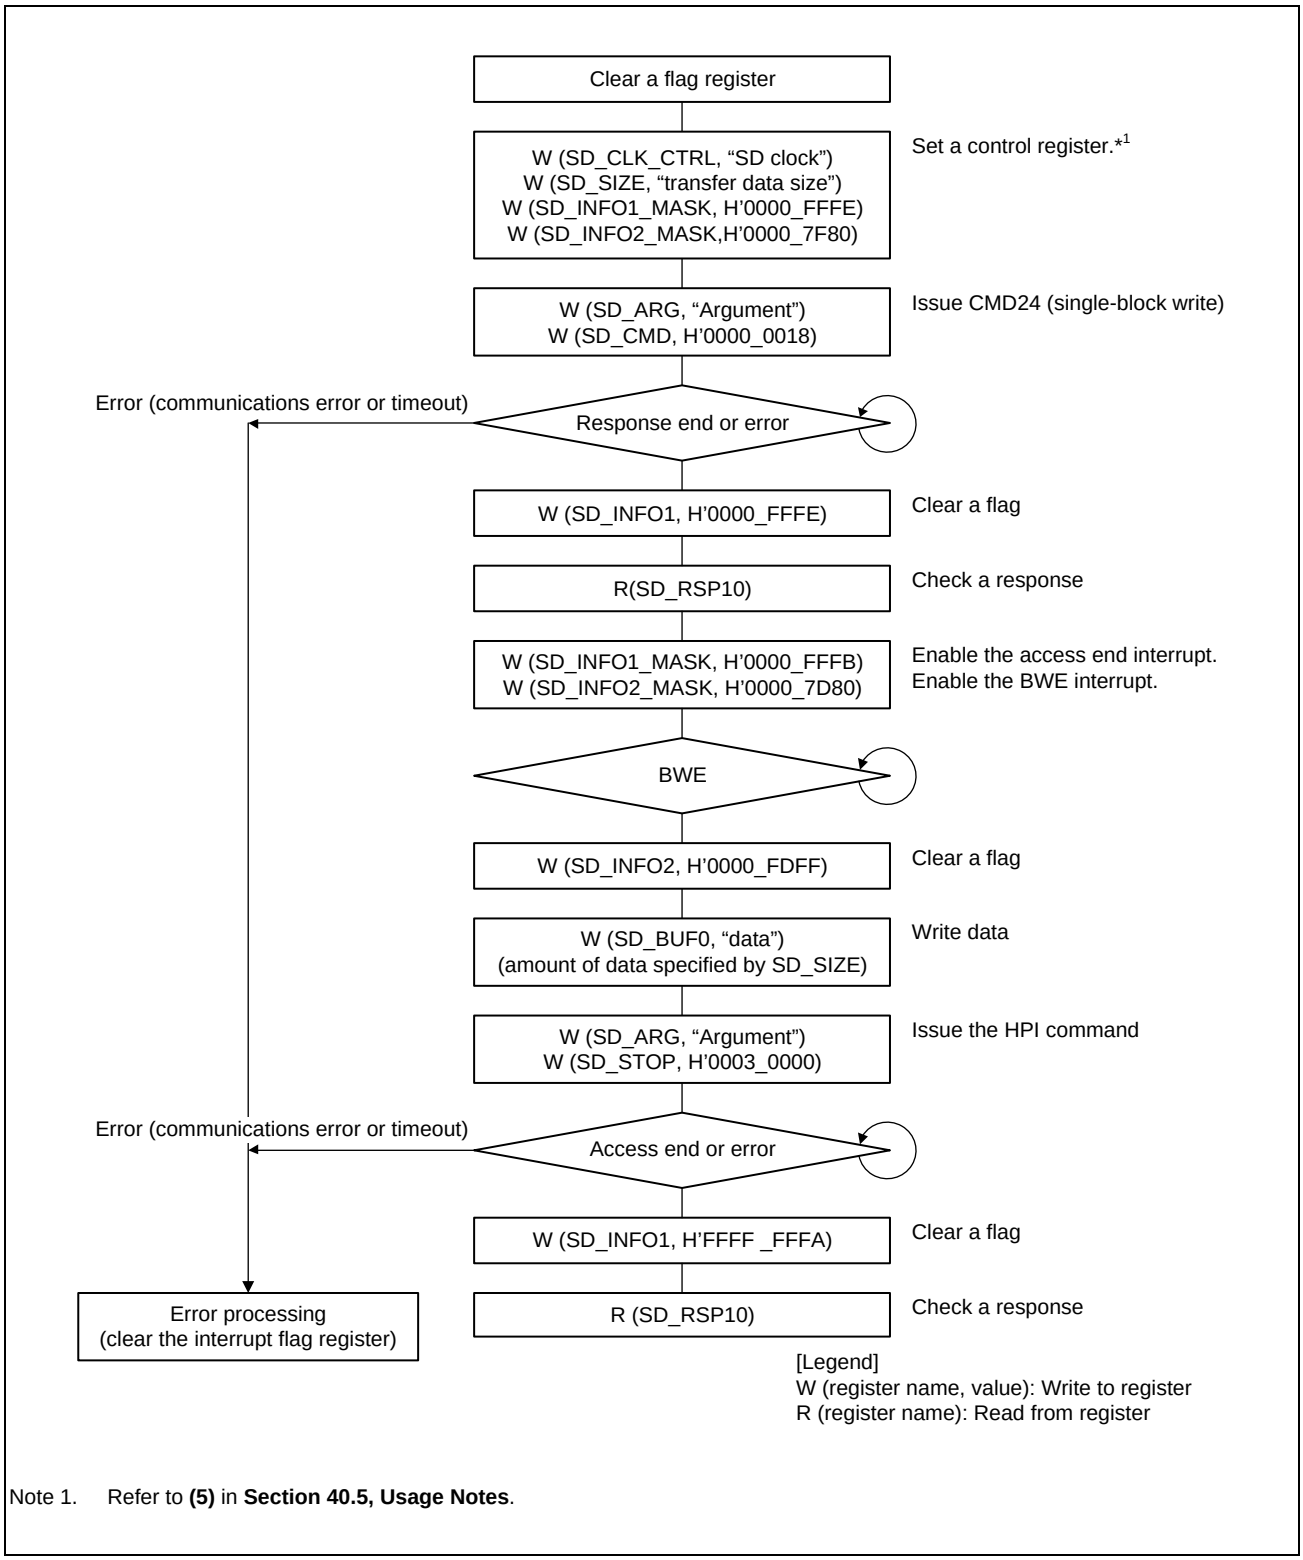
The operation of the high-priority interrupt (HPI) without data transfer is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), HPI enable, interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue
   Set the CMD Argument in SD_ARG and write to SD_CMD.
   Accordingly, CMD is issued, and the operation is started.
4. Flag clear
   On receiving the response, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0.
5. Read the response from SD_RSP10.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO0 bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 to read the response from SD_RSP10.
   This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.12 High-Priority Interrupt (at Single Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.27 Example of the High-Priority Interrupt (at Single Block Write) Flowchart

(2) Operation for HPI at Single Block Write

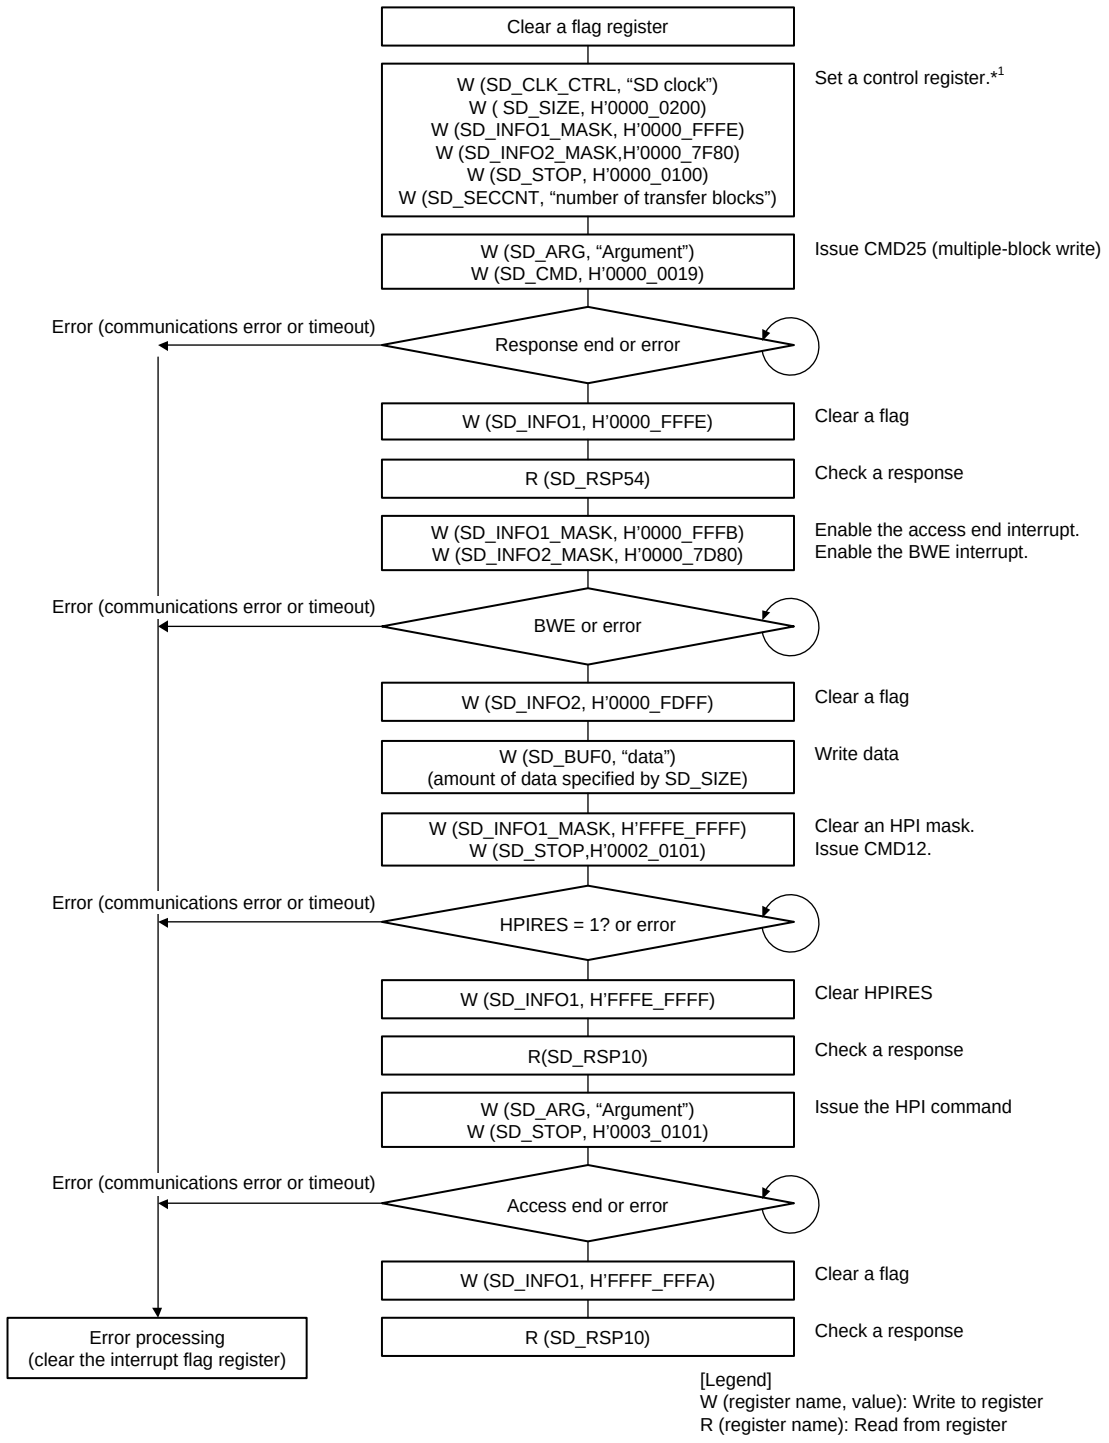
The operation of HPI at single block write is described below.

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
3. Command issue (CMD24)
   Set CMD24 Argument in SD_ARG and write H'0000 0018 to SD_CMD.
   Accordingly, CMD24 is issued, and the single block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP10.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
   If the command sequence is halted, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

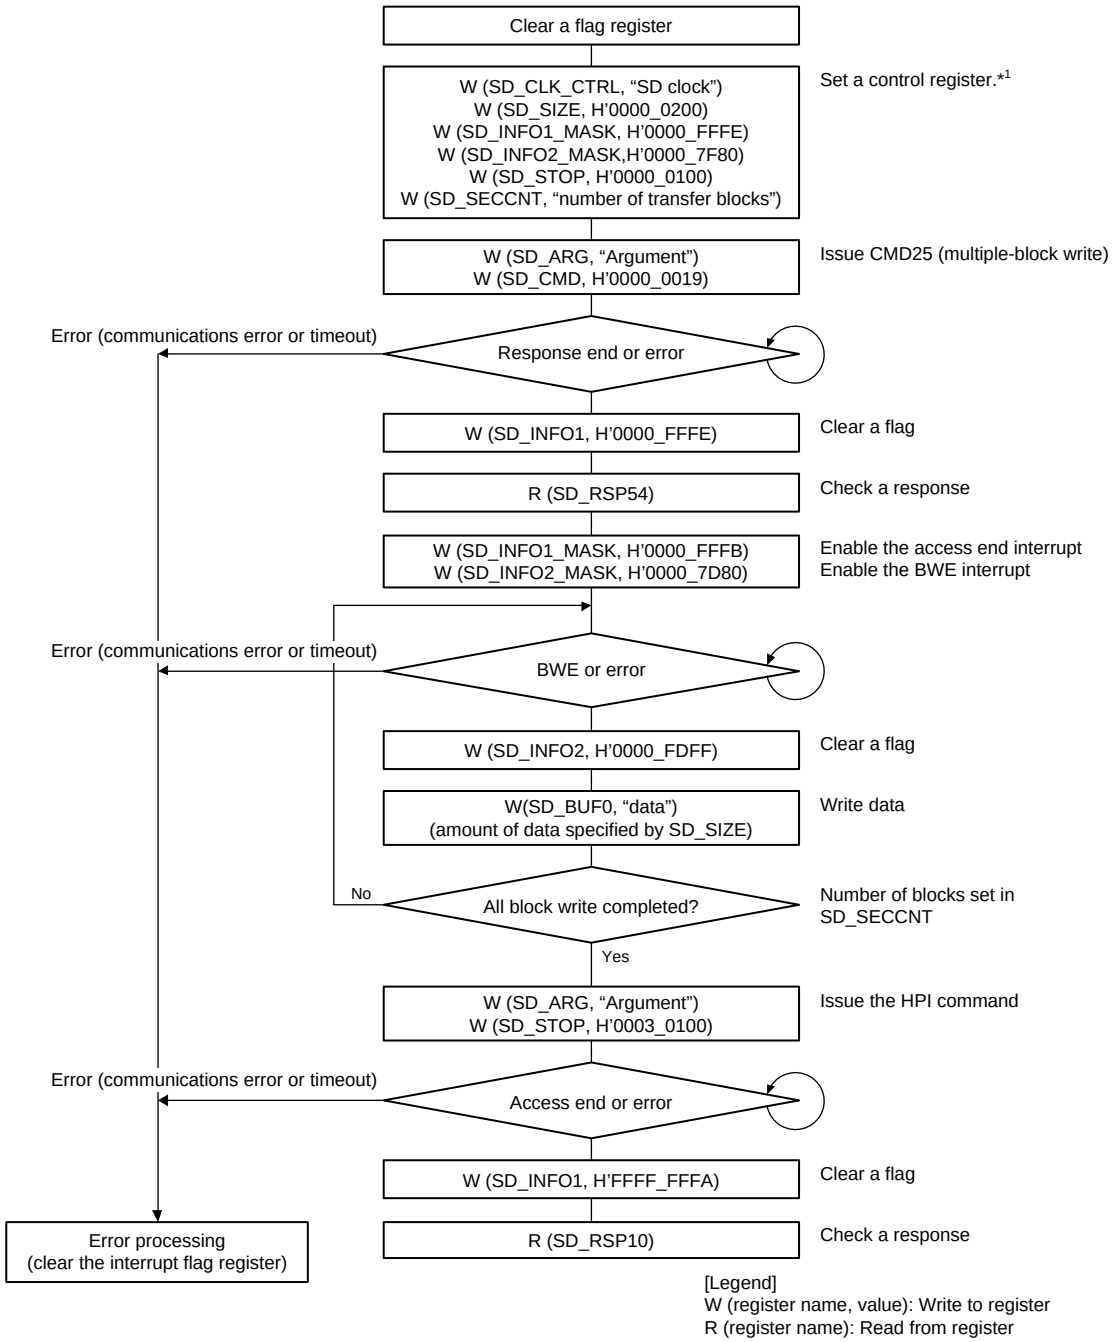
40.4.13 High-Priority Interrupt (at Multiple Block Write)

(1) Flowchart



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.28 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (a)



Note 1. Refer to **(5)** in **Section 40.5, Usage Notes**.

Figure 40.29 Example of the High-Priority Interrupt (at Multiple Block Write) Flowchart (b)

(2) Operation for HPI at Multiple Block Transfer

The operation of HPI at the multiple block write is described below.

(a) When not all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. Command issue (CMD12)
   Write H'FFFE FFFF to SD_INFO1_MASK to enable the HPIRES interrupt. Write H'0002 0101 to SD_STOP, which causes CMD12 to be issued.
7. Response check
   When the response is received, the HPIRES bit in SD_INFO1 is set to 1 to generate an interrupt. Clear the HPIRES bit to 0 to read the response from SD_RSP10.
8. HPI command issue (CMD25)
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
9. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

(b) When all the data has been written to SD_BUF

1. Flag register clear
   First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
2. Control register set
   Set the SD clock (SDCLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
   Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.
3. Command issue (CMD25)
   Set CMD25 Argument in SD_ARG and write H'0000 0019 to SD_CMD.
   Accordingly, CMD25 is issued, and the multiple block write operation is started.
4. Response check
   On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP54.
   If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed. Clear the INFO2 bit to 0 and read the response.
5. Data write and data transmit to SD card
   Write H'0000 FFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write H'0000 7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card.
   Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT.
   However, a communications error or timeout may be generated if data are being transmitted while writing to SD_BUF0 is in progress.
6. HPI command issue
   Set the HPI command argument in SD_ARG and set the HPIMODE and HPICMD bits in SD_STOP to 1.
7. Operation complete
   When reception of the response to the HPI command is completed and the busy state is released, the INFO2 and INFO0 bits in SD_INFO1 are set to 1 to generate an interrupt. Clear the INFO2 and INFO0 bits to 0 to read the response from SD_RSP10. This is the end of HPI operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

40.4.14 Example of SD_CMD Register Setting

Table 40.8 lists the example of SD_CMD (SD interface) register setting.

Table 40.8 Example of SD_CMD Register Setting (SD) (1/2)

Type	Command	Example of SD_CMD Register Setting	Remark
CMD	CMD0	H'0000 0000

40.5 Usage Notes

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.

If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.

However, for the single byte (in the case of 16- or 32-bit access) or three bytes (in the case of 32-bit access) when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even (in the case of 32-bit access), since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. This must be avoided by either of the following countermeasures.

1) When receiving one or two blocks of data, use single block reading.
2) Read the response to CMD18 from SD_RSP54.

<Mechanism of incorrect reading>

Figure 40.30 shows the processing flows of SD/MMC host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of **Figure 40.30**, when an interrupt is generated on reception of the CMD18 response and the timing with which the SD card response register (SD_RSP10) is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

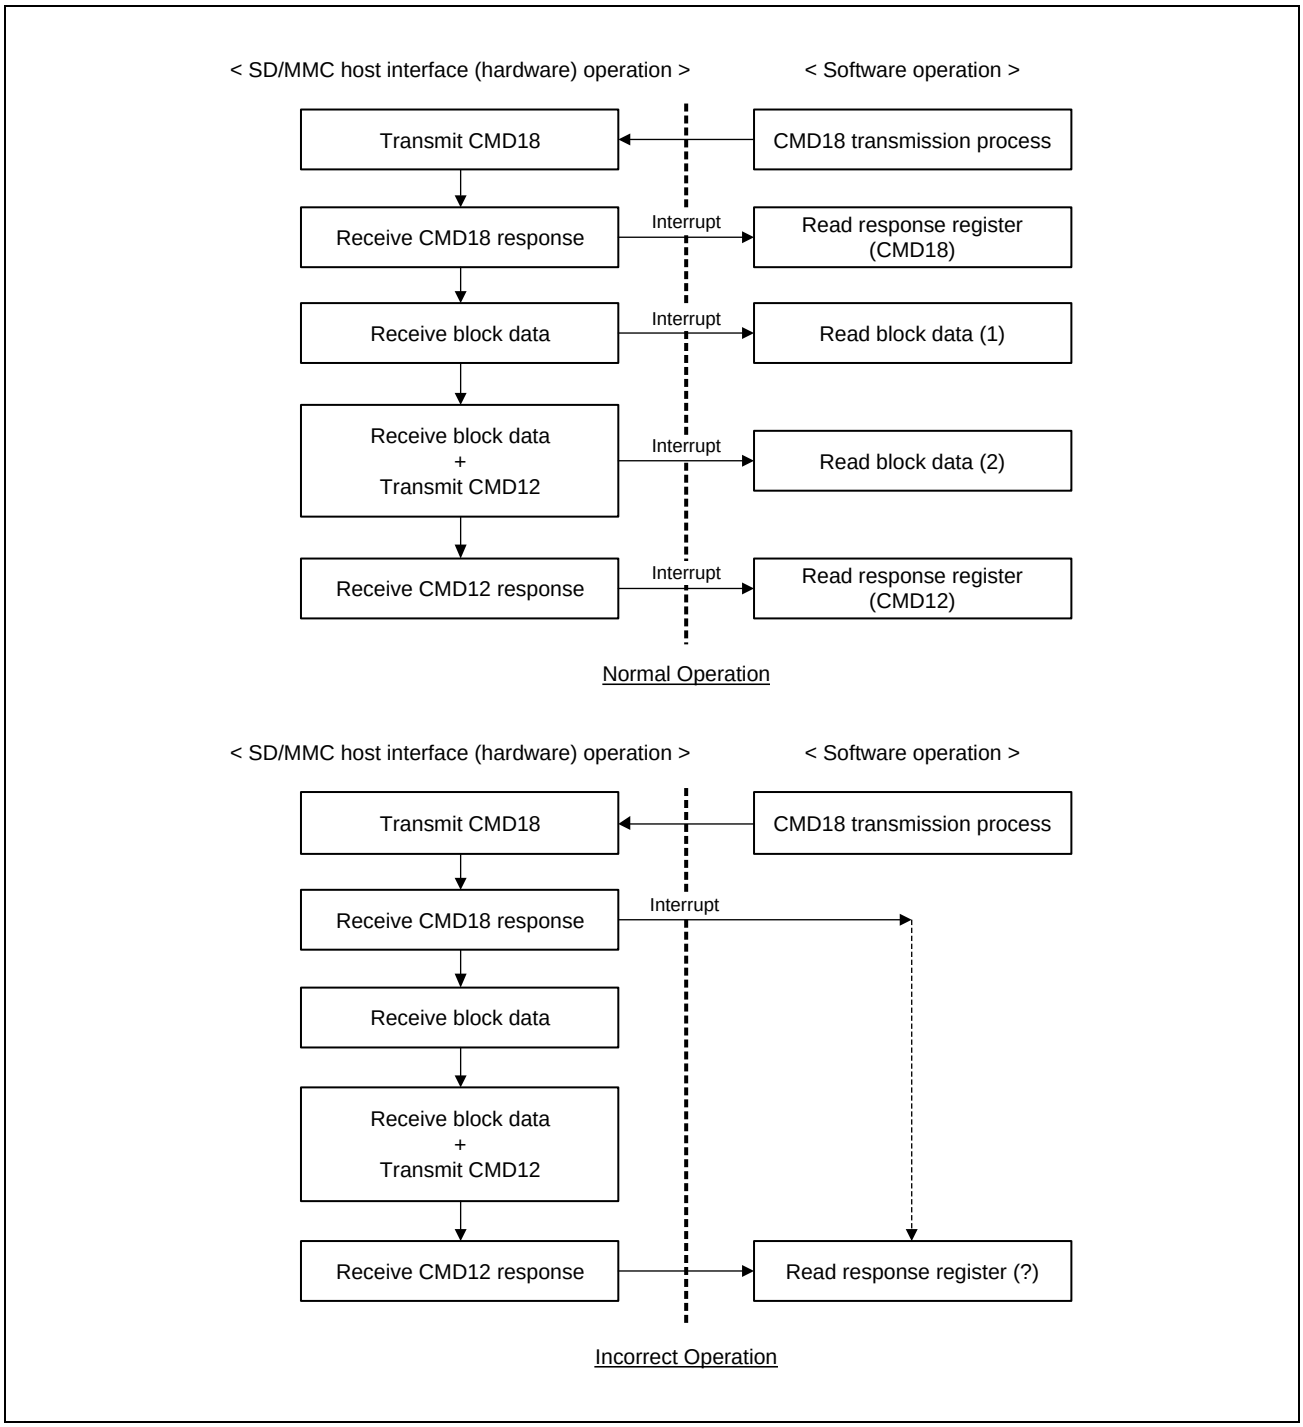

Figure 40.30 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SDCLK Output

In the SD Card standard, 74 cycles of SDCLK must be output before initialization of the card. For this reason, use automatic control of SDCLK output after 74 cycles of SDCLK have been output. Furthermore, if automatic control of SDCLK output was in use, SDCLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SDCLK output and restart supply of SDCLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Notes on SD_CLK_CTRL Register Settings

When the SCLKDIVEN bit in SD_INFO2 is 0, SD_CLK_CTRL cannot be written to. Before writing to SD_CLK_CTRL, be sure to check that the SCLKDIVEN bit in SD_INFO2 is 1.

(6) Restrictions on specifications

1. The SDIO suspend/resume is not supported.
2. The SPI bus is not supported.
3. The shared bus and 8-bit SD bus for embedded SDIO are not supported.
4. The stream transfer for MMC cards is not supported.

(7) STP bit setting during multiple block read

During execution of multiple block read with automatic CMD12 execution by setting the SEC bit in SD_STOP to 1, even if the STP bit in SD_STOP is set to 1 to forcibly stop the execution, the command sequence may not stop depending on the timing of setting the STP bit.

To avoid this, when setting the STP bit in SD_STOP to 1 during multiple block transfer, clear the SEC bit in SD_STOP to 0 at the same time. (Even when the SCLKDIVEN bit in SD_INFO2 is 0, change the SEC bit from 1 to 0.)

When the command sequence has not stopped because the SEC bit was not cleared to 0, the command sequence can be stopped by clearing the SDRST bit in SOFT_RST to 0.

When forcibly terminating the CMD53 multiple block transfer through the IOABT bit in SDIO_MODE, be sure to leave the SEC bit in SD_STOP as 1.

40.6 Sampling Clock Controller (SCC)

40.6.1 Features

This module controls a sampling clock (hereafter referred to as the SCC sampling clock) that is used for SD UHS-I/ SDR104 and MMC HS200. When this module is used with the LSI, SD UHS-I/SDR104 and MMC HS200 can be supported.

40.6.2 SCC Block Diagram

Figure 40.31 shows a block diagram of the sampling clock controller.

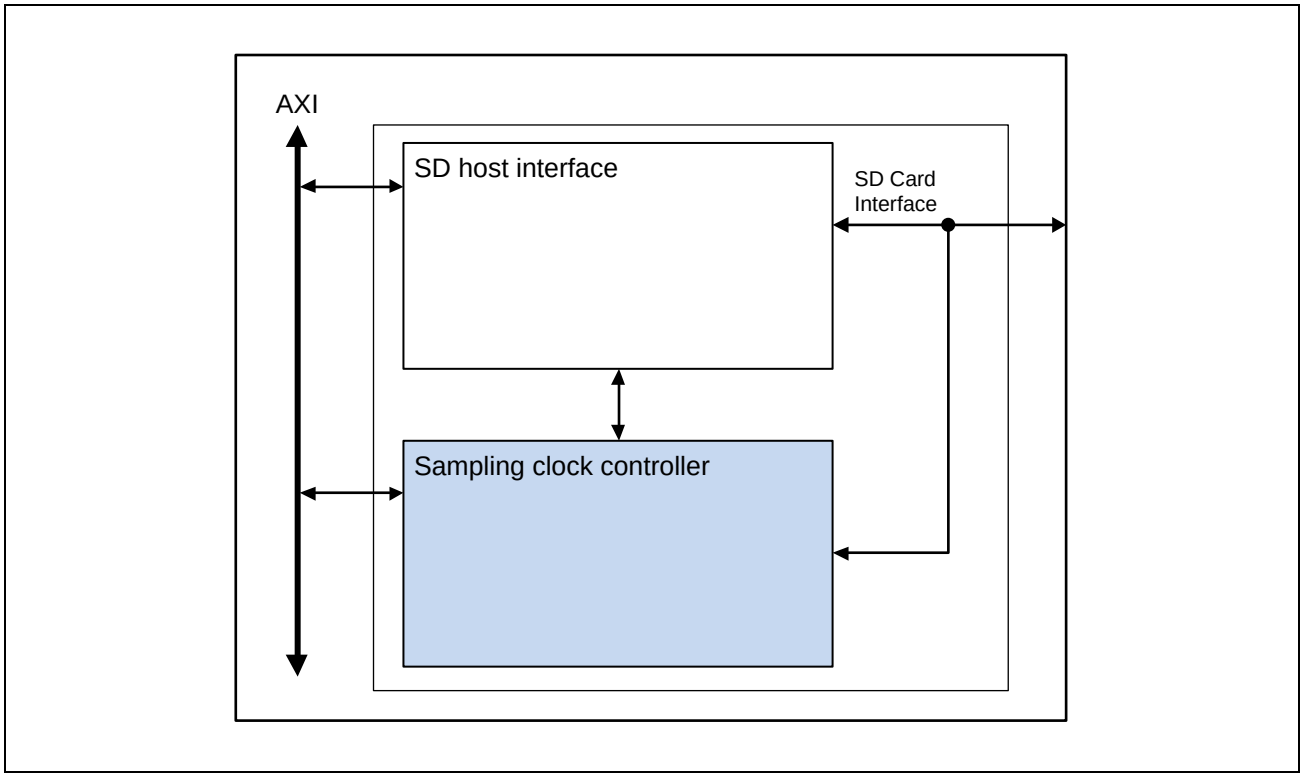

Figure 40.31 Block Diagram of the Sampling Clock Controller

40.6.3 SCC Register Configuration

Table 40.10 shows the SCC registers. Regarding the base address of registers as follows, refter to **Section 40.1.3**.

Channel 0: H’11C01000

Channel 1: H’11C11000

Table 40.10 Register Configuration

Name	Abbreviation	Address [9:0]	Access Size
Initial setting register	SCC_DTCNTL	H’1000	32/64
Sampling clock position setting register	SCC_TAPSET	H’1008	32/64
Hardware adjustment register 1	SCC_DT2FF	H’1010	32/64
Sampling clock selection register	SCC_CKSEL	H’1018	32/64
Sampling clock position correction register	SCC_RVSCNTL	H’1020	32/64
Sampling clock position correction request register	SCC_RVSREQ	H’1028	32/64
Sampling data comparison register	SCC_SMPCMP	H’1030	32/64
Hardware adjustment register 2	SCC_TMPPORT	H’1038	32/64

40.7 SCC Register Descriptions

40.7.1 Initial Setting Register (SCC_DTCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
23 to 16	TAPNUM7 to TAPNUM0	H'08	R/W	When bits DIV7 to DIV0 in the SD_CLK_CTRL register are H'FF (1: 1 mode), set these bits to H'08.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	TAPEN	0	R/W	SCC Sampling Clock Operation Enable 0: SCC sampling clock operation is disabled. 1: SCC sampling clock operation is enabled.

40.7.2 Sampling Clock Position Setting Register (SCC_TAPSET)

Bit	Bit Name	Initial Value	R/W	Description
63 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
7 to 0	TAPSET7 to TAPSET0	H'00	R/W	SCC Sampling Clock Position • Set the tuning result in the range from 0 to TAPNUM-1.

40.7.3 Sampling Clock Selection Register (SCC_CKSEL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
0	DTSEL	0	R/W	Sampling Clock Selection 0: An SCC sampling clock is not used (for other than SDR104 and HS200). 1: An SCC sampling clock is used (for SDR104 or HS200). • For SDR104 or HS200, set DTSEL to 1. DIV[7:0] in the SD_CLK_CTRL register to H'FF (1:1 mode). • When this bit is switched, stop the SD clock output from the SD/MMC host interface (set SCLKEN in SD_CLK_CTRL to 0).

40.7.4 Sampling Clock Position Correction Register (SCC_RVSCNTL)

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	TAPSEL7 to TAPSEL0	H'00	R	SCC Sampling Clock Position Display • Displays the SCC sampling clock position selected by hardware. • After RVSEN has been set to 1, the value may differ from that of TAPSET.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
1	RVSW	0	R/W	This bit is read as 0. The write value should be 1.
0	RVSEN	0	R/W	SCC Sampling Clock Position Correction Enable 0: SCC sampling clock position correction is disabled. 1: SCC sampling clock position correction is enabled. • When RVSEN is set to 1 after tuning has been performed, this module corrects the SCC sampling clock position each time of a command sequence of the SD/MMC host interface. • However, when RVSERR is 1, this module does not correct the SCC sampling clock position. • While tuning is being performed, set RVSEN to 0.

