Since the end of the ,80s, the trend of integrating more and more electronics and intelligence in machines has rapidly gained momentum. Whereas before, only controls in a switch cabinet regulated actuator or sensor systems by way of so-called I/O cards, today there is an increasing number of intelligent field devices outfitted with local I/Os and connected to the switch cabinet via a fieldbus or even have the entire control system on board.

Up until this point in time, M8 and M12 connectors were only referred to and used as sensor connectors. The open end of the sensor cable was routed in the switch cabinet and wired there. Today, sensors and actuators in the field frequently are connected to a passive I/O box or one with fieldbus capability. The harsh influences of the environment on these boxes make proven and, particularly, tightly sealed (IP 65/67) connectors a necessity. As such, it only made sense to use the M8 or M12 connector systems here as well, which already had established themselves in the field of sensor technology. Meanwhile, the M12 connector also is recommended as a fieldbus connector for almost all field bus applications. To make sure that nothing gets mixed up, there are a series of codes for assistance.

ERNI, the known specialist for printed circuit board connectors, has seized an opportunity. Today, there still is an insufficient number of connector types for these boards. As field devices are very specific, a wide variety of flexible modular connectors is required in order to implement these applications with as little effort and expense as possible.

International Standards for M8/M12 connectors

- IEC 60947-5-2 low voltage sensor switch device
- IEC 61076-2-101 form factor M12 further polarizations for M12
- IEC 61076-2-104 form factor M8 further polarizations for M8
- Profibus installation guideline
- Interbus Club specification
- IAONA, Industrial Ethernet, planning and installation guide
- SafetyBUS
- DeviceNet

M8/M12 Circular Connectors

General

PCB Connectors

ERNI has developed such a modular system with M8/12 connectors that is fully flexible in application and has SMT connections that are so robust that bulk packaging and feed-ing are possible. The connector has also been designed for tape-on-reel packaging. The concept allows connectors to be produced at various heights and with different pin configurations. The black insulator is made of high-temperature plastic, and is suitable for soldering with all the usual SMT soldering procedures. The new M8/M12 connectors are designed for lead-free processing, which is mandatory since July 2006. Especially cost cutting by reduction of printed circuit board surface is achieved. In specific applications, two printed circuit boards can be replaced by one. A pick & place pad for female connectors is not required while using a gripper or special pipette.

Cable Assemblies

As a completion to the product portfolio ERNI Electronics also offers cable assemblies for the connection of sensors/ actuators or other automation systems devices such as I/O distribution boxes. The standard product range covers pre-assembled, over-moulded circular connectors of sizes M8 and M12 either as interconnection of two circular connectors or as a cord set having an open end of line.

In addition, the portfolio comprises of field-attachable connectors for tool-less cable termination, T-coupler, panel feed-throughs and adapter for quick and cost-efficient connection in the field. ERNI extends the variety with different cable qualities that meet the most versatile industrial requirements and therefore are applicable for a wide range of use. PVC as a competitive and economic solution or PUR (UL/CSA approved), halogenfree and UV resistant, for highly demanding applications in drag chains and harsh environments – where operational reliability is crucial. Innovative product features like the self-securing screw locking guarantee vibration-proof and secure connection. The coupling nut additionally combines a knurled surface with a spanner flat suitable for standard wrenches.

Different configurations, designs and codings are available from stock. All parts meet IP67 requirements (IEC 60529) to ensure protection against dust and water immersion. ERNI's pre-assembled cable assemblies use standard-wise two cable qualities in five different lengths. Further options are possible on request.

