ABOUT RICHTEK

Founded in 1998, Richtek is one of the leading global analog chip design companies, specializing in the design and development of comprehensive power solutions that range from DC/DC regulators to power management multi-channel ICs. Since 2015, Richtek has been a subsidiary of MediaTek, allowing us to leverage MediaTek's expertise to expand our product portfolio through consolidation and collaboration.

Richtek aims to accelerate your design with a variety of design support resources, such as [Richtek Designer™](#), application notes, technical documents, and more. Additionally, you can sign up for 'MyRichtek' to access free samples, exclusive product information and the latest [product newsletters](#).

Richtek has established an innovative and dynamic quality management system. As a result of this system, we have attained and continued to maintain [ISO 90001](#), [ISO 14001](#), [ISO 45001](#) and [ISO 26262](#) certifications. Richtek is committed to protecting the environment and conforming to the regulation requirements with the declaration of RoHS, the declaration of REACH and more green product files for [download](#).

GET RICHTEK PRODUCTS ONLINE

Richtek works with both [DigiKey](#) and [Mouser Electronics](#), our [global distributors](#) to offer a broad variety of products including ICs, EVBs and design tools to make your designing easier.

01• AUTOMOTIVE & E-MOBILITY

With AEC-Q100, Richtek's innovative automotive products are primed for present and future automotive qualification requirements. Richtek received ISO26262 Functional Safety Standard certification to ensure safety requirements of automotive product designs. Our automotive products with high performance and reliability have successfully been selected by automotive manufacturers across the world.

02• COMMUNICATION & ENTERPRISE

Richtek offers a wide-ranging power management portfolio, delivering dependable, high-performance solutions for reliable communication and computing systems, and beyond.

RICHTEK

03• INDUSTRIAL

Richtek's industrial system reference designs empower engineers to create robust, efficient, and secure environments for diverse industrial applications. Our solutions feature a wide input range, catering to varying power requirements while meeting harsh environmental standards.

04• CONSUMER ELECTRONICS

Richtek provides both discrete power solutions and integrated PMICs for consumer and portable electronics. Designed for compact PCBs and battery-powered devices, our power solutions minimize component counts and power consumption. We also provide various reference designs to expedite your design process.

SOCIAL RESPONSIBILITY AND ENVIRONMENTAL COMMITMENT

At Richtek, we are deeply committed to socially responsible and environmentally sustainable operations. We leverage our core strengths, technology, and a passionate team, in collaboration with global partners, to make a meaningful impact. We firmly believe that our collective efforts will pave the way for a sustainable future.

MEETING GREENHOUSE GAS SPECIFICATION

Starting in 2015, we adopted the Greenhouse Gas Specification and successfully transitioned to ISO 14064-1:2018 by 2022. This signifies that Richtek has implemented greenhouse gas emission management and remains committed to reducing its environmental impact.

BUILDING STRONG SUSTAINABILITY THROUGH

IMPROVING ENERGY CONVERSION EFFICIENCY

We formulate business strategies centered on energy conservation and extend our expertise to a global scale. Since Richtek's involvement in power management chips, our primary focus has been enhancing product efficiency.

DELIVERING GREEN PRODUCTS

At Richtek, our focus extends beyond anticipating our customers' present and future needs; we are equally committed to ensuring a clean and sustainable future for the next generation.

USB TYPE-C & POWER DELIVERY SOLUTIONS

As a member of the USB Implementers Forum (USB-IF), Richtek has been developing innovative USB type-C and PD-compliant products to meet the latest USB PD specification, as well as China's UFCS fast charging standard, for a wide range of applications, including travel adapters, car chargers, portable devices and more.

USB TYPE-C & PD CONTROLLERS

[*] Policy management coordinates information from USB-related connectors, USB PD controllers, and more. Integration implies that this function is consolidated by the MCU within the IC. The policy management of TCPC is controlled by the system's MCU.

[*] Power Role: DRP stands for Dual Role Power, which can function as either a power source or a power sink. Provider operates as a power source.

E-MARKER SOLUTIONS

Cables that support SuperSpeed USB 3.1 data transfer or cables capable of carrying currents higher than 3A must be electronically marked to inform the host about cable characteristics, such as current capability and the presence of a re-driver for signal conditioning, among other factors. The presence of an e-marked cable is detected by the CC logic, which then connects VCONN power to the cable electronics.

POWER MANAGEMENT MULTI-CHANNEL ICS

Richtek's PMICs are developed for various applications, including automotive applications, industrial SoC power, Vcore power, portable devices, SSD, TV SoC power and general power management.