40.7.5 Sampling Clock Position Correction Request Register (SCC_RVSREQ)

Bit	Bit Name	Initial Value	R/W	Description
63 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
2	RVSERR	0	R/W	SCC Sampling Clock Position Correction Error 0: There is no correction error. 1: There is a correction error. • If this bit is set to 1 after a command sequence, write 0 to this bit and perform tuning again. • Ignore this bit while tuning is being performed. • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
1	REQTAPUP	0	R/W	SCC Sampling Clock Position Positive Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the positive direction (when TAPSEL = TAPNUM-1, set 0 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.
0	REQTAPDWN	0	R/W	SCC Sampling Clock Position Negative Direction Correction Request 0: There is no correction request. 1: There is a correction request. • If this bit is set to 1 after a command sequence, write 0 to this bit and rewrite TAPSET in the negative direction (when TAPSEL = 0, set TAPNUM-1 to TAPSET). • When RVSEN is 1, this bit is disabled (this bit is not set to 1). • Writing 1 to this bit is disabled and writing 0 to this bit is only enabled.

40.7.6 Hardware Adjustment Register 1 (SCC_DT2FF)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 8	DT2NE	H'03	R/W	Hardware Adjustment 2 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H'02 to this bit, make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.
7 to 0	DT2NS	H'00	R/W	Hardware Adjustment 1 This is a setting register for adjusting the timing inside the IP when using Tuning. When using Tuning, set H'07 to this bit., make the setting before setting 1 in SCC_CKSEL [0] .DTSEL.

40.7.7 Sampling data comparison register (SCC_SMPCMP)

Data comparison register indicates the result of the comparison of the sampling data. The subject of the comparison is the before and the behind TAP.

Bit	Bit Name	Initial Value	R/W	Description
63 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
24 to 16	CMPNGU	All 0	R/W	Comparison of sampling data with the previous TAP Clock. Bit 16-23 is the comparison result of data 0-7. Bit 24 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
8 to 0	CMPNGD	All 0	R/W	Comparison of sampling data with the after TAP Clock. Bit 0-7 is the comparison result of data 0-7. Bit 8 is the comparison result of CMD. 0: Match 1: Mismatch < Clear conditions.> The start of the command sequence Write to SCC_TAPSET register

40.7.8 Hardware adjustment register 2 (SCC_TMPPORT)

This register makes a setting that SD_DATA, which has been fetched by the sampling clock at each TAP position, is used in the appropriate timing.

Bit	Bit Name	Initial Value	R/W	Description
63 to16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits.
15 to 0	TMPOUT	H’0000	R/W	Hardware adjustment 3 When using the delay tuning mechanism, set the following values. When TAPNUM = 8, set H’0000 to these bits. When operating with other than SDR104 / HS200, this register adjusts the clock delay of the Flip Flop that latches the received data from the outside of the chip. For this product, set H’0000 when transferring at 3.3V, and set H’0001 when transferring at 1.8V.

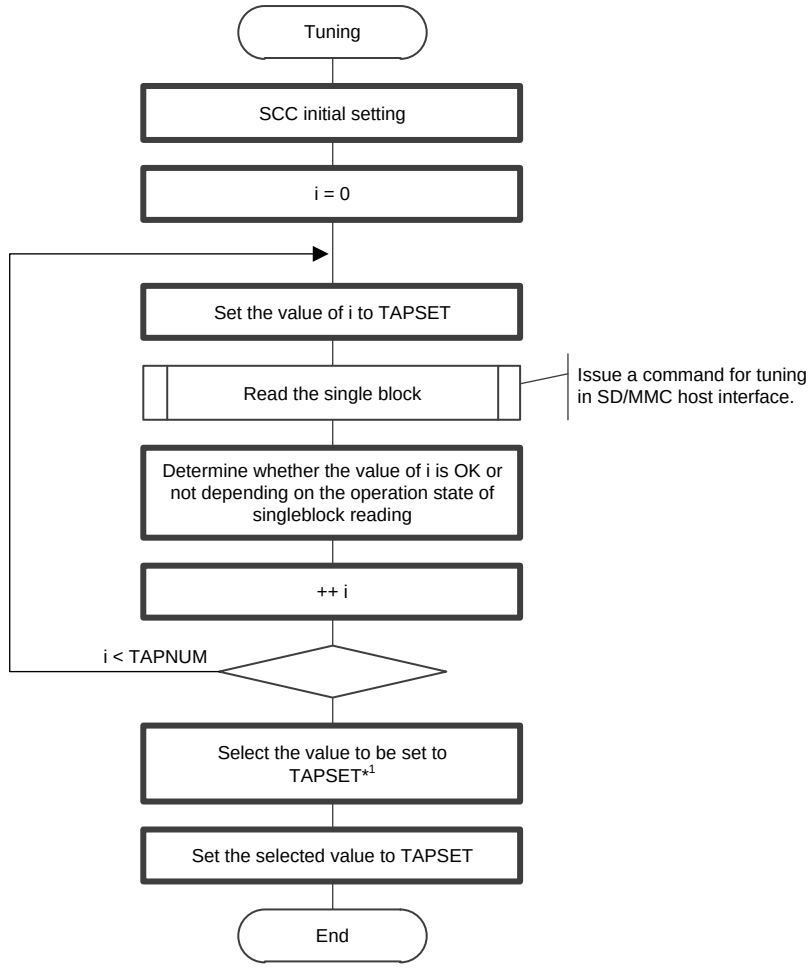
40.8 Usage Example of SCC

40.8.1 Tuning

SCC is tuned by using operation of single-block reading.

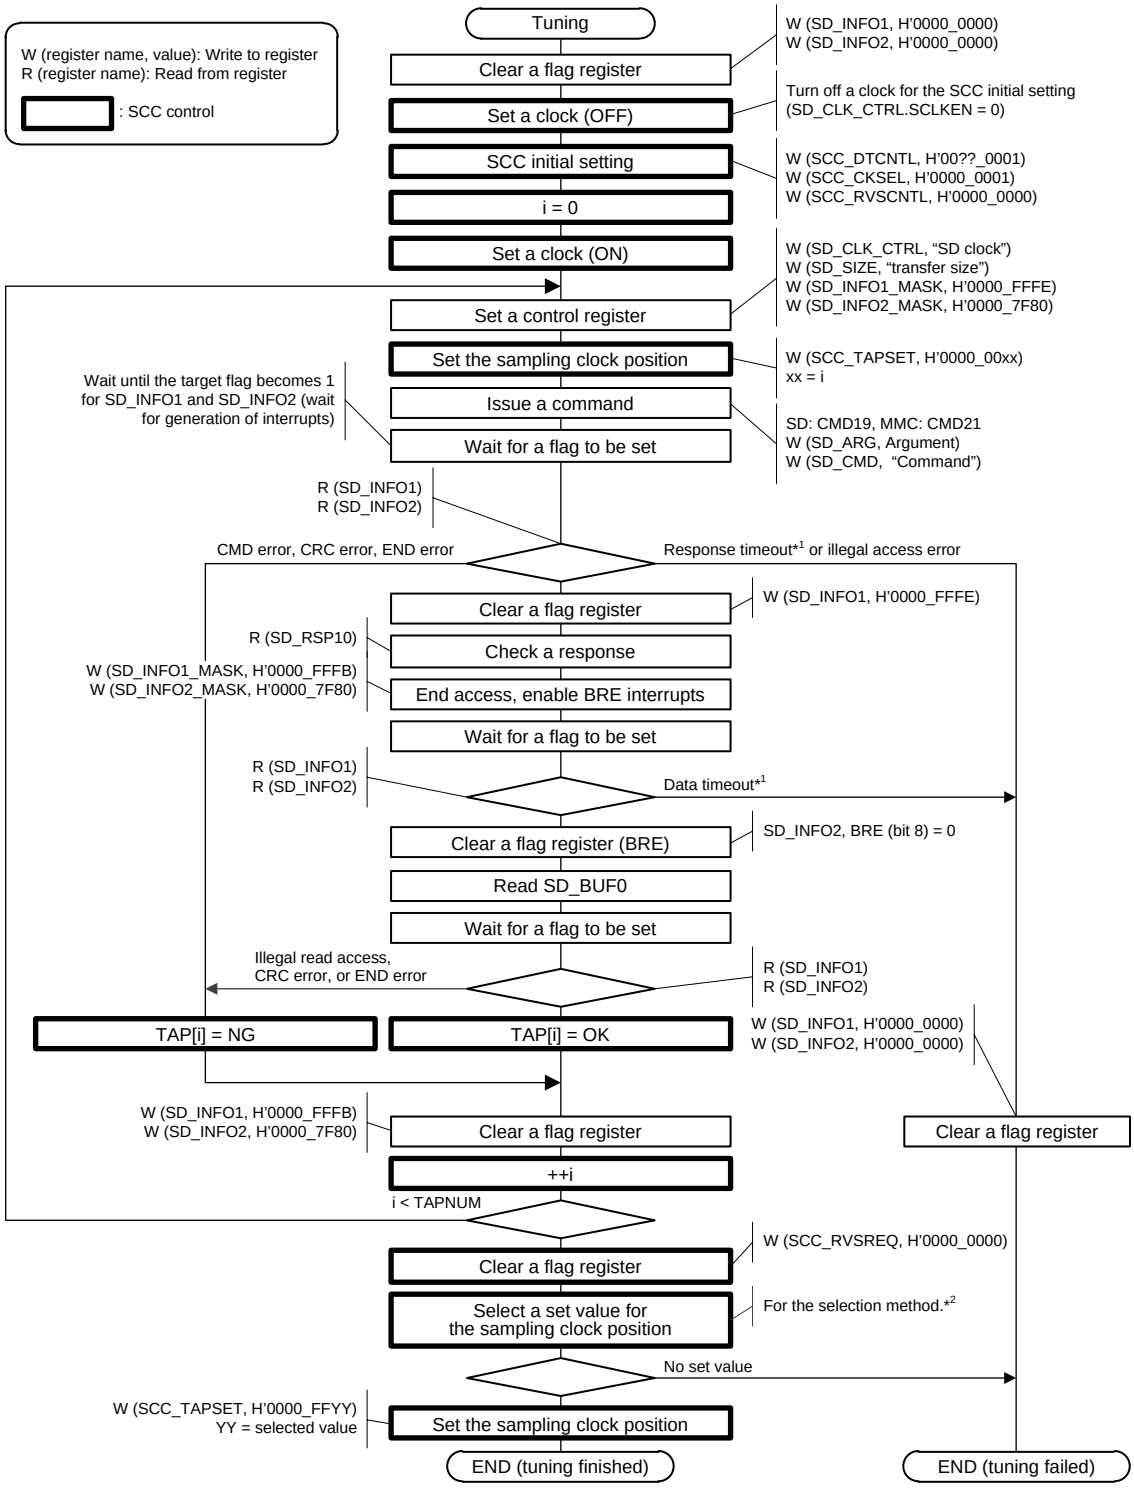
As shown in **Figure 40.32**, check whether the single-block read command normally ends when the sampling clock position is changed from 0 to TAPNUM-1 and save the result. After checking, confirm that there exists the range which has three or more continuous normal ends (OK). Then, the median value within the continuous range is determined as the final adjustment value.

Figure 40.33 and **Table 40.11** show the detailed tuning flow and the method how to select the sampling clock position (example when TAPNUM = 8).



Note 1. See the example shown in **Table 40.11**.

Figure 40.32 Example of Tuning Flow (Outline)



Note 1. If all of the TAP[i] has become "NG".

Note 2. See **Table 40.11**.

Figure 40.33 Example of Tuning Flow (Detailed)

Table 40.11 Example of the Method How to Select the Sampling Clock Position (when TAPNUM = 8)

Item	i	Case 1	Case 2	Case 3	Case 4	Case 5*1
TAP[i]	0	NG	OK	NG	OK	OK
	1	OK	OK	NG	NG	OK
	2	OK	NG	OK	NG	OK
	3	OK(←)	NG	OK	NG	OK
	4	OK	NG	NG	NG	OK
	5	OK	OK	NG	OK	OK
	6	NG	OK	NG	OK(←)	OK
Max. value→	7	NG	OK(←)	NG	OK	OK
	(0)	NG	OK	NG	OK	OK
	(1)	OK	OK	NG	NG	OK
	(2)	OK	NG	OK	NG	OK
	(3)	OK	NG	OK	NG	OK
	(4)	OK	NG	NG	NG	OK
	(5)	OK	OK	NG	OK	OK
	(6)	NG	OK	NG	OK	OK
	(7)	NG	OK	NG	OK	OK
Selected value		i = 3	i = 7	Fail	i = 6 or 7	i = 0 to 7

Remarks: (←): Example of selection, (x): repeated display of index x of TAP[x]

(a) The sampling clock position is selected by considering a margin in the range which has three or more continuous 'TAP[i] = OK'.

(b) The sampling clock position is repeated from 0 after the maximum value (TAPNUM-1). In case 2 above, that position is continued in the order of 5→6→7→0→1.

Note 1. If all of the TAP [i] is OK, the sampling clock position is selected by identifying the change point of data.
Change point of the data can be found in the value of SCC_SMPCMP register. Usage example is **Section 40.8.3, Change point of the input data**.

40.8.2 Sampling Clock Position Correction after Tuning

After tuning, correction of the sampling clock position may be required when a command is issued.

There are manual and automatic correction methods. After a command sequence, if the CMD, CRC, END error or time out occurs or the correction error occurs, tuning will be performed again. The following shows examples of manual and automatic correction methods.

(1) Manual correction of the sampling clock position

Figure 40.34 shows the flow of manual correction of the sampling clock position. **Table 40.12** shows set values determined when correction is required (when TAPNUM = 8).

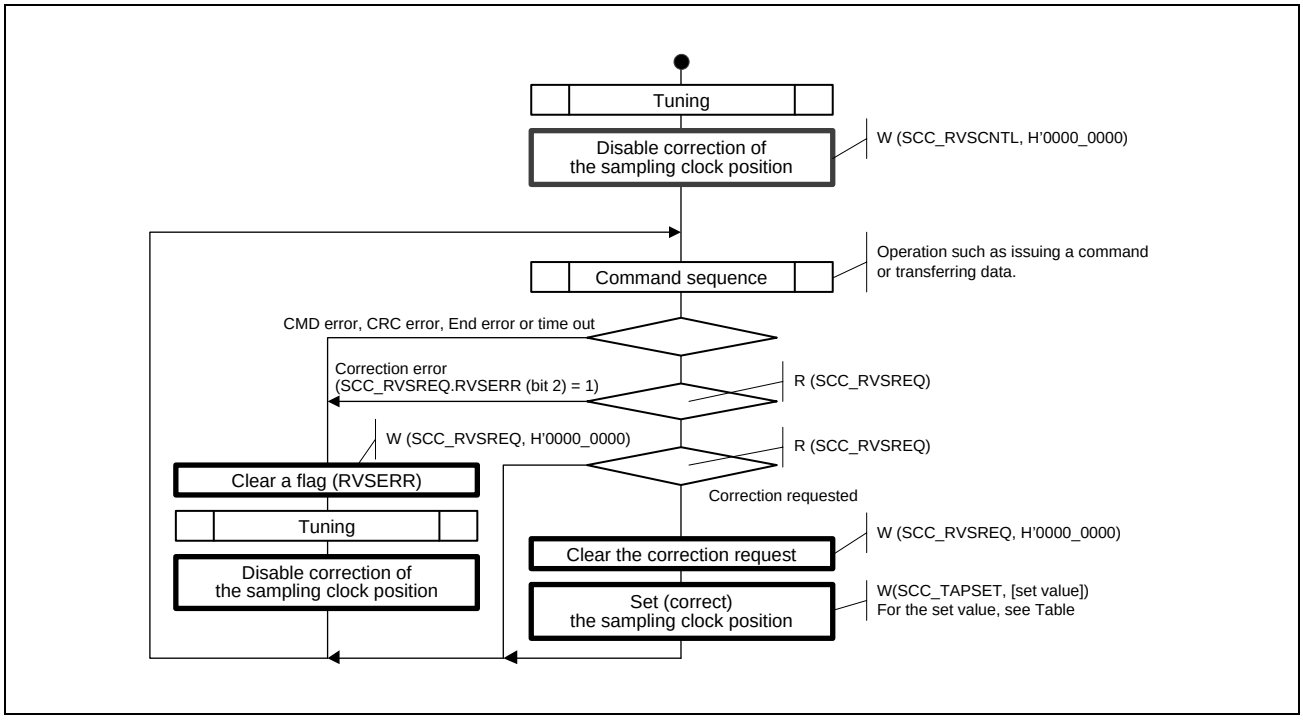


Figure 40.34 Flow of Manual Correction of the Sampling Clock Position (Example)

Table 40.12 Set Values for TAPSET when Correction is Required (when TAPNUM = 8)

No.	Current value of TAPSET	Value set to TAPSET when REQTAPUP = 1	Value set to TAPSET when REQTAPDWN = 1
1	0	1	7
2	1	2	0
3	2	3	1
4	3	4	2
5	4	5	3
6	5	6	4
7	6	7	5
8	7	0	6

Note: As is the case in the tuning selection method, the sampling clock position is 0 after the maximum value (TAPNUM-1).

(2) Automatic correction of the sampling clock position

Figure 40.35 shows the flow of automatic correction of the sampling clock position.

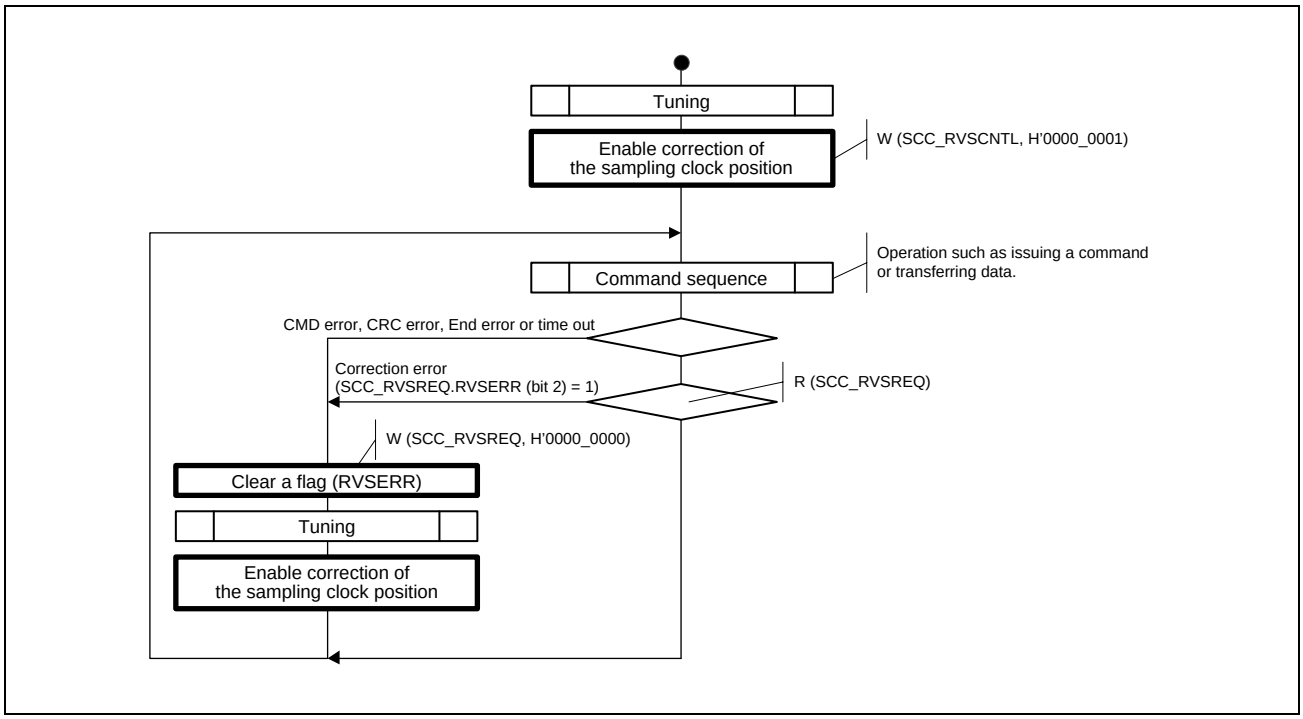

Figure 40.35 Flow of Automatic Correction of the Sampling Clock Position (Example)

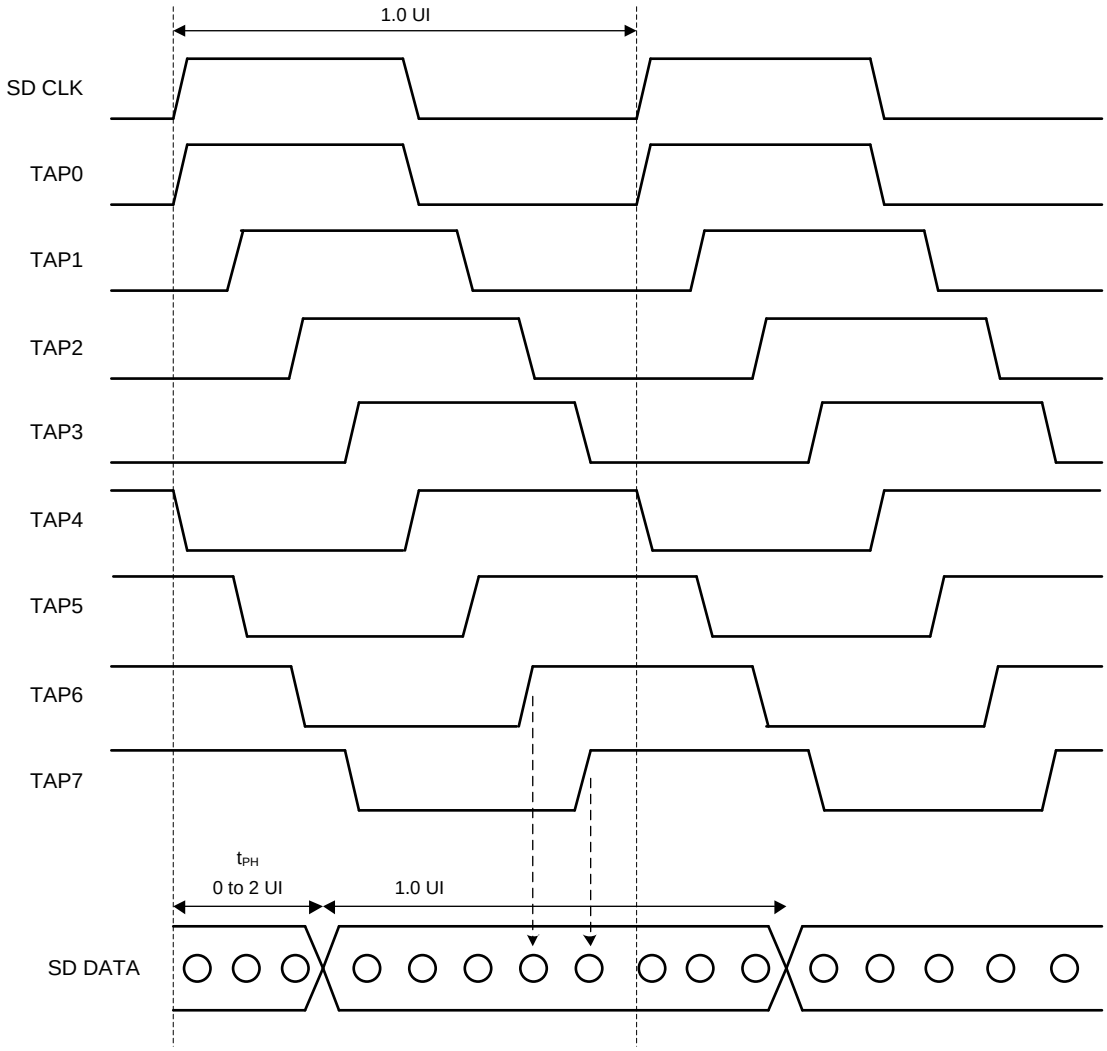
40.8.3 Change point of the input data

Tuning is capture the data by the TAP clock selected. However, also captures the data by the previous TAP clock and the behind the TAP clock at the same time. This result is reflected in the sampling data comparison register (SCC_SMPCMP). Point of mismatch before and after the selected TAP clock is the changing point of the data. In this example, it is desirable to set as TAP6 or TAP7.



Note: After recognizing the changing point of the input data, need to set the TAP clock.

Figure 40.36 Example, All taps is OK.

Figure 40.36 is shown change point of data between TAP2 and TAP3. Change point of the data can be confirmed by sampling data comparison register (SCC_SMPCMP). When the tuning of TAP2 or TAP3, CMPNGU bit of sampling data comparison register indicates a mismatch. As the width of the input data is 1 (UI), select TAP6 or TAP7 which is the median of next TAP3 from TAP3.

41. General Purpose Input Output Port (GPIO)

This LSI can use up to 82 general-purpose I/O ports.

Each port of the general-purpose I/O port is multiplexed with the terminal of the peripheral function, and either the general-purpose I/O port function or the peripheral function can be selected by setting the register.

41.1 Features

41.1.1 General Purpose Input Output Port (GPIO)

General-purpose input/output ports (GPIOs) provide general-purpose ports that can be configured as inputs or outputs.

When set as an output, it can be written to an internal register to control the state driven by the output pin. When set as an input, you can read the state of the input by reading the state of the internal registers. You can also generate interrupts using the GPIO input pin.

- GPIO Output Control (Port Register [Pn])
- GPIO Input, Output Enable (Port Mode Register [PMn])
- GPIO Input Monitor (Port Input Register [PINn])
- Interrupt used the GPIO input (Interrupt Enable Control Register[ISEL])

Also, it able to control the following on some ports

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Pull Up / Pull down Switching for each port
- Digital noise filter control for each port

41.1.2 Port Function Control

Switching of each port function can be controlled by the following register settings.

- GPIO function and peripheral function selection (Port Mode Control Register[PMCn])
- Selection of each peripheral function (Port Function Control Register[PFCm]) [Function0 to 7]

NOTE

Please refer to another file for the pin function for the peripheral functions that can be selected.
Please refer to above excel file for the“Pin function list” described in each chapter.

Do not select the same peripheral function for multiple different external terminals.

41.1.3 Special Purpose Port Function Control

The settings of the following specific ports can be controlled by registers.

- IO voltage mode control for each port
- Buffer drive ability control for each port
- Slew Rate Switching for each port
- Digital noise filter control for each port
- Ether MII / RGMII mode control

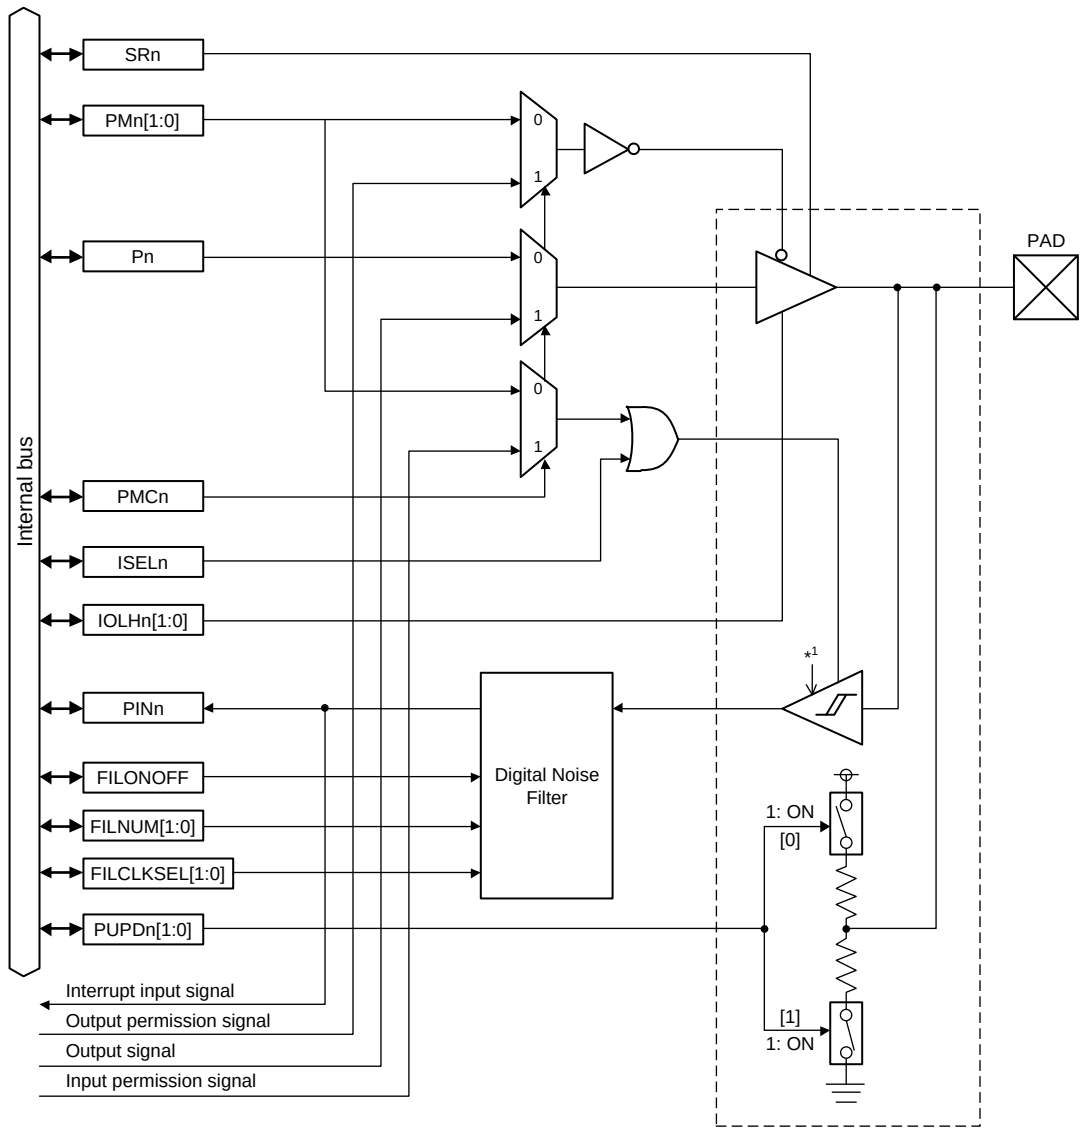
The specific ports shown below are targeted.

- Target Functions: Ether ch0/ch1, SDHI ch0/ch1, QSPI、RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2

41.1.4 General Purpose Input Output Port Configuration

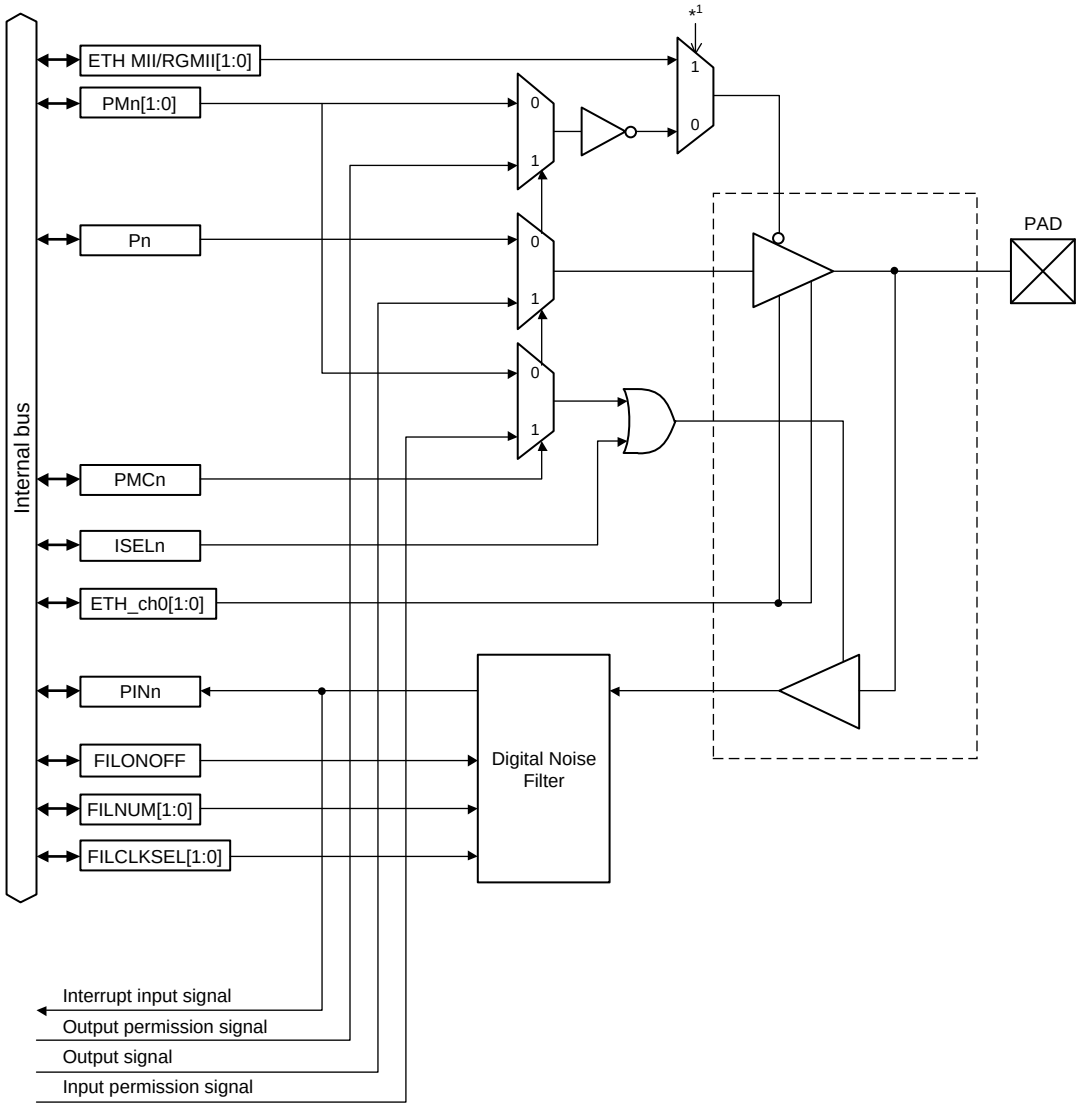
The configuration of the general-purpose I/O port is shown in **Figure 41.1** to **Figure 41.5**.