PVC

- qualified cable for medium mechanical load and usage of non-recurrent stress, i.e. for assembly lines
- easy to dismantle
- good chemical resistance
- limited resistance against abrasion and lubricants
- the competitive and economic solution for less demanding applications

PUR

- cable for heavy-duty applications in harsh environments and continuous stress, i.e. during metal cutting operations
- drag chain capable
- highly resistant against abrasion
- very good resistance against oil, lubricants, coolants and other aggressive chemicals
- halogen-free, hydrolysis and UV resistant
- flame retardant
- reliable solution for highly demanding applications; UL/ CSA approved

As a proven specialist for printed circuit board connectors, ERNI Electronics has expanded its expertise towards industrial customers i.e. from automation technology and process industry by offering highly flexible and modular solutions, which consequently emphasize the idea of decentralised automation systems.

Polarizations according to IEC 61076-2-101 for M12 male connectors

A - Polarization (sensor/actuator applications, DeviceNet CANopen)

B - Polarization (fieldbus applications like Profibus, Interbus)

C - Polarization / not introduced yet on the market

P - Polarization (4 Signal + PE) / not introduced yet on the market

D - Polarization (5 Pin for Data-Applications) / not introduced yet on the market

D - Polarization (4 Pin for Industrial Ethernet, Fast Ethernet 100 Mbit/s)

M8/M12 Circular Connectors

Installation Conditions

Assembly of M8/M12 PCB connectors

ERNI recommends two standard assembly heights. The usable connectors are the same for both heights. Based on a 3 mm thick front plate there are distances of 9 mm and 13 mm applicable with the according metal shells. The shells need to be fixed via thread in the front plate. To ensure the protection class IP65/67 it is necessary to remain within the recommended tolerances of 9 mm ± 0.1 or 13 mm ± 0.1 .

The 9 and 13mm distances allow the use of standard spacers which enable a proper fixing to the pcb.

Examples for mixed M8 pcb assembly

Examples for mixed M12 pcb assembly

Style 1 prevents pressure on the o-ring when connectors are mated. The forces are absorbed by the metal shell, which protects the top surface of the pcb male connector from a direct o-ring contact.

Style 2 allows more flexibility regarding tolerances in vertical direction.

Tightening force for all metal shells is 1.5 Nm ± 0.2

The mounting thread for M12 shell is M14x1 and for the M8 shell is M10x1. For mechanical issues the front panel thickness should be 3 mm thick and for proper sealing (O-Ring) the surface around the thread hole should have no damage and be of quality R max 16 μm . Please regard thickness of platings in conjunction with front panel threads. Regarding EMV issues the front plate or its plating should be conductive with the metal shell and have at least an Ni plating.

Example for mixed M12 PCB assembly, front plate thickness 1 mm, assembled with counternut

For the assembly option with a counternut there is no thread in the front plate necessary. This option is suitable for a front plate thickness beginning at 1 mm up to 4 mm.

M12 male with additional sealing option.

Sensor and actuator applications in harsh industrial environment need to be sealed against liquids. Those devices have often abackfilling with gel or resin (epoxy) and therefore a sealing is required to keep the infill inside of the housing. On the other hand there are devices which should be protected against moisture and liquids from outside; especially also during installation if the connector interface is open (not connected to a cable). For this requirements the ERNI M12 male connector with additional sealing option is the best fit. A standard O-ring 7x1 can be used. The connector is always delivered without O-ring.

M12 Connector for Direct Integration

Automation components make considerable contributions to efficiency increases in production but are also subject to extreme cost pressure. To save costs, this M12 connector version can be „directly“ integrated, meaning that the device housing thus becomes part of the connector since it can be produced in a single operation with the coding and the locking thread.

Potential savings: fully-automatic SMT soldering process and saving of threaded parts as well as their assembly share.

The coding is determined by means of the injection-molded or die-cast housing. Refer to the IEC 61076-2-101 for the dimensions for this. The sealing of the housing is performed via an O-ring, the assembly of which is optional. In addition, the turned contact seals the insulating body by means of special contours. The entire system is thereby water-proof, even when unconnected. Tightness with regard to casting compounds typically exists. This, however, must be tested in the respective project with the respective casting compound. Considerably different coefficients of expansion of the materials may lead to the necessity of the use of THR technology for better absorption of the forces that may affect the solder joints with casting technology due to temperature cycles and loads from vibrations and shocks.