MULTI-PHASE CONTROLLERS

Buck controllers step down the input voltage to a lower output voltage using external switches. The output current is limited by external MOSFETs, providing designers with flexibility to optimize performance.

MEMORY POWER SOLUTIONS

DDR memory terminator LDOs provide both source and sink functionality and require precise output voltage regulation. These products are compatible with various DDR memory types, ranging from DDR1 to DDR5, including Low Power (LP) DDR3/4. The low Vin LDOs necessitate an external low-power bias voltage. When selecting a suitable product for your application, consider factors such as DDR type, current rating, and features like output voltage sensing, REFOUT, and different power state settings via S3/S5 pins.

DDR5 PMIC SOLUTIONS

DDR 5 power solutions for DDR5 LR-/RDIMM, and NVDIMM, as well as DDR5 SO-DIMM/UDIMM.

Part Number	Description	Vin range (V)	Regulator blocks	Interface	Features	Package(s)

BATTERY MANAGEMENT

Richtek's battery management products and supporting tools expedite the design of highly efficient and high-performance battery-powered applications. This includes a wide range of chargers, battery gauges, and protection.

SINGLE CELL LI-ION LINEAR BATTERY CHARGERS

Single-cell Li-ion battery charger ICs are used to provide the correct charge current and voltage in battery-powered applications. These chargers measure both battery charge current and voltage, and they control the pass MOSFET to ensure that the charge current follows the required battery charging operation modes: pre-conditioning, constant current, constant voltage, and current cut-off. Most linear chargers for single-cell Li-ion batteries operate on a 5V supply and are typically suitable for charge currents up to 1.2A.

BATTERY FUEL GAUGE

Richtek's battery gauges employ Voltaic Gauge with current sensing (VGCS) to determine the State of Charge, State of Health, Full Charge Capacity, Time to Empty, and Cycle Count of Li-Ion cells. They utilize an internal algorithm to calculate these parameters and communicate them to the host microcontroller via I²C.

LCD AND OLED DISPLAY POWER

Richtek offers an extensive portfolio of display power solutions, including LCD bias and OLED power drivers, designed for use in portable and wearable applications. These driver products feature unique topologies to optimize power efficiency for displays of various sizes while ensuring high responsiveness for the best picture quality. Richtek has further expanded its offerings to support next-generation applications with higher current loads.

WHITE LED DRIVERS FOR DISPLAY BACKLIGHTING

Single-string or multi-string LED drivers are suitable for small battery-powered devices or large LCD panel backlighting, offering precise dimming control.

SWITCHING REGULATORS

BUCK CONVERTERS

The control loop topology of a Buck converter has a significant impact on the converter's transient behavior, stability criteria, and switching frequency behavior. The following overview shows the different Buck converter control topologies in the Richtek portfolio, along with their advantages and disadvantages:

Topology	Switching Frequency	Transient Response	Stability	Pulse Skip Ripple	Duty-Cycle Range	Over-Current Protection	Ext. Sync. Possibility	Ext.Component Selection
Advanced-COT HV ACOT®	Variable	Excellent (Incl. PSM transition)	Simple	Medium	Very Low-Medium	Valley or Peak & Valley Current	No	Not Critical
Advanced-COT LV ACOT®	Variable	Excellent (Incl. PSM transition)	Medium	Medium	Low-High	Valley or Peak & Valley Current	No	Required
Current Mode-COT (CM-COT)	Variable	Good	Medium	Medium	Low-Medium	Valley Current	No	Required

The main difference between ACOT® and COT: For good stability COT must use higher ESR (Polymer) output capacitors, as they do not integrate the PSR ramp. ACOT® can work with both low ESR and high ESR output capacitors.

GENERAL BUCK CONVERTER FEATURES AND FUNCTION DESCRIPTION:

- PSM parts will automatically skip pulses at light load thereby enhancing light load efficiency, at the expense of higher ripple and worse transient response in light load range.
- Forced PWM parts will maintain their nominal switching frequency also at light load, which gives lowest ripple and best transient response.
- 100% Duty-Cycle parts can maintain regulation even at extremely low $V_{in}-V_{out}$ difference, and the parts can operate in drop-out mode which can be useful in battery-powered applications.
- External Sync. Parts can have their internal switching frequency clock synchronized to an external clock, making it possible to run several Buck converters at the same frequency and controlling the frequency precisely to avoid noise in certain sensitive frequency bands.
- External Soft-Start makes it possible to adjust the converter rise time during start-up via an external capacitor, to reduce inrush currents when using large output capacitors.
- External Comp. allows users to tune the converter control-loop response. This adds extra flexibility in the choices of output capacitors in current mode converters.
- Power Good signal can be used to signal other devices that the voltage rail is within specification. It can also be used to drive the enable pin of another converter, thereby giving a specific power sequence during start-up.