In addition, the configuration of the multiplexed Ether ch0 / ch1 is also included in the configuration diagram of the general-purpose I/O port.



Note 1. When RIIC * is selected as the peripheral module, SMT = 1 and the Schmitt trigger circuit is enabled.

Figure 41.1 P0_0 to P0_3, P5_0 to P6_4, P11_0 to P18_5 (Multiplexed peripheral functions)



Note 1. When ETH0 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.2 P1_0 (Multiplexed Ether ch0)

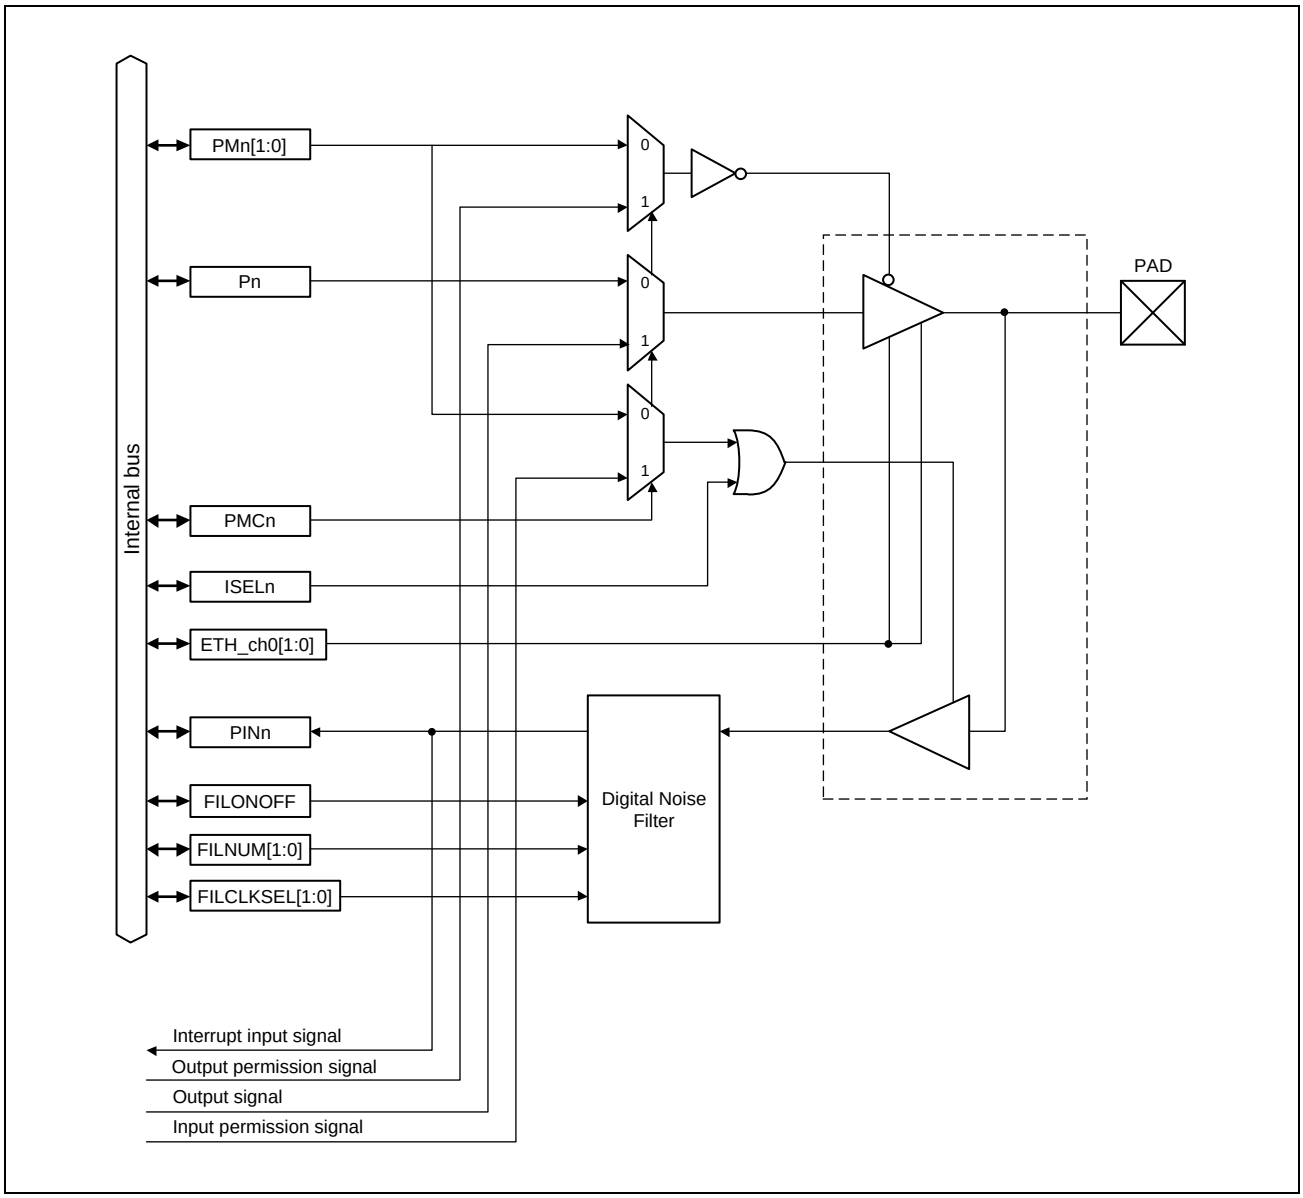


Figure 41.3 P1_1 to P4_5 (Multiplexed Ether ch0)

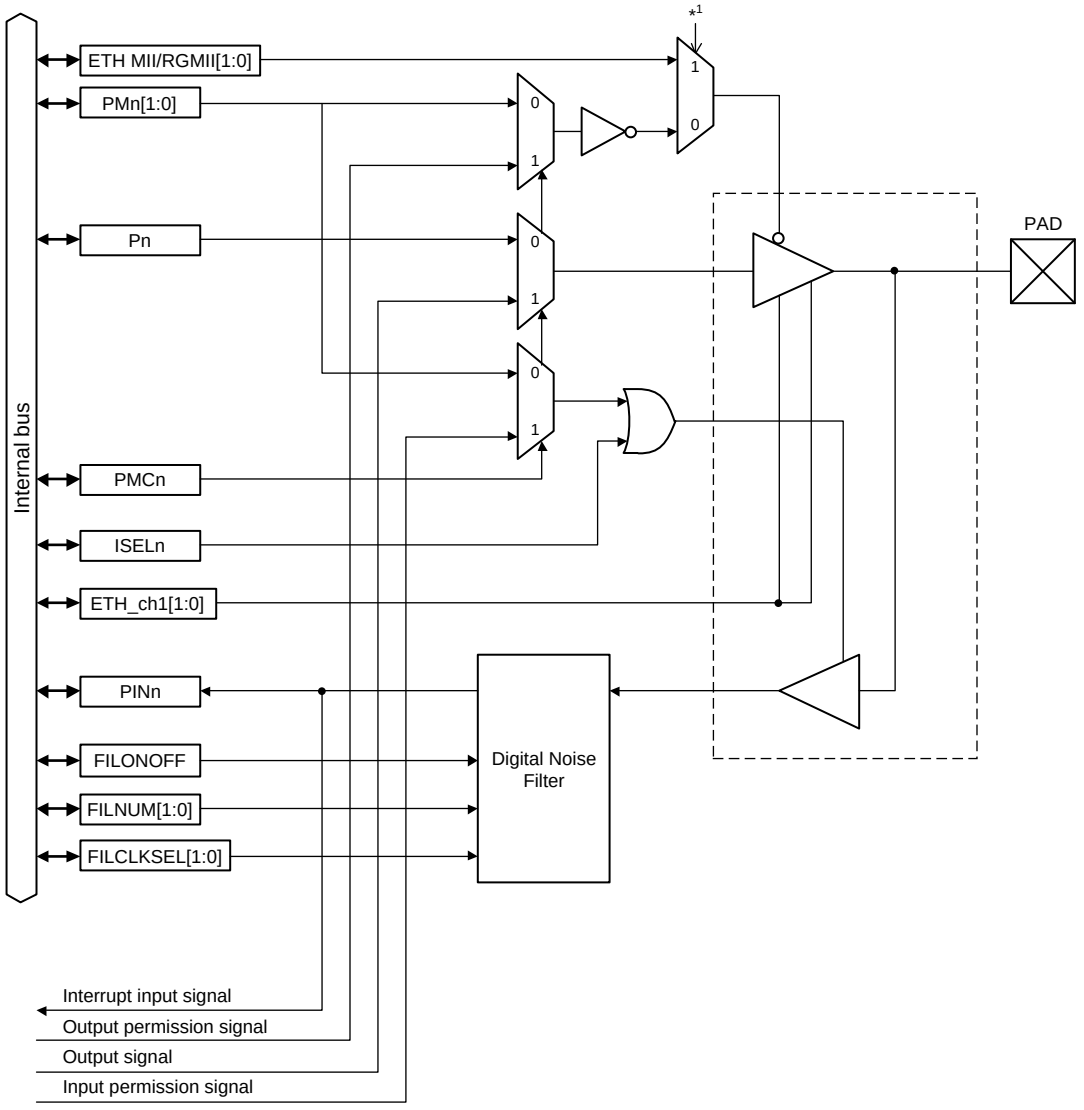

Note 1. When ETH1 is selected as the peripheral module, the ETH MII / RGMII register output is selected.

Figure 41.4 P7_0 (Multiplexed Ether ch1)

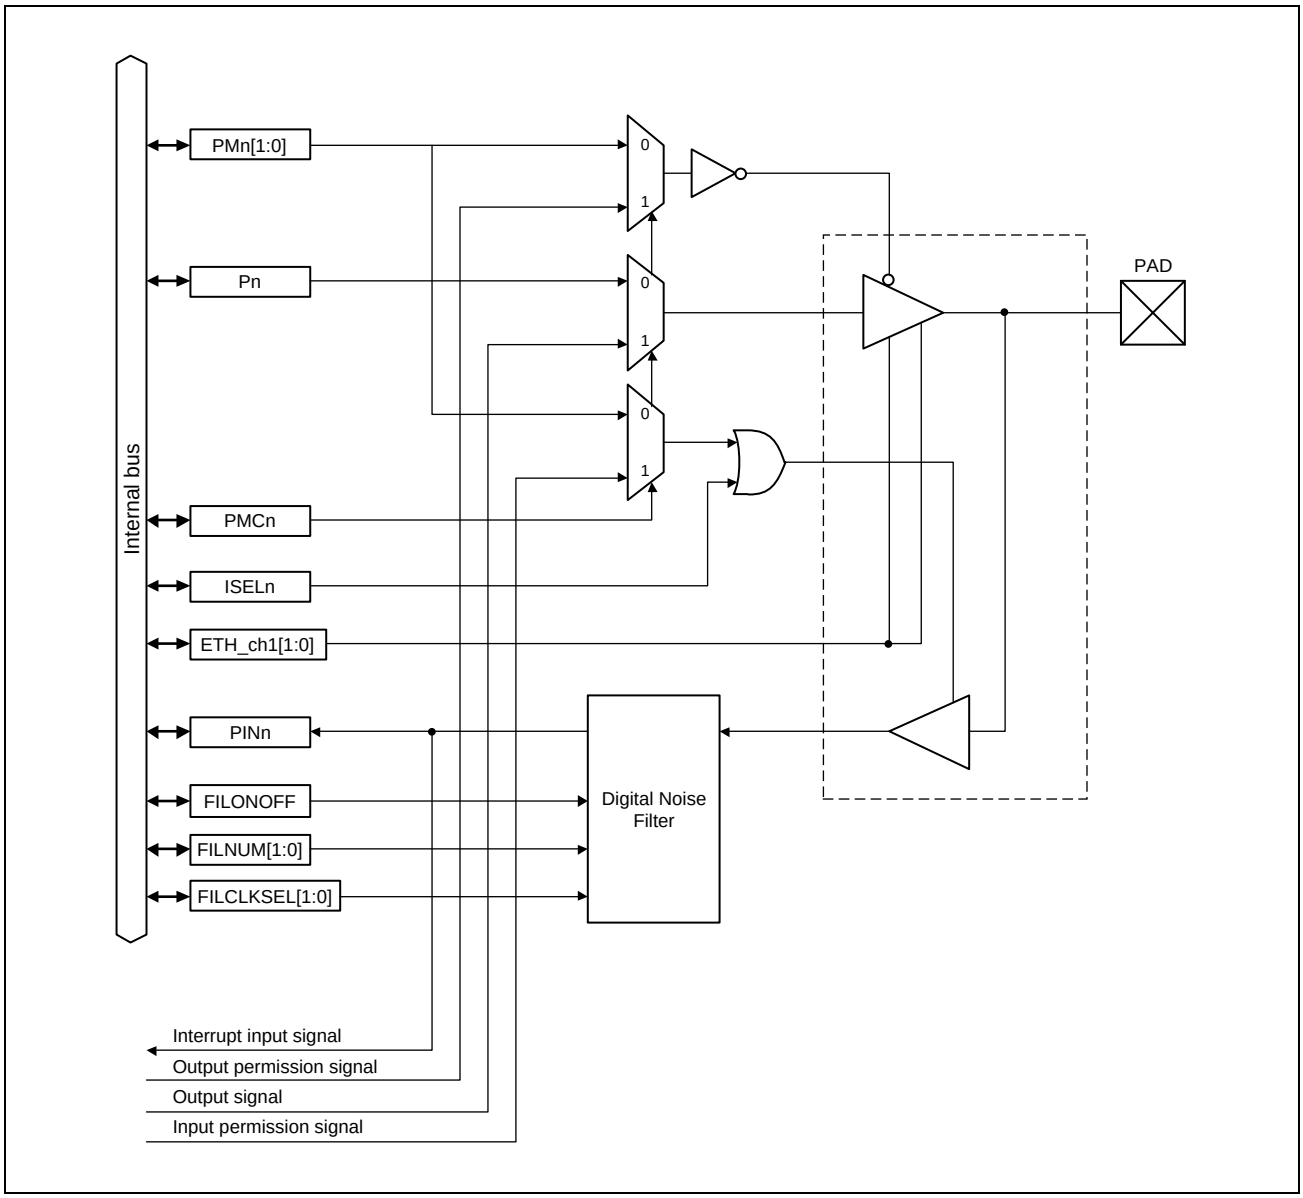

Figure 41.5 P7_1 to P10_4 (Multiplexed Ether ch1)

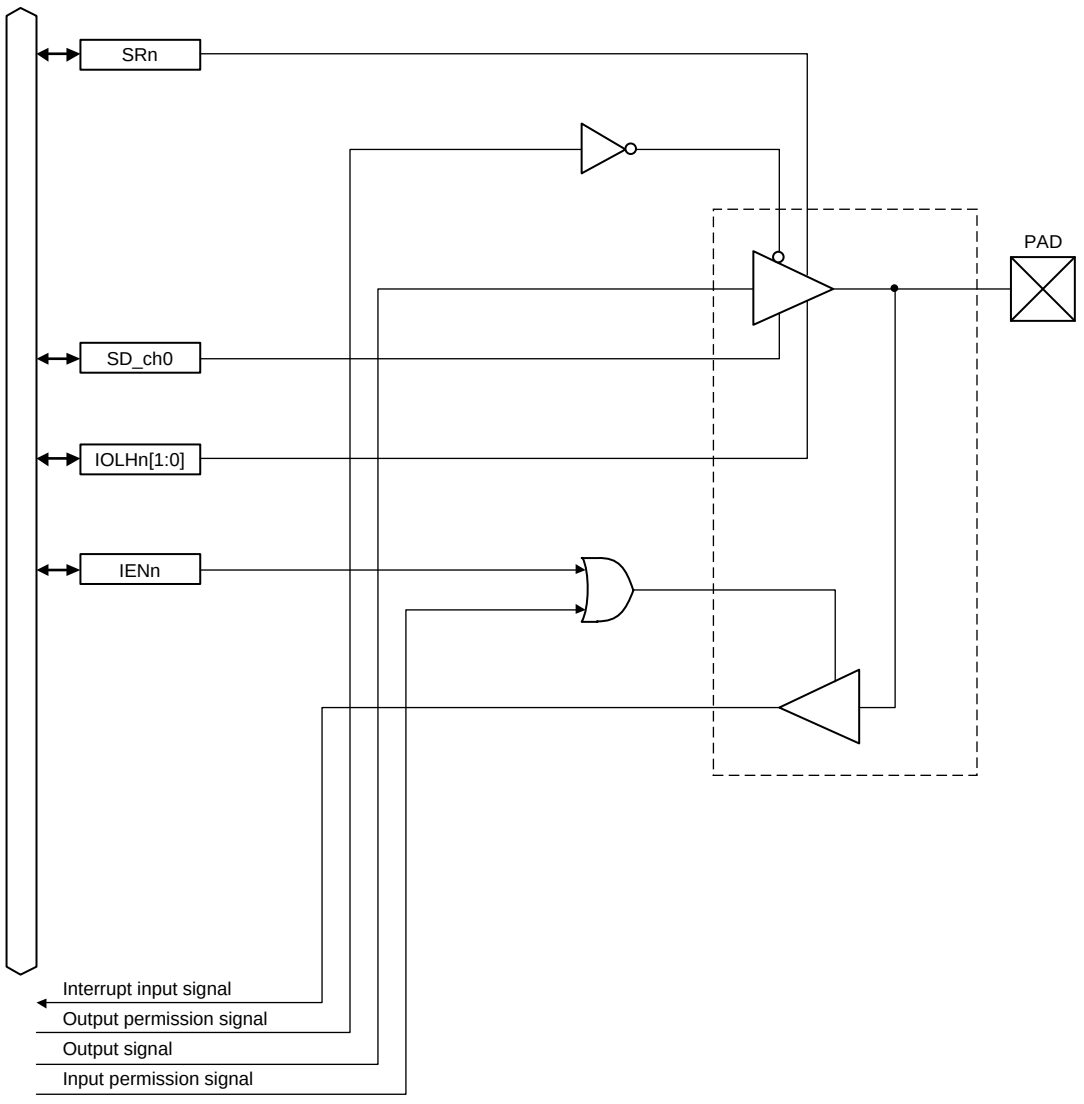
41.1.5 Special purpose port Configuration

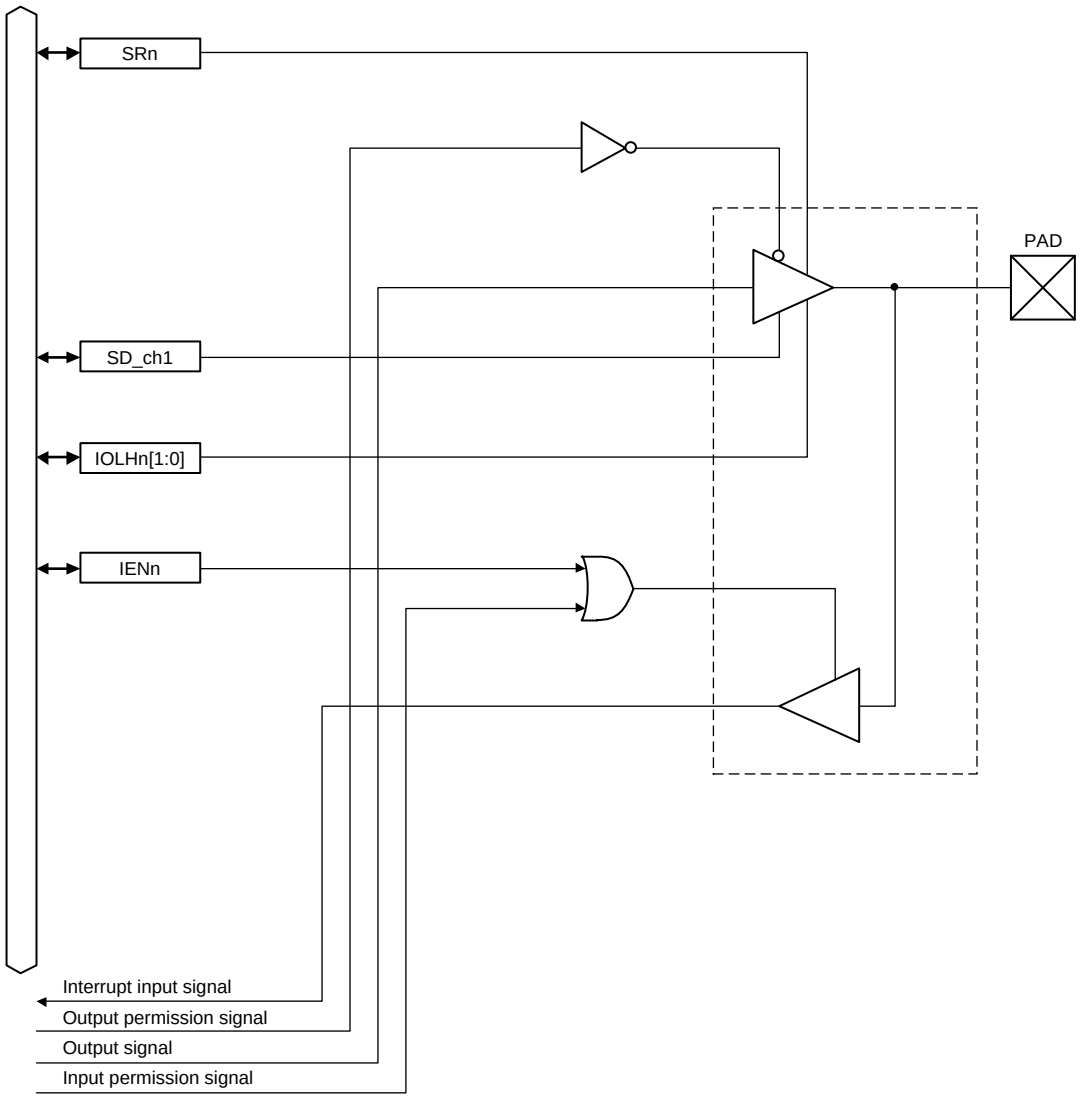
The functions and the signal of configurations shown below are shown in **Figure 41.6** to **Figure 41.13**.

- Target Functions: SDHI ch0, SDHI ch1, QSPI, RIIC
- Target Signals: NMI, TMS/SWDIO, TDO, WDTOVF_PERROUT#, AUDIO_CLK1, AUDIO_CLK2



Note: The IENn registers do not exist at the SD0_CLK and SD0_RST# pins.

Figure 41.6 SDHI ch0 (SD0_CLK, SD0_CMD, SD0_RST#, SD0_DATA[7:0])



Note: The IENn registers do not exist at the SD1_CLK pin.

41.2 Register Configuration

The base address is shown below.

Base address: H'0_1103_0000 (Cortex-A55 Address Space)

The register addresses shown in the following chapters will be offset addresses from the above base address.

NOTE

Access to areas for which Offset address is not defined in the register map is prohibited.

Please align the addresses according to the access size.

41.2.1 Port Register (Pn)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

41.3.4 Port Function Control Register (PFCm)

The PFCm register sets multiplexed functions.

This register can be write-protected by the PWPR register.

For the offset address, refer to **Section 41.2.4, Port Function Control Register (PFCm)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	PFC7			—	PFC6			—	PFC5			—	PFC4		
Initial Value	—	0	0	0	—	0	0	0	—	0	0	0	—	0	0	0
R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

41.3.6 Interrupt Enable Control Register (ISEL)

The ISEL register controls whether to enable or disable interrupts.

The pin set as the GPIO input port can be used as an external interrupt input. Controls whether this feature is enabled or disabled. When enabled, this pin can be used as an interrupt by setting the interrupt controller.

For the offset address, refer to **Section 41.2.6, Interrupt Enable Control Register (ISEL)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	ISEL3	—	—	—	—	—	—	—	ISEL2

41.3.10 Write protected register (PWPR)

The PWPR register sets write permission / prohibition for the PFC register and the PFCWE bit of this register.

For the offset address, refer to **Section 41.2.10, Write protected register (PWPR)**.

Bit	7	6	5	4	3	2	1	0
	BOWI	PFCWE	—	—	—	—	—	—
Initial Value	1	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BOWI	1b	R/W	1b: Writing a value to the PFCWE bit disabled 0b: Writing a value to the PFCWE bit enabled
6	PFCWE	0b	R/W	1b: Writing a value to the PFC register enabled 0b: Writing a value to the PFC register disabled
5 to 0	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.

41.3.11 Digital Noise Filter Switching Register (FILONOFF)

This register controls whether the digital noise filter are enabled / disabled for GPIO input pin and NMI pin.

For the offset address, refer to **Section 41.2.11, Digital Noise Filter Switching Register (FILONOFF)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	FILON3	—	—	—	—	—	—	—	FILON2

FILCLKSEL22_H	—	—	P18_5	P18_4

The operation of the digital noise filter will be explained using a timing chart using the external terminal P0_0 as an example.

(1) When the digital noise filter is disabled (FILONOFF = 0)

The timing chart of FILONOFF = 0 (OFF), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

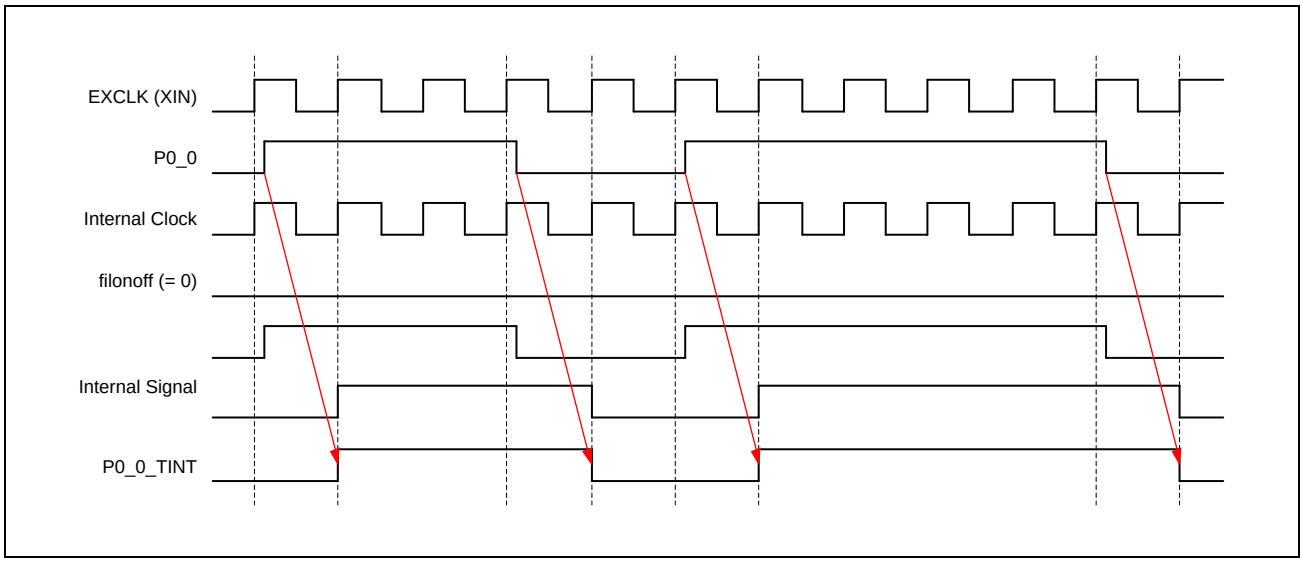

Figure 41.14 Digital noise filter (FILONOFF = 0) timing chart

The signal at the external terminal (P0_0) is not filtered regardless of the number of stages set in the FILNUM register.

The digital noise filter circuit inserts one stage of FF in the output of a digital noise filter.

Therefore, the external terminal (P0_0) signal is propagated internally with a delay of one cycle. (EXCLK (XIN)).

(2) When the digital noise filter is enabled (FILONOFF = 1)

The timing chart of FILONOFF = 1 (ON), FILNUM [1: 0] = “00” (FF4 stage), FILCLKSEL [1: 0] = “00” (without frequency division) is shown below.

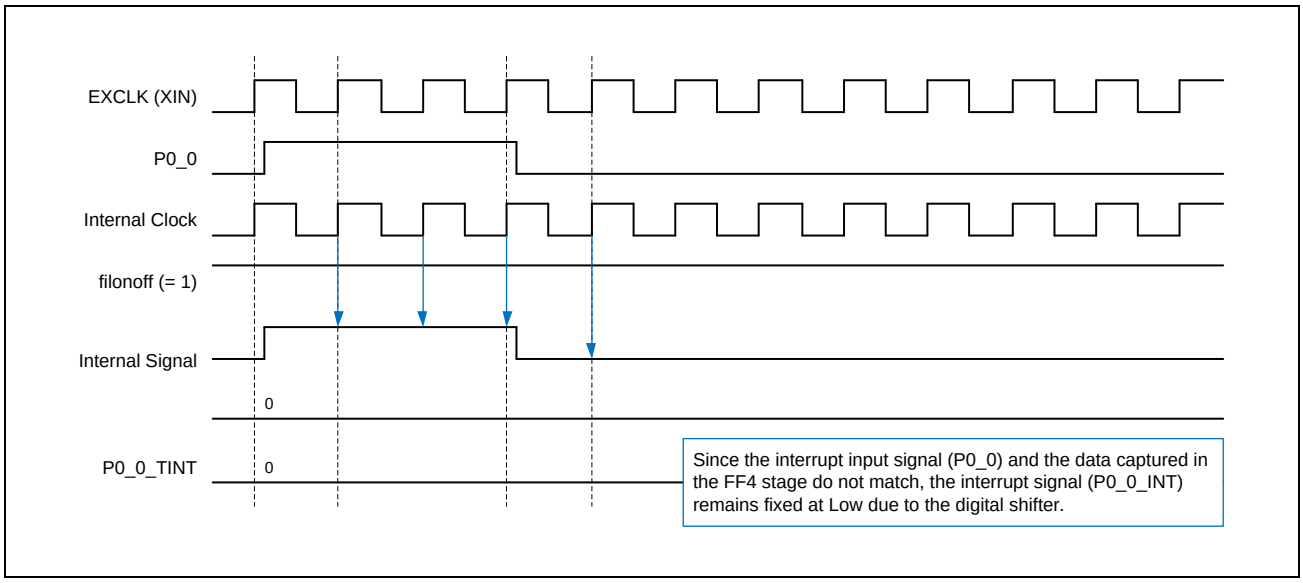

Figure 41.15 Digital noise filter (FILONOFF = 1) Timing chart (1)

The signal of the external terminal (P0_0) is filtered, if even one signal captured by each FF for the number of FF stages set in the FILNUM register does not match.

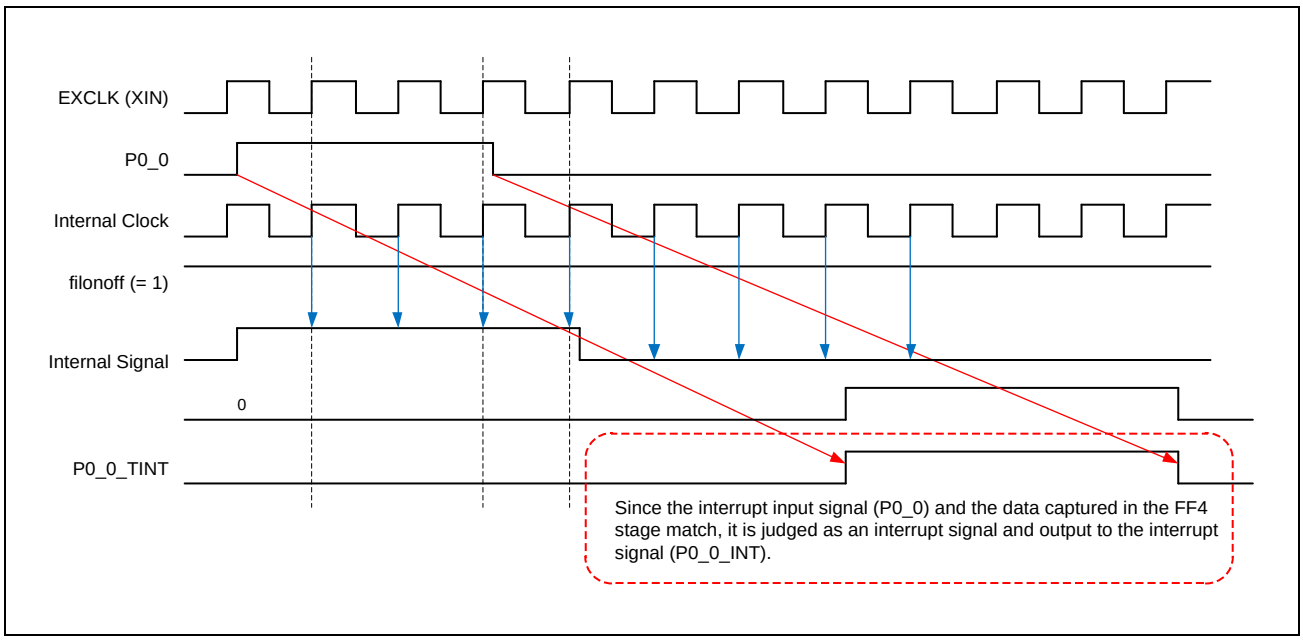

Figure 41.16 Digital noise filter (FILONOFF = 1) Timing chart (2)

The external terminal (P0_0) signal is the signal captured by each FF for the number of FF stages set in the FILNUM register.If they all match, no filtering is done.

The digital noise filter circuit outputs to the interrupt signal with a delay of FILTER_CYCLE.

[FILTER_CYCLE Calculation]

FILTER_CYCLE = FILNUM_FF + $FILTER_FF

FILNUM_FF: Number of FF stages set in the FILNUM register @EXCLK(XIN)
FILTER_FF: FF 2 stage in digital noise filter @EXCLK(XIN) + Digital noise filter output FF 1 stage @EXCLK(XIN)

Note: One stage of FF is inserted in the final stage of the digital noise filter circuit. Therefore, interrupt signals less than 1CLK @ EXCLK (XIN) may be removed regardless of whether the digital noise filter is enabled or disabled.