Examples and sealing options for ERNI M8/M12 connectors combined with integrative metal shells

The solutions shown earlier should give further ideas, how the ERNI M8/M12 pcb connectors also could be used.
The mentioned solutions are not offered yet as standard parts. Of course ERNI is able to offer similar customized parts on request.

M8/M12 Circular Connectors

M8 Male PCB Connectors

Consistent to M8 female versions, ERNI M8 male connectors succeed with the same concept: capability for fully-automated SMT soldering processes. The male version uses machined gold plated contacts ensuring at least 100 mechanical operations. Solid retention clips absorb mating forces and make the surface mounted device stress-resistant.

Male connectors are reliable for power supply interfaces in I/O boxes. Despite its small design the connector allows a current rating of 5.7 A at 20 °C (all pins fully loaded). It is also being used as bus connector where M12 B-coded types would need too much space.

M8 Cable Assemblies

ERNI's M8 cable solutions fit to the according PCB counterpart and the threaded panel flange offered in addition.

The importance of this comprehensive solution offered by one supplier is that individual components are tested altogether. Even though there is a standard (IEC) applicable, small differences of individual components may cause problems, e.g. not achieving IP67. ERNI's solution is qualified and tested altogether and meets all IEC requirements. M8 cable assemblies are over-moulded and offered either as interconnection of two circular connectors or as a cord set having an open end of line. ERNI's portfolio covers further criteria:

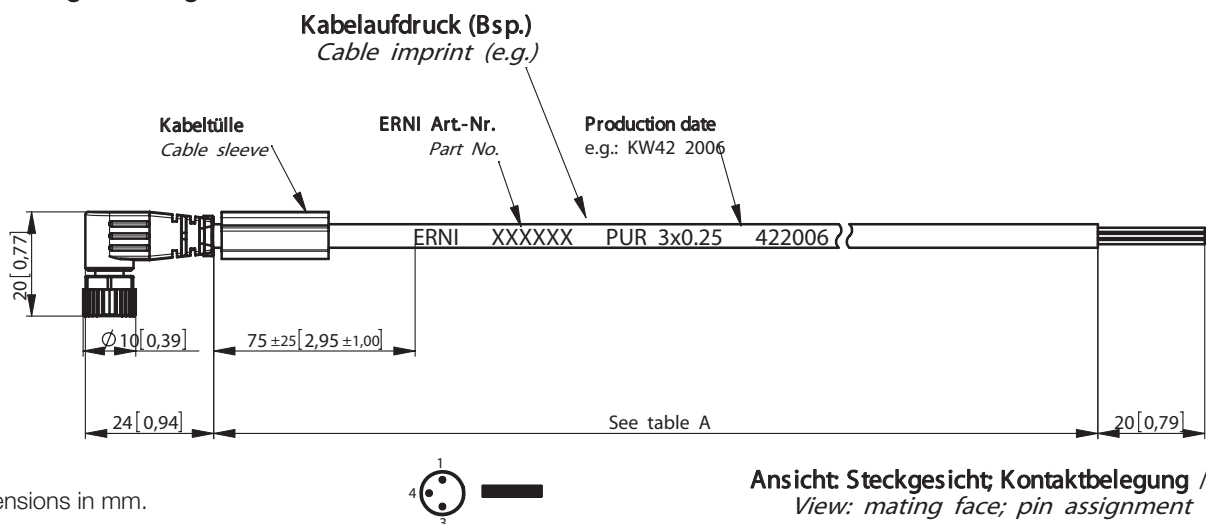

- no. of contacts:
3, 4
- LED: 2 LEDs optional
- cable: PVC / PUR (UL/CSA)
- standard cable length:
 - interconnection: 0.3, 0.6, 1.0, 1.5, 2.0 m
 - pigtail: 1.5, 3.0, 5.0, 7.5, 10.0 m

M8/M12 Circular Connectors

M8 Quick Termination

When installing sensor/actuator devices sometimes pre-assembled cables can cause difficulties or even prevent from successful installation because of cables laying in cable ducts or going through narrow components and small gaps. This would increase the wiring time and raise maintenance cost. ERNI's field-wireable quick termination connectors are an adequate and efficient solution ensuring highest flexibility for cabling of sensor/actuator peripherals. Easy termination of standard cables is guaranteed by tool-less IDC technology.