BUCK CONTROLLERS

Buck controllers step down the input voltage to a lower output voltage using external switches. The output current is limited by external MOSFETs, providing designers with the flexibility to optimize performance.

BOOST CONVERTERS

Boost converters step up the input voltage to a higher output voltage. This process involves charging an inductor through an internal MOSFET switch and discharging the inductor to the load through a rectifier when the MOSFET switch is off. The maximum load current is determined by the current rating of the MOSFET switch and the step-up ratio, while the maximum output voltage capability is determined by the MOSFET voltage rating. In some boost converters, a MOSFET is integrated as a rectifier to enable synchronous rectification.

BOOST CONTROLLERS

Boost controllers step up the input voltage to a higher output voltage using external switches. The output current is limited by external MOSFETs, providing designers with the flexibility to optimize performance. Boost controllers enable designers to achieve higher levels of output power and operating temperature ranges that may not be achievable with boost converters.

BUCK-BOOST CONVERTERS

Buck-Boost converters find use in applications where the input voltage can vary, either falling below or rising above the output voltage. These converters automatically configure their four internal MOSFET switches to operate in Buck mode when Vin exceeds Vout and switch to Boost operation when Vin falls below Vout. This versatility makes Buck-Boost converters ideal for battery-powered applications, extending battery life when the battery voltage drops below the regulated output voltage.

LINEAR REGULATORS

Low dropout linear regulators (LDOs) can be used in applications that require the conversion of a higher input voltage to a lower output voltage at relatively moderate power levels. Richtek has developed a broad portfolio of LDOs featuring high power supply ripple rejection (PSRR) to ensure the output voltage remains free of noise and ripple, low quiescent current (I_q) to extend battery life, and various packaging options for different power dissipation requirements. Our wide input-voltage LDOs are well-suited for industrial applications, while the high-performance AEC-Q100 qualified LDOs are ideal for automotive applications.

Richtek LDOs are categorized based on various features, including fixed/adjustable V_{out} , biased voltage requirements, low I_q , low noise/high PSRR, and different applications such as general purpose, automotive, and industrial.

<7V LOW VIN

>30V WIDE VIN

LDOs with an input voltage higher than 30V can be applied in applications with a wider input voltage range, reaching up to 80V. It is important to note that LDO power dissipation is determined by the formula $(V_{in} - V_{out}) \times I_{load}$. Consequently, a significant drop in $(V_{in} - V_{out})$ can rapidly result in high LDO dissipation, especially at moderate load currents.

SWITCHES

Richtek provides a diverse switch portfolio where power switches are used to enable or disable specific supply rails, often serving as protection for USB ports. These devices feature slew-rate controlled switch-on actions to eliminate inrush currents and include protection functions such as OVP, OTP, and reverse current protection.

POWER SWITCHES

Power switches establish an electrical connection between a voltage source or ground and a load. Our extensive portfolio ranges from basic load switches to power switches with extra features.

SUPERVISORS & RESET ICS

We provide a wide range of power monitoring, protection, and reset ICs designed to oversee system conditions and ensure normal operation. Our monitoring and protection ICs can detect over/under-voltage conditions on the supply rail, preventing any damage to downstream sensitive devices. The reset ICs monitor the supply voltage of microcontrollers and generate a reset signal when the supply drops below a specified limit. These devices integrate various features to ensure system health across all applications.

AC/DC

We offer a comprehensive range of products for switching power supplies, encompassing AC-DC conversion. This includes multi-mode flyback controllers commonly employed in switching power supplies, synchronous rectifier controllers, and more. Designing with our products simplifies the design process by reducing the number of components and enhancing system reliability.

MULTI-MODE FLYBACK CONTROLLERS

Easy-to-use flyback controllers with sophisticated power save modes for ultra-low standby power.

BLDC MOTOR DRIVERS

Richtek offers an extensive range of motor driver solutions that cater to the needs of various applications, including brushless DC motors for home appliances, PMSM/BLDC motors, water pumps, cooling fans, and more. With this comprehensive product lineup and our advanced sensor-less sinewave FOC control algorithm, Richtek aims to provide our customers with flexible, easy-to-implement, and reliable motor driver solutions. Furthermore, we offer firmware and hardware technical support throughout the product development and launch phases.