41.3.14 Ether ch0 Voltage Mode Control Register (ETH_ch0)

This register is sets the IO voltage mode control of Ether ch0.

For the offset address, refer to **Section 41.2.14, Ether ch0 IO Voltage Mode Control Register (ETH_ch0)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH0_2.5V_PVDD	ETH0_1.8V_PVDD
Initial Value	—	—	—	—	—	—	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
1	ETH0_2.5V_PVDD	0b	R/W	These bits set the IO voltage mode.
0	ETH0_1.8V_PVDD	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3V (Initial value)
0	1	1.8V
1	0	2.5V
1	1	Setting prohibited

- For the IO voltage mode of P1_0 to P4_5, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch0 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_0) to be used.

  When Function2 to Function7, a function other than Ether ch0 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function7 in the Pin function List.

  For Function2 to Function7, only 3.3V can be set.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.15 Ether ch1 Voltage Mode Control Register (ETH_ch1)

This register sets the IO voltage mode control for Etherch1.

For the offset address, refer to **Section 41.2.15, Ether ch1 IO Voltage Mode Control Register (ETH_ch1)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH1_2.5V_PVDD	ETH1_1.8V_PVDD
Initial Value	—	—	—	—	—	—	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
1	ETH1_2.5V_PVDD	0b	R/W	These bits set the IO voltage mode.
0	ETH1_1.8V_PVDD	0b	R/W	

Bit 1	Bit 0	IO Voltage
0	0	3.3V (Initial value)
0	1	1.8V
1	0	2.5V
1	1	Setting prohibited

- For the IO voltage mode of P7_0 to P10_4, set the above register according to the voltage mode of the external device to be connected.
- At Function1, the Ether ch1 function is selected, so set the value of this register according to the power supply voltage (PVDD182533_1) to be used.

  When Function2 to Function7, a function other than Ether ch1 is selected, so set the value of this register to IO voltage mode (3.3v).

  For each peripheral function, refer to Function0 to Function7 in the Pin function List.

  For Function2 to Function7, only 3.3V can be set.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.16 Ether MII/RGMII Mode Control Register (ETH MII/RGMII)

This register can be selected “MII” or “RGMII” of Ether.

This register is valid only for Function1

For the offset address, refer to **Section 41.2.16, Ether MII/RGMII Mode Control Register (ETH MII/RGMII)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ETH1_mode	ETH0_mode
Initial Value	—	—	—	—	—	—	1	1
R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
1	ETH1_mode	1b	R/W	Ether MII or RGMII can be selected by setting this register. 0b = RGMII The Direction of the IO buffer is Output. 1b = MII(Initial value) The Direction of the IO buffer is Input.
0	ETH0_mode	1b	R/W	

Note: By setting this register, the direction of some pins when using Ether’s MII or RGMII can be selected.
Refer to **Section 30, Gigabit Ethernet Interface** chapter for switching between MII and RGMII of Ether.

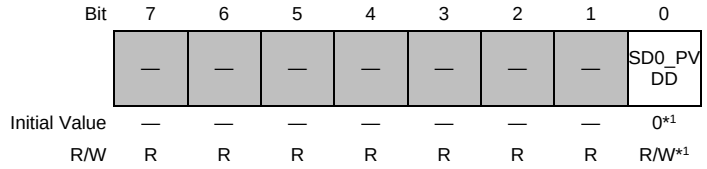
Note: In RGMII mode, set the external terminals shown below to port mode (PMCn = 0) and I/O disabled (PMn = 00b).

Ether ch0		Ether ch1	
Terminal name Function0	Terminal name Function1	Terminal name Function0	Terminal name Function1
P2_2	ET0_TX_COL	P8_2	ET1_TX_COL
P2_3	ET0_TX_CRS	P8_3	ET1_TX_CRS
P4_2	ET0_RX_ERR	P10_1	ET1_RX_ERR

41.3.17 SD ch0 IO Voltage Mode Control Register (SD_ch0)

This register sets the IO voltage mode control of SD ch0.

For the offset address, refer to **Section 41.2.17, SD ch0 IO Voltage Mode Control Register (SD_ch0)**.



Note 1. In Boot Mode1 and Boot Mode2, R / W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	SD0_PVDD	0b*1	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)*1

Note 1. The initial value of this register

- The IO voltage mode of SD0_CLK, SD0_CMD, SD0_DATA [7-0], SD0_RST# is set by selecting each mode of this register and MD_BOOT [2: 0].
  - When Boot Modes 1 and 2 are not selected: This register can be Read / Write (R / W). The initial value is the above value.
  - When Boot Modes 1 and 2 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

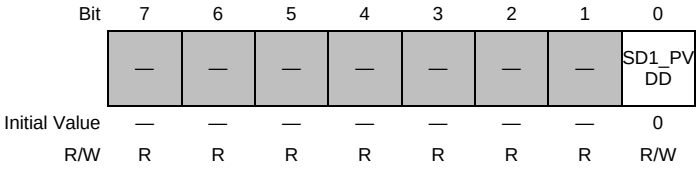
MD_BOOT[2:0]			Mode	Selection function	Selection Device	Control method
0	0	1	Boot Mode 1	SDHI0	eMMC(1.8V)	By Hardware
0	1	0	Boot Mode 2	SDHI0	eMMC(3.3V)	By Hardware
Other			SD_ch0 Control by Register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.18 SD ch1 IO Voltage Mode Control Register (SD_ch1)

This register sets the IO voltage mode control of SD ch1.

For the offset address, refer to **Section 41.2.18, SD ch1 IO Voltage Mode Control Register (SD_ch1)**.



Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	SD1_PVDD	0b	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)

Note: The IO voltage mode of SD1_CLK, SD1_CMD, SD1_DATA [3-0] is set by this register.

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 3.3V and the register is set to 1.8V, the reliability of this LSI will be affected.

41.3.19 QSPI IO Voltage Mode Control Register (QSPI)

This register sets the IO voltage mode control of QSPI and Octa Memory.

For the offset address, refer to **Section 41.2.19, QSPI IO Voltage Mode Control Register (QSPI)**.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	QSPI_PVDD
Initial Value	—	—	—	—	—	—	—	0*1
R/W	R	R	R	R	R	R	R	R/W*1

Note 1. In Boot Mode3 and Boot Mode4, R / W is R (Read Only).

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	—	R	Reserved When read, the initial value is read. The written value will be ignored.
0	QSPI_PVDD	0b*1	R/W	This bit sets the IO voltage mode. 1b: I/O domain voltage ≤ 1.8V 0b: I/O domain voltage ≥ 3.3V (Initial value)*1

Note 1. The initial value of this register

- The IO voltage of QSPI0_SPCLK, QSPI0_IO[3-0], QSPI0_SSL, QSPI_RESET#, QSPI_WP#, OM_CS1#, OM_DQS, OM_SIO[7:4] is set by each mode of this register and MD_BOOT[2: 0].
  - When Boot Modes 3 and 4 are not selected: This register can be Read/Write (R/W). The initial value is the above value.
  - When Boot Modes 3 and 4 are selected: This register is Read Only (R), and the voltage mode of the selected device is as follows.

MD_BOOT[2:0]			Mode	Selection Function	Selection Device	Control method
0	1	1	Boot Mode 3	SPI Multi I/O Bus Controller/Octa Memory Controller	Single/Quad/Octal(1.8V)	By Hardware
1	0	0	Boot Mode 4	SPI Multi I/O Bus Controller	Single/Quad(3.3V)	By Hardware
Other			QSPI Control by register			

Note: When setting this register, do not set the IO voltage mode lower than the applied voltage. For example, if the applied voltage is set to 1.8V and the register is set to 3.3V, the reliability of this LSI will be affected.

41.3.20 Input Enable Control Register (IEN)

This register is a register that controls the input of the special purpose port.

For the offset address, refer to **Section 41.2.20, Input Enable Control Register (IEN)**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	IEN3	—	—	—	—	—	—	—	IEN2
Initial Value	—	—	—	—	—	—	—	0	—	—	—	—	—	—	—	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	IEN1	—	—	—	—	—	—	—	IEN0

41.4 Operation

The operating procedure for the general-purpose I/O port function and the operating procedure for peripheral functions are shown below.

41.4.1 Operation for GPIO Function

(1) Set the PMCn register to “0” (initial value = 0).

(2) Set the GPIO input / output with the PMn register.

(3) Set the GPIO output value in the Pn register.

(4) The input value of the input terminal can be detected by the PINn register.

(5) When setting the interrupt input using the GPIO input pin, set the ISEL register to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for interrupt input and GPIO input.
- Set the FILNUM and FILCLKSEL registers according to the purpose of use.

41.4.2 Operation for Peripheral Function

(1) Set the PMCn register to “1” (initial value = 0).

(2) Set the PWPR register to allow writing to the PFCm register.

After setting the PWPR.B0WI bit to “0” (initial value = 1), set the PWPR.PFCWE bit to “1” (initial value = 0).

Select the required function from Functions 1-5. (Hereafter, Function1 setting example)

(3) Set PFCm = 001b and switch to Function1.

(4) Set the PFCm register to write-protected. After setting the PWPR.PFCWE bit to “0”, set the PWPR.B0WI bit to “1”.

- Set the FILONOFF, IOLH, SR, and PUPD registers between (1) and (2) as necessary.
- Set the FILONOFF register when using GPIO to set a digital noise filter for the IRQ[0-7].
- Set the FILNUM and FILCLKSEL registers according to the purpose of use. And also, the NMI input can set the noise filter by the same registers.

42. Low Power Mode

This chapter describes the lower mode of this LSI.

42.1 Overview

This LSI has three modes of low power consumption shown in the following table.

These three modes work independently.

Table 42.1 Low Power Mode

Low Power Mode	Description	Return factor
Module Standby Mode	Stop the clock of specific peripheral module by setting the CPG register. Refer to **Section 42.2, Module Standby Mode** for detail.	CPG register setting
Cortex-A55 Sleep Mode	Put Cortex-A55 into a low power state by issuing a WFI instruction. Refer to **Section 2.3.1, Cortex-A55 Sleep Mode** and **Section 42.3, Cortex-A55 Sleep Mode** for detail.	Interrupt

Note: When a system reset is applied, the LSI is released from the low power mode and initialized.

42.2 Module Standby Mode

42.2.1 Overview

The Module Standby Mode is a mode that requests the clock stop of the module specified by the master.

The purpose of this mode is to reduce power consumption by stopping unnecessary functions.

The master which can request the clock stop is Cortex-A55. So, Cortex-A55 cannot be placed in the Module Standby Mode. To reduce the power consumption in the CPUs, use the CPU sleep modes to be described later.

This mode is implemented by stopping the clock supply by the CPG register and switching the MSTOP signal of the bus through CPG register settings.

If the master accesses a module that has the clock stopped and the MSTOP bit set, a bus error will occur.

The following registers are used in the Module Standby Mode.

Table 42.2 Module Standby Mode related registers

Register name	Abbreviation	Description
Clock Control Register	CPG_CLKON_***	The detail information of each register is described in **Section 6, System Controller (SYSC)** and **Section 7, Clock Pulse Generator (CPG)**. The usage of these registers is described in **Section 42.2.2, Operation**.
MSTOP Register	CPG_BUS_***_MSTOP	

The following figure shows the block connection overview related Module Standby Mode.

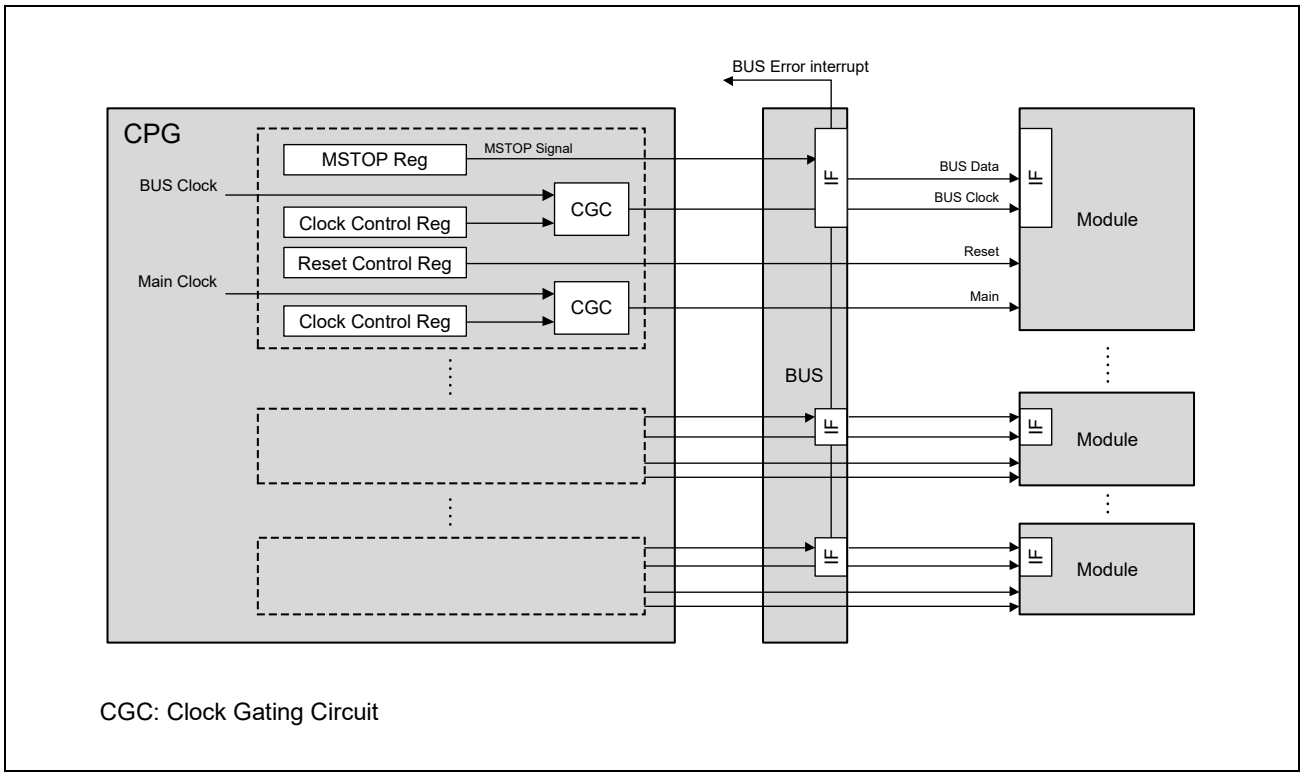

Figure 42.1 Block connection overview for Module Standby Mode

42.2.2 Operation

The following chart shows the procedure to enter and return from the Module Standby Mode.

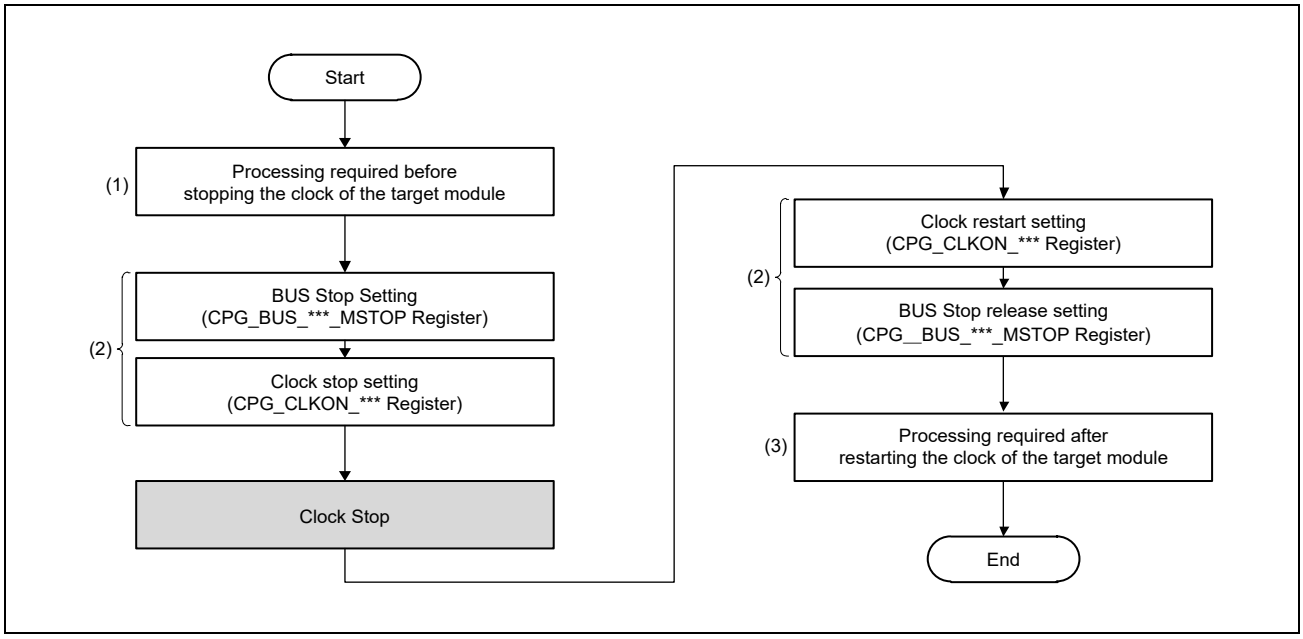

Figure 42.2 Module Standby Mode procedure

(1) Depend on the module, there may be a request to stop during communication, image processing, and various processing. In this case, if the managed CPU can be stopped unilaterally for each module, a stop request is immediately issued to the CPG. For those that cannot be stopped until a certain process is completed, after confirming that the managed CPU has stopped for each module, a stop request is made to the CPG.

(2) Refer to **Section 42.2.2.1, Setting of Clock control and MSTOP register** regarding to the setting of Clock Control Register and MSTOP Register.

(3) Whether the reset control is required depends on the module; check the specifications of the target module. Set the reset control register to 0 to enter the reset state. Set 1 for the release from the reset state.

42.2.2.1 Setting of Clock control and MSTOP register

The following table shows the combination of the Clock Control register and the MSTOP register to stop the clock of the target module.

The Module Standby Mode can be applied only to the modules shown in the table below.

- When entering the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 1.
  Set the Clock Control Register bit of the target module to 0.

- When exiting the Module Standby Mode:

  Set the MSTOP Register bit of the target module to 0.
  Set the Clock Control Register bit of the target module to 1.

Table 42.3 Registers for Module Standby Mode (1/2)

Target module for Module Standby Mode	Clock Control Register		MSTOP Register	
	Register Name (CPG_CLKON_***)	bit	Register Name (CPG_BUS_***_MSTOP)	bit

Note 1. The clock for USB2.0 PHY can only be stopped when the clock for USB2.0 ch0 and ch1 are stopped.

42.3 Cortex-A55 Sleep Mode

42.3.1 Overview

Refer to **Section 2.3.1, Cotrex-A55 Sleep Mode** for detail.

The following table shows the registers related to the Cortex-A55 Sleep Mode.

Refer to **Section 6, System Controller (SYSC)** for detail.

Table 42.4 Cotrex-A55 Sleep Mode related registers

Register name	Abbreviation	Bit name
Lowpower Sequence Control Register2	SYS_LP_CTL2	bit[0]: CA55_STBYCTL

43. Debug Interface

43.1 Overview

This LSI has a debug interface for boundary scan function and debug support for Cortex-A55.

43.1.1 Features

The functions of the debug interface of this LSI are shown below.

- Debug Interface
  - Support JTAG and SWD
- Debugger control function (DAP function)
  - Direct control of IP without going through CPU by switching Access Port (AP)
- Trace data support
  - Cortex-A55 trace output
  - Buffer function of trace data by ETF
  - Trace data output to system bus by using ETR
- Boundary Scan
  - Connection test between this LSI and other LSIs on the user board
- Other functions
  - Interlocking operation of Cortex-A55, system counter (SYC), watchdog timer, general timer (GTM), and debug component by cross trigger
  - Support WDT counter stop control function
  - Add time information to trace data by Time Stamp (24MHz operation)

43.1.2 Block Diagram

Figure 43.1 shows the block diagram of the debug interface, and **Figure 43.2** shows the block diagram of the Core Sight System (CST).

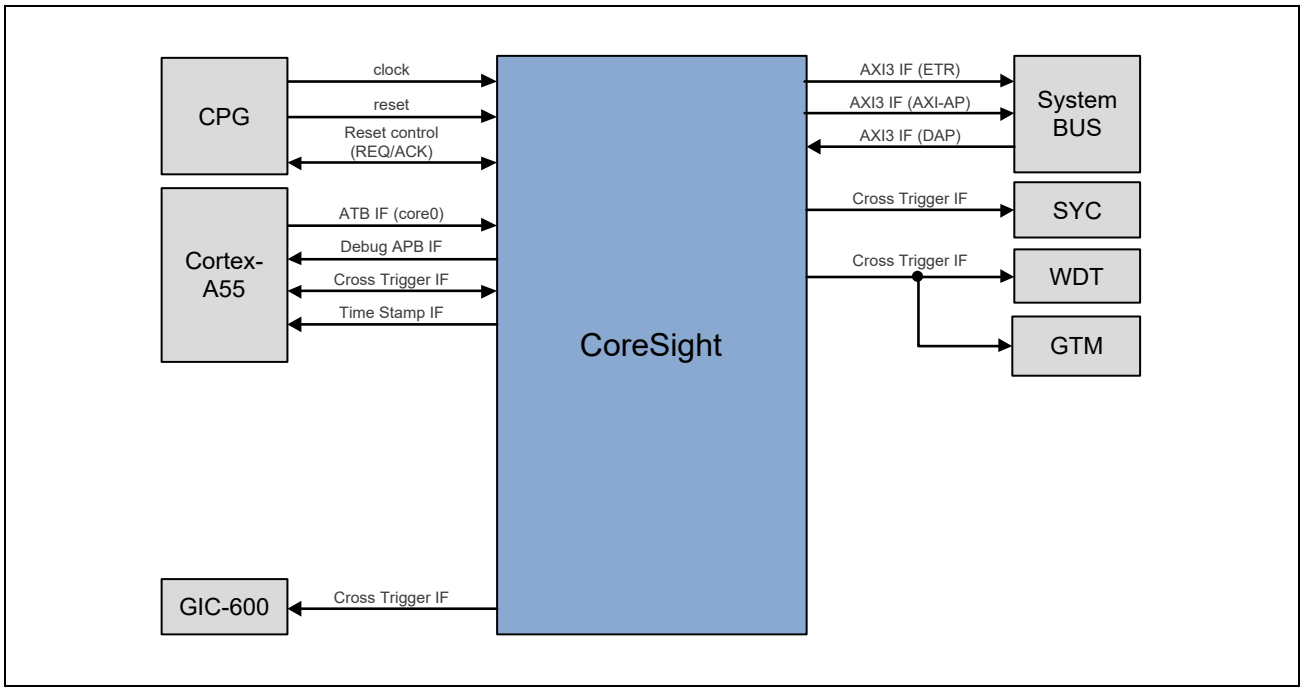

Figure 43.1 Debug System Block Diagram

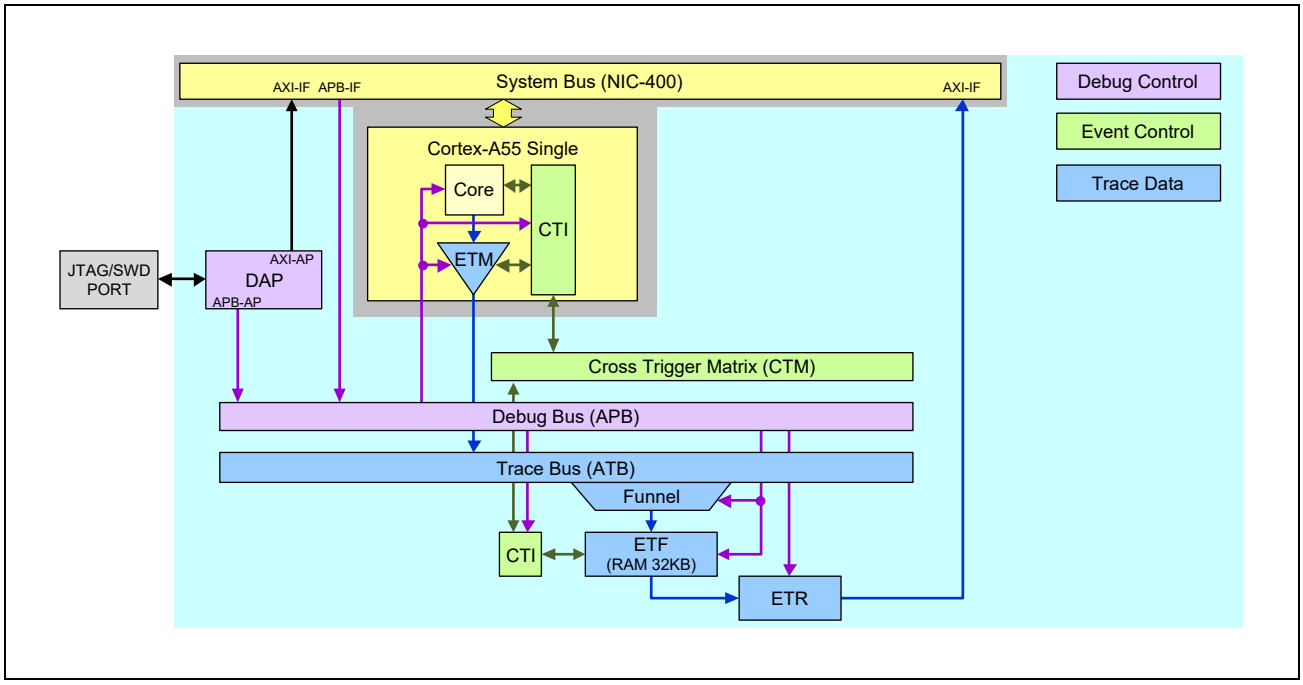

Figure 43.2 Core Sight System Block Diagram

- Debug Bus (APB)

  Bus used for controlling debug functions and acquiring debug data (register values and trace data in On-Chip Buffer)

  - DAP: Debug Access Port

- Cross Trigger Matrix (CTM)

  Functions required for co-debugging triggered by mutual events between CPU and Component

  - CTI: Cross Trigger Interface

- Trace Bus (ATB)

  A data bus which the trace data output by ETM flows

  - ETM: Embedder Trace Macrocell
  - ETR: Embedder Trace Router
  - ETF: Embedder Trace FIFO
  - Funnel: Trace data merge function

For details on ETM, ETR, and ETF, refer to “CoreSight Trace Memory Controller Technical Reference Manual”.

43.1.3 External Pins

- JTAG pins

The debug interface supports JTAG IF and SWD IF. **Table 43.1** shows the JTAG pins and their functions.

Table 43.1 JTAG Pins

Pin Name	I/O	Function		Name
		JTAG IF	SWD IF	
TCK/SWDCLK	Input	TCK	SWCLK	Test clock, Serial wire clock
TMS/SWDIO	Input, Input/Output	TMS	SWDIO	Test mode select, Serial wire data input/output
TDI	Input	TDI	—	Test data input
TDO	Output	TDO	—	Test data output
TRST#	Input	TRST	—	Test reset

- DEBUGEN pins

Table 43.2 shows the functions of the DEBUGEN pin.

Table 43.2 DEBUGEN Pins

Pin Name	I/O	Function
DEBUGEN	Input	Switches between normal operation and debug operation. 0: Normal operation 1: Debug operation

The DEBUGEN value must be fixed before releasing the power-on reset (PRST#). **Table 43.3** shows the difference in operation between normal operation and debug operation.

Table 43.3 Difference in Operation by DEBUGEN

	Normal Operation (DEBUGEN=0)	Debug Operation (DEBUGEN=1)	Related Module
Debug function module (CoreSight (other than DAP))	Boot impossible (Reset state)	Boot (Refer **Section 43.6.1** for reset condition and range)	CPG (Reset control)

- BSCANP pins

Table 43.4 shows the functions of the BSCANP pin.

Table 43.4 BSCANP Pins

Pin Name	I/O	Function
BSCANP	Input	Switches between normal operation and boundary scan test mode. 0: Normal operation 1: Boundary scan test mode

Boundary scan test mode is a mode in which a connection test is performed between the terminals of this LSI and other ICs connected on the customer's board and is performed when BSCANP = 1.

The actual access is controlled by the 5 terminals of JTAG when BSCANP = 1.

Table 43.5 shows the operation modes of this LSI according to the values of the DEBUGEN pin and BSCANP pin.

Table 43.5 Operating Mode

Pin Name		
BSCANP	DEBUGEN	Operating Mode
0	0	Normal operation
0	1	Debug operation
1	*	Boundary scan test mode

43.1.4 Treatment of Unused Pins

When the external terminal of the debug interface is not used, handle it as shown in **Table 43.6**.

Table 43.6 Handling of Unused Pins

Pin Name	Handle*1
TCK/SWDCLK	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TMS/SWDIO	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)
TDO	Open-circuit
TRST#*2	Fix this pin at a low level (pull down or connect to the ground level)
DEBUGEN	Fix this pin at a low level (pull down or connect to the ground level)
BSCANP	Fix this pin at a low level (pull down or connect to the ground level)

Note 1. Mount the pull-up/pull-down resistors on the board side

Note 2. TRST# should be fixed at low level in non-debug mode, and TRST# should be changed from low level to high level in debug mode.

43.2 Address Space

The CoreSight of this LSI has a 4 MB debug system address space. The address space of the debug system is shown in **Table 43.7**.

Table 43.7 Address Space of the Debug System

Address	Component*1
CoreSight Debug Components (Overall Address Space of this LSI)	
H'0_10C0_0000 ~ H'0_10C0_FFFF	CoreSight: ROM table
H'0_10C1_0000 ~ H'0_10C1_FFFF	CoreSight: Timestamp generator
H'0_10C2_0000 ~ H'0_10C2_FFFF	CoreSight: ETF
H'0_10C3_0000 ~ H'0_10C3_FFFF	CoreSight: ETR
H'0_10C4_0000 ~ H'0_10C4_FFFF	CoreSight: Trace Funnel
H'0_10C5_0000 ~ H'0_10C5_FFFF	CoreSight: CTI0
H'0_10C6_0000 ~ H'0_10C6_FFFF	CoreSight: CTI1
H'0_10C7_0000 ~ H'0_10CE_FFFF	CoreSight: Reserved
H'0_10CF_0000 ~ H'0_10CF_FFFF	CoreSight: Reserved
Reserved	
H'0_10D0_0000 ~ H'0_10DF_FFFF	Reserved
Cortex-A55 Debug Components (Overall Address Space of this LSI)	
H'0_10E0_0000 ~ H'0_10E0_FFFF	Cortex-A55: ROM table
H'0_10E1_0000 ~ H'0_10E1_FFFF	Cortex-A55: Core0 Debug
H'0_10E2_0000 ~ H'0_10E2_FFFF	Cortex-A55: Core0 CTI
H'0_10E3_0000 ~ H'0_10E3_FFFF	Cortex-A55: Core0 PMU
H'0_10E4_0000 ~ H'0_10E4_FFFF	Cortex-A55: Core0 ETM
H'0_10E5_0000 ~ H'0_10ED_FFFF	Reserved
H'0_10EE_0000 ~ H'0_10EE_FFFF	Reserved
H'0_10EF_0000 ~ H'0_10F0_FFFF	Reserved
H'0_10F1_0000 ~ H'0_10F1_FFFF	Reserved
H'0_10F2_0000 ~ H'0_10F2_FFFF	Reserved
H'0_10F3_0000 ~ H'0_10F3_FFFF	Reserved
H'0_10F4_0000 ~ H'0_10F4_FFFF	Reserved
H'0_10F5_0000 ~ H'0_10FF_FFFF	Cortex-A55: Reserved
Reserved Address Space	
H'E000_0000 ~ H'E000_0FFF	Reserved
H'E000_1000 ~ H'E000_1FFF	Reserved
H'E000_2000 ~ H'E000_2FFF	Reserved
H'E000_3000 ~ H'E000_DFFF	Reserved
H'E000_E000 ~ H'E000_EFFF	Reserved
H'E000_F000 ~ H'E002_DFFF	Reserved
H'E002_E000 ~ H'E002_EFFF	Reserved
H'E002_F000 ~ H'E004_0FFF	Reserved
H'E004_1000 ~ H'E004_1FFF	Reserved
H'E004_2000 ~ H'E004_2FFF	Reserved
H'E004_3000 ~ H'E00F_EFFF	Reserved
H'E00F_F000 ~ H'E00F_FFFF	Reserved

Note 1. Access to the Reserved area is prohibited. Operation is not guaranteed when accessed.

NOTE

- The CoreSight Debug Components area and Cortex-A55 Debug Components area can be accessed via the system bus and APB-AP.
  APB-AP is connected to port-0 of DAP. For the port configuration of DAP, refer to **Section 43.6.2, DAP**.
- Each component is placed on a 64KB address boundary according to the ARMv8 Debug memory map. As an entity, the first 4 KB is valid.

43.3 Register Descriptions

43.3.1 ID Register (BSID)

The BSID register is a 32-bit register that cannot be accessed from the CPU. When the BSCANP pin is 1, it can be read from the TDO pin by setting the IDCODE command on the TAP controller. It cannot be written.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BSID[31:16]															
Initial Value	0	0	0	0	1	0	0	0	0	1	0	0	0	1	0	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSID[15:0]															
Initial Value	0	0	0	0	0	1	0	0	0	1	0	0	0	1	1	1
R/W	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BSID[31:0]	H'0845_0447	—	This is the ID register specified in JTAG. The upper 4 bits (bit31-28) may change depending on the chip version.

43.3.2 Other Registers

For details on each register other than the BSID register, refer to "ARM CoreSight SoC-400 Technical Reference Manual" and "CoreSight Trace Memory Controller Technical Reference Manual".

43.4 Debug Connection

43.4.1 Debug Connection Mode

There are the following four modes for the debug connection method of this LSI.

Authentication Mode	Method
No authentication	Allow access from the debugger without authentication (initial setting)
SEC authentication*1	Allow access from the debugger after authentication is OK. (authentication method is security authentication by security IP)
Authentication refusal*1	Block access from the debugger

Note 1. SEC authentication and Authentication refusal can only be authenticated with secure products.