Further features:

- up to 10 times reconnectable
- integrated strain-relief
- vibration-proof feature
- suitable for cable diameter 3.2 - 5.4 mm

M8/M12 Circular Connectors

M12 Female PCB Connectors

ERNI introduced the first M12 SMT connector in 2003. The ability for surface mount assembly processes contributes to the design-to-cost philosophy and leads to significant cost savings in general applications.

The modular connector system comprises of not only the connector itself but also considers various threaded metal flanges and O-ring seals. A solution that allows designer to flexibly create different PCB to front panel distances.

Moreover it protects from dust and water immersion according to IP67. Several codings compliant to IEC 61076-2-101 are supported.

M8/M12 Circular Connectors

M12 Male PCB Connectors

The M12 SMT male connectors complete the product range of M12 PCB connectors from ERNI.

A-coded versions are successfully used for power supply on sensor/actuator distribution boxes or on Ethernet switches.

The A-coded connectors are also standard for low voltage switching devices according to IEC 60947-5-2.

The modular connector system includes male connectors of two different heights and various threaded metal flanges that allow to realize different distances between PCB and front panel. O-ring seals ensure protection according to IP67.

M12 Cable Assemblies

Pre-assembled cables are one of the effective possibilities to save time and money. There is no need to consider the correct pin assignment. Coding latches ensure secure mating supported by an integrated vibration-proof feature. Over-moulded connectors guarantee a watertight solution (IP67). M12 cable assemblies are either offered as an interconnection of two circular connectors or as a cord set having an open end of line (pigtail). Especially in harsh environments and for demanding applications the PUR cable assembly is the leading edge. Standardized coding is conform with requirements of different applications and bus technologies.

ERNI's portfolio covers further criteria:

- no. of contacts: 4, 5, 8
- LED: 3 LEDs optional
- cable: PVC / PUR (UL/CSA)
- standard cable length:
 - interconnection: 0.3, 0.6, 1.0, 1.5, 2.0 m
 - pigtail: 1.5, 3.0, 5.0, 7.5, 10.0 m

M12 Quick Termination

When installing a fieldbus system sometimes pre-assembled cables may cause difficulties or even prevent from successful installation because of cables laying in cable ducts or going through narrow components and small gaps. This would increase the wiring time and therefore raise maintenance cost. ERNI's field-attachable quick termination connectors are an adequate and efficient solution ensuring highest flexibility for cabling of automation systems. Easy termination of standard cables is guaranteed by tool-less IDC technology.

Further features:

- reconnectable up to 10 times
- integrated strain-relief
- vibration-proof screw locking
- suitable for cable diameter 4.0 - 5.1 mm

M8/M12 Circular Connectors

Accessories Adapter

Adapters are useful to reduce the amount of different parts on stock or on Bill Of Materials. Sometimes there are automation components on the market which are available only as M8 or M12 size. In many cases this requires a multitude of connectors from both technologies.

With adapters this can be reduced to one system, M8 or M12, that is easily manageable.

Adapters are also recommended for service issues i.e. replacement of cables as they allow greater flexibility.

Accessories

T-Coupler

T-Couplers are used for space saving sensor connectivity. Two sensors/actuators can be merged to one cable. The coupler can be attached close to the machine e.g. near a pneumatic cylinder or directly screwed onto a sensor I/O distribution box by a designated mounting hole on the housing.

Features:

- self-securing screw locking, vibration-proof
- contact finish gold-plated for a minimum of 100 mechanical operations