For SEC authentication modes, enter the authentication code from the debugger is needed.

For information on the authentication function of secure products, please contact our sales.

43.5 Debug Access Range

The debug access range by CoreSight is for all slaves as well as Cortex-A55. For details, refer to **Section 5.3, Accessible Areas**.

43.6 Operation

43.6.1 Debug Related Reset

Please refer to **Section 7.3.2.1, Range of Reset Application** for debug-related reset and reset range.

43.6.2 DAP

DAP is equipped with SWJ-DP as Debug Port (DP) and APB-AP, AXI-AP, AHB-AP as Access Port (AP).

The DAP port numbers are shown in **Table 43.8**. Indicates the correspondence between the port number specified in the DP SELECT register and the AP, and its usage.

Table 43.8 DAP Port Number

Port number	AP	Usage
Port-0	APB-AP	Debug Component recognition and settings
Port-1	AXI-AP	System IP control (access to system bus)

43.6.3 Trace

43.6.3.1 Data Flow

In CoreSight, all trace data is aggregated once by Trace Funnel, and stored in ETF, or output to the system bus via ETR in the subsequent stage. Setting this port number to the Trace Funnel according to the route of the trace data is needed. The Trace Funnel port numbers are shown in **Table 43.9**.

Table 43.9 Trace Funnel Port Number

Port Number	Source Components
Port-0	CA55: Core0 ETM
Port-1	Reserved

43.6.3.2 Timestamp

If time information want to be included in the trace data, the Timestamp Generator can be used. The timestamp replicator port numbers are shown in **Table 43.10**. The Timestamp Generator runs on a 24-MHz clock.

Table 43.10 Timestamp Replicator Port Number

Port Number	Target Components
Port-0	CA55: Core0 ETM

43.6.4 Cross Trigger

The CTI (Cross Trigger Interface) implemented in CoreSight, Cortex-A55 is used to communicate debug events.

43.6.4.1 CoreSight Cross Trigger Connectiion

CoreSight has two CTIs. The connection specifications are shown in **Table 43.11** to **Table 43.14**.

Table 43.11 CoreSight CTI0 Trigger Input

Trigger Input Bit	Source Components	Description
[7]	(Unused)	—
[6]	(Unused)	—
[5]	(Unused)	—
[4]	(Unused)	—

[0]	GIC-600	GIC-600 Event Input (sample_req/sample_ack)

43.6.4.2 Cortex-A55 Cross Trigger Connectiion

The Cortex-A55 has one CTI (Cortex-A55 Core0 CTI). The connection specifications for each are shown in **Table 43.15** and **Table 43.16**.

Table 43.15 Cortex-A55 CTI0 trigger input

Trigger Input Bit	Source Components	Description
[7]	Cortex-A55: Core0 ETM	ETM Trace Output 3 trigger event
[6]	Cortex-A55: Core0 ETM	ETM Trace Output 2 trigger event
[5]	Cortex-A55: Core0 ETM	ETM Trace Output 1 trigger event

[7]	Cortex-A55: Core0 ETM	Generic Trace External Input 3 trigger event
[6]	Cortex-A55: Core0 ETM	Generic Trace External Input 2 trigger event
[5]	Cortex-A55: Core0 ETM	Generic Trace External Input 1 trigger event
[4]	Cortex-A55: Core0 ETM	Generic Trace External Input 0 trigger event
[3]	(Unused)	—
[2]	External (GIC-600)	Generic CTI Interrupt trigger event
[1]	Cortex-A55: Core0 PE	Restart Request trigger event
[0]	Cortex-A55: Core0 PE	Debug Request trigger event

43.6.5 WDT Counter Stop Control

This LSI has a WDT counter stop control function linked with a debug event to prevent an unintended reset by WDT during debug operation. When a debug event occurs, CoreSight asserts the WDT counter stop request signal, controls the WDT counter stop signal (CNTSTOP), and stops counting. The target WDT is all WDT. For details on the WDT count stop function, refer to **Section 6.4.2, WDT Stop control function**.

43.6.6 GTM Counter Stop Control

This LSI has a GTM counter stop control function linked with debug events to prevent unintended GTM counts during debug operation. When a debug event occurs, CoreSight asserts a GTM counter stop request signal to stop the GTM count.

43.6.7 SYC Counter Stop Control

This LSI has a SYC counter stop control function linked with debug events to prevent unintended SYC counts during debug operation. When a debug event occurs, CoreSight asserts a SYC counter stop request signal to stop the SYC count.

44. Thermal Sensor Unit (TSU)

This LSI chip incorporates a thermal sensor unit (TSU) that measures the temperature inside the LSI.

44.1 Overview

44.1.1 Features

- This LSI has a single TSU.
- The thermal sensor in this unit measures temperatures in the range from −40°C to 125°C with an accuracy of ±3°C.
- The TSU repeats measurement at 20-µs intervals, and automatically updates the results of measurement.

44.1.2 Block Diagram

Figure 44.1 is a block diagram of the TSU.

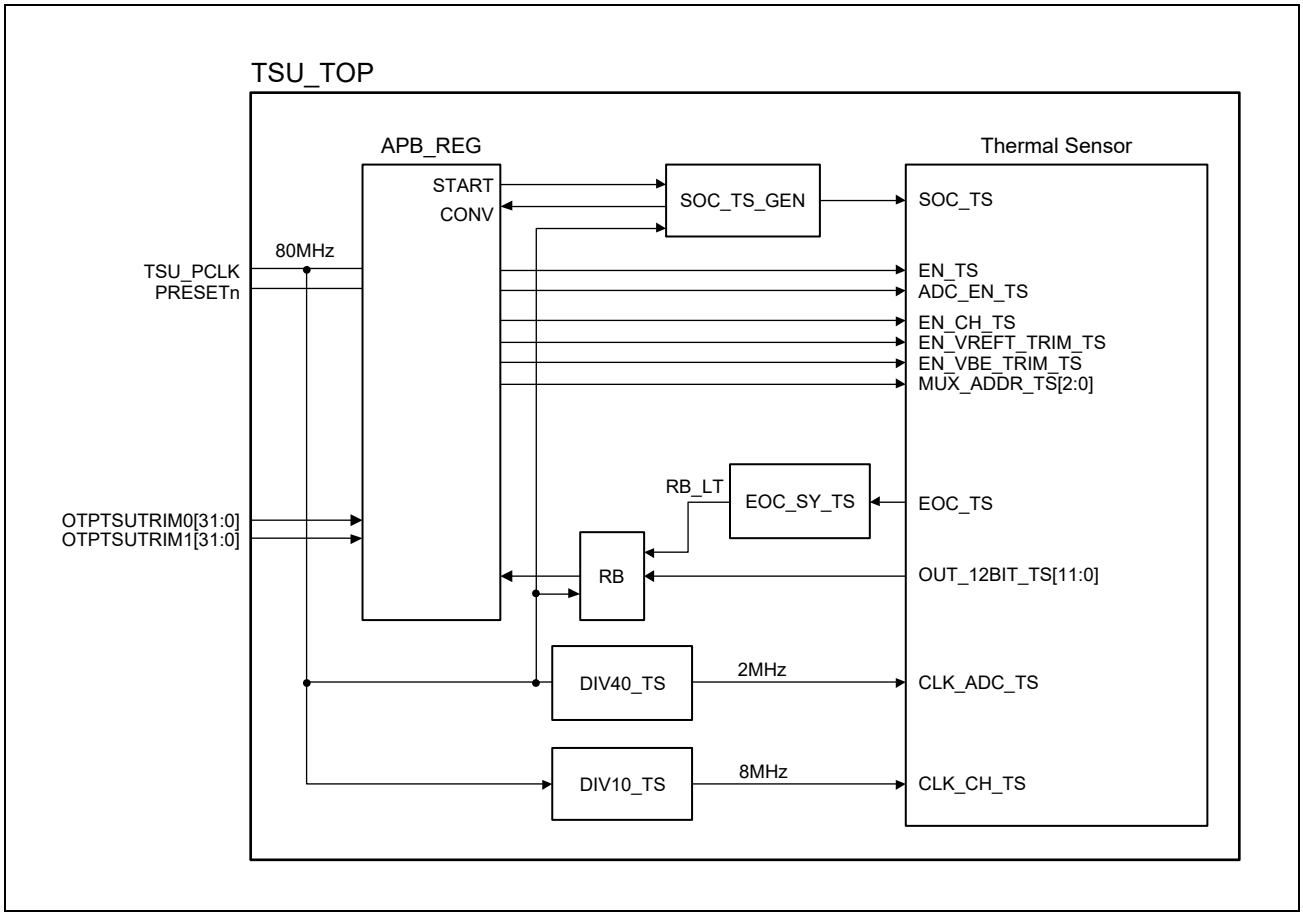

Figure 44.1 Block Diagram of the TSU

The TSU consists of the following blocks.

- APB_REG
- Thermal Sensor
- DIV40_TS and DIV10_TS
- SOC_TS_GEN
- EOC_SY_TS
- Read Buffer (RB)

44.1.2.1 APB_REG

- The APB_REG block provides an external interface for the TSU.
- This block contains control and status registers for the thermal sensor.

44.1.2.2 Thermal Sensor

- The thermal sensor block includes the internal probe, A/D converter and other items.
- The thermal sensor generates 12-bit digital values corresponding to the temperature and outputs them through the OUT_12BIT_TS[11:0] port.

44.1.2.3 DIV40_TS and DIV10_TS

- The TSU operates with the TSU_PCLK clock (80 MHz).
- The DIV40_TS block is a divide-by-40 divider which divides TSU_PCLK to generate a 2-MHz clock frequency to be supplied to the A/D converter in the thermal sensor as CLK_ADC_TS.
- The DIV10_TS block is a divide-by-10 divider which divides TSU_PCLK to generate an 8-MHz clock frequency to be supplied to the thermal sensor core as CLK_CH_TS.

44.1.2.4 SOC_TS_GEN

- The SOC_TS_GEN block generates the SOC_TS signal to be supplied to the thermal sensor for control over the timing of its operations.
- The SOC_TS_GEN block generates the SOC_TS signal every 20 µs. This is triggered by the START signal from the APB_REG block.
- The SOC_TS_GEN block generates the CONV signal that indicates the operating state of the thermal sensor. The value of the CONV signal can be read through the APB_REG block.

44.1.2.5 EOC_SY_TS

- The EOC_SY_TS block detects the EOC_TS signal from the thermal sensor and generates the RB_LT signal in synchronization with TSU_PCLK.
- The EOC_TS signal indicates the end of A/D conversion of the voltage for the temperature measured by the thermal sensor.

44.1.2.6 Read Buffer (RB)

- The RB block captures the 12-bit digital value from the OUT_12BIT_TS[11:0] port terminals of the thermal sensor in a register. This is triggered by the RB_LT signal from the EOC_SY_TS block. This value corresponds to the measured temperature.
- The value captured in the RB block can be read from the TSU through the APB_REG block.

44.1.3 External Pins

The TSU has no external pins.

44.1.4 Interrupts

The TSU has no interrupts.

44.2 Register Configuration

This section describes the registers for use in controlling the TSU.

Base Address: H'0_1005_9400 (Cortex-A55 Address Space)

44.2.1 List of Register

Table 46 1 lists the TSU registers. All registers are accessible in 32-bit units.

Table 44.1 List of the TSU Registers

Register Name	Abbreviation	R/W	Initial Value	Offset Address	Access Size
Sensor Mode Register	TSU_SM	R/W	H'0000_0000	H'00	32
Sensor Trigger Register	TSU_ST	R/W	H'0000_0000	H'04	32
Sensor ADC Data Register	TSU_SAD	R	H'0000_0000	H'0C	32
Sensor Status Register	TSU_SS	R	H'0000_0000	H'10	32
TSU OTP Calibration Register 0	OTPTSUTRIM0_REG	R	—	H'18	32
TSU OTP Calibration Register 1	OTPTSUTRIM1_REG	R	—	H'1C	32

44.3 Register Descriptions

44.3.1 Sensor Mode Register (TSU_SM)

This register is used to specify the operating mode of the thermal sensor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADC_EN_TS	ADC_EN_TS
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	ADC_EN_TS	0b	R/W	These bits specify the operating mode of the thermal sensor.
0	EN_TS	0b	R/W	

ADC_EN_TS	EN_TS	Operating mode of the thermal sensor
1b	1b	Normal operating mode
1b	0b	Power-saving mode
0b	1b	ADC power-saving mode
0b	0b	Power-saving mode

44.3.2 Sensor Trigger Register (TSU_ST)

This register is used to start and stop the cycles of A/D conversion by the thermal sensor. The A/D conversion is repeated at 20-µs intervals once the conversion is started.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSV	START
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
1	RSV	0b	R/W	The software may use this bit as a note. The written value is read.
0	START	0b	R/W	This bit starts and stops the cycles of A/D conversion by the thermal sensor. 1b: Starts the A/D conversion*1 0b: Stops the A/D conversion*2

Note 1. Before setting the START bit to 1b, be sure to set the TSU_SM register. Specifically, set the TSU_SM register, wait for 60 µs, and then set the START bit to 1b.

Note 2. When the START bit is to be set to 0b, be sure to read the A/D-converted value before making the setting.

44.3.3 Sensor ADC Data Register (TSU_SAD)

This register holds the digital value after A/D conversion of the voltage from the thermal sensor.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	OUT_12BIT_TS											
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
11 to 0	OUT_12BIT_TS	H'000	R	These bits hold the digital value after A/D conversion of the voltage from the thermal sensor. The value is 12-bit unsigned.

44.3.4 Sensor Status Register (TSU_SS)

This register indicates the state of A/D conversion in the thermal sensor.

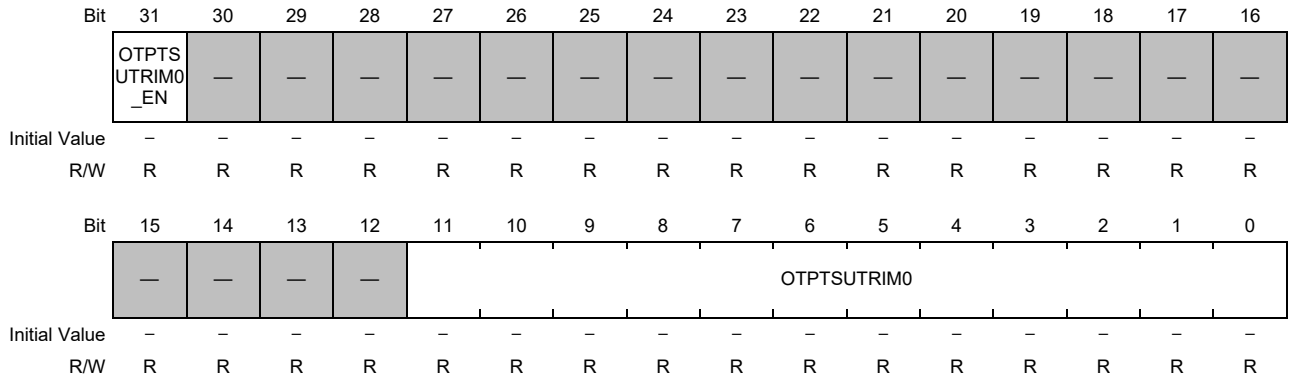
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CONV
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved Whenever it is read, 0 is read. The written value will be ignored.
0	CONV	0b	R	These bits indicate the state of A/D conversion in the thermal sensor. 1b: A/D conversion is ongoing. 0b: A/D conversion is stopped.

44.3.5 TSU OTP Calibration Register 0 (OTPTSUTRIM0_REG)

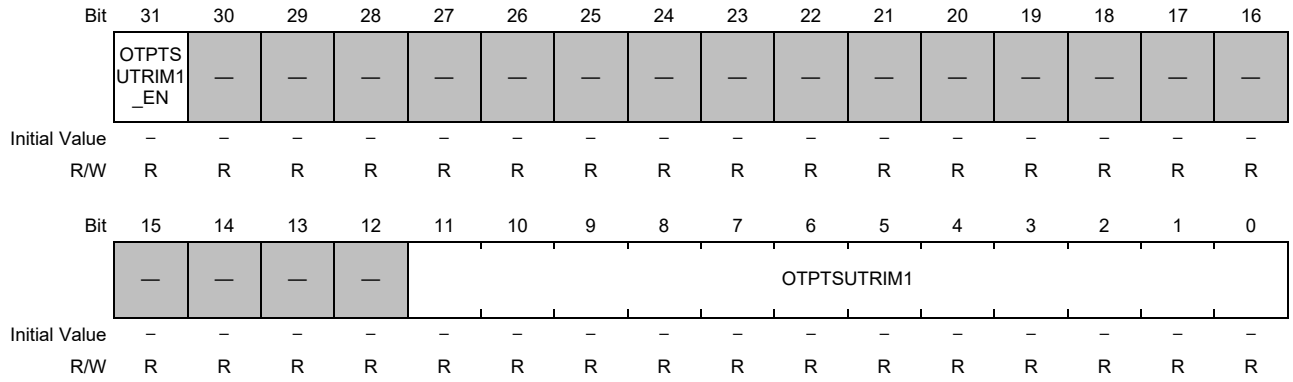
This register holds the correction value for calibration to be used in calculating the temperature



Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM0_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM0 is valid or invalid. 0b: [11:0] OTPTSUTRIM0 is invalid. 1b: [11:0] OTPTSUTRIM0 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM0	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

44.3.6 TSU OTP Calibration Register 1 (OTPTSUTRIM1_REG)

This register holds the correction value for calibration to be used in calculating the temperature.



Bit	Bit Name	Initial Value	R/W	Description
31	OTPTSUTRIM1_EN	—	R	This bit indicates whether [11:0] OTPTSUTRIM1 is valid or invalid. 0b: [11:0] OTPTSUTRIM1 is invalid. 1b: [11:0] OTPTSUTRIM1 is valid.
30 to 12	—	—	R	Reserved When read, the value is indefinite value. The written value will be ignored.
11 to 0	OTPTSUTRIM1	—	R	These bits hold the correction value for calibration to be used in calculating the temperature.

44.4 Operation

44.4.1 Procedure for Starting the A/D Conversion

This section describes the procedure for starting the A/D conversion. Follow this procedure to acquire the A/D converted values for the measured temperatures.

1. Start supplying the clock to the TSU.
2. Release the TSU from the reset state.
3. Set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 1b to place the thermal sensor in the normal operating mode.
4. Wait for 60 µs, leaving the value of the START bit as 0b.
5. Set the START bit in the TSU_ST register to 1b. The thermal sensor then starts the cycles of A/D conversion and the CONV bit in the TSU_SS register indicates 1b.
6. Once 20 µs have passed, the first A/D converted value from the thermal sensor is automatically stored in the TSU_SAD register. The value in that register is then updated every 20 µs. Reading the TSU_SAD register returns the latest A/D converted value.

CAUTION

Ensure that the setting of START is 1b when reading an A/D converted value from the TSU_SAD register.

44.4.2 Procedure for Stopping the A/D Conversion

This section describes the procedure for stopping the A/D conversion.

1. Set the START bit in the TSU_ST register to 0.
2. Poll the CONV bit in the TSU_SS register until it indicates 0b (A/D conversion has stopped).
3. Once you have confirmed that conversion has stopped, set the EN_TS and ADC_EN_TS bits in the TSU_SM register to 0b to place the thermal sensor in the power-saving mode.

CAUTION

If you intend to restart the A/D conversion after having stopped it, start from step 3 in **Section 44.4.1, Procedure for Starting the A/D Conversion**.

44.4.3 Confirming the State of the A/D Conversion by Monitoring the CONV Bit

The A/D conversion by the TSU can be started and stopped by the START bit in the TSU_ST register. However, the timing of stopping the A/D conversion by the thermal sensor is not synchronous with the START bit being set to 0 (stopping the A/D conversion). Monitor the CONV bit in the TSU_SS register to confirm that the A/D conversion by the thermal sensor has stopped.

44.4.4 Procedure for Measuring the Temperature

To calculate the temperature Tj, read registers TSU_SAD, OTPTSUTRIM0_REG, and OTPTSUTRIM1_REG, and follow the procedure below.

1. Read the value of the TSU_SAD register eight times every at least 20 µs. The read values are defined as TSCode[0] to TSCode[7].

2. Calculate the average of the values read, TSCodeAVE, by using the following formula.

$$\mathrm{TSCodeAVE} = \frac{(\mathrm{TSCode}[0] + \cdots + \mathrm{TSCode}[7])}{8}$$

3. Apply curvature correction and calculate DSENSOR by using the following formula.

$$\mathrm{DSENSOR} = \frac{\mathrm{TSCodeAVE}}{(1 + \mathrm{TSCodeAVE} \times 0.000013)}$$

4. Read the correction values for use in calibration from registers OTPTSUTRIM0_REG and OTPTSUTRIM1_REG and use the following formula to calculate Tj.

$$\mathrm{Tj} = (\mathrm{DSENSOR} - \mathrm{OTPTSUTRIM1}) \times \left(\frac{165}{(\mathrm{OTPTSUTRIM0} - \mathrm{OTPTSUTRIM1})}\right) - 40$$

44.5 Usage Note

When the START bit in the TSU_ST register is to be set to 0b, be sure to read the A/D-converted value in the TSU_SAD register before making the setting.

47. Octa Memory Controller

The Octa memory controller enables the connection of OctaFlash™ and OctaRAM™ to this LSI chip.

NOTE

OctaFlash™ and OctaRAM™ are trademarks of Macronix International Co., Ltd.

47.1 Features

- Macronix Serial Multi I/O (MXSMIO®) Octa Peripheral Interface (OPI) for high-end consumer applications is supported.
- One each of an OctaFlash device and an OctaRAM device compliant with the OPI specifications are connectable.
- A chip select signal is assigned to each memory device (QSPI0_SSL: OctaFlash; OM_CS1#: OctaRAM).

  Note: Only one of the memory devices can operate (be read or written to) at a time.

- Supported device interfaces

  SPI: Serial peripheral interface (OctaFlash, SPI mode)

  SOPI: Single Octa I/O (8 bits) (OctaFlash, single data rate)

  DOPI: Double Octa I/O (8 bits) (OctaFlash and OctaRAM, double data rate)

- 3-byte and 4-byte OctaFlash address commands are supported.
- 4-byte OctaRAM address commands are supported.
- The read-while-write (RWW) operation is supported.
- 1LC and 2LC (latency count) OctaRAM devices are supported.
- The error corrected signal (ECS#) is available, and ECC errors can be detected (for OctaFlash only).
- Fastboot mode is not supported.
- Direct access (memory-mapped reading and writing) by the CPU to memory devices in separate flash and RAM address spaces is supported.
- QSPI0_SPCLK: 100 MHz
- PVcc_HO: 1.8 V

47.2 Block Diagram

Figure 47.1 shows a block diagram of this module.

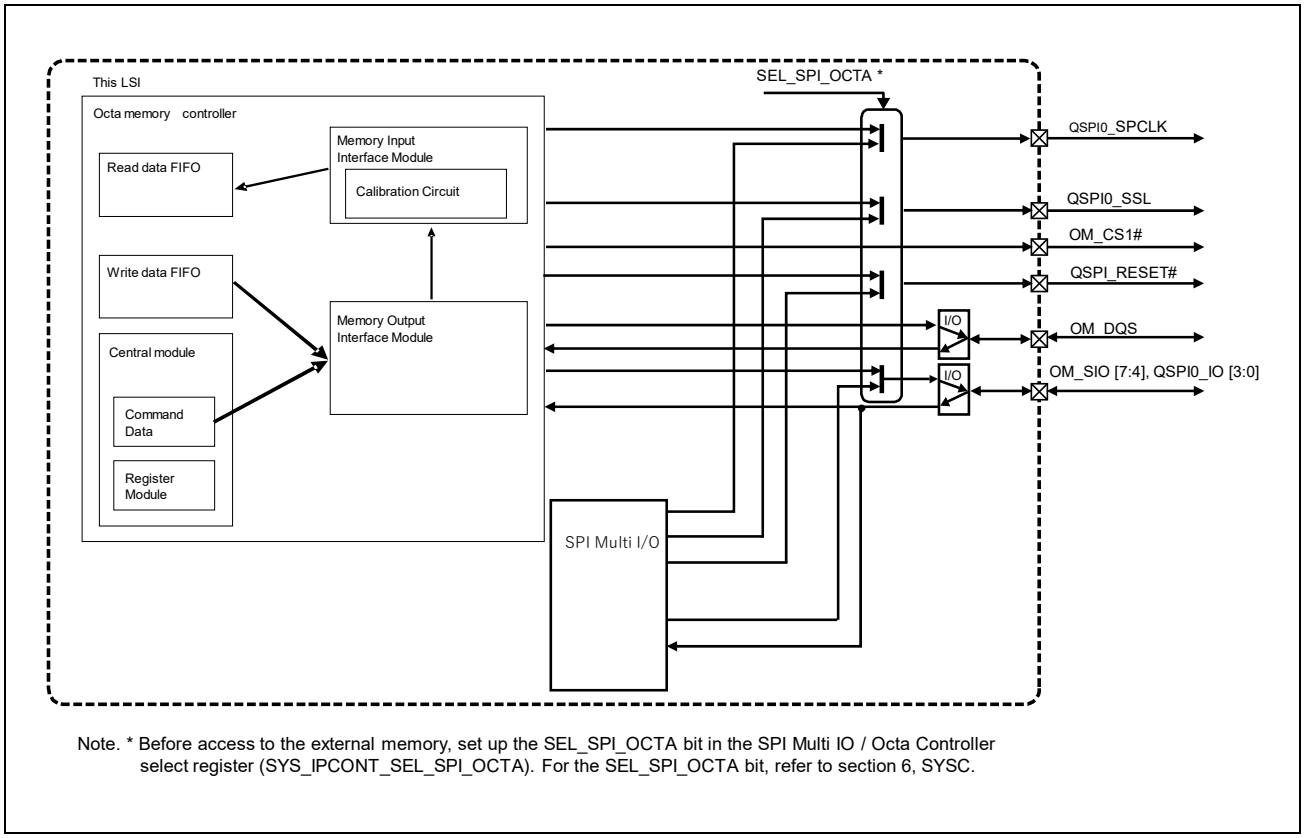


Figure 47.1 Block Diagram

47.3 Input/Output Pins

Table 47.1 shows the pin configuration.

Table 47.1 Configuration of Octa Memory Controller Pins

Pin	I/O	Name	Function
QSPI0_SPCLK	Output	Clock	Clock output
QSPI0_SSL	Output	Chip select 0	Chip select signal for an OctaFlash device
OM_CS1#	Output	Chip select 1	Chip select signal for an OctaRAM device
OM_DQS	Input/Output	Read/write data strobe	Read data strobe/write data mask signal
OM_SIO7 to OM_SIO4	Input/Output	Data	Data input/output
QSPI0_IO3 to QSPI0_IO0	Input/Output	Data	Data input/output
QSPI_RESET#	Output	Reset output	Reset signal for both OctaFlash and OctaRAM devices

Note: OM_ECS# is an input pin that is multiplexed with alternative pin functions that are driven by the 3.3-V power supply. The other pins are solely used for functions that are driven by the 1.8-V power supply.

47.3.1 Device Interface

The device interface is compatible with OctaFlash/OctaRAM interface.

When reading data from the memory or programming the memory with data, the bit order changes with the I/O mode.

The bit order is shown below:

Table 47.2 Bit order in accordance with I/O mode

I/O mode	Bit order (MSB)
Read data from device	
1 I/O (SPI)	OM_SIO1 input
8 I/O (SOPI)	OM_SIO7 to OM_SIO4, QSPI0_IO3 to QSPI0_IO0 input
8 I/O (DOPI)	OM_SIO7 to OM_SIO4, QSPI0_IO3 to QSPI0_IO0 input. Order of data: {D1, D0}, {D3, D2}, ...
Program/Write data to device	
1 I/O (SPI)	OM_SIO0 output
8 I/O (SOPI)	OM_SIO7 to OM_SIO4, QSPI0_IO3 to QSPI0_IO0 output
8 I/O (DOPI)	OM_SIO7 to OM_SIO4, QSPI0_IO3 to QSPI0_IO0 output. Order of data: {D1, D0}, {D3, D2}, ...

47.4 Register Descriptions

Base address: H'1008_0000 (Overall Address Space)

Table 47.3 shows the register configuration.

Access to the flash memory or RAM is allowed in either of the following modes.

Memory-map mode

Reading from and writing to the memory array areas of OctaFlash memory or RAM is possible.

Configuration mode

Transfer of any commands and data is possible.

Table 47.3 Octa memory controller register configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Device command register	DCR	R/W	H'00000000	H'00	32
Device address register	DAR	R/W	H'00000000	H'04	32
Device command setting register	DCSR	R/W	H'00000000	H'08	32

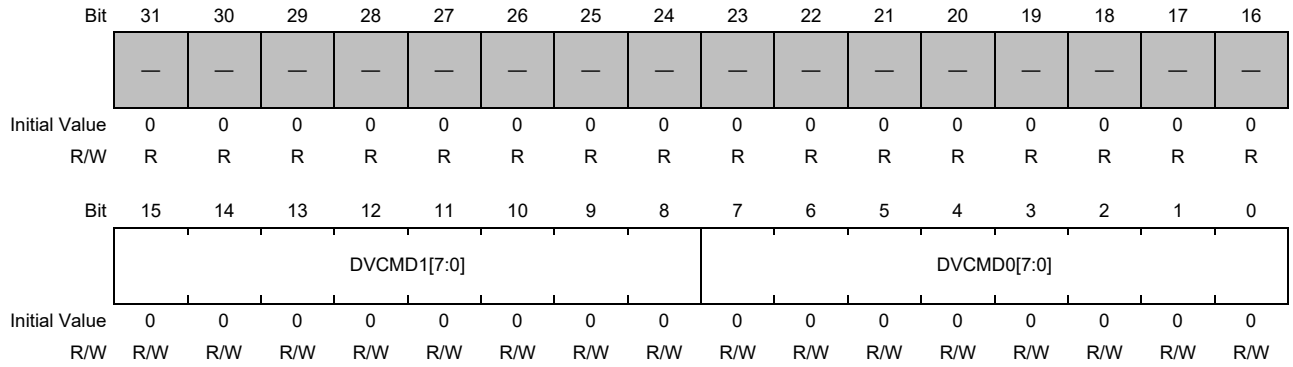
Device reset register	RSTCN	R/W	H'00000000	H'80	32
Address extend register	AER	R/W	H'00000000	H'84	32

47.4.1 Device Command Register (DCR)

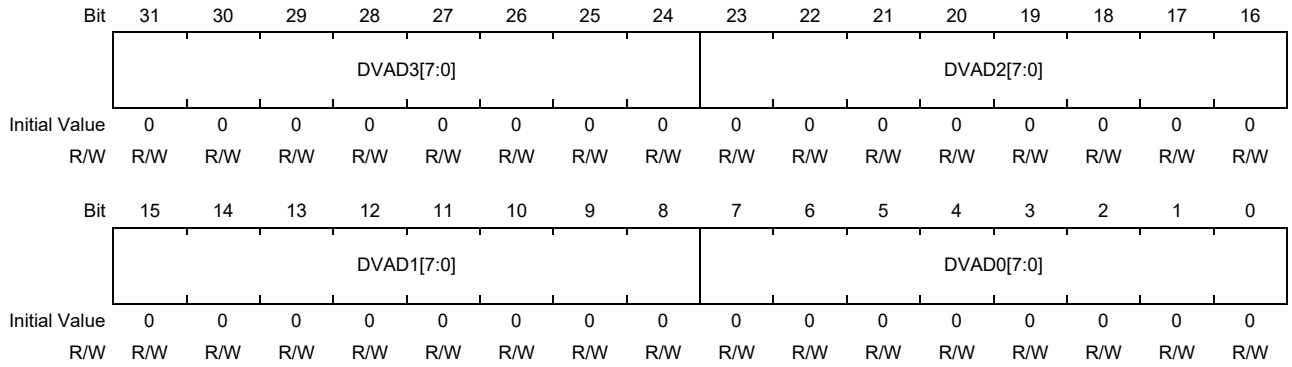
DCR sets the device commands for controller operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	DVCMD1[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[15:8] as the 1st byte to memory.
7 to 0	DVCMD0[7:0]	All 0	R/W	Device Command data Sets the data to be transferred as a command to the device. If DCSR.CMDLEN[2:0] = 1, the controller will send DCR[7:0] as the 1st byte to memory. If DCSR.CMDLEN[2:0] = 2, the controller will send DCR[7:0] as the 2nd byte to memory.

47.4.2 Device Address Register (DAR)

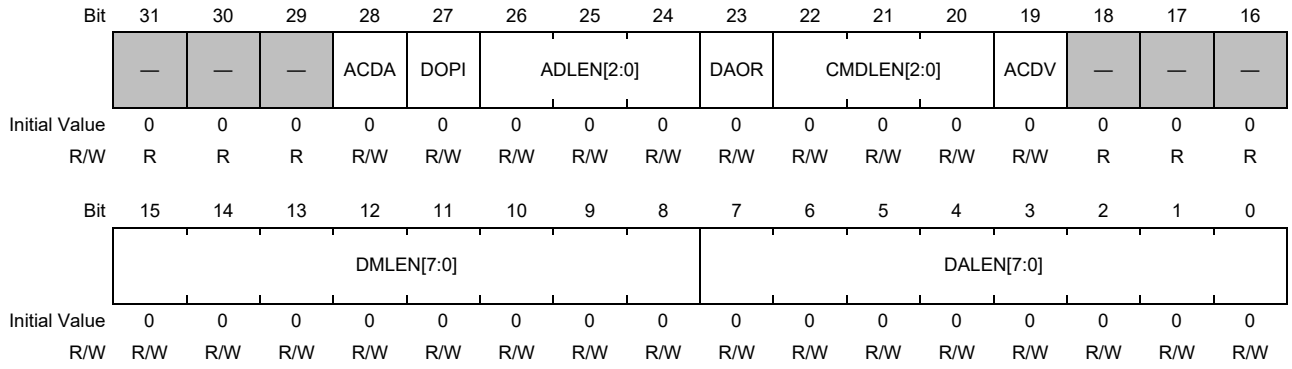
DAR sets the device address for controller operation.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DVAD3[7:0]	All 0	R/W	Device Address data 3 Set the device address data. When DCSR.ADLEN[2:0] = 4 only, set as the first byte.
23 to 16	DVAD2[7:0]	All 0	R/W	Device Address data 2 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the first byte. When DCSR.ADLEN[2:0] = 4, set as the second byte.
15 to 8	DVAD1[7:0]	All 0	R/W	Device Address data 1 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the second byte. When DCSR.ADLEN[2:0] = 4, set as the third byte.
7 to 0	DVAD0[7:0]	All 0	R/W	Device Address data 0 Set the device address data. When DCSR.ADLEN[2:0] = 3, set as the third byte. When DCSR.ADLEN[2:0] = 4, set as the fourth byte.

47.4.3 Device Command Setting Register (DCSR)

DCSR sets device commands.



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	ACDA	0	R/W	Data Access Control Set data access or register access 0: Register access Do not arrange the transfer data. 1: Data access (1) The address bit0 will be forced to 0 in DOPI mode. (2) If DAR[0] of the lead type command is 1, byte 0 from the device will be dropped in DOPI mode. (3) The AXI read data will be arranged according to the DAR. For example: When DAR[1:0] = 1, the first valid data is stored in RDATA[15:8]. (4) The AXI write data is used according to the DAR in DOPI mode. For example: If the target device is Flash Memory and DAR[1:0] = 1, the first byte sent to the flash memory is forced to 0xff. If the target device is RAM and DAR[1: 0] = 1, the first byte sent to RAM is masked by DQSM. (5) When the target device is RAM, the address sent to the memory changes according to RAM specification.
27	DOPI	0	R/W	DOPI single byte setting Even in DOPI mode, set this bit to 1 when the read data has only one byte in each cycle. For example: OctaFlash RDID, RDSR command 0: Each cycle has two bytes data. (normal DOPI mode) 1: Each cycle has one byte data. (The byte data changes at the rising edge of the clock and does not change at the falling edge of the clock.)
26 to 24	ADLEN[2:0]	000	R/W	Transfer address length setting Sets the length of the address to be transferred in bytes.
23	DAOR	0	R/W	Data order setting Sets the byte order of data during read and write operations. 0: byte0, byte1, byte2, byte3 1: byte1, byte0, byte3, byte2
22 to 20	CMDLEN[2:0]	000	R/W	Transfer command length setting Sets the length of the command to be transferred in bytes.
19	ACDV	0	R/W	Access Device setting Sets the device to be accessed. 0: Send commands to device 0. 1: Send commands to device 1.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	DMLEN[7:0]	All 0	R/W	Dummy cycle (latency) setting Sets the length of dummy cycle (latency) in QSPI0_SPCLK units.
7 to 0	DALEN[7:0]	All 0	R/W	Transfer data length setting Sets the length of data to be transferred in bytes. When [7:0] is 0, there are no transmission data to memory and reception data from memory.

47.4.4 Device Size Register 0 (DSR0)

DSR0 specifies the type of memory to be accessed as device 0 and the size of the flash memory.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DV0TYP[1:0]		DV0SZ[29:16]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DV0SZ[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV0TYP[1:0]	00	R/W	Device 0 type setting Set to 00.
29 to 0	DV0SZ[29:0]	All 0	R/W	Device 0 size setting Set a 30-bit value for the size of memory connected as device 0. [Examples] H'08000000: 128-Mbyte flash memory

47.4.5 Device Size Register 1 (DSR1)

DSR1 specifies the type of memory to be accessed as device 1 and the size of the RAM.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DV1TYP[1:0]		DV1SZ[29:16]													
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DV1SZ[15:0]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DV1TYP[1:0]	00	R/W	Device 1 type setting Set to 01.
29 to 0	DV1SZ[29:0]	All 0	R/W	Device 1 size setting Set a 30-bit value for the size of memory connected as device 1. [Examples] H'00800000: 8-Mbyte RAM

47.4.6 Memory Delay Trim Register (MDTR)

MDTR sets the timing adjustment of memory access.

For the information about the auto-calibration, refer to **Section 47.5, Operation**.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	DQSEDOPI[3:0]				DV1DEL[7:0]							
Initial Value	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DQSESOPI[3:0]				DQSERAM[3:0]				DV0DEL[7:0]							
Initial Value	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	DQSEDOPI [3:0]	H'6	R/W	OM_DQS enable counter Setting for the flash memory in the DOPI mode
23 to 16	DV1DEL[7:0]	All 0	R/W	Device 1 delay setting These bits specify the number of cycles of delay to be inserted in the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 1 in the DOPI mode (the RAM).
15 to 12	DQSESOPI [3:0]	H'9	R/W	OM_DQS enable counter Setting for the flash memory in the DOPI mode
11 to 8	DQSERAM [3:0]	H'4	R/W	OM_DQS enable counter Setting for the RAM in the DOPI mode
7 to 0	DV0DEL[7:0]	All 0	R/W	Device 0 delay setting These bits specify the delay cycles to be inserted on the input strobe signal (OM_DQS) to adjust the timing for latching data during read access to device 0 in the SOPI or DOPI mode for the flash memory.

During a read operation with the OM_DQS clock input (in the SOPI or DOPI mode), the OM_DQS clock transitions from the high-impedance state to the input state (for receiving a value of 0 from the external device) after the command and address phases are completed. To obtain valid data, adjust the DQS enable counter and delay cycles.

OM_DQS enable counter setting (QSPI0_SPCLK units)

0000: 1 clock cycle
0001: 2 clock cycles
0010: 3 clock cycles
0010: 4 clock cycles
…
1111: 16 clock cycles

OM_DQS enable counter setting examples

Table 47.4 Examples of Setting the OM_DQS Enable Counter for OctaRAM

Number of dummy cycles (latency)	RAM	
	Pre-cycle On	Pre-cycle Off
3	4	4 to 5
4	4 to 5	4 to 6
5	4 to 6	4 to 7
6	4 to 7	4 to 8
7	4 to 8	4 to 9
8	4 to 9	4 to 10

Table 47.5 Examples of Setting the OM_DQS Enable Counter for OctaFlash Memory

Number of dummy cycles (latency)	SOPI	DOPI	
	Pre-cycle On	Pre-cycle On	Pre-cycle Off
4	8 to 9	5 to 6	5 to 7
6	8 to 11	5 to 8	5 to 9
8	8 to 13	5 to 10	5 to 11
10	8 to 15	5 to 12	5 to 13
12	8 to 15	5 to 14	5 to 15
14	8 to 15	5 to 15	5 to 15
16	8 to 15	5 to 15	5 to 15
18	8 to 15	5 to 15	5 to 15
20	8 to 15	5 to 15	5 to 15

These two tables list cases of DQS delay.

If DQS delay cycle is not within this range, refer to **Section 47.7, OM_DQS Enable Counter**, and recalculate the correct range.

47.4.7 Auto-Calibration Timer Register (ACTR)

ACTR sets the cycle at which automatic calibration is executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTP[31:16]															
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTP[31:0]	H'10000000	R/W	Automatic calibration cycle time setting Sets performing cycle for the automatic calibration with 32 bits. Automatic calibration cycle time (ns) = CTP[31:0] × SCLK / 2 When automatic calibration is enabled (CDSR.ACMODE[1:0] = H'1) and the value of the internal timer is equal to that of this register, automatic calibration will start.

47.4.8 Auto-Calibration Address Register 0 (ACAR0)

ACAR0 sets the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CAD0[31:16]

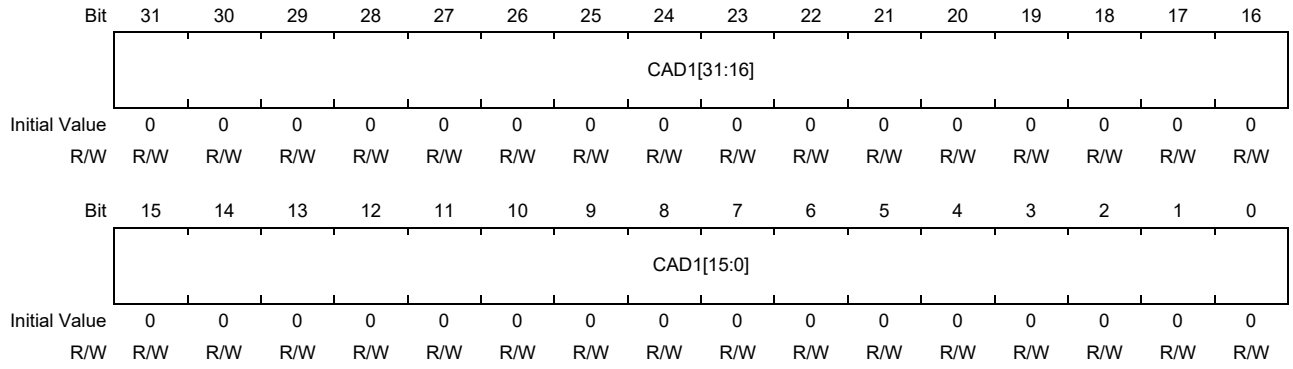
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD0[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaFlash memory for writing to and reading from in auto-calibration of device 0. *Note*: Set an address in terms of the memory space of the OctaFlash device, not in the OctaFlash space within this LSI chip.

47.4.9 Auto-Calibration Address Register 1 (ACAR1)

ACAR1 sets the address in OctaRAM for writing to and reading from in auto-calibration of device 1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CAD1[31:0]	All 0	R/W	Automatic calibration address These bits set the address in OctaRAM for writing to and reading from in auto-calibration of device 1. *Note*: Set an address in terms of the memory space of the OctaRAM device, not in the OctaRAM space within this LSI chip.

47.4.10 Device Memory Map Read Chip Select Timing Setting Register (DRCSTR)

DRCSTR sets the timing of memory-mapped reading for each device.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DVRDLO1[1:0]		DVRDHI1[2:0]			DVRDCMD1[2:0]			—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVRDLO1 [1:0]	00	R/W	Device 1 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 1. Timing definition from OM_CS1# low to the first QSPI0_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29, 27	DVRDHI1[2:0]	000	R/W	Device 1 select signal High timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last QSPI0_SPCLK low to OM_CS1# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVRDCMD1 [2:0]	000	R/W	Device 1 Command execution interval*1 Indicates the timing, between command and command for device 1. Timing, until the OM_CS1# signal goes from High to the next Low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVRDLO0 [1:0]	00	R/W	Device 0 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the read operation for the device 0. Timing definition from QSPI0_SSL low to the first QSPI0_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVRDHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting*1 Indicates the timing, from the end of read operation to the select signal is pulled up. Timing definition from the last QSPI0_SPCLK low to QSPI0_SSL high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	DVRDCMD0 [2:0]	000	R/W	Device 0 Command execution interval setting*1 Indicates the timing between command to command for the device 0. Timing definition from QSPI0_SSL high to the next QSPI0_SSL low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7	CTR0	0	R/W	Device 0 Continuous read setting When the continuous read is enabled, wait for the continuous read operation to be performed using the value set in CTRW0[6:0]. Do not set this bit to 1 except for OctaFlash DOPI mode. 0: Continuous read disabled for device 0 1: Continuous read enabled for device 0
6 to 0	CTRW0[6:0]	All 0	R/W	Device 0 continuous read cycle setting When continuous read of Device 0 is enabled, the selection signal is fixed to Low for the set clock cycle, after the read operation is performed. If the number of clock cycles exceeds twice the value set in these bits before the next read operation is performed, the select signal is returned to High.

Note 1. These clock cycles are values in internal clock units. In QSPI0_SPCLK units, the clock cycle is 1/2 of the above table.

47.4.11 Device Memory Map Write Chip Select Timing Setting Register (DWCSTR)

DWCSTR sets the timing of memory-mapped writing for each device.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	DVWLO1[1:0]	00	R/W	Device 1 select signal pull-down timing setting*1 Indicates the timing between the device 1 select signal pull-down to the write operation. Timing definition from OM_CS1# low to the first QSPI0_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
29 to 27	DVWHI1[2:0]	000	R/W	Device 1 select signal pull-up timing setting*1 Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last QSPI0_SPCLK low to OM_CS1# high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	DVWCMD1 [2:0]	000	R/W	Device 1 Command execution interval setting*1 Indicates the timing between command to command for the device 1. Timing definition from OM_CS1# high to the next OM_CS1# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVWLO0[1:0]	00	R/W	Device 0 select signal pull-down timing setting*1 Indicates the timing between the select signal pull-down to the write operation for the device 0. Timing definition from QSPI0_SSL low to the first QSPI0_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles
13 to 11	DVWHI0[2:0]	000	R/W	Device 0 select signal pull-up timing setting*1 Indicates the timing, from the end of write operation to the select signal is pulled up. Timing definition from the last QSPI0_SPCLK low to QSPI0_SSL high DOPI mode 000: 1.5 clock cycles 001: 2.5 clock cycles 010: 3.5 clock cycles 011: 4.5 clock cycles 100: 5.5 clock cycles 101: 6.5 clock cycles 110: 7.5 clock cycles 111: 8.5 clock cycles Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	DVWCMD0 [2:0]	000	R/W	Device 0 Command execution interval setting*1 Indicates the timing between command to command for the device 0. Timing definition from QSPI0_SSL high to the next QSPI0_SSL low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. These clock cycles are values in internal clock units. In QSPI0_SPCLK units, the clock cycle is 1/2 of the above table.

47.4.12 Device Chip Select Timing Setting Register (DCSTR)

DCSTR sets the timing of operations in configuration mode.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DVSELLO [1:0]	All 0	R/W	Device select signal pull-down timing setting*1 Indicates the timing, from the device selection signal is pulled-down to the command execution. Timing definition from OM_CS# low to the first QSPI0_SPCLK high DOPI mode 00: 1.5 clock cycles 01: 2.5 clock cycles 10: 3.5 clock cycles 11: 4.5 clock cycles Other mode 00: 2 clock cycles 01: 3 clock cycles 10: 4 clock cycles 11: 5 clock cycles

Bit	Bit Name	Initial Value	R/W	Description
13 to 11	DVSELHI[2:0]	000	R/W	Device select signal pull-up timing setting*1 Indicates the timing when the select signal is pulled up from the end of the command execution. Timing definition from the last QSPI0_SPCLK low to OM_CS# high DOPI or (SOPI) mode 000: Setting prohibited 001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Setting prohibited 101: 6.5 (7) clock cycles 110: 7.5 (8) clock cycles 111: 8.5 (9) clock cycles *Note*: The values in parentheses apply to SOPI mode. Other mode 000: 2 clock cycles 001: 3 clock cycles 010: 4 clock cycles 011: 5 clock cycles 100: 6 clock cycles 101: 7 clock cycles 110: 8 clock cycles 111: 9 clock cycles
10 to 8	DVSELCMD [2:0]	000	R/W	Device Command execution interval setting*1 Indicates the timing between command to command. Timing definition from OM_CS# high to the next OM_CS# low 000: 2 clock cycles 001: 5 clock cycles 010: 7 clock cycles 011: 9 clock cycles 100: 11 clock cycles 101: 13 clock cycles 110: 15 clock cycles 111: 17 clock cycles
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. These clock cycles are values in internal clock units. In QSPI0_SPCLK units, the clock cycle is 1/2 of the above table.

47.4.13 Controller and Device Setting Register (CDSR)

CDSR controls the automatic calibration, pre-cycle setting, and device transfer type of the controller and each of the devices.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DLFT	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ACMODE[1:0]		ACMEME[1:0]		—	—	—	—	DV1PC	DV0PC	DV1TTYP[1:0]		DV0TTYP[1:0]	
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

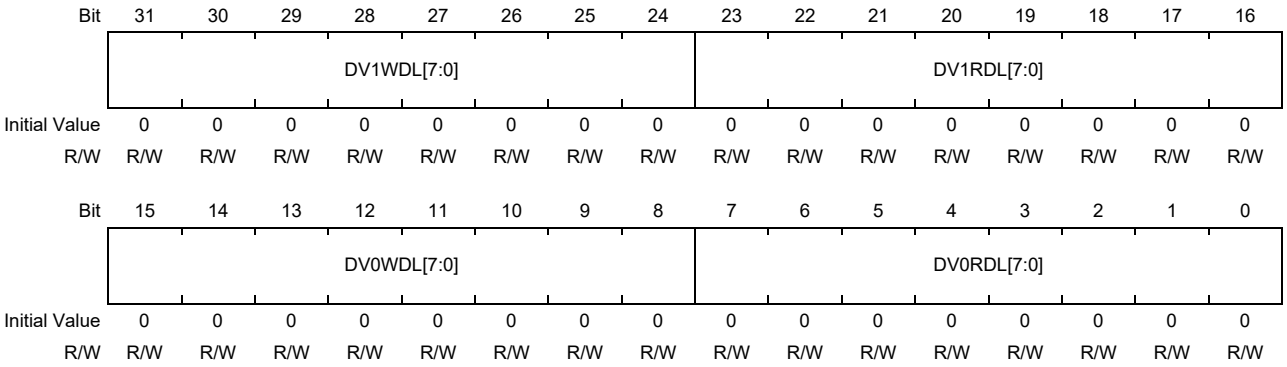
Bit	Bit Name	Initial Value	R/W	Description
31	DLFT	0	R/W	Deadlock Free Timer Enable Enable the timer to prevent the occurrence of controller deadlock. The timeout status is reset only by a system reset. 0: Enable timer 1: Disable timer *Note*: This function is available only when QSPI0_SPCLK is 132 MHz. Otherwise, disable the timer.
30 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	ACMODE[1:0]	00	R/W	Automatic calibration mode 00: Automatic calibration is disabled.*1 01: Automatic calibration is enabled. 10: Setting prohibited. 11: Setting prohibited. The ACMODE bits should be set to disabled during read access to the OctaFlash device. Automatic calibration is only available in the DOPI mode.
11, 10	ACMEME[1:0]	00	R/W	Automatic calibration memory enable setting Automatic calibration supports only DOPI mode. To end DOPI mode, disable automatic calibration. [1]: Enable for device 1 1: Enable 0: Disable [0]: Enable for device 0 1: Enable 0: Disable
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	DV1PC	0	R/W	Device1_memory precycle setting 0: Disable 1: Enable
4	DV0PC	0	R/W	Device0_memory precycle setting 0: Disable 1: Enable

Bit	Bit Name	Initial Value	R/W	Description
3, 2	DV1TTYP [1:0]	00	R/W	Device1_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited
1, 0	DV0TTYP [1:0]	00	R/W	Device0_transfer_type setting 00: SPI mode 01: SOPI mode 10: DOPI mode 11: Setting prohibited

Note 1. When automatic calibration is disabled, the device 0 delay (OctaFlash) and device 1 delay (OctaRAM) should be manually specified in the memory delay trim register (MDTR) (see **Section 47.4.6**). Set this register with reference to “initial setting MDTR (OctaFlash memory)” and “initial setting MDTR (OctaRAM)” in **Figure 47.16**.

47.4.14 Memory Map Dummy Length Register (MDLR)

MDLR sets the number of dummy cycles (latency) for writing and reading the memory map.

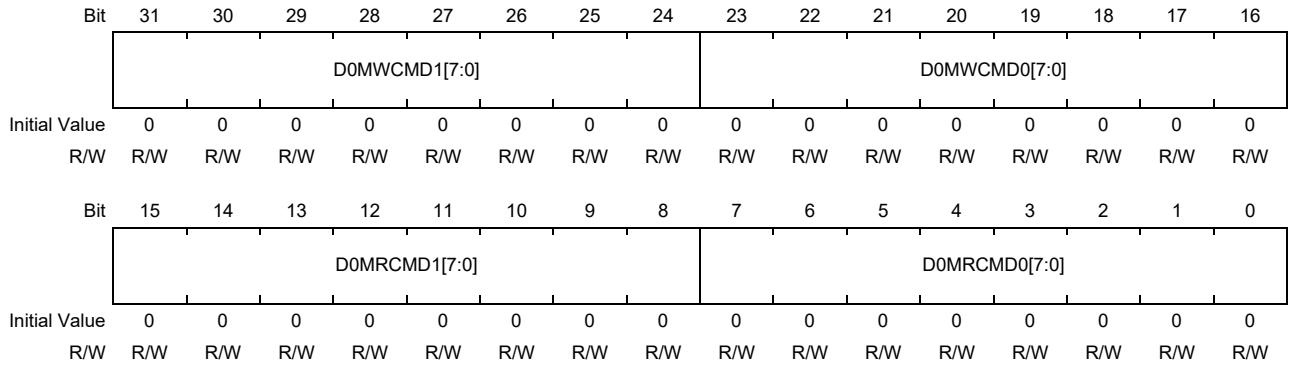


Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DV1WDL[7:0]	All 0	R/W	Device 1 Write dummy cycles (latency) setting Set the dummy length when writing to device 1 in QSPI0_SPCLK cycles unit.
23 to 16	DV1RDL[7:0]	All 0	R/W	Device 1 Read dummy cycles (latency) setting Set the dummy length when reading to device 1 in QSPI0_SPCLK cycles unit.
15 to 8	DV0WDL[7:0]	All 0	R/W	Device 0 Write dummy cycles (latency) setting Set the dummy length when writing to device 0 in QSPI0_SPCLK cycles unit.
7 to 0	DV0RDL[7:0]	All 0	R/W	Device 0 Read dummy cycles (latency) setting Set the dummy length when reading to device 0 in QSPI0_SPCLK cycles unit.

Note: When changing the dummy cycles (latency) for the OctaFlash device, modify the setting on the memory and then modify the setting in the DMLEN[7:0] bits in the device command setting register (DCSR) so that the dummy length becomes the same between the memory and this Octa memory controller. After that, execute the status read command to confirm the memory status.

47.4.15 Memory Map Read/Write Command Register 0 (MRWCR0)

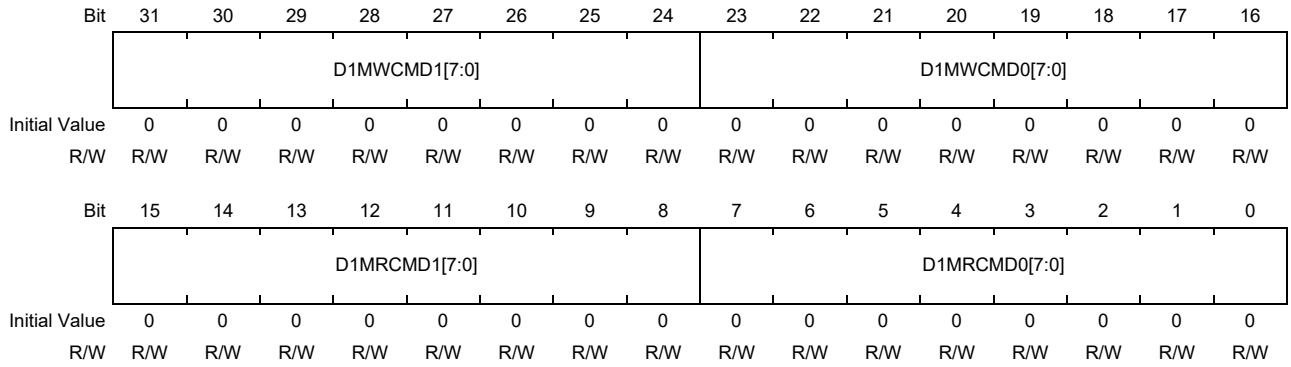
MRWCR0 sets the read/write commands for the device 0.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D0MWCMD1 [7:0]	All 0	R/W	Memory map write command 1 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
23 to 16	D0MWCMD0 [7:0]	All 0	R/W	Memory map write command 0 setting, Set the memory map write command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
15 to 8	D0MRCMD1 [7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].
7 to 0	D0MRCMD0 [7:0]	All 0	R/W	Memory map read command 0 setting, Set the memory map read command. According to the flash memory spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 0 is specified by CDSR.DV0TTYP[1:0].

47.4.16 Memory Map Read/Write Command Register 1 (MRWCR1)

MRWCR1 sets the read/write commands for the device 1.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	D1MWCMD1 [7:0]	All 0	R/W	Memory map write command 1 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
23 to 16	D1MWCMD0 [7:0]	All 0	R/W	Memory map write command 0 setting Set the memory map write command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
15 to 8	D1MRCMD1 [7:0]	All 0	R/W	Memory map read command 1 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will not send command 1. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].
7 to 0	D1MRCMD0 [7:0]	All 0	R/W	Memory map read command 0 setting Set the memory map read command. According to the RAM spec, there are SPI, SOPI, and DOPI mode. In SPI mode, the controller will send only command 0. In SOPI and DOPI mode, the controller will send command 1 first and then send command 0. The mode of device 1 is specified by CDSR.DV1TTYP[1:0].

47.4.17 Memory Map Read/Write Setting Register (MRWCSR)

MRWCSR sets the memory map read/write operations.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MWO1	MWCL1[2:0]			MWAL1[2:0]			—	MRO1	MRCL1[2:0]			MRAL1[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	MWO0	MWCL0[2:0]			MWAL0[2:0]			—	MRO0	MRCL0[2:0]			MRAL0[2:0]		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	MWO1	0	R/W	Device 1 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
29 to 27	MWCL1[2:0]	000	R/W	Device 1 write command length setting Set the number of bytes in the write command for device 1.
26 to 24	MWAL1[2:0]	000	R/W	Device 1 write address length setting Set the memory map write address byte length for device 1.
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	MRO1	0	R/W	Device 1 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. *Note*: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
21 to 19	MRCL1[2:0]	000	R/W	Device 1 read command length setting Set the read command byte length for device 1.
18 to 16	MRAL1[2:0]	000	R/W	Device 1 read address length setting Set the memory map read address byte length for device 1.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	MWO0	0	R/W	Device 0 write order setting 0: Write order is byte0, byte1, byte2, byte3. 1: Write order is byte1, byte0, byte3, byte2.
13 to 11	MWCL0[2:0]	000	R/W	Device 0 write command length setting Set the write command byte length for device 0.
10 to 8	MWAL0[2:0]	000	R/W	Device 0 write address length setting Set the memory map write address byte length for device 0.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	MRO0	0	R/W	Device 0 read order setting 0: Read order is byte0, byte1, byte2, byte3. 1: Read order is byte1, byte0, byte3, byte2. *Note*: This setting is only valid in the DOPI mode. It has no effect in the SOPI or SPI mode.
5 to 3	MRCL0[2:0]	000	R/W	Device 0 read command length setting Set the write command byte length for device 0.
2 to 0	MRAL0[2:0]	000	R/W	Device 0 read address length setting Set the memory map read address byte length for device 0.

47.4.18 Error Status Register (ESR)

ESR indicates the error status when performing memory map read and write commands.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MWESR[7:0]								MRESR[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	0	R	Reserved These bits are always read as 0.
15 to 8	MWESR[7:0]	All 0	R	Memory map write error status H'80 = invalid command H'01 = write data length error
7 to 0	MRESR[7:0]	All 0	R	Memory map read error status H'80 = invalid command H'01 = ECC error H'02 = preamble error H'03 = wait OM_DQS timeout

47.4.19 Configure Write without Data Register (CWNDR)

CWNDR is used to execute a write command without data in the configuration mode. Writing 0 to this register makes this module issue a write command without actually writing data to memory.
Specify an address in DAR, a command in DCSR, and command data in DCR.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	—	All 0	W	The write value should always be 0.

47.4.20 Configure Write Data Register (CWDR)

CWDR is used to set the data for writing when a write command is to be executed in the configuration mode. Writing to this register makes the controller to issue a write command and transfer the data to be written. The byte order of data transferred by the controller to the memory is in accord with the setting of the DAOR bit in CDSR. Specify an address in DAR, a command in DCSR, and command data in DCR.

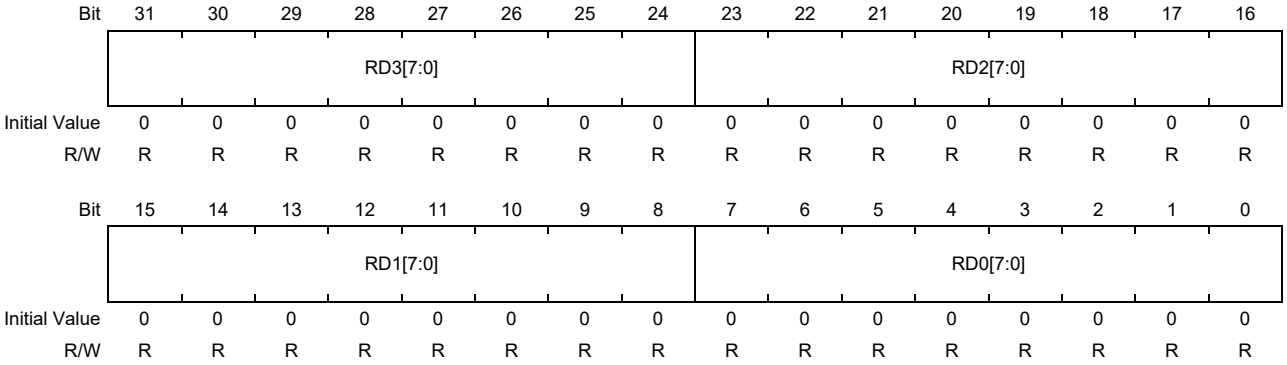
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WD3[7:0]								WD2[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WD1[7:0]								WD0[7:0]							
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	WD3[7:0]	All 0	W	Write data 3 Set the third byte of the write data.
23 to 16	WD2[7:0]	All 0	W	Write data 2 Set the second byte of the write data.
15 to 8	WD1[7:0]	All 0	W	Write data 1 Set the first byte of the write data.
7 to 0	WD0[7:0]	All 0	W	Write data 0 Set the zeroth byte of the write data.

47.4.21 Configure Read Register (CRR)

CRR is used to execute a read command in the configuration mode and holds the data that are read. Reading from this register makes the controller issue a read command and the data that are read are stored in this register. Specify an address in DAR, a command in DCSR, and command data in DCR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RD3[7:0]	All 0	R	Read data 3 Store the third byte of the read data.
23 to 16	RD2[7:0]	All 0	R	Read data 2 Store the second byte of the read data.
15 to 8	RD1[7:0]	All 0	R	Read data 1 Store the first byte of the read data.
7 to 0	RD0[7:0]	All 0	R	Read data 0 Store the zeroth byte of the read data.

47.4.22 Device Reset Register (RSTCNT)

RSTCNT is used to control O_MEM_RESET_N.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSTVAL
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
0	RSTVAL	0	R/W	Output value of O_MEM_RESET_N 0: O_MEM_RESET_N = L 1: O_MEM_RESET_N = H

47.4.23 Address Extend Register (AER)

AER is used to extend the accessible range of OctaRAM.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	AAS		
Initial Value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved When read, the initial value is read. The written value will be ignored.
2 to 0	AAS	000b	R/W	Accessible address space 000b: H'0_2800_0000 to H'0_287F_FFFF (8 Mbytes) 001b: H'0_2800_0000 to H'0_28FF_FFFF (16 Mbytes) 011b: H'0_2800_0000 to H'0_29FF_FFFF (32 Mbytes) 111b: H'0_2800_0000 to H'0_2BFF_FFFF (64 Mbytes) Others: Prohibited.

47.5 Operation

47.5.1 Octa Memory Controller System Configuration

Figure 47.2 shows an example of connections between the Octa memory controller in this LSI and OctaFlash and OctaRAM devices.

CS0# should be connected to the OctaFlash device and CS1# should be connected to the OctaRAM device.

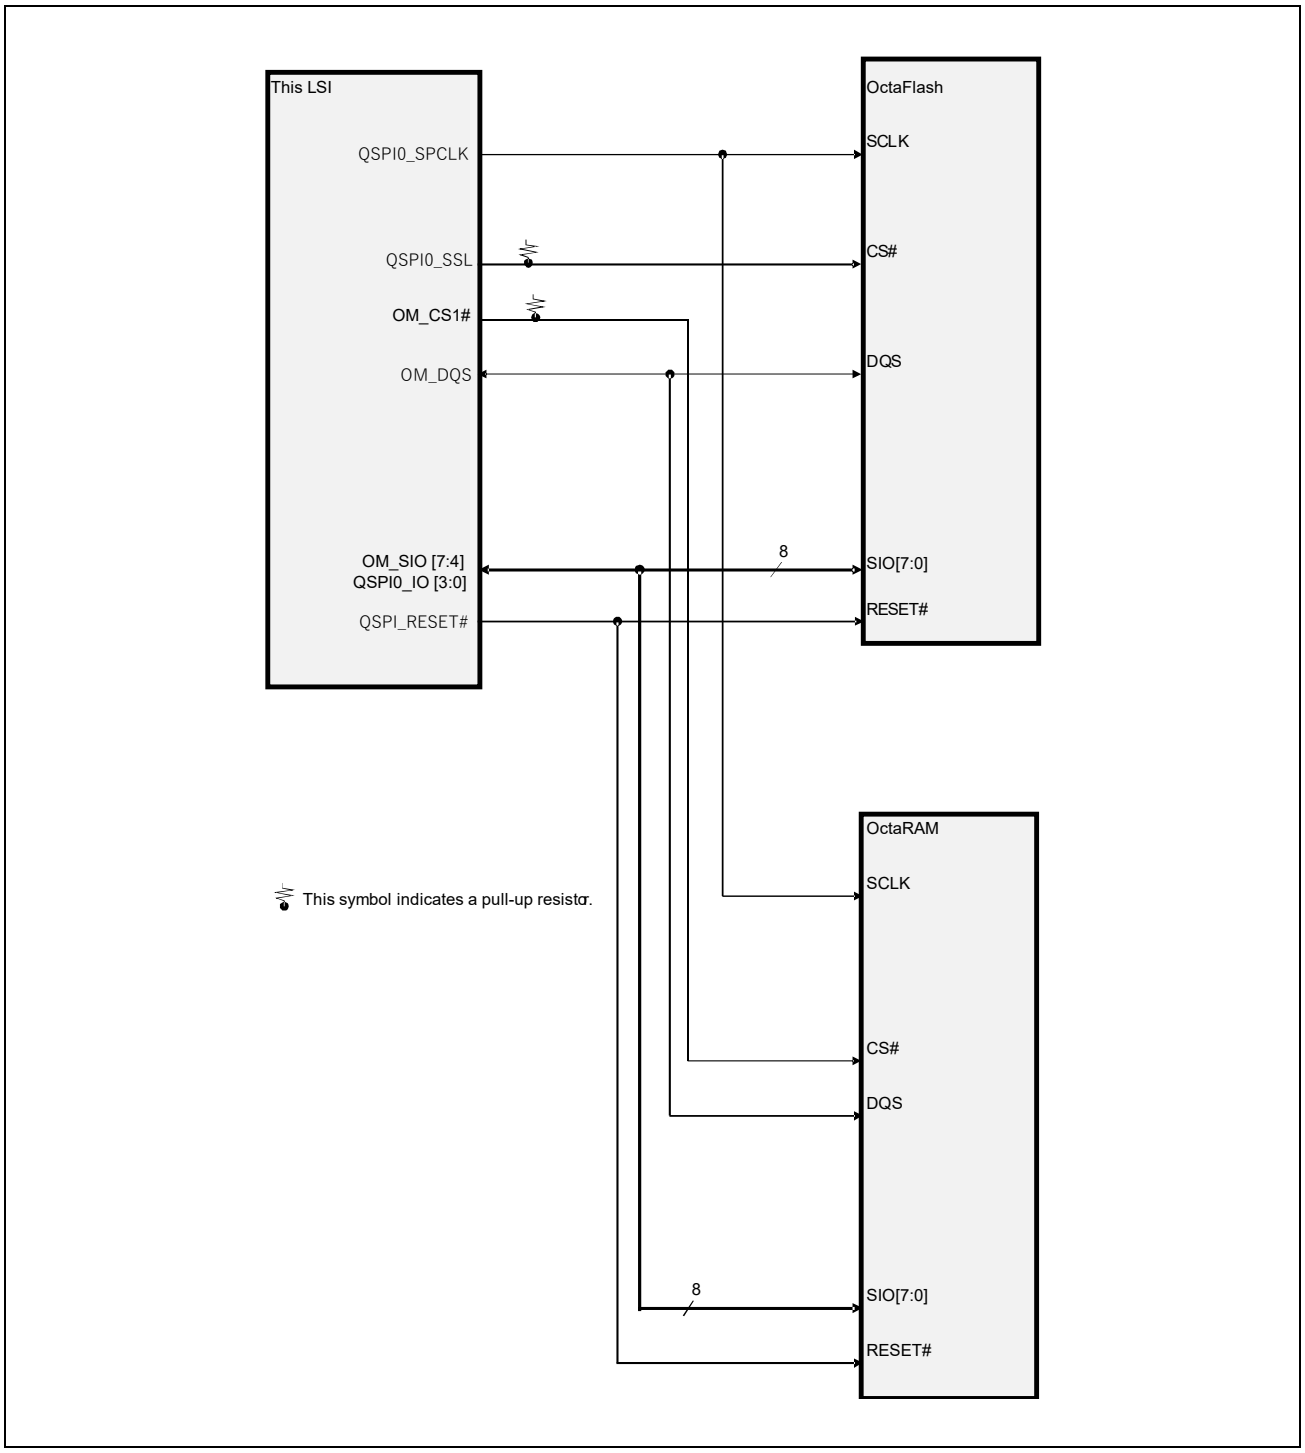


Figure 47.2 Example of Connections between this LSI and OctaFlash and OctaRAM Devices

47.5.2 Address Map

In the memory-map mode, OctaFlash is allocated to the OctaFlash space (H’20000000 to H’27FFFFFF), and OctaRAM is allocated to the OctaRAM space (H’28000000 to H’2FFFFFFF).

One OctaFlash device and one OctaRAM device can be connected to this LSI, and up to 128 Mbytes can be accessed in OctaFlash.and up to 8 Mbytes can be accessed in OctaRAM.

	Internal Address	Maximum Accessible Area
OctaFlash	H’20000000 to H’27FFFFFF	Up to 128 Mbytes
OctaRAM	H’28000000 to H’2FFFFFFF	Up to 8 Mbytes

47.5.3 Octa Memory Interface

This section describes the Octa memory interface.

47.5.3.1 Write Operation

The Octa memory controller outputs a command and an address and writes one or more data bytes by using lines QSPI0_SSL (OM_CS1#), QSPI0_SPCLK, and OM_SIO7 to OM_SIO0.

The write operation for OctaRAM has latency cycles before data is written to memory.

Figure 47.3 to **Figure 47.5** show waveforms of the write operation in the OctaFlash interface, and **Figure 47.6** shows a waveform of the write operation in the OctaRAM interface.

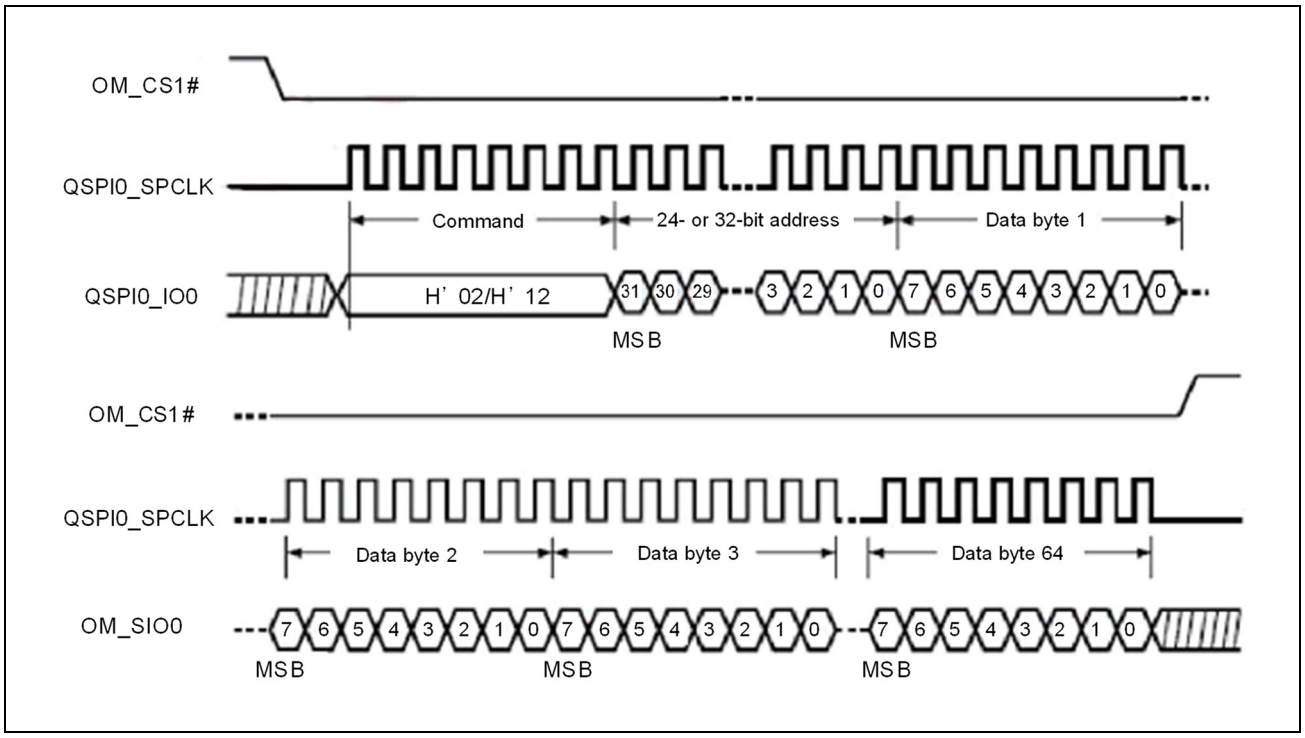

Figure 47.3 Waveform of Write Operation in OctaFlash Interface (SPI Mode)

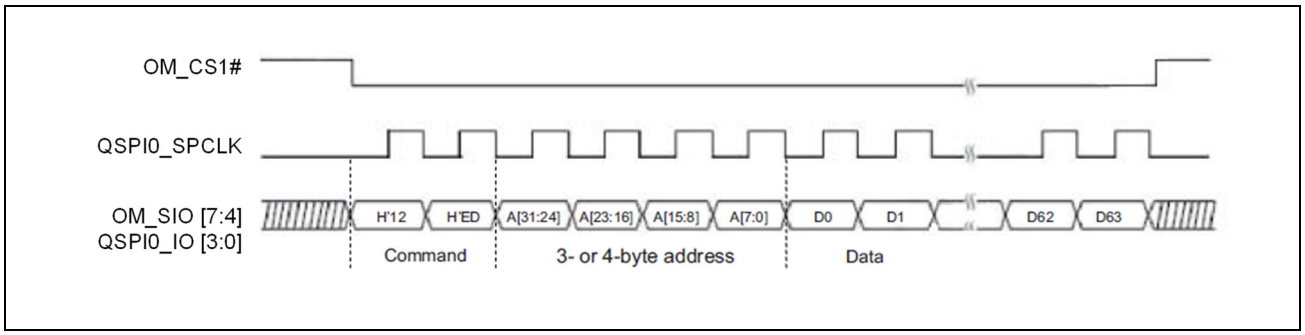

Figure 47.4 Waveform of Write Operation in OctaFlash Interface (SOPI Mode)

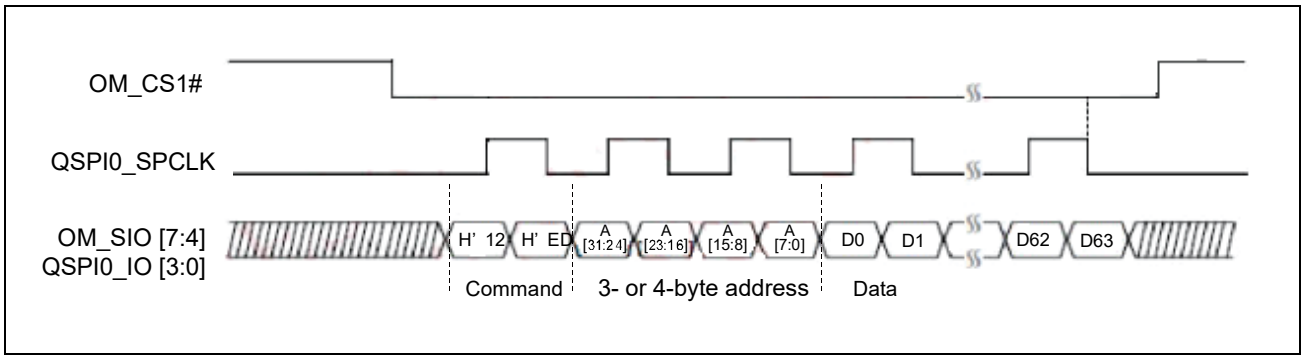

Figure 47.5 Waveform of Write Operation in OctaFlash Interface (DOPI Mode)

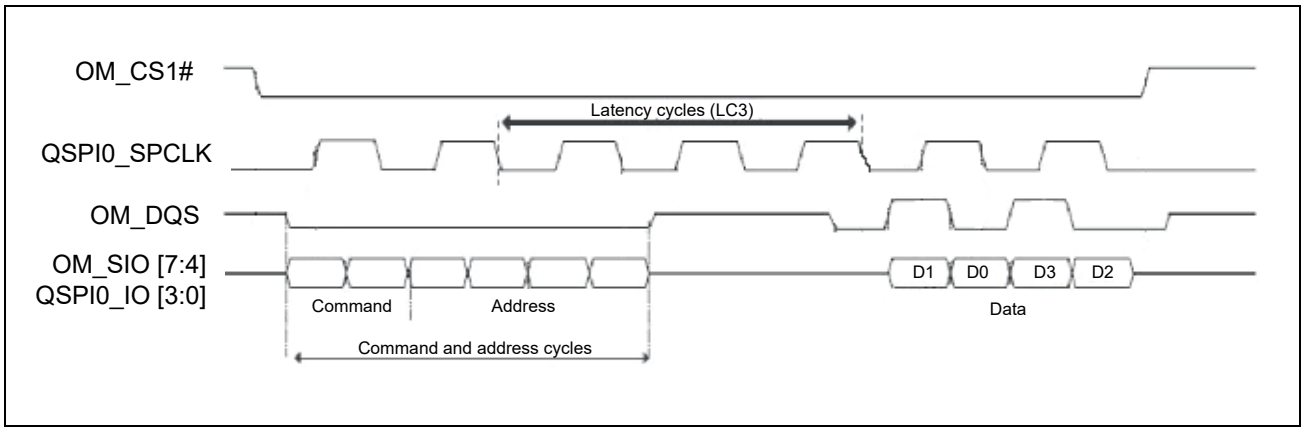

Figure 47.6 Waveform of Write Operation in OctaRAM Interface

47.5.3.2 Read Operation

The Octa memory controller outputs a command and an address and reads one or more data bytes by using lines QSPI0_SSL (OM_CS1#),QSPI0_SPCLK, and OM_SIO7 to OM_SIO0.

The read operation for OctaFlash and OctaRAM has latency cycles before data is read from memory.

The number of latency cycles should be specified in the memory map dummy length setting register (MDLR) (see **Section 47.4.14**) in accordance with the setting in the memory device.

Figure 47.7 to **Figure 47.9** show waveforms of the read operation in the OctaFlash interface, and **Figure 47.10** shows a waveform of the read operation in the OctaRAM interface.

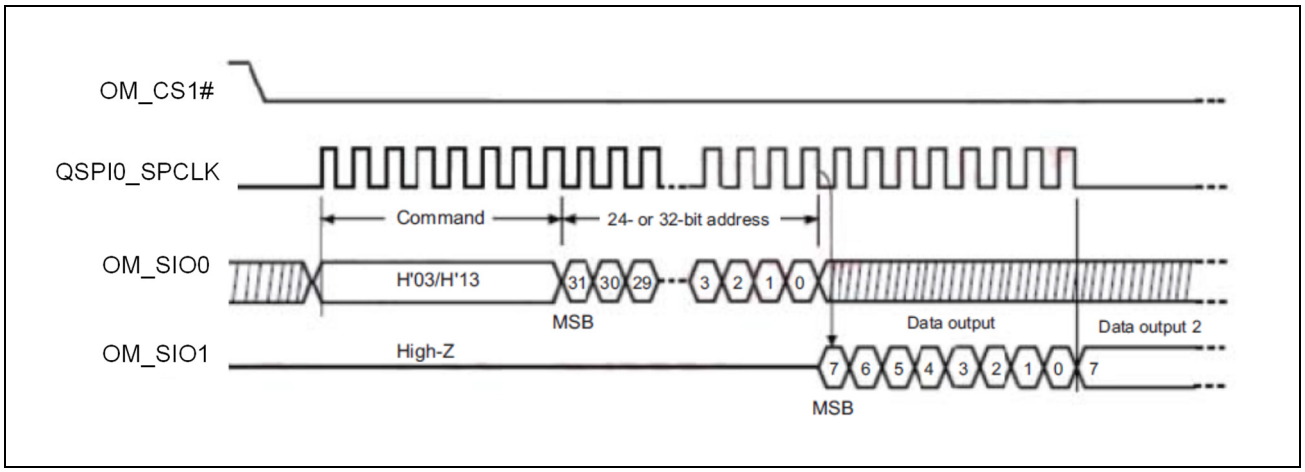

Figure 47.7 Waveform of Read Operation in OctaFlash Interface (SPI Mode)

47.5.4 Data Alignment in the OctaFlash and OctaRAM Spaces

Figure 47.11 shows the memory data alignment in the OctaFlash and OctaRAM spaces.

Figure 47.12 shows the data alignment when the configuration register in OctaFlash or OctaRAM is accessed.

When OctaFlash is connected (MRWCSR.MWO0 = 0, MRWCSR.MRO0 = 0) or
OctaRAM is connected (MRWCSR.MWO1 = 0, MRWCSR.MRO1 = 0)

Flash/RAM 8-bit DDR	Access width	Address	Internal bus 63–56	55–48	47–40	39–32	31–24	23–16	15–8	7–0
0 D0[7:0]	1 byte	b'000	X	X	X	X	X	X	X	D0
1 D1[7:0]		b'001	X	X	X	X	X	X	D1	X
2 D2[7:0]		b'010	X	X	X	X	X	D2	X	X

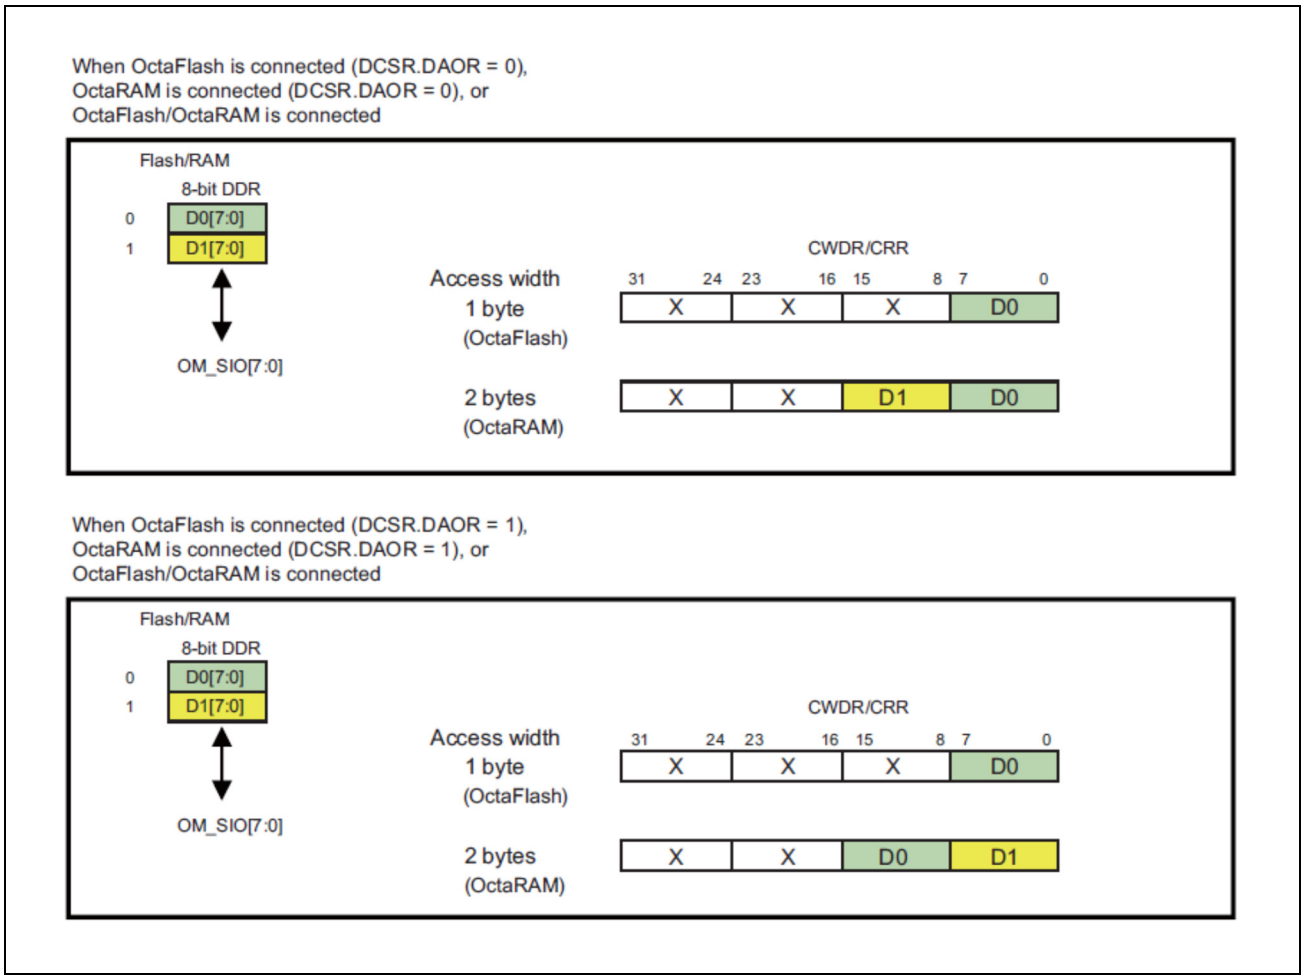

Figure 47.12 Configuration Register Data Alignment in the OctaFlash and OctaRAM Spaces

47.5.5 One-Byte Write Access to an Octa Memory Device in the DOPI Mode

This section describes one-byte write access in the DOPI mode.

Writing to the Octa memory device in the DOPI mode is handled in 2-byte units.

When the target device is OctaRAM, the output OM_DQS signal of the controller can be used to mask bytes by driving it to the high level during the operation of writing. This allows the masking of invalid write data.

When the target device is OctaFlash, one-byte write access must not be attempted since OctaFlash only supports twobyte access.

Figure 47.13 shows the waveforms in one-byte write access in the DOPI mode.

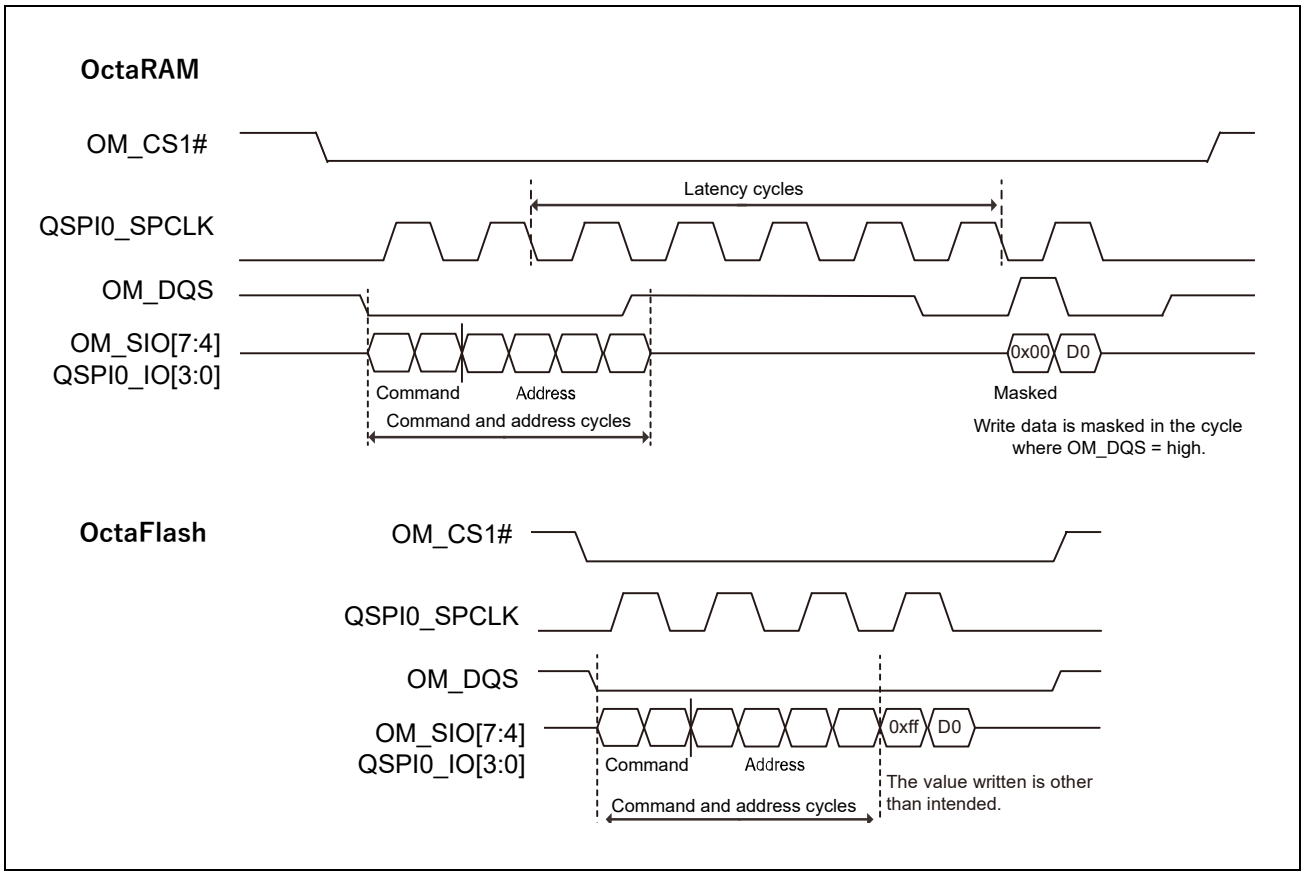

Figure 47.13 Waveforms in One-Byte Write Access in the DOPI Mode

47.5.6 Operation Flows

This section describes the flows of Octa memory controller operations for various purposes.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

The sample settings assume the following environment.

(1) Memory connections: CS0 (device 0) to OctaFlash and CS1 (device 1) to OctaRAM

(2) QSPI0_SPCLK (Octa memory clock) frequency: 132 MHz

47.5.6.1 Initial Settings

The following shows an example of initial settings of the Octa memory controller.
Before access to the external memory, set up the SEL_SPI_OCTA bit in the SPI Multi IO/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA) in the initial setting steps.

Table 47.6 Example of Initial Settings of the Octa Memory Controller

Step	Read/Write	Address (Register)	Data	Data Length (Bytes)	Description
1	Write	DSR0	H'08000000	4	Specifies the type and size of device 0.
2	Write	DSR1	H'40800000	4	Specifies the type and size of device 1.
3	Write	MDTR	H'0740A640	4	Adjusts the memory access timings.
4	Write	DRCSTR	H'29002900	4	Specifies the read timing for each device.
5	Write	DWCSTR	H'1A001A00	4	Specifies the write timing for each device.
6	Write	DCSTR	H'00002900	4	Specifies the timings of the chip select signals.
7	Write	CDSR	H'0000000A	4	Sets up the controller functions. (1) Memory pre-cycle is enabled or disabled. (2) Transfer type is specified (SPI, SOPI, or DOPI).
8	Write	MDLR	H'05050E0E	4	Specifies number of dummy cycles (latency).
9	Write	MRWCR0	H'12EDEE11	4	Specifies the read and write commands for device 0.
10	Write	MRWCR1	H'2000A000	4	Specifies the read and write commands for device 1.
11	Write	MRWCSR	H'54545454	4	Sets up the memory-mapped reading and writing. (1) The length (bytes) of a command is specified. (2) The length (bytes) of an address is specified. (3) The order of bytes to be written is specified.

Note: Set up the SEL_SPI_OCTA bit in the SPI Multi IO/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA). For the SEL_SPI_OCTA bit, refer to **Section 41, General Purpose Input Output Port (GPIO)**.

47.5.6.2 Basic Operation Settings

This section describes the basic operations of OctaFlash and OctaRAM.

The following only shows sample settings, and appropriate commands and data should be specified in accordance with the specifications of the target memory device.

(1) OctaFlash Operation Settings

Table 47.7 Write Enable Settings

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description
			Data	Data Length (Bytes)	Data	Data Length (Bytes)	
1	Write	DCR	H'00000006	4	H'000006F9	4	
2	Write	DCSR	H'00100000	4	H'00200000	4	
3	Write	CWNDR	Any value	4	Any value	4	

Table 47.8 Read Status Register

Step	Read/ Write	Register	SPI Mode		OPI Mode		Description

3	Write	DCSR	H'04A80502	4	
4	Read	CRR	H'0000xxxx	2	The high-order 16 bits are all set to 0s, and the read data is stored in the low-order 16 bits.

Table 47.16 Write Configuration Register

Step	Read/ Write	Register	Data	Data Length (Bytes)	Description
1	Write	DCR	H'00004000	4	
2	Write	DAR	H'00040000	4	
3	Write	DCSR	H'04A80002	4	
4	Write	CWDR	H'0000xxxx	2	Set all the high-order 16 bits to 0s, and specify the write data in the low-order 16 bits.

47.6 Delaying OM_DQS and Auto-Calibration

47.6.1 Delaying OM_DQS

Depending on the characteristics of the DOPI mode, the controller might not be able to latch data on the rising and falling edges of the OM_DQS clock signal. OM_DQS will then require a delay to allow the latching of data with sufficient margins for the setup and hold times. The DV1DEL[7:0] and DV0DEL[7:0] bits in the memory delay trimming register (MDTR) can be used to specify the amount of delay.

Figure 47.14 shows how a delayed OM_DQS becomes asserted at a good time for latching of the data.

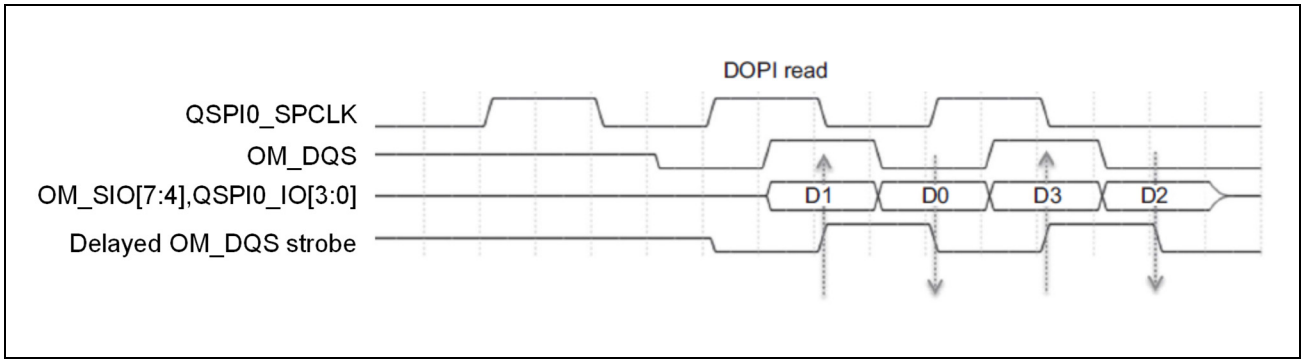

Figure 47.14 Example of Securing the Latching of Data by Delaying OM_DQS

47.6.2 OM_DQS Auto-Calibration

This LSI has an automatic calibration to prevent acquisition of wrong data due to the variation of voltage and temperature. When using the automatic calibration, set the following registers.

- Controller and device setting register (CDSR): Automatic calibration mode ACMODE[1:0] bits setting
- Auto-calibration timer register (ACTR): Automatic calibration cycle time setting
- Auto-calibration address registers 0 and 1 (ACAR0/ACAR1): Preamble pattern store address setting

Automatic calibration requires 16 bytes user area to store the preamble pattern. Store the preamble pattern to the setting address of ACAR0 and ACAR1.

Preamble pattern:

H’00F708F7 FF0000F7 0800FF00 FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 0,

H’00F708F7 FF0000F7 0800FF00 FFFF0000
When MRWCSR.MRO1 or MRWCSR.MRO0 is 1,

H’F700F708 00FFF700 000800FF FFFF0000
store in the flash memory or RAM device.

The operation proceeds as follows when auto-calibration is enabled.

Once the time specified in ACTR has elapsed, the Octa memory controller varies the delay time for OM_DQS and checks whether the preamble pattern can correctly be read from the address specified in ACAR0 or ACAR1.

The preamble pattern is read 48 times per auto-calibration.

The controller seeks the most appropriate timing of latching in this sequence of reading and updates the DV0DEL or DV1DEL bits in MDTR with the result. This re-starts the timer for auto-calibration.

Note that access to the OctaFlash memory or OctaRAM area by the CPU or other bus masters is held pending until reading of the preamble data for auto-calibration is completed.

Figure 47.15 describes the flow of automatic calibration settings for OctaFlash and OctaRAM devices.

Before starting settings, check that the Octa memory controller is selected in the SEL_SPI_OCTA bit in the SPI Multi IO/Octa Controller select register (SYS_IPCONT_SEL_SPI_OCTA).

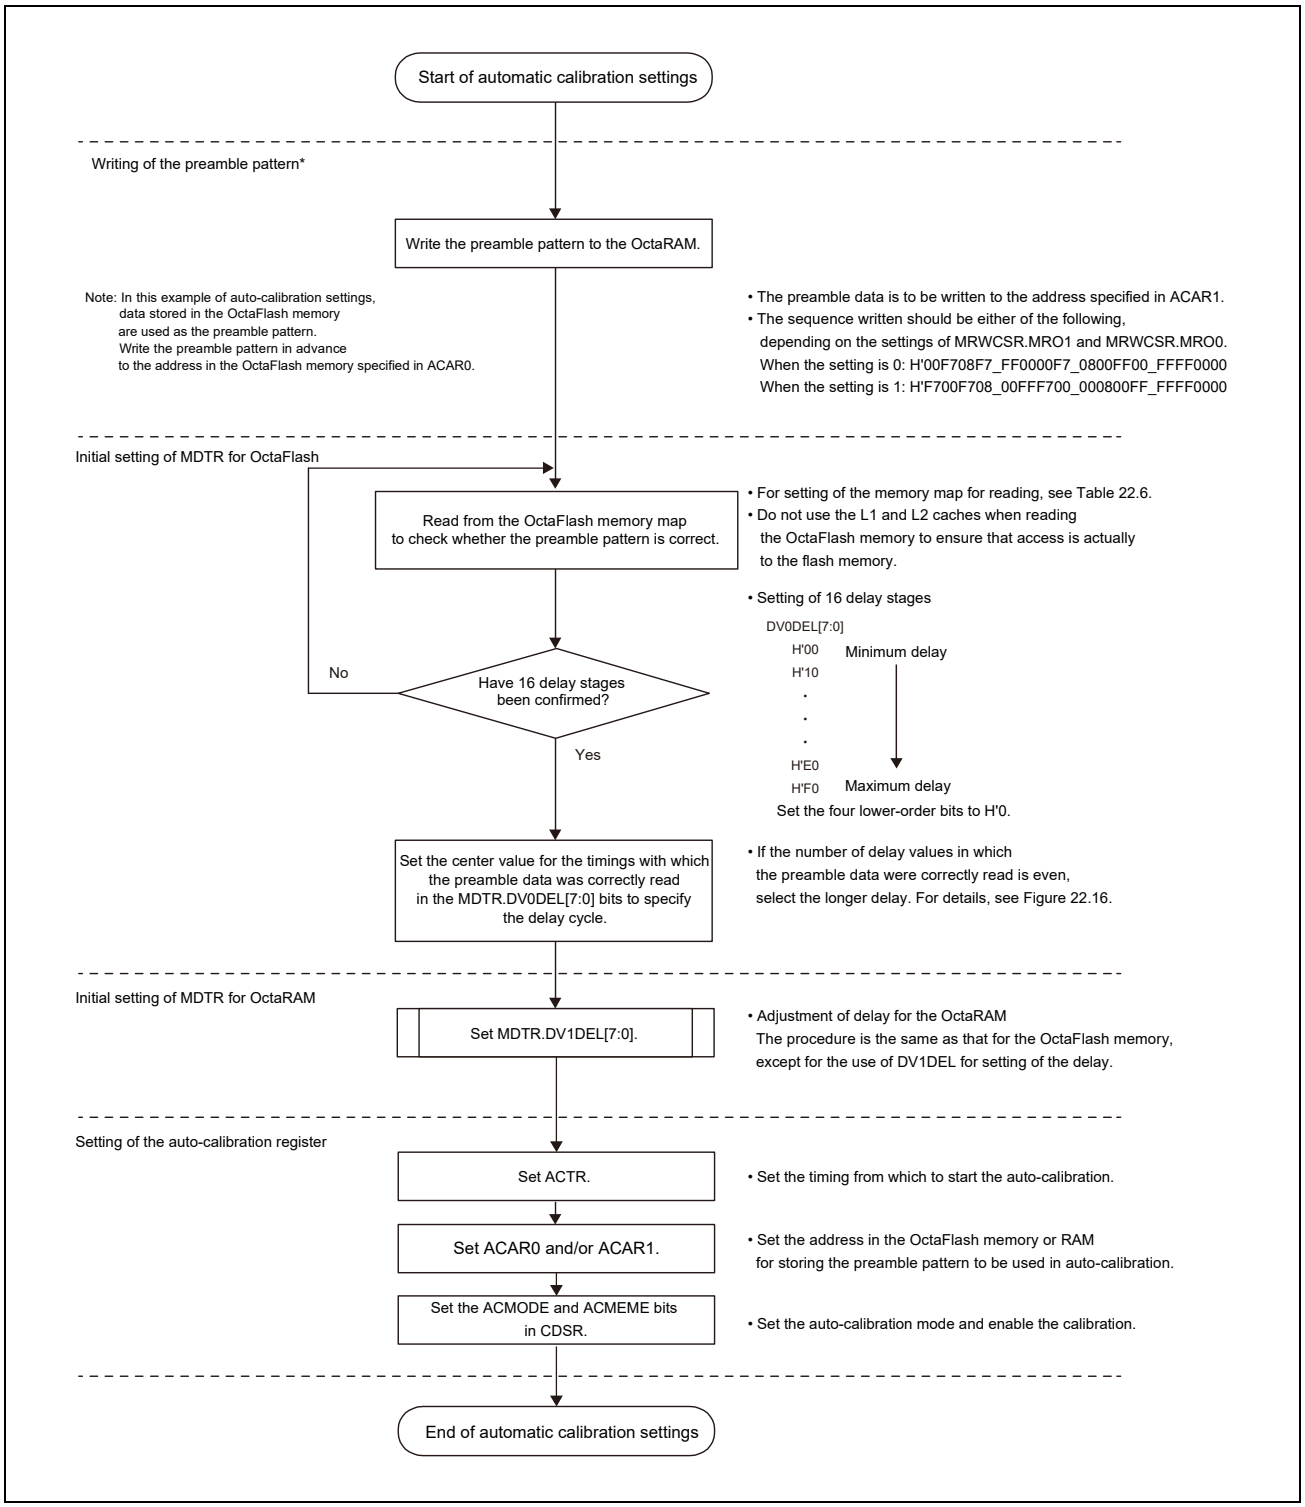

Figure 47.15 Flow of Settings for the Auto-Calibration Mode

Figure 47.16 shows an example of the initial setting of the DV0DEL or DV1DEL Bits in MDTR.

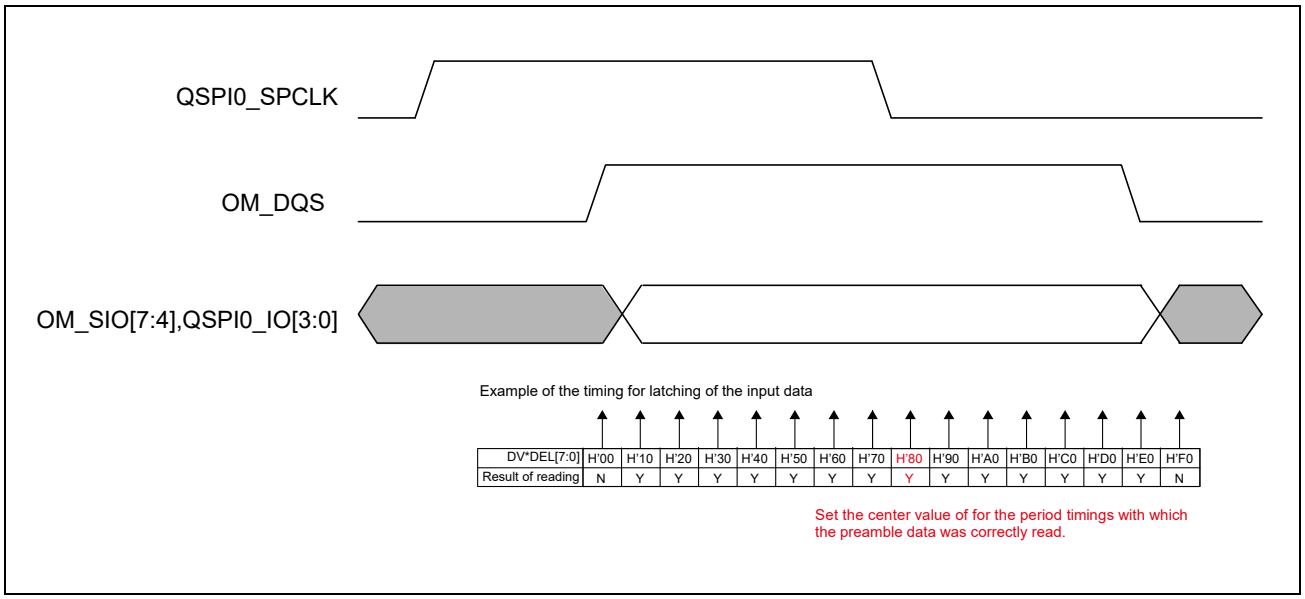

Figure 47.16 Example of the Initial Setting of the DV0DEL or DV1DEL Bits in MDTR

47.7 OM_DQS Enable Counter

During read command operation, the OM_DQS signal is used as the data latch clock by the controller. When the memory device is in the idle state, OM_DQS maintains a high impedance (Hi-Z) state, and asserts low before data is output. This Hi-Z to low transition may latch wrong data by driving the OM_DQS data latch logic of the controller.

Figure 47.15 shows the waveform when OM_DQS maintains a high-impedance (Hi-Z) state and asserts low before data is output.

Avoiding such Hi-Z to low transitions, this controller can bypass wrong data with memory delay trim register (MDTR). (MDTR.DQSEDOPI[3:0] for Flash DOPI mode, MDTR.DQSESOPI[3:0] for Flash SOPI mode, and MDTR.DQSERAM[3:0] for RAM mode)

Each of the bit fields can be set within the range from 0 to 15.

OM_DQS enable counter (MDTR) minimum value ≥ Number of the command cycles + number of the address cycles*1 + number of the stable OM_DQS cycles*2 + number of the OM_DQS delay cycles*3

OM_DQS enable counter (MDTR) maximum value ≤ Number of the command cycles + number of the address cycles*1 + number of the memory dummy cycles (latency) + number of the OM_DQS delay cycles*3 + pre-cycle setting*4

Note 1. Flash SOPI: Number of the command cycles + number of the address cycles = 2 + 4 = 6
Flash DOPI: Number of the command cycles + number of the address cycles = 1 + 2 = 3
RAM DOPI: number of command cycles + number of address cycles = 1 + 2 − 1 = 2 (start dummy (latency) calculation from the second cycle)

Note 2. Number of stable OM_DQS cycles: Maximum value is 2 cycles of QSPI0_SPCLK (Reference specification of OctaFlash/OctaRAM)

Note 3. Number of the OM_DQS delay cycles: OM_DQS clock delay due to external causes
When OM_DQS delay ≤ 0.25 QSPI0_SPCLK: OM_DQS delay cycles = −1
When 0.25 QSPI0_SPCLK < OM_DQS delay ≤ 1.25 QSPI0_SPCLK: OM_DQS delay cycles = 0
When 1.25 QSPI0_SPCLK < OM_DQS delay ≤ 2.25 QSPI0_SPCLK: OM_DQS delay cycles = 1
In the flash SOPI mode, read 0.25 as 0.5, 1.25 as 1.5, and 2.25 as 2.5 in the above expressions.

Note 4. Pre-cycle setting: OM_DQS pre-cycle on/off
OM_DQS pre-cycle off: Pre-cycle setting = 0
OM_DQS pre-cycle on: Pre-cycle setting = −1

Setting example: Flash DOPI mode, dummy cycles (latency) = 4, pre-cycle is off

Minimum value of OM_DQS enable counter (MDTR) ≥ 1 + 2 + 2 + 0 = 5
Maximum value of OM_DQS enable counter (MDTR) ≤ 1 + 2 + 4 + 0 = 7

From the above, setting MDTR .DQSEDOPI[3:0] from 5 to 7 can latch the correct data. If MDTR is too small, wrong data may be latched due to a transition from Hi-Z to Low. If MDTR is too large, no data is latched.

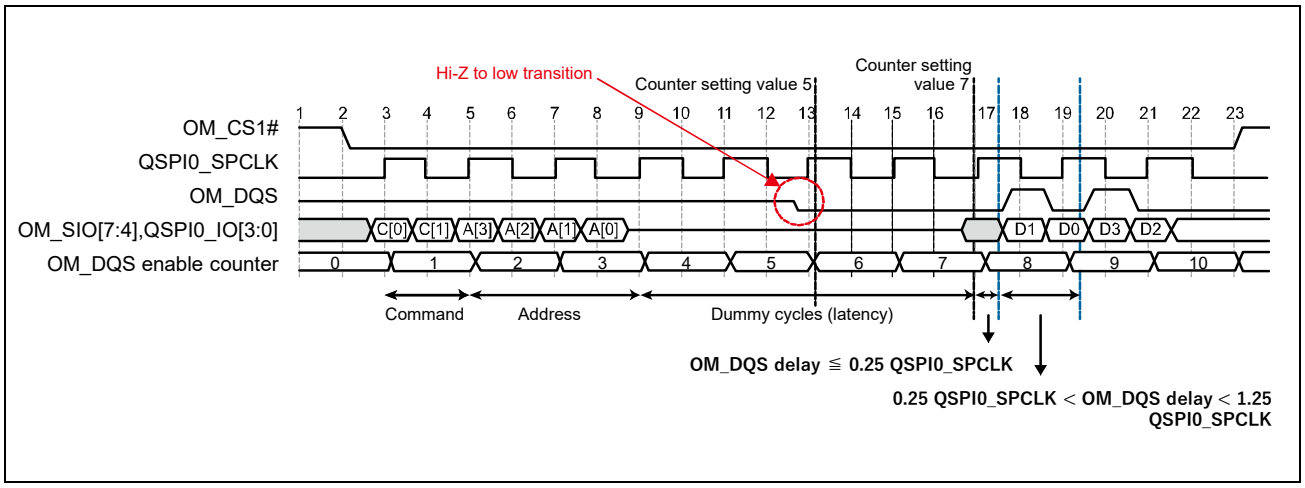

Figure 47.17 Timing of the OM_DQS Enable Counter in DOPI Mode for the Flash Memory with 4 as the Number of Dummy Cycles (Latency), and OM_DQS Pre-Cycle Off

48.3 Power-On/Power-Off Sequence

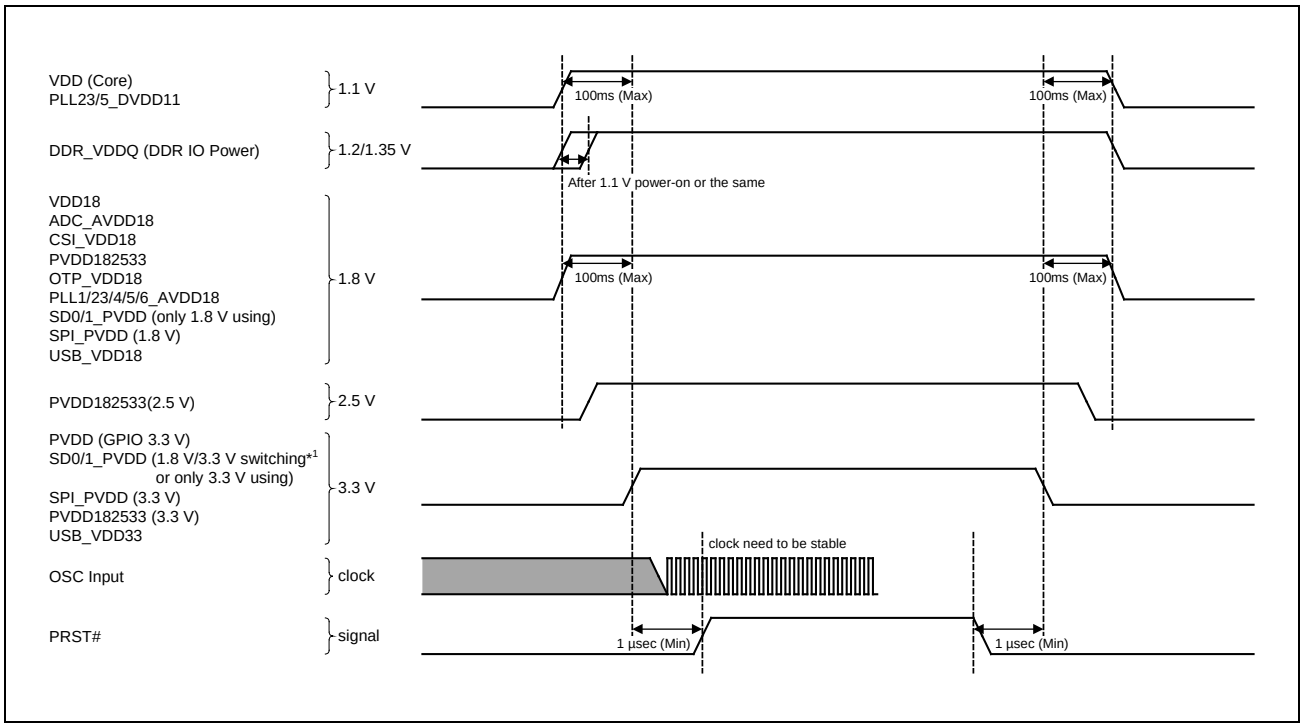

Figure 48.1 Power-On/Power-Off Sequence

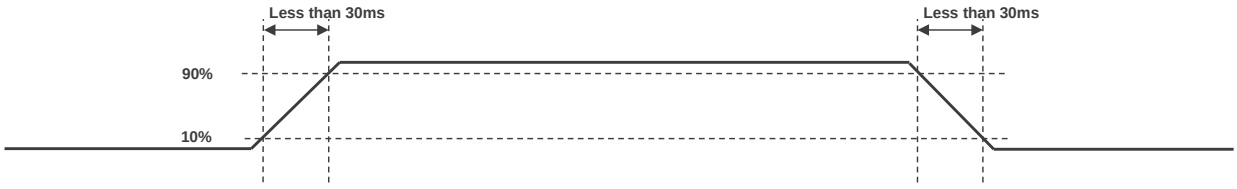
NOTES

1. Turn on 3.3 V after 1.1 V/1.8 V.

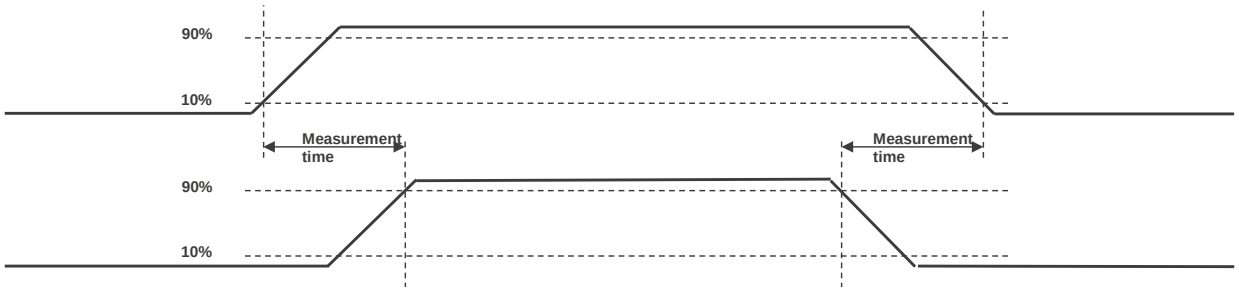
   Note 1. About SD0/1_PV_{DD}, especially in the case of switching between 1.8 V and 3.3 V at same power rail, 1.8-V power-on/off timing can also follow 3.3-V power rail sequence as shown in the **Figure 48.1**.

2. Turn on the DDR IO power supply at the same time as or after the 1.1-V power supply.
3. From first power rising start to last power rising end must be within 100 ms.
4. The power-off sequence is the reverse of the power-on sequence
   (PRST# → Low ⇨ 3.3 V = OFF ⇨ Other = OFF)
5. PRST# should be changed from Low to High after the 3.3-V power supply is turned on, after 1 µsec, and after the input clock from the oscillator stabilizes.
6. Refer to SD0/1_PV_{DD} when connecting eMMC.



Note: The rise / fall time of each power supply should be within 30 msec.
Start point / end point of rising / falling time of each power supply should be 10% or 90% level of each power supply.

Figure 48.2 Power Up Time/Power Down Time (1)



Note: In case of there is restriction of sequence between different power supply, measurement time is starting point that is 10% of earlier rising power voltage level to end point that is 90% of later rising power voltage level, and starting point that is 90% of earlier falling power voltage level to end point that is 10% of later falling power voltage level.

Figure 48.3 Power Up Time/Power Down Time (2)

48.4 DC Characteristics

Table 48.3 DC Characteristics (1) [3.3-V I/O]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	2	—	PV_{DD} + 0.3	V	
Low-level input voltage		V_{IL}	− 0.3	—	0.8	V	
Hysteresis threshold ↑		V_T+	0.9	—	2.1	V	
Hysteresis threshold ↓		V_T−	0.7	—	1.9	V	
Input hysteresis voltage		V_{HYS}	0.306	—	0.420	V	
Output logic high voltage	(I_{OH} = –2mA)	V_{OH}	PV_{DD} – 0.4	—	PV_{DD}	V	
	(I_{OH} = –4mA)						
	(I_{OH} = –8mA)						
	(I_{OH} = –12mA)						
Output logic low voltage	(I_{OL} = 2mA)	V_{OL}	0	—	0.4	V	
	(I_{OL} = 4mA)						
	(I_{OL} = 8mA)						
	(I_{OL} = 12mA)						
Weak pull-up resistor (input mode)		R_{UP}	7K	—	100K	Ω	
Weak pull-down resistor (input mode)		R_{DN}	7K	—	100K	Ω	

Note 1. Schmitt can be used at only RIIC mode.

Table 48.4 DC Characteristics (2) [1.8-V I/O]

Item		Symbol	Min.	Typ.	Max.	Unit	Remarks
High-level input voltage		V_{IH}	0.65 × V_{DD18}	—	V_{DD18} + 0.3	V	
Low-level input voltage		V_{IL}	− 0.3	—	0.35 × V_{DD18}	V	
Output logic high voltage	(I_{OH} = –2mA)	V_{OH}	V_{DD18} – 0.4	—	V_{DD18}	V	
	(I_{OH}= –4mA)						
	(I_{OH} = –8mA)						
	(I_{OH} = –12mA)						
Output logic low voltage	(I_{OL} = 2mA)	V_{OL}	0	—	0.4	V	
	(I_{OL} = 4mA)						
	(I_{OL} = 8mA)						
	(I_{OL} = 12mA)

Table 48.37 POE3 Timing

Item		Symbol	Min.	Max.	Unit	Figures
POE3	POEn# input pulse width	t_{POE3W}	1.5	—	t_{p1cy}*1	**Figure 48.38**

Note 1. t_{p1cyc} indicates peripheral clock means POE3_CLKM_POE (P0ϕ).

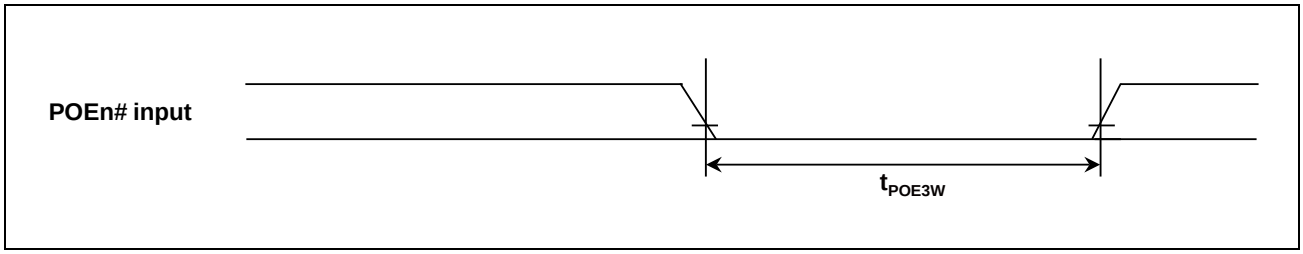

Figure 48.38 POEn# Input Pulse Timing

48.5.14 I²C Bus Interface Access Timing

Table 48.38 I²C Bus Interface Timing

Item	Symbol	I/O	Standard Mode (Sm)		Fast Mode (Fm)		Fast Mode Plus (Fm+)		Unit
			Min.	Max.	Min.	Max.	Min.	Max.	
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	0	1000	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	—	1.3	—	0.5	—	µs
Hold time*1	$t_{HD:STA}$	I/O	4.0	—	0.6	—	0.26	—	µs
Low period of SCL clock	t_{LOW}	I/O	4.7	—q	1.3	—	0.5	—	µs
High period of SCL clock	t_{HIGH}	I/O	4.0	—	0.6	—	0.26	—	µs
Setup time for start / restart condition	$t_{SU:STA}$	I/O	4.7	—	0.6	—	0.26	—	µs
Data hold time (I²C bus device)	$t_{HD:DAT}$	I/O	0*2	—	0*2	—	0	—	µs
Data setup time	$t_{SU:DAT}$	I/O	250	—	100*3	—	50	—	ns
SDA and SCL signal rise time	t_R	Input	—	1000	20	300	—	120	ns
SDA and SCL signal fall time*3	t_F	Input	—	300	20 × (PV_{DD}/ 5.5 V)	300	20 × (PV_{DD}/ 5.5 V)	120	ns
		Output	—	300	20 × (PV_{DD}/ 5.5 V)*6	300*6	20 × (PV_{DD}/ 5.5 V)*7	120*7	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	—	0.6	—	0.26	—	µs
Capacitive load for each bus line	C_b	—	—	400*4	—	400*4	—	550*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	—	—	0	50*5	0	50*5	ns

Note: In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note: AC access timing condition: drive ability 4mA, output load 400pF, slew rate = slow

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the CnSCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU: DAT}$ (min.) 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released (t_R (max.) + $t_{SU: DAT}$ (min.) = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICϕ) and the NF[1:0] bits in RIICnMR3. For details, refer to **Section 26, I²C Bus Interface**.

Note 6. External pull-up resistor is required 1077Ω to 1770Ω when using RIIC ch2 or RIIC ch3.

Note 7. External pull-up resistor is required 240Ω to 257Ω when using RIIC ch2 or RIIC ch3.

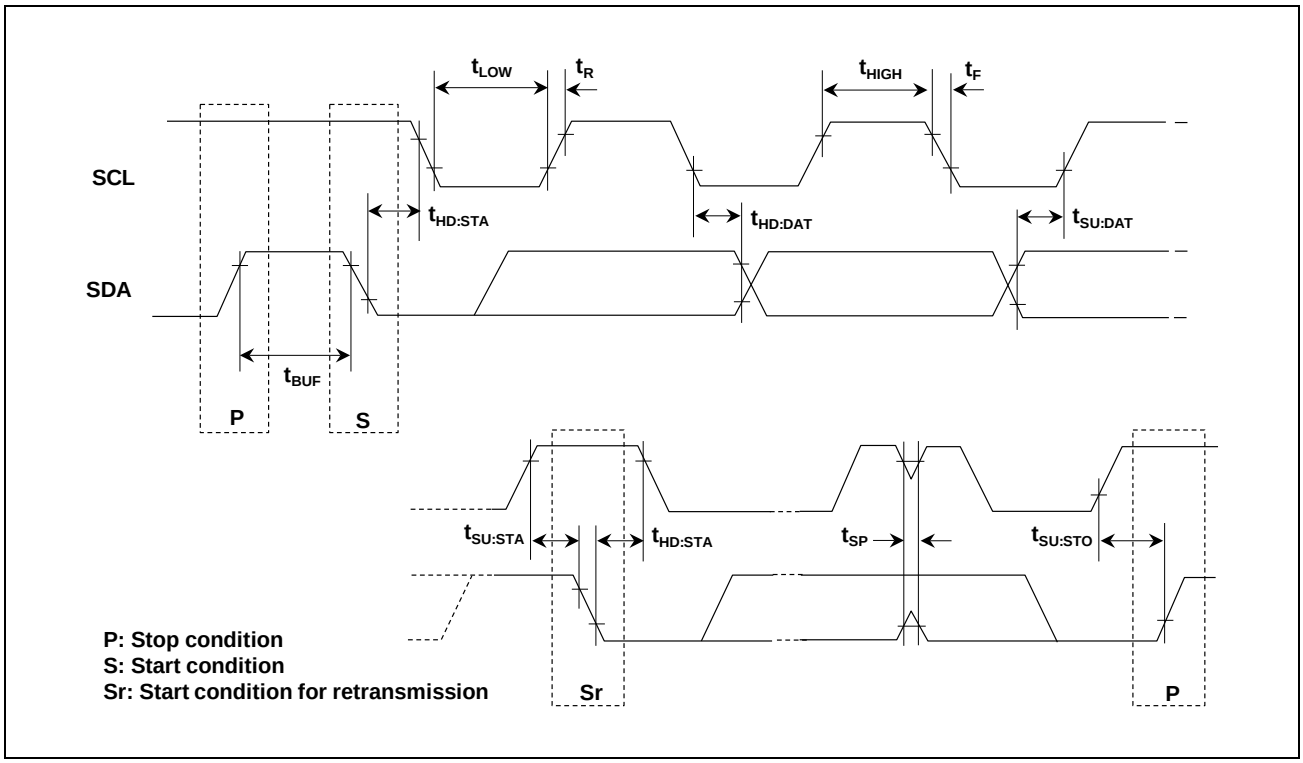

Figure 48.39 Input/Output Timing

48.5.15 Serial Communications Interface with FIFO (SCIFA) Access Timing

Table 48.39 SCIFA Timing

Item			Symbol	Min.	Max.	Unit	Figures
SCIFA	Input clock cycle	Asynchronous	t_{Scyc}	4	—	t_{p1cyc}*1	**Figure 48.40**
		Clocked synchronous		12	—		
	Input clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Input clock rise time		t_{SCKr}	—	5	ns	
	Input clock fall time		t_{SCKf}	—	5	ns	
	Output clock cycle	Asynchronous*2	t_{Scyc}	8	—	t_{p1cyc}*1	
		Clocked synchronous		4	—		
	Output clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Output clock rise time		t_{SCKr}	—	9	ns	
	Output clock fall time		t_{SCKf}	—	9	ns	
	Transmit data delay time	Internal clock	t_{TXD}	−10	10	ns	**Figure 48.41**
		External clock		3 × t_{p1cyc}*1	4 × t_{p1cyc}*1 + 20		
	Receive data setup time	Internal clock	t_{RXS}	3 × t_{p1cyc}*1 + 20	—	ns	
		External clock		t_{p1cyc}*1 + 10	—		
	Receive data hold time	Internal clock	t_{RXH}	−3 × t_{p1cyc}*1	—	ns	
		External clock		2 × t_{p1cyc}*1 + 10	—		

Note: AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. t_{p1cyc} indicates peripheral clock means SCIFn_CLK_PCK (P0ϕ) (n = 0 to 4).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.

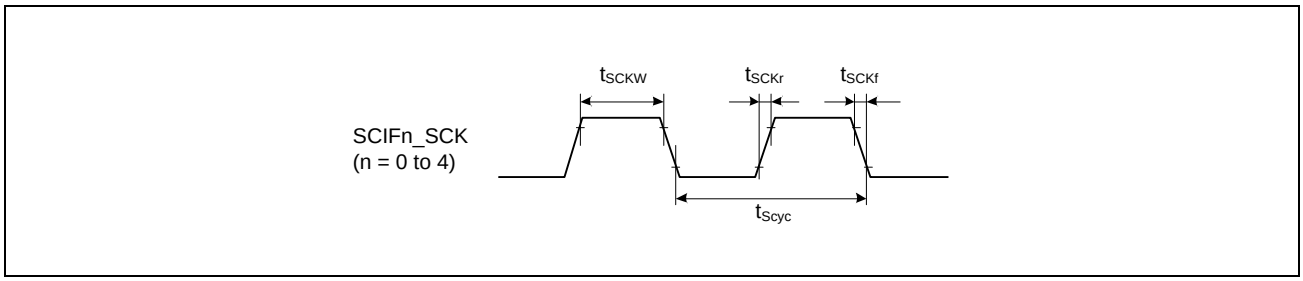

Figure 48.40 SCK Input Clock Timing

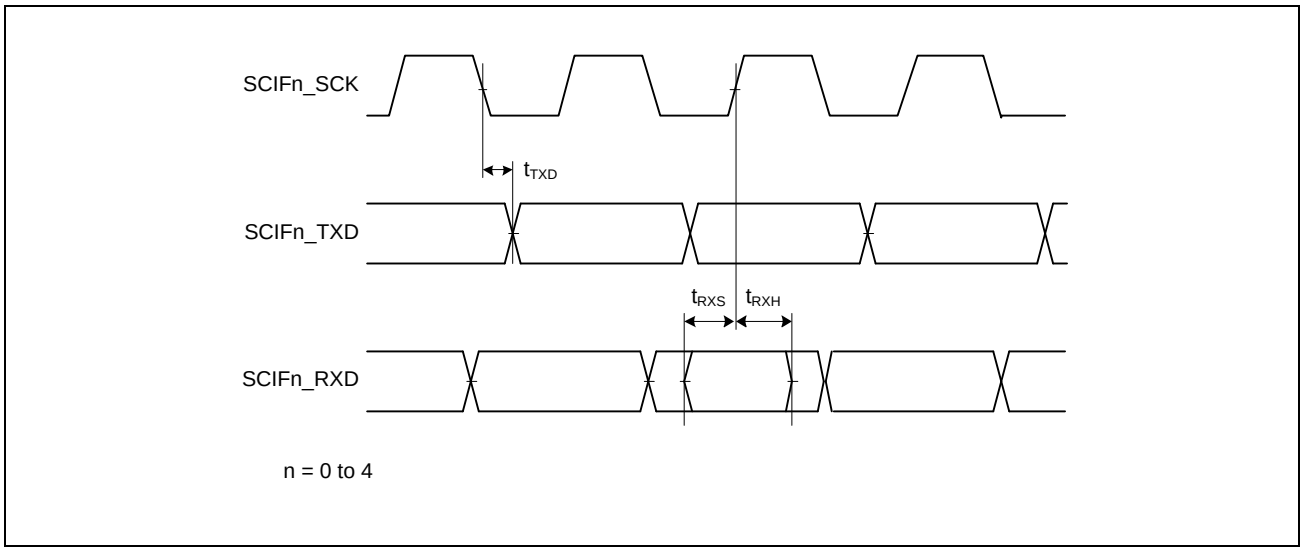

Figure 48.41 SCIFA Input/Output Timing in Clocked Synchronous Mode

48.5.16 Serial Communications Interface (SCI) Access Timing

Table 48.40 SCI Timing

Item			Symbol	Min.	Max.	Unit	Figures
SCI	Input clock cycle	Asynchronous	t_{Scyc}	4	—	t_{p1cyc}*1	**Figure 48.42**
		Clocked synchronous		6	—		
	Input clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Input clock rise time		t_{SCKr}	—	5	ns	
	Input clock fall time		t_{SCKf}	—	5	ns	
	Output clock cycle	Asynchronous*2	t_{Scyc}	8	—	t_{p1cyc}*1	
		Clocked synchronous		4	—		
	Output clock pulse width		t_{SCKW}	0.4	0.6	t_{p1cyc}*1	
	Output clock rise time		t_{SCKr}	—	5	ns	
	Output clock fall time		t_{SCKf}	—	5	ns	
	Transmit data delay time	Clocked synchronous	t_{TXD}	—	28	ns	**Figure 48.43**
	Receive data setup time	Clocked synchronous	t_{RXS}	15	—	ns	
	Receive data hold time	Clocked synchronous	t_{RXH}	5	—	ns	

Note: AC access timing condition: drive ability 12mA, output load 30pF, slew rate = fast

Note 1. t_{p1cyc} indicates peripheral clock means SCIn_CLKP (P0ϕ) (n = 0 to 1).

Note 2. When the SEMR.ABCS0 and SEMR.BGDM bits are set to 1.
